and a ligature ſhall bee made croſſe-wayes above the ſhoulders, but that not too ſtrait, leſt it hinder the Patients breathing. I by theſe meanes, at the appointment of Anthony of Burbon King of Navarre, cured Anthony Benand a Knight of the Order, who had his breaſt-plate bended and driven in, with an iron bullet ſhot out of a Field-Peece, as alſo his *ſternum* together therewith, and he fell down as dead with the blow; he did ſpit blood for three months after I had ſet the bone: yet for all this he lives at this day in perfect health.

A hiſtorie.

CHAP. XI.

Of the fracture of the ribs.

THe true ribs, for that they are bonie, may be broken in any part of them. But the baſtard ribs cannot be truly broken unleſſe at the backe bone, becauſe they are onely bonie in that part, but griſtly on the foreſide towards the breaſt-bone, wherefore there they can only be folded or crooked in. Theſe which are ſubject to fractures, may be broken inwards and outwards. But oft times it comes to paſſe, that they are not abſolutely broken, but cleft into ſplinters, and that ſometimes inwards, but not outwards. Thus the fiſſure doth ofttimes not exceede the middle ſubſtance of the rib, but ſometimes it ſo breakes through it all, that the fragments and ſplinters do prick and wound the membrane, which inveſts and lines them on the inſide, and then there is great danger. But when the fracture is ſimple without a wound, compreſſion, puncture of the membrane, and laſtly, without any other ſymptome; then the danger is leſſe. Therefore Hippocrates wiſheth, that theſe, who are thus affected, fill themſelves more freely with meat; for that moderate repletion of the belly, is (as it were) a certaine prop or ſtay for the ribs, keeping them well in their place and ſtate: which rule chiefly takes place in fractures of the baſtard ribs. For ſuch as have them broken, uſually feele themſelves better after, than before meat. For emptineſſe of meat, or of the ſtomack, makes a ſuſpenſion of the ribs, as not underpropped by the meat. Now that fracture which is outwardly, is farre more eaſie to heale, than that which is inwardly; for that this pricketh the membrane or *Pleura*, and cauſeth inflammation, which may eaſily end in an *Empyema*. Adde hereunto, that this is not ſo eaſily to be handled or dealt withall, as the other: whereby it commeth to paſſe, that it cannot be ſo eaſily reſtored; for that theſe things cannot bee ſo fully and freely performed in this kinde of fracture, which are neceſſary to the ſetting of the bone, as to draw it out, hold it and joyne it together. It is therefore healed within twenty dayes, if nothing elſe hinder. The ſignes of fractured ribs are not obſcure; for by feeling the grieved part with your fingers, you may eaſily perceive the fracture by the inequalitie of the bones, and their noyſe or crackling, eſpecially, if they bee quite broke aſunder. But if a rib be broken on the inſide, a pricking paine, far more grievous than in a Pleuriſie, troubles the Patient; becauſe the ſharp ſplinters pricke the Coſtall membrane: whence great difficulty in breathing, a cough and ſpitting of blood enſue. For blood, flowing from the veſſels broken by the violence of the thing cauſing the fracture, is (as it were) ſucked up by the lungs, and ſo by a dry cough carried into the weazond, and at length ſpit out of the mouth. Some, to pull up the bone that is quite broken and depreſt, apply a cupping glaſſe, and that is ill done: for there is cauſed greater attraction of humors, and exceſſe of paine by the preſſure and contraction of the adjacent parts, by the cupping-glaſſe; wherefore Hippocrates alſo forbids it. Therefore it is better to endeavour to reſtore it after this following manner. Let the Patient lye upon his ſound ſide, and let there be layd upon the fractured ſide an emplaiſter made of Turpentine, roſin, black pitch, wheat floure, maſtick and aloes, and ſpread upon a ſtrong and new cloath. When it hath ſtucke there ſome time, then plucke it ſuddenly with great violence from below upwards: for ſo the rib will follow together therewith, and bee plucked and drawne upwards. It is not ſufficient to have done this once, but you

The cure.

muſt doe it often, untill ſuch time as the Patient ſhall finde himſelfe better, and to breathe more eaſily. There will be much more hope of reſtitution, if, whileſt the Surgeon doe this diligently, the Patient forbeare coughing, and hold his breath. Otherwiſe, if neceſſitie urge, as if ſharpe ſplinters with moſt bitter tormenting paine pricke the Coſtall membrane overſpred with many nerves, veines, and arteries, which run under the ribs, whence difficultie of breathing, ſpitting of blood, a cough and fever enſue; then the only way to deliver the Patient from danger of imminent death, is, to make inciſion on the part, where the rib is broken, that ſo laying it bare, you may diſcerne the pricking fragments, and take them out with your inſtrument, or elſe cut them off. And if you make a great wound by inciſion, then ſhall you ſew it up, and cure it according to the common rules of curing wounds. Now Diet, Phlebotomie and Purgation, which (as Hippocrates ſaith) are not very needfull in a ſimple fracture, for that there are no ſymptomes, which may require ſuch remedies; yet, they, by reaſon of the complicated ſymptomes, as a convulſion, feaver, *Empyema*, and the like, muſt here be preſcribed, by the advice of the Phyſician which over-ſees the cure. A Cerate, and other remedies fitting the occaſion, ſhall be applyed to the grieved part: no other ligatures can be uſed, than ſuch as are fit to hold faſt and ſtay the locall medicines. There is no other rule of ſite and lying, than ſuch as is taken from the will and content of the Patient.

A ſimple fracture may be cured onely by Surgerie.

Chap. XII.

Of certaine preternaturall affects which enſue upon broken ribs.

Many ſymptomes enſue upon fractured and contuſed ribs: but amongſt the reſt, there are two which are not common, whereof we will treate in this place. The firſt is, the inflation, or riſing up of the contuſed fleſh, which alſo enſues upon light affects of the bone, which have bin neglected at the beginning. But the fleſh is not meerly puffed up of its ſelfe, but alſo with a certaine phlegmatick, glutinous and viſcous humour gathering thereinto. The cauſe hereof is, the weakneſſe of the digeſtive facultie of the part, occaſioned by the ſtroake and diſtemper; which therefore cannot aſſimulate the nouriſhment flowing more plentifully than it was wont, eyther drawne thither by means of the pain, or ſent thither by a blinde violence of nature, ſtirred thereto by a deſire of its own preſervation. Wherfore this halfe crude humor remaining there, raiſeth much flatuling from its ſelfe, or elſe wrought upon by the weaker heat, it is reſolved into cloudy vapours; whence it commeth to paſſe, that the fleſh is ſwolne up in that place, and the ſkinne on the contrary growes ſoft, as if it were blowne up with a quill. Therefore laying your hand thereon, you may heare the noyſe of the winde going forth thereof, and ſee a cavity left in the part, as it is uſually ſeene in œdematous tumors. Unleſſe you remedie this inflation, there will enſue an inflammation, fever, abſceſſe, difficulty of breathing; and laſtly, that ſecond kinde of affect, whereof we have determined to treat in this Chapter, to wit, the putrefaction, corruption, or blaſting of the ribs. An abſceſſe, and the ſeparation of the fleſh from the bone, is the cauſe hereof: for hence it commeth to paſſe, that the bone, deſpoyled of its naturall and fleſhly cloathing wherewith it was cheriſhed, is eaſily offended by the touch of the entring ayre, which it never formerly felt, and ſo at length it becommeth (as it were) blaſted: which when it happens, they ſpit up filth, and ſo fall into a conſumption, and at length dye. To withſtand all theſe inconveniencies, you muſt, as ſpeedily as you can, reſtore the fractured bones by the formerly delivered meanes. And then this mucous tumor muſt be reſolved by proper heating and diſcuſſing medicines, and kept downe by boulſters and rowlers; that ſo the fleſh may touch the bone, and cover it as it uſually did. But the ligature ſhall not be made ſo ſtrait, as to hinder the ribs from their wonted motion in expiration and inſpiration. If the tumor degenerate into an Abſceſſe, it ſhalbe ſpeedily opened, leſt

The cauſe.

leſt the matter, kept in too long, corrupt the bone which lyes under it, by the contagion of its putrefaction. The Ulcer being opened, the matter ſhall bee evacuated by putting a pipe into the ulcer; the end whereof ſhalbe bound about with a thred, leſt it fall into the capacity of the cheſt, and that it may bee drawne forth at your pleaſure.

CHAP. XIII.

Of the fracture of the Vertebræ, *or Rack bones of the backe, and of their proceſſes.*

THe *Vertebræ* are ſome-whiles broken, otherwhiles bruiſed, or ſtrained on the inſide, wherby it commeth to paſſe, that the membranes which inveſt the ſpinall marrow, as alſo the ſpinall marrow its ſelfe, are compreſſed and ſtraitened, which cauſe many maligne accidents; which, whether they be curable or not, may be certainly foretold by their magnitude. Amongſt theſe ſymptomes, are the ſtupidity, or numneſſe and palſie of the armes, legges, fundament and bladder, which diminiſh, or elſe take away from them the facultie of ſenſe and motion; ſo that their urine and excrements come from them againſt their wils and knowledge, or elſe are wholly ſuppreſt. Which when they happen (ſaith Hippocrates) you may fore-tell that death is at hand, by reaſon that the ſpinall marrow is hurt. Having made ſuch a prognoſticke, you may make an inciſion, ſo to take forth the ſplinters of the broken *vertebræ*, which, driven in, preſſe the ſpinall marrow, and the nerves thereof. If you cannot doe this, at leaſt you ſhall apply ſuch medicines as may aſſwage paine, and hinder inflammation; and then the broken bones ſhall be reſtored to their places, and contained therein by thoſe meanes which we ſhall mention when we come to treat of the luxation of the ſpine. But if that the proceſſes onely of the *vertebræ* be broken, the fragments ſhall be put in their places, unleſſe they bee quite ſevered from their *perioſtium*. But if they bee ſevered, you ſhall open the skinne and take them forth, and then dreſſe the wound as is fit. Wee underſtand, that onely the proceſſes of the *vertebræ* are broken, if, in the abſence of the fore-mentioned ſymptomes of numnes and the palſey, you, laying your finger upon the grieved part, feele ſomething, as a bony fragment, ſhaking and moving thereunder, with a certaine crackling noyſe, and cavitie, and depreſſion; and then, if when the Patient holds downe his head, and bends his backe, hee feele farre more paine, than when hee ſtands up ſtraight on his feete. For in ſtooping, the skinne of the backe is ſomewhat ſtretched forth, and extended, and alſo forced upon the ſharpe Splinters of the fragments, whence proceedes a dolorificke ſolution of continuitie, and a pricking: in ſtanding ſtraight up, on the contrary, the ſtretched skinne is relaxed, and conſequently leſſe moleſted by the ſharpe fragments. The fractured proceſſes of the *vertebræ* eaſily heale, unleſſe they bee aſſociated with ſome other more grievous ſymptome which may hinder; ſuch as is a certaine great contuſion, and the like. For, as wee formerly ſayd out of Hippocrates, All rare and ſpongie bones are knit by a *Callus* within a few dayes.

The affects of the *vertebræ*.

Chap. XIV.

Of the fracture of the holy-bone.

What fracture of the Holy-bone curable and what not.

ALſo the Holy-bone in a certaine part thereof, which may be eaſily healed, may be broken by the blow of bruiſing things, as by a bullet ſhot out of a musket, as I have obſerved in many. But if the fracture violate, together with the *vertebræ* thereof, the ſpinall marrow contained therein, then the Patient can ſcarce ſcape death, for the reaſons ſhewed in the former Chapter.

Chap. XV.

Of the fracture of the Rumpe.

The deſcription of the rump.

THe Rumpe is compoſed of foure bones: the firſt whereof hath a cavitie, wherein it receives the loweſt *vertebra* of the Holy-bone: the other three are joyned together by *Symphyſis* or Coalition; at the end of theſe hangs a certaine ſmall griſtle. The fracture of theſe bones ſhall be cured by putting your finger into the Patients fundament, and ſo thruſting it even to the fractured place. For, thus you may thruſt the fragment forth, and fit and reſtore it to the reſt of the bones by your other hand lying upon the backe. But that it may be the ſooner healed, it is fit the Patient keep his bed, during all the time of the cure. But if there be a neceſſitie to riſe, hee ſhall ſo ſit in a perforated ſeat, that there may bee nothing which may preſſe the broken part; and fitting remedies for healing fractures ſhall be applyed, as occaſion ſhall offer its ſelfe.

The cure.

Chap. XVI.

Of the fracture of the Hip, or Os Ilium.

The deſcription of the Hip.

THe Hip conſiſts of three bones: The firſt is named *Os Ilium*, the Haunch-bone; the other, *Os Iſchion*, the Huckle bone; the third, *Os pubis*, the Share-bone. Theſe three bones in men of full growth, are ſo faſt knit and joyned together, that they can by no meanes be ſeparated; but in children they may be ſeparated without much adoe. This bone may be broken in any part thereof, either by a ſtroake, or by a fall from high upon any hard bodie. You ſhall know the fracture by the ſame kinde of ſignes, as you know others, to wit, paine, pricking, a depreſſed cavitie, and inequalitie, and alſo a numneſſe of the legge of the ſame ſide. The ſplinters of the bones (if quite broke off) muſt by making inciſion be taken away at the firſt dreſſing: in performance of which operation, you muſt have a care, that you hurt not with your inſtrument the heads of the muſcles, nor any veſſels, eſpecially which are great; nor laſtly, that large nerve which is ſent into the muſcles of the thigh and legge. On the contrary, ſuch fragments as are not broken or ſevered from their *perioſtium*, ſhall bee ſmoothed and ſet in order with your fingers, as is fitting. Other things ſhall be done according as art and neceſſity ſhall perſwade and require.

Chap.

Chap. XVII.

Of a fracture of the Shoulder, or Arme-bone.

The deſcription of the arme or ſhoulder-bone.

THe Arme-bone is round, hollow, full of marrow, riſing up with an indifferent necke, and ending on the upper part into ſomewhat a thick head. On the lower part it hath two proceſſes, the one before, the other behinde: between which there is (as it were) an halfe circle, or the cavity of a pulley, each end whereof leads into its cavitie, of which one is interior, another exterior; that by theſe (as it were) hollow ſtops, the bending and extenſion of the arme might bee limited: leſt that the bone of the cubite, if the circle ſhould have beene perfect, ſliding equally this way and that way, might, by its turning, have gone quite round, as a rope runnes in a pulley; which thing would much have confuſed the motion of the Cubite. For ſo the extenſion, or bending it backe, would have beene equall to the neceſſarie bending it inwards. It is very expedient that a Surgeon know theſe things, that ſo hee may the better know how to reſtore the fractures and luxations of this part.

The cure.

If one of the fragments of this broken bone ſhall lye much over the other, and the patient have a good ſtrong bodie, then the arme ſhall be much extended, the Patient being ſo ſet upon a lowe ſeat, that he may not riſe, when the fracture ſhall bee a-ſetting, and ſo hinder the begunne worke; and alſo, that ſo the Surgeon may the more eaſily performe his operation upon the Patient ſeated under him: yet Hippocrates, regarding another thing, would have the Patient to ſit higher. But you muſt have a care, that the ſhoulder-bone it ſelfe be drawne directly down-wards, and the cubit ſo bended as when you put it into a ſcarſe. For if any one ſet this bone, lifting the arme upwards, or otherwiſe extending it, then muſt it be kept in that poſture: for otherwiſe, if the figure be changed, the ſetting will quickly bee ſpoyled, when as you come to put the arme in a ſcarſe.

How the arme muſt be placed when the bone is ſet.

Wherefore the Surgeon muſt diligently and carefully obſerve, that in ſetting a broken arme, hee put it in ſuch a poſture, that reſting on the breaſt, it looke downe towards the girdle. You muſt have a care in laying the ſplints, and rowling your ligatures, that they hurt not, nor preſſe too hard upon the joynts.

Sect.3. offic. ſect.1. de fract.

For, in the opinion of Hippocrates, by the preſſure of parts which are nervous, fleſhleſſe, and conſequently endued with exquiſite ſenſe, by the ſplints there is danger of moſt grievous paine, inflammation, denudation both of the bone and nerve; but chiefly, if ſuch compreſſion hurt the inner part, towards which the arme is bended: wherefore the ſplints made for this place muſt bee the ſhorter. Therefore, after the Arme-bone is ſet, the arme ſhall bee layd upon the breaſt in a right angle, and there bound up in a ſcarſe, leſt that the Patient, when he hath neede to ſtirre, ſpoyle and undoe the ſetting, and figure of the broken bone.

In what time it will knit.

But the arme muſt be kept in quiet, untill ſuch time as the fragments ſhall bee confirmed with a *Callus*, which uſually is in fortie dayes, ſooner or later, according to the different conſtitutions of bodies.

Chap. XVIII.

Of the fracture of the Cubit, or the Ell and Wand.

The differences.

IT ſometimes happeneth, that the Cubite and Wand are broken together and at once, and otherwhiles that but the one of them is fractured. Now they are broken eyther in their midſt or ends; their ends (I ſay) which are eyther towards the elbow, or elſe towards the wreſt. That fracture is worſt of all, wherein both the bones are broken, for then the member is made wholly impotent to performe any ſort of action, and the cure is alſo more difficult; for the member cannot ſo eaſily be contained in its ſtate: for that bone which remaines whole, ſerves

for

The cure.

Sent.3.ſect.1. de fract.

Com. in lib. de art.

for a ſtay to the arme, and hinders the muſcles from being drawn backe, which uſually draw backe and ſhrinke up themſelves, whenſoever both bones are broken. Hence it is, that that fracture is judged the worſt, wherein the Cubit or Ell bone is broken. But that is eaſieſt of all, wherein onely the Wand is broken, for ſo the fractured part is ſuſtained by the Ell-bone: When both the bones are broken, there muſt bee made a ſtronger extenſion, for that the muſcles are the more contracted. Therefore, whenſoever eyther of them remaines whole, it doth more ſervice in ſuſtaining the other, than any eyther ligatures or ſplints, for that it keeps the muſcles right in their places. Wherefore, after the bones ſhal be ſet and rowled up with ligatures and ſplints, the arme muſt bee ſo carried up in a ſcarfe put about the necke, that the hand may not be much higher than the elbow, leſt the blood and other humors may fall downe thereinto. But the hand ſhall be ſet in that poſture which is betweene prone and ſupine, for ſo the Wand ſhall lye directly under the Ell, as we have read it obſerved by Hippocrates. The reaſon is, for that by a ſupine figure or ſituation, both the bone and muſcles are perverted: for firſt, for the bone, the *Apophyſis, ſtyloides* and *Olecranum* of the Cubit, ought to be in an equall plaine, and to be ſeated each againſt other; which is not ſo in a ſupine figure, as wherein the *Proceſſus ſtyloides* of the Cubit is ſet againſt the inner proceſſe of the arme bone. But in muſcles, for that, like as the inſertion and ſite of the head of a muſcle is, ſuch alſo is the ſite of the belly thereof, and laſtly, ſuch the inſertion of the tayle thereof; but by a ſupine figure, the muſcles ariſing from the inner proceſſe of the arme-bone and bending the cubit, ſhall have their tayle placed in an higher and more exteriour ſite. In the *interim*, you muſt not omit, but that the Patients arme may, with as little paine as poſſibly you can, be bended and extended now and then, leſt by the too long reſt of the tyed up part, and the intermiſſion of its proper function, the bones of the joynt may be ſowdred together by the interpoſition, and as it were glue of the defluxion which fals abundantly into the joynt of the Ell-bow, and neighbouring parts, whence the ſtiffeneſſe and unmoveableneſſe thereof, as if there were a *Callus* growne there: from whence it may happen, that the arme thereafter may neither be bended, nor extended, which I have obſerved to have happened to many. Whereof alſo Galen makes mention, and cals this kinde of vitiated conformation *Ancyle* and *Ancyloſis*. If a wound alſo aſſociate a fracture of the arme, then ſee, that you put about it plates of Latin, or Paſt-bord, and make a convenient Ligature, and that the fragments of the bones be kept in the ſame ſtate wherein they were ſet and reſtored. Moreover, let him lay his arme upon a ſoft pillow or cuſhion, as the following Figure ſhewes you.

Chap. XIX.

Of the fracture of a Hand.

The bones of the Wreſt, and After-wreſt, may bee broken: but, in Hippocrates opinion, chiefly by that kind of fracture which is called a *Sedes*; now if they ſhal happen to be broken, this ſhal be the maner of reſtoring them. Let the Patient lay forth his hand upon ſome even and ſmooth table, then let your ſervant ſtretch forth the broken bones, & the workmaſter reſtore them thus extended, and put them in their proper ſeats. But being reſtored, they muſt be kept in their places by ſuch remedies as are uſed in other fractures; to wit, cerates, compreſſes, linnen clothes, and ſplints. Now the fractured fingers ſhall be tyed or bound to their neighbours, that ſo they may the more eaſily, as bound to a ſtake, be kept in that ſtate wherein they have been put by the hand of the Workeman. But theſe bones, ſeeing they are of a rare and ſpongie nature, are in a ſhort time and eaſily ſtrengthened, or knit by a *Callus*. Theſe things being done, the hollowneſſe or palme of the hand ſhall be filled with a Tennis ball, for thus the broken bones ſhall not only be more eaſily kept in their places, but alſo the fingers themſelves ſhall be kept in a middle poſture, that is, not wholly open, nor quite ſhut. If they be kept in any other figure, the enſuing *Callus* will either deprave or quite aboliſh that action of the hand, wherby we take hold of any thing. The caſe ſtands otherwiſe with the fractured Toes; for they ſhall bee kept ſtraight and even out, leſt they ſhould hinder our going or ſtanding.

Sect.2.de fract. ſent.9.

The cure.

To what purpoſe the carrying of a ball in a fractured hand ſerves.

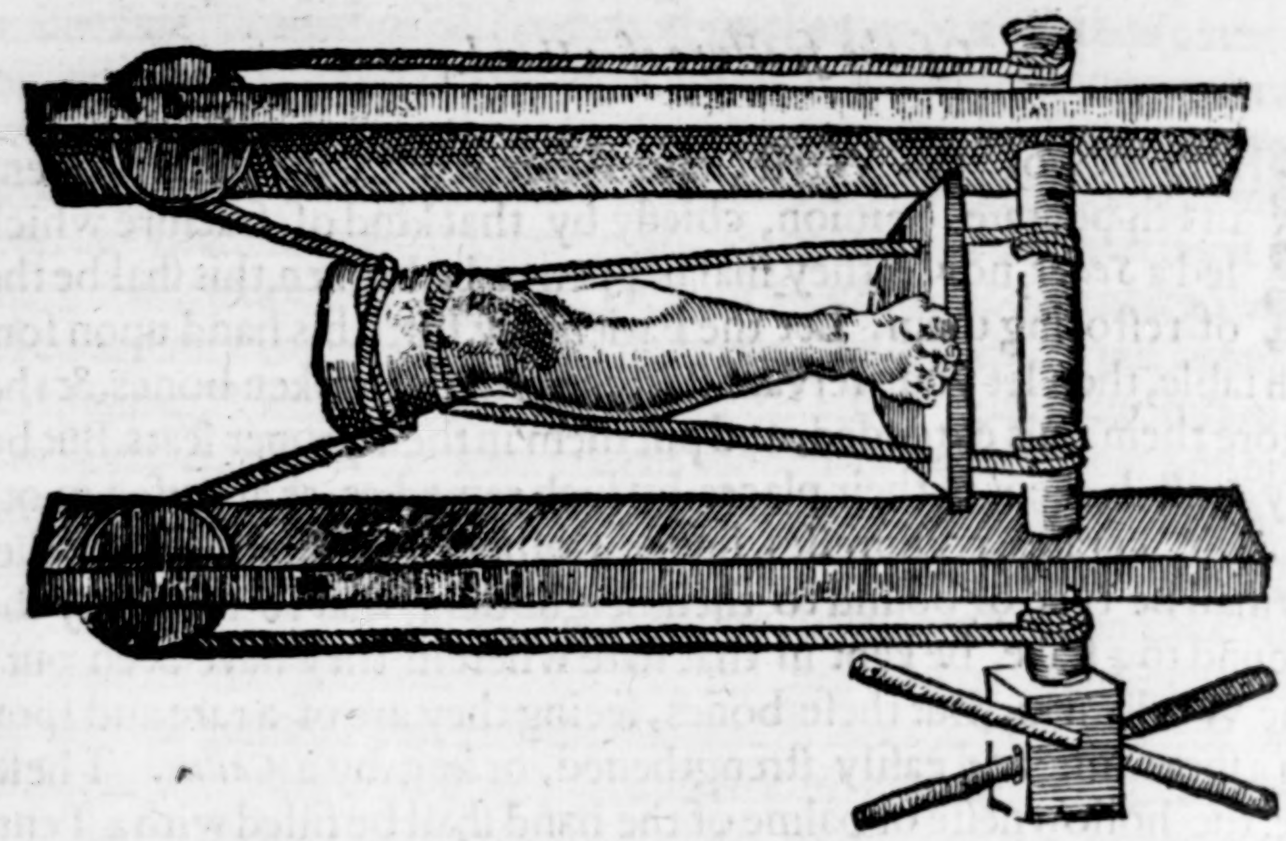
Chap. XX.

Of the fracture of a Thigh.

It is a hard thing to bring the fragments of the broken thigh together to be ſet, by reaſon of the large and ſtrong muſcles of that part; which whileſt they are drawne backe towards their originall, by a motion both naturall and convulſive, they carry together with them the fragment of the bone, whereinto they are inſerted. Therefore, when as the fracture of this bone ſhall be reſtored, the Patient muſt lye upon his back with his legge ſtretched forth, and the Surgeon muſt ſtrongly and with great force extend the thigh; but if he alone ſhall not be able ſufficiently to extend it, he ſhall imploy two other ſtrong attendants, by whoſe joynt-helpe the fragments may be fitted and ſet each againſt other. For this purpoſe, when as the ſtrength of the hand was not ſufficient, the Ancients uſed an Inſtrument, called a *Gloſſocomium*, whereof this is the figure.

Why the bone of the thigh is more difficultly ſet.

The figure of a Gloſſocomium, *or Extender.*



Sent. 67. & 68. ſect. 2. de fract.

The naturall and internall crookedneſſe muſt be preſerved in ſetting the bone.

The part to bee bound up, muſt be made plaine either by nature or art.

The manner of binding uſed by Surgeons at this day.

In ſtead of this *Gloſſocomium*, you may make uſe of my pulley; for Hippocrates in this bone when it is broken, doth approve of extenſion ſo great, that although by the greatneſſe of the extenſion the ends of the fragments be ſomewhat diſtant aſunder, an emptie ſpace being left betweene; yet notwithſtanding would hee have ligature made. For it is not here as it is in the extenſions of other bones, whereas the caſting about of Ligatures keeps the muſcles unmoveable: but here, in the extended thighes, the deligation is not of ſuch force, as that it may ſtay and keepe the bones and muſcles in that ſtate, wherein the Surgeon hath placed them. For, ſeeing that the muſcles of the thigh are large and ſtrong, they overcome the ligation, and are not kept under by it. The Surgeon, in ſetting it, ſhall alſo conſider, that the thigh-bone is hollowed on the inner ſide, but gibbous on the outſide, therefore it muſt be ſet in its native figure. Otherwiſe, if anie, unmindefull of this conſideration, would have it ſtraight, he ſhall make his Patient halt all his life after: wherefore this inner and native hollowneſſe muſt be filled up and preſerved by putting in a compreſſe or boulſter, ſpread over with *unguentum roſatum*, or the like glutinous thing that it may not fall off: for thus alſo the ligation ſhall the more faithfully keep the fragments of the bone in their places. Moreover, compreſſes ſhall be applied to the more ſlender and leſſe protuberating parts of the thigh, as thoſe which are next the ham and knee, that ſo the whole ligation may be alike, and conſequently the more firme. Now ligatures, as we formerly noted, are ordained for three things. The firſt is, that the bones may bee kept in that ſtate wherein they were ſet, untill they be ſtrengthened by a *Callus*. The ſecond is, to hinder defluxion, which eaſily fals into the broken and luxated parts, both by reaſon of paine, as alſo by weakneſſe. The third is, to ſtay and hold faſt the ſplints and medicines which are applied. Inflammation is hindred by repreſſing and hindring the blood and other humours, ready to flow downe, from entring into the part, and by preſſing thoſe humors, which are preternaturally contained in the part, into the neighbouring parts above and below. Wherefore there muſt no ſmall care be had of preparing ligatures, to wit, that they bee made of choyce and well woven cloth, yet not courſe or rough; and let them be of ſuch length and breadth, as the Surgeon, perſwaded by an artificiall conjecture, ſhal judge to be fit for the thickneſſe and length of the member, and greatneſſe of the fracture: for ligatures ought to be of breadth to involve and cover all the fractured part, and a great part of that which is ſound. But ſeeing that in my Booke of Bandages, I have ſeemed chiefly to ſet downe and approve the manner of binding uſed by Hippocrates, now I thinke good here in this place to deſcribe that which is in common uſe amongſt our Surgeons.

Our

Our Surgeons therefore at this day require three Ligatures for fractures, the firſt whereof they preſently caſt upon the hurt part, whether broken or diſlocated, or onely ſtrained, making the firſt wrappings upon it; ſo that they moſt and ſtraitlieſt binde it there, but leſſe and more looſely on both ſides thereof. Such circumvolutions, or wrappings, are drawne upwards, and there ended. They muſt bee rowled thicke, and not wide; for ſo if they preſently follow, and lye one upon another, they will hold the bones more firmely, and more farre and wide preſſe forth and repreſſe the ſuperfluous blood from the ſound part. They preſently in like ſort caſt the ſecond ligature upon the verie fracture, giving it two wraps, then going downwards; yet ſo, as that they are opener or wider, and farther diſtant each from other, and not ſo cloſe together, as the circumvolutions of the firſt ligature; that ſo they may preſſe the humors the leſſe to the extremities of the part, as thoſe which cannot receive and beare, without inflammation and danger of a gangrene, ſuch abundance of humors, for that they are not ſufficiently ſpatious, as alſo more remote from the fountaine of native heat, which is greater in the center than in the circumference. At the lower end of the hurt part the circumvolutions either end, or elſe are twined thence backe againe. They caſt on the third ligature in that lower end of the hurt part, and rowle it ſmoothly and gently upwards, the windings being made contrarie to the windings of the firſt and ſecond ligatures; that they may ſo draw backe into their naturall ſtate the muſcles, which peradventure have beene drawne aſide by the force of the former wrappings. Theſe ligations finiſhed, they apply three ſplints of paſt-bord, or ſome ſuch matter; the firſt below the fracture, and that truly more broad, and of ſufficient length; and then two others, one on each ſide, diſtant each from other ſome fingers breadth, to the end to keep the bone that it doe not ſtirre to this ſide or that, being wrapped about with Tow or Cotton. Then they thinke of placing or laying the part, to which purpoſe they propound to themſelves three ſcopes. The firſt is, that the part may lye ſoft; the ſecond, ſmooth, or even; the third, ſomewhat high. The hurt part ought truely to lye ſoft, for that hard lying preſſes it, and cauſes paine and inflammation; which whiles the Patient cannot patiently endure, he is forced to change his place, whilſt he everie way ſeeks eaſe for his paine: and thus he now and then moves the fractured part, which ought to be kept quiet without any motion. It muſt lye ſmooth or even, becauſe an unequall or uneven ſite diſtorts or draws awry the part, whilſt one portion of the hurt part is borne up, and ſuſtained by that which lyes under it; but the other hanging downe hath nothing thereunder, whereupon it may reſt. Therefore Hippocrates bids us diligently to take heed, that the heele doe not hang downe, nor the foot remaine without a pillow, for hence paine and a troubleſome defluxion of humors is to be feared. But the part ought to lye ſomewhat high, that the defluxion may bee hindred, which is eaſily ſtirred up by a prone and declining ſite: for if the foote ſhall be placed in a lower figure, the blood which flowes thither from the legge, will cauſe inflammation. But on the contrarie, if it bee higher, nothing can flow downe thereinto. Therefore abſolutely not only the foote, but alſo the thigh and legge, are to be placed higher than the reſt of the bodie: yet, keeping ſuch a meane, that the part may not be too much diſtended, as Hippocrates admoniſheth us. In the meane time, this hurt legge or ſide, ought to bee of equall length with the ſound, and for that purpoſe it muſt bee ſtayed on both ſides with Junks, as we ſhall ſhew you hereafter, when we come to ſpeak of a broken legge.

Why the windings of the upper ligatures muſt be thicker and ſtraiter than the lower.

Why the third ligature muſt bee rowled contrary to the two firſt.

The Surgeon muſt be mindefull of three things in placing the member.

Sect.2.de fract.

Sent.33.& 36. ſect.2.de fract.

The bandage being performed as we have ſaid, the following night, and the next day the Patient feels the member more ſtraitly bound, than when it was firſt wrapped; yea, verily the knee is lifted up into a ſoft tumor by the expreſſion of the humor from the wounded part: but on the contrarie, the enſuing day the ligation is ſlackned and relaxed, ſome portion of the humor contained in the part being digeſted. Alſo the next day all things are perceived more looſe, there being made a larger reſolution of the humor. Then therefore the Bandages muſt be looſed, and that not only, leſt that the fragments of the bones ſhould fall forth of their place, but alſo that we may gratifie the Patient by that alteration or change of place, and beſides that wee may avoyde itching, which uſually happens to parts too long bound up, by

When the firſt ligation muſt be looſed.

Ccc 2

by reaſon of the ſuppreſſion of acride and fuliginous excrements, which uſe to be gathered in great quantitie in a part at reſt and bound up, both from the excrementitious humors, wherewith the part is moiſtened, and the alimentarie humors in a part which is idle and at quiet; by reaſon the diſſlation and tranſpiration are hindred by want of exerciſe, and the pores of the skinne ſhut up by the abundance of the ligatures: ſo that by the ſuppreſſion thereof, many have not only an itching, but alſo, the skinne being broke by the acrimonie of theſe, as well vapours as humors, which are kept ſhut and pent up, have ulcers breake forth. Therefore when ſuch accidents ſhall be feared, the part ſhall ſo long be fomented with warme water and oyle, as you ſhall thinke fit: for, ſuch fomenting aſſwageth paine, relaxeth that which was too much ſtraitened by the binding, and amends the refrigeration of the part, cauſed by the repercuſſion and expreſſion of the blood and ſpirits, the native and internall heat being by this meanes revived. If, together with the tumor, there be a contuſion and ſugillation, it muſt bee the longer fomented, that the excrementitious humor reſiding in the part may be digeſted. But if this quantitie of time ſhall not ſuffice, then muſt you uſe ſtronger digeſtives: yet have a care you uſe them not too long; for ſo you ſhould hinder the generation of a *Callus*. Therefore that ſaying of Hippocrates muſt here be remembred, which ſaith, That a weak fomentation, and the ſhort time of uſing one doth attract, but not diſcuſſe; but a longer and ſtronger waſtes the fleſh. Beſides alſo, you muſt have regard to the temper and habit of the Patient; for fomentations, uſed to plethorick bodies, draw ſuperfluous humors to the part. The Ancients bid, that the ligatures be looſed everie third day, untill their ſeventh day; but after the ſeventh, on everie ſeventh day: but hereof nothing can be certainly and perpetually decreed. For, according to the accidents the Patients muſt be dreſſed ſooner or later, more often or ſeldome, renuing the ligatures, and the reſt of the dreſſing. Therefore, if no ſymptome urge, I would have none of theſe things, which are done to the Patient at the firſt dreſſing, to be moved, unleſſe as ſlowly and ſeldome as you may. For you hinder the knitting of the bone, if you never ſo little move the ends of the fragments thereof: for, as you ſee wood is joyned together by glue, and pewter with ſowder; ſo the fragments of bones are, by the providence of nature, glued and ſowdred together by a *Callus*. Wherefore broken bones have very much need of reſt, to the generating of a *Callus*; otherwiſe, the matter thereof flowing downe, quickly flowes away, and nothing is done. You may much helpe forwards the generation of a *Callus*, which is begunne about the thirteenth or fifteenth day, by applying an emplaiſter made with the white of an egge, having the powder of red roſe leaves, and wheat floure mixed therewith, and other Catagmatick plaiſters, which ſhall hereafter be deſcribed in ſpeaking of the fracture of a legge.

Sent.15.ſect.3. de offic.

Reſt neceſſary for the knitting of ſet bones.

CHAP. XXI.

Of the fracture of the Thigh nigh to the joynt, or the upper or lower head of the bone.

A hiſtorie.

A Fracture ſometimes happens at the joynt of the hip in the neck of the thigh-bone, as I once obſerved in an honeſt matron. I being called to her, when I had obſerved the hurt Thigh to be ſhorter than the whole, with the outward prominencie of the *Iſchium*, which at the firſt ſight I ſuppoſed to proceede from the head of the thigh bone, I preſently perſwaded my ſelfe it was a diſlocation and no fracture; I then therefore extended the bone, and forced (as I thought) the head thereof into its cavitie. The equalitie of both the legges in bigneſſe which followed upon this extenſion, encreaſed my perſwaſion that it was a diſlocation. The next day I viſited her the ſecond time, and found her in great paine, her hurt legge the ſhorter, and her foot wreſted inwards.

Then I looſed all her ligatures, and perceived ſuch a prominencie as I did formerly. Wherefore I endeavoured againe to force in the head of the bone, as I formerly did. But as I was buſied therein, I heard a little crackling, and alſo I conſidered, that there was no cavitie nor depreſſion in the joynt, by which ſignes I certainly perſwaded my ſelfe, that the bone was broken, and not diſlocated. Neyther only ſuch kinde of Fractures, but alſo the ſeparation of the *appendix* or head of this bone from its place, may induce one to thinke it a diſlocation; which thing hath ſometimes deceived ſome heedleſſe Surgeons, who have not dreamt of the divulſion or ſeparation of the *appendix* from the top of the Thigh-bone, but have judged it only a diſlocation. Then therefore (that I may returne to my former narration) I ſet the bone, and joyned the fragments together, layd thereupon ſplints with compreſſes, made ligations with a rowler, having two heads wrapped about the joynt, and the bodie croſſe-wiſe, and I defended her foote with a Caſe, that none of the clothes might preſſe it. I faſtened a rope to a poſte, and ſo let it come downe into the midſt of the bed, and tyed many knots thereon, for the better taking hold and lifting up her ſelfe; the which thing you muſt alwaies doe in fractures and diſlocations of the thigh and legge, that ſo your Patients may have ſome ſtay, whereby they may ſuccour themſelves with their hands, as oft as they deſire to riſe, or lift themſelves up in their beds, or goe to ſtoole; as alſo, that they may give perſpiration, and as it were ventilation to the loynes, buttocks, rumpe, and other parts, compreſſed and wearied with long lying, for want wherof they are moleſted with heat and paine; whence ulcers ariſe, which oft-times torment the Patient with ſuch tormenting heate and paine, that he is even conſumed by a fever, watchings, and want of reſt. This opportunitie of raiſing the bodie out of the bed, is by ſo much the more needfull in this place, by how much the fracture is nearer the joynt: for there it is more dangerous than in the midſt of the thigh, and conſequently more difficult to dreſſe and heale, for that the part is bloodleſſe, and by reaſon of the multitude of the nerves, tendons and ligaments, which are obnoxious to many maligne ſymptomes. But the Surgeon muſt have diligent care in this kinde of fracture, and muſt looke often that the bone, which is ſet, doe not fall forth againe, which eaſily happens here by any light ſtirring of the bodie, & the like occaſion, for that the thigh hath but one onely bone. Therefore, as oft as the Bandages ſhal be looſed, and the fracture dreſſed, hee ſhall attentively view the figure of the bone, and the magnitude of the affected part, comparing it with the ſound; for the ſet and compoſed fragments of the broken bone, can ſcarce fall aſunder, but that the one muſt lye upon the other. But before it be knit, the part muſt be extended and reſtored to its ſtate, that ſo the Patient may not halt during the reſidue of his life. For I have read it written in Avicen, that ſcarce any doe ſo well recover a fractured thigh, that they doe not halt thereof: therefore the Patient muſt be carefull, that hee move himſelfe, or his bodie, as little as hee can. Many of the Ancients have ſet downe the time of the conſolidation of this bone to bee fiftie dayes: but (as I formerly ſayd) there can bee no certaine or determinate time hereof. But in what time ſoever this bone ſhall bee knit, the Patient muſt not ſtand or goe thereon preſently upon it; for that there remaines a weakeneſſe in the part a long time after, ſo that the Patients are forced to uſe Crutches to goe withall, in the meane ſpace while they recover more ſtrength.

Another fracture of the thigh, reſembling a luxation.

Why the fracture of a bone neare a joynt is more dangerous.

Lib.3.fen.6. tract.1.c.14.

In what ſpace the thigh bone may be knit.

Chap. XXII.

Of the Fracture of the Patella, *or whirle-bone of the Knee.*

The differences.

Signes.

Cure.

Why thoſe halt who have had this bone fractured.

THe Whirle-bone of the knee is oft times contuſed, but not ſo frequently broken: yet when that happens, it goes into two or three peeces, ſometimes long-wiſe, ſometimes athwart. Sometimes it is broken in the midſt, and ſome-whiles ſhivered into many ſplinters, and all theſe eyther with, or without a wound. The ſignes are, impotencie in going, a hollowneſſe in that place, and a ſenſible ſeparation of the fragments of the hurt part, and the crackling of theſe parts under your hand. It is ſet after this manner; Wiſh the Patient to ſtretch forth his legge, yea, hee muſt keepe it extended all the while, untill it be knit; and therefore leſt hee ſhould bend it unawares, the hollowneſſe of the Ham ſhall be filled with a boulſter: for by bending of the knee, the ſet fragments of the whirle-bone would againe fly in ſunder. This being done, the fragments ſhall by the hand of the Surgeon be ſet as is fitting, and be kept ſo ſet by the application of convenient remedies, making ligatures, and applying Junks, as wee ſaid muſt be done in a fracture of the Thigh-bone. And laſtly, you muſt obſerve and doe in this, as in the fracture of a legge. For the Prognoſtick, this I affirme, That I have ſeene none of thoſe who have had this bone fractured, who have not halted during the reſt of their lives. The cauſe hereof is, the knitting by the concretion of a *Callus* hinders the free bending of the knee; going, eſpecially on even ground is more eaſie to the Patient, but an aſcent is farre more difficult, and abſolutely painfull. The Patient muſt neceſſarily for this kinde of fracture lye or keep his bed, at the leaſt for forty dayes.

Chap. XXIII.

Of a broken Legge.

Sent.65.ſect.2. de fract.

Signes that both the bones are broken.

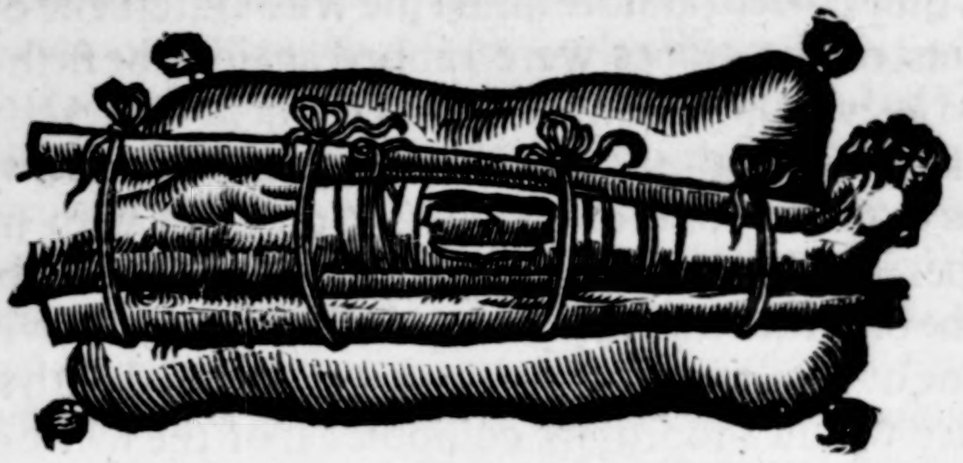
A hiſtorie.

THis kinde of Fracture is cured after the ſame manner as that of the arme or cubit. Hippocrates admoniſheth us, that the *Tibia*, or Leg-bone is more dangerous to be broken, and more difficult and ſlow to be healed than the *Fibula*, or Shin-bone; becauſe that is the thicker, and as it were the upholder of the whole bulke of the bodie: but this other is but as it were a certaine additament or aſſiſtant, provided for the ſtaying or bearing up of the muſcles of the legge, by which the foot is moved. The legge bone being only broken, the ſignes thereof are perceived onely in the inner part of the legge; for that the Shin-bone being whole, ſuffers it not to throw or caſt forth its ſelfe. On the contrarie, when the Shin-bone onely is broken, the ſignes thereof appeare only in the externall part of the legge; becauſe the legge bone, being oppoſed thereto, doth not ſuffer it to caſt in its ſelfe, and with its fragments to turne inwards. But when both the bones are broken, the ſignes of the fracture may equally appeare both here and there. But when only one of theſe bones are broken, the fracture is farre more eaſie to dreſſe and heale, becauſe that which remaines whole, is a much more firme ſtay to that which is hurt, than any ſplints can bee. But that I may the better inſtruct and make readie the Surgeon for the reſtoring of this fracture, I will illuſtrate the matter by an example from my ſelfe. John Neſtor, Doctor of Phyſick, Richard Hubert, and I, went together to viſit a Patient at the Place of the Frier Minorites. Wherefore, intending to paſſe over the Seine within ſight of the place, I endeavoured to make my horſe take boat, and therefore ſwitched him over the buttocks. The Jade, madded herewith, ſo ſtrucke at me with his heels, that he brake both the bones of my left legge, ſome foure fingers breadth above my ankle. Then I, fearing ſome worſe miſchiefe, and leſt the Jade ſhould double his blow, flew back; and as I fled backe, the broken bones flew in ſunder; and breaking through the fleſh, ſtocking and boote, ſhewed themſelves, whereby I felt as much paine, as it is credible a man was able to endure. Wherefore I was preſently carried into the boate, that ſo I might be carried to the other ſide of the water to be dreſſed: but the ſtirring of the boat as they rowed, almoſt killed me with bitterneſſe of paine, for that the ſharpe fragments of the bones were rubbed againſt the fleſh which lay next them. Being ferried over, as I was conveyed into the next houſes, my pain was much encreaſed, whileſt lifted by the hands of divers perſons, one while up, another downe, ſometimes to the left ſide, otherwhiles to the right with my whole bodie, and all the parts thereof. When at the length, I was layd upon a bed, I was ſomewhat freed from the bitterneſſe of my paine, and had time to wipe off the ſweat, which ranne downe over all my bodie. Then was I dreſſed with ſuch a medicine, as the time and place would affoord; we compoſed it of the white of an egge, wheat floure, ſoote of a chimney, and melted butter. For the reſt, I intreated Richard Hubert, that he would handle me, as if he knew mee not, neither that, moved for love of mee, he ſhould remit any thing of the ſeveritie of art, but chiefly, that hee would ſtretch my foot ſtraight out, and if the wound were not ſufficiently wide, that hee would enlarge it with his inciſion knife, that ſo hee might the more eaſily ſet the broken bones in their due place; that hee would with his fingers (whoſe judgement is farre more certaine than the beſt made inſtruments) ſearch, whether the ſplinters which were in the wound were quite ſevered from the bone, and therfore to be taken forth; that he would with his hand preſſe forth the blood, and the clods of blood which were in a great quantitie concrete at the mouth of the wound; that he would bind up and place my legge in that ſite and manner, as he thought beſt: which is, that he ſhould have three rowlers in a readineſſe; the firſt whereof he ſhould caſt directly upon the wound, ſo that he ſhould beginne his ligation at the wound: alſo he ſhould put ſplints about it; ſome three, but others two fingers breadth, of the length of halfe a foote, ſomewhat depreſſed and hollowed, whereby they might be the more eaſily put about the legge, more ſtraitly at their ends, and a fingers diſtance each from other, which at the laſt he ſhould binde with fillets, like thoſe wherewith Women uſe to binde up their haire; yet ſo, that the binding might be more ſtrait upon the wound: and that he would fill the cavitie of the ham, and of the ancles, with boulſters made of flaxe wrapped in linnen clothes: that he would fortifie the ſides of my legge with Junkes made of bents or little ſtickes, and lined with linnen cloth, ſtretched from my heele to my groine, and bound over in foure places; ſo that the ſtrait figure of the legge might ſcarcely bee perverted by any force: that he would gently, and ſmoothly lift up my legge to an indifferent height: and laſtly, that he ſhould arme it from the violence of externall injuries, by putting it in a boxe or caſe. But you muſt note, that the fit placing or laying of the legge is a matter of ſuch moment, that if any errour be here committed, it will cauſe no leſſe than lameneſſe. For if it be lifted up higher than is fit, the *Callus* will be hollow on the foreſide; if lower, then it will be gibbous or bunching forth. Neither alſo doe they commit a ſmall errour, who doe not fill up the cavities at the ancles after the forementioned manner: for, hereupon the heele will be much afflicted, whileſt it is forced to ſuſtaine a tedious and painefull compreſſion, which at length brings a hot diſtemper, becauſe the ſpirits cannot freely flow thereto; which I, finding by experience, not knowing the cauſe, wiſhed them ever now and then to lift up my heele, wherby it might enjoy the benefit of perſpiration, and the ſpirits have free entrance thereinto, & the contained vapours paſſing forth. To conclude, my hurt legge was layd upon a cuſhion after the manner you ſee here deſcribed.

A ſoone made medicine.

What to doe when the legge is broken.

The figure of a Legge fractured with a wound, and bound up.



Chap. XXIV.

Of ſome things to be obſerved in Ligation, when a fracture is aſſociated with a wound.

That the ligation muſt be moſt ſtrait upon the wound.

What ſymptomes enſue the want of binding upon the wounded part.

Signes of the corruption of the bones.

When the wounded part muſt be omitted in ligation.

This, taken out of the doctrine of the Ancients, ought to bee kept firme and ratified, That Ligation muſt bee made upon the wound; otherwiſe the wounded part will preſently lift it ſelfe up into a great tumor, receiving the humors preſſed thither by the force of the Ligation made on this and that ſide, above and bolow, whence enſue many maligne ſymptomes. You may make triall hereof upon a ſound fleſhie part; for if you binde it above and below, not touching that which is in the midſt, it will be lifted up into a great tumor, and change the flouriſhing and native colour into a livide or blackiſh hue, by reaſon of the flowing and abundance of the humors preſſed forth on everie ſide from the neighbouring parts. Therefore ſuch things will happen much the rather in a wounded or ulcerated part. But for this cauſe, the ulcer will remaine unſuppurated and weeping, crude and liquid *ſanies* flowing there-hence, like unto that which uſually flowes from inflamed eyes. Such *ſanies*, if it fall upon the bones, and make any ſtay there, it, with the touch therof, burnes and corrupts them, and ſo much the more, if they be rare and ſoft. Theſe will bee the ſignes of ſuch corruption of the bones; if a greater quantitie, and that more filthie *ſanies*, flow from the ulcer, than was accuſtomed, or the nature of a ſimple ulcer requires; if the lippes of the ulcer be inverted; if the fleſh be more ſoft and flaccid about them; if a ſorrowfull ſenſe of a beating, and alſo deepe paine torment the Patient by fitts; if, by ſearching with your Probe, you perceive the bone to be ſpoyled of its *perioſtium*; and laſtly, if you finde it ſcaily and rough, or alſo if your Probe bee put downe ſomewhat hard, it runne into the ſubſtance of the bone. But we have treated ſufficiently hereof in our particular Treatiſe of the rottenneſſe of the bones. But certainely ſuch rottenneſſe will never happen to the bone, if the hurt part be bound up, as is fit, and according to art. Wherefore I judge it not amiſſe, againe to admoniſh the Surgeon of this, That as farre as the thing ſhall ſuffer, hee make his rowlings upon the wound; unleſſe by chance there be ſuch exceſſive paine and great inflammation, that, through occaſion of ſuch ſymptomes and accidents, he be diverted from this proper and legitimate cure of the diſeaſe. Therefore then, becauſe nothing more can be done, let him only doe this, which may be done without offence; that is, let him ſupply the defect of ligation and rowlers, with a linnen cloth, not too weake, nor too much worne, being twice or thrice doubled, and which may ſerve to compaſſe the wound and neighbouring parts once about: let him ſew the edges thereof at the ſides of the wound, leſt he be forced to ſtirre the fragments of the bones (which once ſet ought to be kept unmoved) as often as the wound comes to be dreſſed. For, broken bones doe not require ſuch frequent dreſſing, as wounds and ulcers doe. By this it appeares, that as want of binding, and too much looſeneſſe in abſence

ſence of paine and a Phlegmon, ſo alſo too ſtrait ligation, when paine is preſent, brings a Phlegmon and Abſceſſe to the wound. Therefore let all things here, according to the forementioned rules and circumſtances, be indifferent. I have for this purpoſe thought good to reiterate theſe things, becauſe you ſhall as yet finde many, who follow the practice of Paulus, and make many circumvolutions here and there, above and below the wound, which preſently they carrie croſſe-wiſe. But this croſſe or lattice-like kinde of ligation is wholly to be diſliked, and that onely to be uſed which we have deſcribed, according to the minde of Hippocrates. Now it is time, that I returne to the former hiſtorie of my miſhap, and declare what was done to me after that firſt dreſſing, which I have formerly mentioned.

Lattice-like binding to be ſhunned.

Chap. XXV.

What was uſed to the Authors Legge after the firſt dreſſing.

I Being brought home to mine owne houſe in Paris in the afternoone, they tooke from me, out of the Baſilica of the left arme, ſome ſixe ounces of blood. And then at the ſecond dreſſing the lippes or edges of the wound and places thereabout were anointed with *unguentum roſatum*, which, by a joynt conſent of the Ancients, is much commended in the beginnings of fractures: for it will aſſwage paine, and hinder inflammation, by repelling the humors farre from the wounded part: for it is cold, aſtringent and repelling, as the compoſition thereof ſhewes; for it is made *ex oleo omphacino, aqua roſacea, pauco aceto & cera alba.* Therefore I uſed this oyntment for ſixe dayes; I dipped the compreſſes and rowlers ſomewhiles in oxycrate, otherwhiles in thick and aſtringent red wine, for the ſtrengthning of the part, and repreſſing the humors; which two things wee muſt have a care of in Hippocrates opinion, in fractures eſpecially with a wound. Wherfore if at any time the compreſſes or rowlers ſeemed to dry, I now and then moyſtened them with the oxycrate, or roſe vineger: for, by their too much drineſſe, paine and inflammation happen; and if they binde the part ſomewhat more ſtrait, they hurt it alſo by their hardneſſe. You ſhall ſee many ſurgeons, who in this kinde of affect, from the beginning to the end, uſe onely aſtringent and emplaſtick medicines, wholly contrary to the methode ſet down by Hippocrates, and commended by Galen. For, by the continued uſe of ſuch things, the pores and breathing places of the ſkinne are ſhut up; whence the fuliginous excrement being ſuppreſt, the externall heat is increaſed, and itching cauſed, and at length an ulcer by the fretting of the acride and ſerous humor long ſuppreſt. Whereby you may learne, that aſtringent and emplaſtick medicines muſt not bee uſed above ſixe daies. In ſtead hereof you ſhall uſe the emplaiſters, which I ſhall preſently deſcribe. In the beginning of my diſeaſe I uſed ſo ſpare a diet, that for nine daies, I ate nothing each day, but twelve ſtewed prunes, and ſixe morſels of bread, and dranke a Paris pinte of ſugred water, of which water this was the compoſition.

Unguentum roſatum, wherefore good in fractures.

You muſt have a care, that the compreſſes and rowlers grow not hard by drineſſe.

℞. *ſacc. albiſ.* ℥ xii. *aquæ font.* ℔ xii. *cinam.* ʒ iii. *bulliant ſimul ſecundum artem:* Otherwhiles I uſed ſyrup of maydens hair with boyled water: Otherwhiles, the divine drinke (as they terme it) whereof this is the compoſition. ℞. *aquæ coctæ* ℔. vi. *ſacc. albiſ.* ℥ iiii. *ſucc. lim.* ℥ i. *agitentur & tranſvaſentur ſæpius in vaſis vitreis.* I was purged when neede required with a bole of *Caſsia* with Rubarbe. I uſed alſo ſuppoſitories of Caſtle ſoape to make me goe to ſtoole; for, if at any time I wanted due evacuation, a preternaturall heat preſently ſeized upon my kidneyes. With this, though exquiſite manner of diet, I could not prevaile, but that a fever tooke mee upon the eleventh day of my diſeaſe, and a defluxion, which turned into an Abſceſſe, long flowing with much matter. I thinke the occaſion hereof was ſome portion of the humor ſuppreſt in the bottome of the wound; as alſo by too looſe binding, by reaſon that I could not endure juſt or more ſtrait binding; and laſtly,

The deſcription of a ſugred water.

The cauſes of a fever and abſceſſe, enſuing upon a fracture.

ſcales

Signes of ſcales ſevered from their bones.

ſcales or ſhivers of bones quite broke off, and therefore unapt to be agglutinated: for theſe therefore putrefying, drew by conſent the proper nouriſhment of the part into putrefaction, and by the putredinous heat thence ariſing, did plentifully adminiſter the materiall and efficient cauſe to the defluxion and inflammation. I was moved to thinke they were ſcales, ſevered from their bone, by the thin and crude *ſanies* flowing from the wound, the much ſwolne ſides of the wound, and the more looſe and ſpongie fleſh thereabouts. To theſe cauſes, this alſo did accrew, one night amongſt the reſt, as I ſlept, the muſcles ſo contracted themſelves by a violent motion, that they drew my whole Legge upwards; ſo that the bones, by the vehemency of the convulſion, were diſplaced, and preſſed the ſides of the wound; neyther could they be perfectly compoſed or ſet, unleſſe by a new extenſion and impulſion, which was much more painefull to mee than the former. My fever, when it had laſted with me ſeven dayes, at length enjoyed a *Criſis* and end, partly by the eruption of matter, and partly by ſweat, flowing from me in a plenteous manner.

Chap. XXVI.

What may be the cauſe of the convulſive twitching of broken members.

Why the extreme parts are cold when we ſleepe.

This contraction, and (as it were) convulſive twitching, uſually happens to fractured members in the time of ſleepe. I thinke the cauſe thereof is, for that the native heat withdraws its ſelfe while we ſleepe, into the center of the body; whereby it commeth to paſſe, that the extreme parts grow colde. In the meane while, nature, by its accuſtomed providence, ſends ſpirits to the ſuply of the hurt part. But becauſe they are not received of the part evill affected and unapt thereto, they betake themſelves together, and ſuddenly, according to their wonted celerity, thither from whence they came, the muſcles follow their motion: with the muſcles, the bones, whereinto they are inſerted, are together drawne; whereby it comes to paſſe, that they are againe diſplaced, and with great torment of paine, fall from their former ſeate. This contraction of the muſcles is towards their originall.

Chap. XXVII.

Certaine Documents concerning the parts, whereon the Patient muſt neceſſarily reſt, whileſt he lyes in his bed.

The naturall faculties languiſh in the parts by idleneſſe, but are ſtrengthened by action.

Those who have their Legge or the like bone broken, becauſe they are hindered by the bitterneſſe of paine, and alſo wiſh for their cure or conſolidation, are forced to keep themſelves without ſtirring, and upon their backes in their beds for a long time together. In the meane ſpace, the parts whereupon they muſt neceſſarily lye, as the heele, backe, holy-bone, rumpe, the muſcles of the broken thigh or legge remaine ſtretched forth and unmoveable, ſet at libertie from their uſuall functions. Whereby it comes to paſſe, that all their ſtrength decayes, and growes dull by little and little. Moreover alſo, by the ſuppreſſion of the fuliginous and acride excrements, and want of perſpiration, they grow preternaturally hote; whence defluxion, an abſceſſe and ulcer, happen to them, but principally to the holy-bone, the rumpe and heele: to the former, for that they are defended with ſmall ſtore of fleſh; to the latter, for that it is of more exquiſite ſenſe. Now the ulcers of theſe parts are difficultly healed, yea, and oft-times they cauſe a gangrene in the fleſh, and a rottenneſſe and mortification in the bones there-under, and for the moſt part a continued fever, *delirium*, convulſion, and (by that ſympathie which generally accompanies ſuch affects) a hicketing. For the heele and ſtomacke are two very nervous parts, the latter in the whole bodie

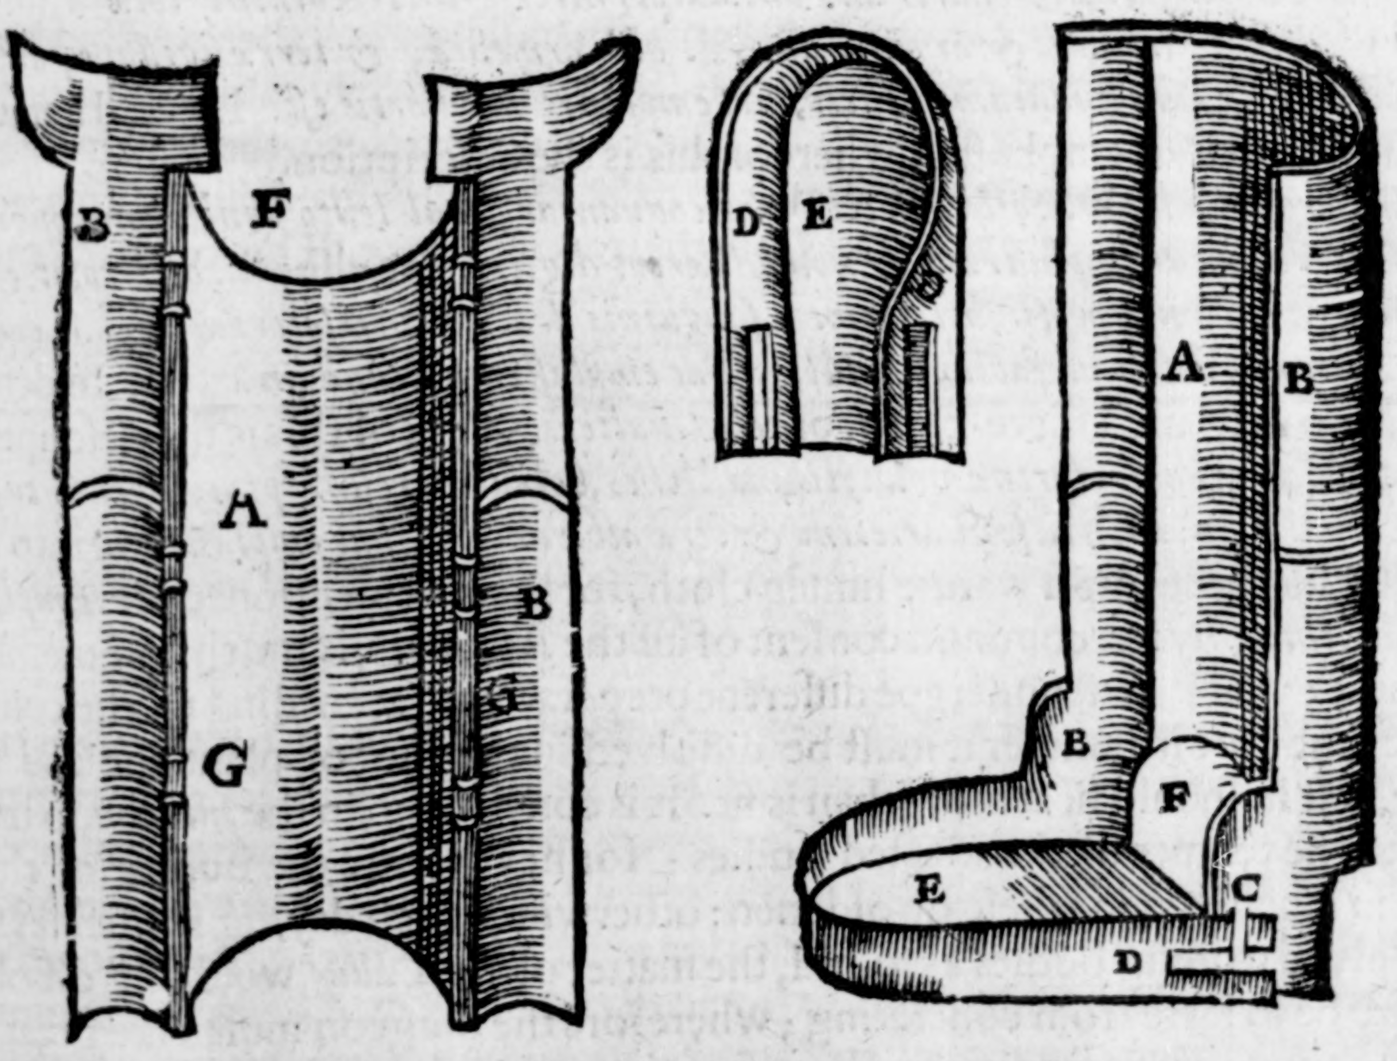
thereof, and by a large portion of the nerves of the ſixth conjugation; but the other by the great tendon paſſing under it, the which is produced by the meeting, and as it were growing together of the three muſcles of the calfe of the legge. All which are deadly, both by diſſipation of the native heat by the feveriſh, and that which is preternaturall; as alſo by the infection of the noble parts, whoſe uſe the life cannot want, by carrion-like vapours. When as I conſidered all theſe things with my ſelfe, and (become more skilfull by the example of others) underſtood how dangerous they were, I wiſhed them now and then to lift my heele up out of the bed; and taking hold of the rope which hung over my head, I heaved up my ſelfe, that ſo the parts, preſſed with continuall lying, might tranſpire, and be ventilated. Moreover alſo I reſted theſe parts upon a round cuſhion, being open in the middle, and ſtuffed with ſoft feathers, and layd under my rumpe and heele, that they might be refreſhed by the benefit and gentle breathing of the ayre: and I did oft-times apply linnen clothes, ſpred over with *unguentum roſatum*, for the aſſwaging of the paine and heat. Beſides alſo, I deviſed a Caſſe of Lattin, wherein the broken legge being layd, is kept in its place, farre more ſurely and certainely than by anie Junks; and moreover alſo, it may all be moved to and againe at the Patients pleaſure. This Caſſe will alſo hinder the heele from lying with all its bodie and weight upon the bed, putting a ſoft and thicke boulſter under the calfe, in that place where the Caſſe is hollow: beſides alſo, it armes and defends it againſt the falling downe and weight of the bed-clothes, having a little arch made over and above, of the ſame matter. All which ſhall bee made manifeſt unto you by the following figure.

Remedies for the prevention of the foreſaid ulcers.

The uſe of a Lattin Caſſe.

The figure of a Caſſe.



A A. *Shew the bottome or belly of the Caſſe.*
B B. *The wings or ſides to be opened and ſhut at pleaſure.*
C. *The end of the wings, whereto the ſole or arch is fitted.*
D D. *The Arch.*
E E. *The Sole.*
F F. *An open ſpace, whereat the heele hangs forth of the Caſſe.*

Now it remaines, that I tell you what remedies I applyed to the Abſceſſe which happened upon my wound. When therefore I perceived an Abſceſſe to breed, I compoſed a ſuppurative medicine of the yoalks of egges, common oyle, turpentine, and

A ſuppurative medicine.

and a little wheat floure, and I uſed it untill it was opened: then to cleanſe it I uſed this following remedie.

A deterſive.

℞. *ſyrupi roſati & terebinth. venetæ, an.* ℥ii. *pulveris radicis ireos florentiæ, aloes, maſtiches, farinæ hordei, an.* ʒ ß. *incorporentur omnia ſimul & fiat mundificativum:* but I had a care, that the place, whereat I conjectured the quite ſevered ſcales of the bones muſt breake forth, ſhould be filled with tents made of ſponge or flaxe, that ſo, by this meanes, I might keep the ulcer open at my pleaſure. But I put into the bottome of the ulcer catagmatick and cephalicke powders, with a little burnt Alum to procure the egreſſe of the formerly mentioned ſcales. Theſe at length caſt forth, I cicatrized the ulcer with burnt Alum. For, this having a drying and aſtringent facultie, confirmes and hardens the fleſh, which is looſe and ſpongie, and flowing with liquid *ſanies*, and helps forwards natures endeavour in cicatrization. For, the fragments of the bones, they, by reaſon of their naturall drineſſe and hardneſs, cannot be joyned and knit together by themſelves without a *medium:* but they need a certaine ſubſtance, which, thickning and concreting at their ends, doth at length glue them together, and (as it were) faſten them with ſoder. This ſubſtance hath its matter of the proper ſubſtance and marrow of the bones; but the forme from the native heat, and emplaſtick medicines, which moderately heat. For, on the contrarie, theſe medicines, which, by their too much heat, doe diſcuſſe and attenuate, doe (as it were) melt and diſſolve the matter of the *Callus*, and ſo hinder the knitting. Wherefore for this purpoſe, I would wiſh you to make uſe of the following emplaſters, of whoſe efficacie I have had experience: for, hence they are called knitting or conſolidating plaiſters.

Catagmatick powders have power to caſt forth the ſcales of bones.

The cauſes both efficient and materiall of a *Callus*.

Medicines conducing to the generation of a *Callus*.

℞. *olei myrtill. & roſarum omphac. an.* ℔.ß. *rad. altheæ* ℔.ii. *rad. fraxini, & fol. ejuſdem, rad. conſolidæ majoris & fol. ejuſdem, fol. ſalicis an.* m.i. *fiat decoctio in ſufficienti quantitate vini nigri, & aquæ fabrorum, ad medietatis conſumptionem, adde in colatura pulveris myrrhæ & thuris an.* ℥ ß. *adipis hirci* ℔.ß. *terebinth. lotæ* ℥iiii. *maſtiches* ʒ iii. *lithargyri auri & argenti an.* ℥ii. *boli armeniæ, & terræ ſigillatæ, an.* ℥i.ß. *minii* ʒ vi. *ceræ albæ quantum ſufficit, fiat emplaſtrum, ut artis eſt.* In ſtead hereof you may uſe the blacke emplaiſter, whereof this is the deſcription.

The black plaiſter.

℞. *lithargyri auri* ℔.i. *olei & aceti* ℔.ii. *coquantur ſimul lento igne donec nigrum & ſplendens reddatur emplaſtrum, & non adhæreat digitis.* Or elſe, ℞. *olei roſat. & myrtill. an.* ℥ ii. *nucum cupreſſi, boli armen. ſanguinis drac. pulveriſatorum an.* ℥.ß. *emplaſtri diachalciteos* ℥ iiii. *liquefaciant ſimul, & fiat emplaſtrum ſecundum artem.* In defect of theſe, you may uſe a Cere-cloth, or *tela Gualteri*, whereof this is the deſcription.

The deſcription of a *Sparadrapum* or cere-cloth.

℞. *pulveris thuris, farinæ volatilis, maſtiches, boli arm. reſinæ pini, nucum cupreſſi, rubiæ tinctorum, an.* ℥ii. *ſevi arietini & ceræ albæ an.* ℔.ß. *fiat emplaſtrum:* into which (whileſt it is hote) dip a warme linnen cloth, for the forementioned uſe. *Emplaſtrum Diacalcithios*, by the common conſent of all the Ancients, is much commended for fractures: but it muſt undergoe different preparations, according to the condition of the time; for in ſummer it muſt be diſſolved in the juice of plantaine and nightſhade, leſt it ſhould heat more than is fit. It is convenient, in the *interim*, to have regard to the temper of the affected bodies; for neyther are the bodies of children to be ſo much dried as theſe of old men: otherwiſe, if ſuch drying medicines ſhould be applyed to yong bodies as to old, the matter of the *Callus* would be diſſolved, it would be ſo farre from concreting; wherefore the Surgeon muſt take great heede in the choyce of his medicines. For, often times remedies, good of themſelves, are by uſe made not good, becauſe they are uſed and applyed without judgment: which is the cauſe that oft times pernicious accidents happen, or elſe the *Callus* becomes more ſoft, hard, ſlender, crooked, or laſtly concretes more ſlowly by the great error, and to the great ſhame of the Surgeon.

Medicines good of themſelves, not good by event.

CHAP. XXVIII.

By what meanes we may know the Callus is a breeding.

WHen I knew that my legge begunne to knit, when as leſſe matter than was uſuall came from the ulcer, when the paine ſlackened, and laſtly, when as the convulſive twitchings ceaſed; which cauſed me to judge it fit to dreſſe it ſeldomer than I was uſed to doe. For, by the frequent deterſion in dreſſing an ulcer, whilſt a *Callus* is breeding, the matters whereof it is to be made, are drawne away and ſpent, which are (as they terme them) *Rôs*, *Cambium*, and *Gluten*, which are the proper and genuine nouriſhments both of the bony, as alſo of the fleſhie ſubſtance. I by other ſignes alſo conjectured the breeding of the *Callus*, to wit, by the ſweating of a certaine dewie blood out of the edges and pores of the wound, which gently dyed and bedewed the boulſters and ligatures, proceeding from the effluxe of the ſubtler and gentler portion of that matter, which plenteouſly flowed downe for the breeding of a *Callus*. As alſo, by a tickling and pleaſing ſenſe of a certaine vapour, continually creeping, with a moderate and gentle heate, from the upper parts even to the place of the wound. Wherfore thence forwards I ſomewhat looſened the ligation, leſt, by keeping it too ſtrait, I ſhould hinder from entring to the fragments of the bones, the matter of the *Callus*, which is a portion of the blood, temperate in qualitie, and moderate in quantie. Then therefore I thought good, to uſe nouriſhments fit to generate more groſſe, thicke and tenacious blood, and ſufficient for generating a *Callus*; ſuch as are the extremities, tendinous and griſtly parts of beaſts, as the heads, feete, legges and eares of Hoggs, Oxen, Sheepe, Kids; all which I boyled with Rice, French Barley, and the like, uſing ſomewhiles one, ſomwhiles another, to pleaſe my ſtomack & palate. I alſo ſomtimes fed upon frumity, or wheat ſodden in Capon broth with the yoalks of egges; I dranke red, thicke and aſtringent wine, indifferently tempered with water. For my ſecond courſe, I ate cheſnuts and medlars: neyther doe I without ſome reaſon, thus particularize my diet: for that groſſe nouriſhments, eſpecially if they be friable and fragile, as beefe is, are alike hurtfull (for as much as pertaines to the generating of a *Callus*) as light meats are. For that makes the *Callus* too dry, theſe too tender. Wherfore Galen pronounces theſe meats only fit for generating a *Callus*, which are neyther fragile nor friable, neither ſerous and thin, nor too dry; but indifferent groſſe, and alſo viſcide, fat and tough. Theſe meats, digeſted by the ſtomacke into *Chilus*, are ſent into the guts, and from hence, by the meſaraick veines, into the Gate-veine, and the hollow part of the Liver, thence into the Hollow-veine, and ſo into the Veines diſperſed over all the bodie and the parts thereof. There are alſo ſome of theſe veines which carrie blood into the bones; but in the large cavities of the bones is marrow contained, as in the ſmall a certaine marrowie ſubſtance, proportionable thereto, being their proper nouriſhment. The generation of marrow is from the groſſer portion of the blood; which flowes into the greater cavities of the bones by larger veines and arteries, but into the leſſe by leſſer, which end in their pores and ſmall paſſages. For, in large bones you may obſerve large and apparent paſſages, by which the veines and arteries enter for the forementioned uſe. By the ſame waies the nerves alſo inſinuate themſelves, from whence proceedes a membrane which involves the marrow of the bones, the which by that means is endued with moſt exquiſite ſenſe, as experience teacheth; which is the cauſe that makes many beleeve, that the marrow hath ſenſe of feeling, becauſe the membranes thereof being hurt cauſe moſt bitter paine. Therefore out of the marrow and the proper ſubſtance of the bone, there ſweats a certaine groſſe and terreſtriall juice, whereof, by the power of the aſſimilating facultie, which ſerves in ſtead of the formative, a *Callus* growes and knits. Simple fractures of the legge are uſually knit in fiftie daies; but through the occaſion of the wound and the ſcales quite broke off, and other accidents which befell mee, it was three whole months before the fragments of the bones were perfectly knit, and it was alſo another month, before I could goe upon

When the *Callus* is breeding the ulcer muſt be ſeldome dreſt.

Hipp. ſent. 43. ſect. 1. de fract.

Meats fit for generating a *Callus*.

Lib. 6. meth. cap. 5.

Why the marrow may ſeeme to have ſenſe of feeling.

In what ſpace the legge is uſually knit.

my legge without the helpe of a Crutch. Going was painefull to me for ſome few daies, becauſe the *Callus* had taken up ſome place of the muſcles: for, before my former freedome of motion could returne againe to the broken and knit part, it was neceſſarie, that the Tendons and Membranes ſhould ſeparate themſelves by little and little from the ſcarre. In the performance of all theſe things, I had the diligent and faithfull aſſiſtance amongſt the Surgeons, to omit Phyſitians, of Anthonie Portall, the Kings Surgeon.

Chap. XXIX.

Of thoſe things which may hinder the generation of a Callus, *and how to correct the faults thereof, if it be ill formed.*

Diſcuſsing and unctuous medicines hinder the generation of a *Callus*.

What helps forward the generation thereof.

Having already ſpoken of the ſignes of a *Callus* beginning to concrete, of its generation and the manner thereof: it now remaines, that wee treat of thoſe things which hinder the generation thereof; and what on the contrarie helpe forwards the conformation and concretion thereof. Now theſe things which either wholly hinder, or elſe retarde the generation of a *Callus*, have a ſtrong and powerfull diſcuſsive and attenuating facultie; or elſe they are unctuous, oyly and moiſt. For, by ſuch the juice, wherof the *Callus* ought to be, is eyther melted and conſumed, or elſe growes ſoft, and is relaxed. But on the contrarie, thoſe things which helpe forwards a *Callus* muſt bee drying, incraſſating, thickening, hardening and emplaſticke, moderately hot and aſtringent. But for moiſt and relaxing medicines, they ought to have no place here, unleſſe when it happens that the *Callus* is ill formed, that is, too thicke, or crooked, or otherwiſe ill ſhapen, whereby it may be waſted and broken, ſo to bee reſtored againe after a better manner. Yet notwithſtanding, ſuch things are not to be attempted, unleſſe when the *Callus* is yet greene, and ſo depraved, that the fault therof doth very much pervert the native conformation of the part, and exceedingly offend the action. Then therefore in ſuch a caſe, the place muſt be fomented with a decoction of a ſheeps head and guts, wherein ſhall be boyled the roots of Marſh mallowes, of Brionie, the ſeeds of Line, of Fænugreeke, Pigeons dung, Bay-berries, and the like. You ſhall alſo uſe this following oyntment and plaiſter.

℞. *unguenti de Althæa* ℥ iiii. *olei liliorum. & axungiæ anſeris an.*℥ i. *aquæ vitæ parum, liqueſiant ſimul, fiat linimentum quo liniatur pars.* Then apply this following emplaiſter.

℞. *emplaſt. de Vigo cum mercurio, cerati æſypati deſcriptione Philagrii, an.* ℥ iii. *olei anethini & liliorum an.*ʒ i. *liqueſiant omnia ſimul, fiat emplaſtrum*, let it bee ſpred upon leather for the foreſaid uſe. When by this meanes the *Callus* ſhall ſeeme to be ſufficiently mollified, it ſhal be broken, and the bones reſtored to their naturall ſtate, and the cure of the fracture to be followed as at the beginning. If the *Callus* be become too hard through age, it is better not to break it, but to let it alone, leſt ſome worſe accident befall the Patient. For it may ſo fall out, that by your labouring to breake it, the bone may breake in ſome other part, before it break in that which is knit by the *Callus*. Therefore the diſcreet Patient had rather live lame, than for eſchewing it, to undergoe the hazzard of his life. If the *Callus* be too groſſe, it ſhalbe diminiſhed (if it be as yet freſh) with emollient, reſolving, and powerfully aſtringent medicines, which have force to diſſolve, dry and exhauſt. It will alſo bee good ſtrongly to rubb the *Callus* with oyle of Bayes, wherein Salt-peter, or ſome other kinde of Salt hath been diſſolved, then wrapped about with a Rowler, to binde it very ſtraitly, putting a leaden plate thereon, whereby the flowing downe of the nouriſhing humor into the part, may be forbidden; that thus by little and little the *Callus* may decay and diminiſh. If on the contrarie, it any waies happen, that the *Callus* be more thin and ſlender, or grows more ſlowly, for that it is too ſtraitly bound, or becauſe the idle part is longer kept in quiet than is fit, without exerciſing of its proper function (which cauſe is to be reckoned amongſt the chiefe cauſes of the leaneneſſe

What *Callus* muſt not be broken, though diſtorte, or otherwiſe ill conformed.

The cauſes of too ſlender a *Callus*.

neſs, even for this reaſon, for that exerciſe ſtirres up the native heat of the part,the worker of digeſtion and nutrition)or elſe for that they feed upon ſuch nouriſhments as offend in quality, or quantity,or both, or for that the ligature uſed to the part is too often looſed, or becauſe the part its ſelfe is too haſtily and before the time put to undergoe ſolid offices and motions. According to the variety of cauſes,medicines ſhall bee applyed. For if the ligature of the part bee too ſtrait, it ſhall bee looſed, yea verily the fractured place, the ligature being taken away, ſhall be quite freed from ligation, and a new kind of ligature muſt bee made, which muſt be rowled downe from the roote of the veſſels, that is, from the armepitts,if the arme; or from the groine,if the legge be broken, to the fracture: yet ſo,as that you may leave it untouched or taken in,for thus the blood is preſſed from the fountain and ſpring, and forced into the affected part,by a way quite contrary to that, whereby we have formerly taught in feare of inflammation, to hinder it from entrance into the affected part. Alſo gentle frictions and fomentations with warme water may be profitably made, from which you muſt then diſiſt when the part ſhall begin to grow hot and ſwell. If any too long continue theſe frictions and fomentations, hee ſhall reſolve that which he hath drawne thither. For this we have often times obſerved,that frictions & fomentations have contrary effects, according to the ſhortneſs and continuance of time. Pications wil alſo conduce to this purpoſe,and other things which cuſtomarily are uſed to members troubled with an *atrophia*,or want of nouriſhment.

Remedies therefore.

When we muſt deſiſt from fomenting and frictions.

Chap.XXX.

Of fomentations which be uſed to broken bones.

Divers fomentations are uſed to broken bones for ſeverall cauſes. When we uſe warme water for a fomentation, wee meane that, which is juſt between hot and cold, that is, which feeles luke warme to the hand of the Phyſitian and Patient. A fomentation of ſuch water uſed for ſome ſhort ſpace doth moderately heat, attenuate and prepare for reſolution,the humor which is in the ſurface of the bodie; it drawes blood and an alimentarie humor to the part labouring of an *Atrophia*; it aſſwages paine, relaxes that which is too much extended, and moderately heats the member refrigerated through occaſion of too ſtrait binding,or by any other means. On the contrarie,too hot fomenting cools by accident,digeſting and diſcuſſing the hot humor which was contained in the member. We meane a ſhort time is ſpent in fomenting, when the part begins to grow red and ſwell; a juſt ſpace, when the part is manifeſtly red and ſwolne: but we conjecture,that much or too much time is ſpent thereon,if the redneſſe,which formerly appeared,goe away, and the tumor,which lifted up the part, ſubſide. Alſo in fomenting, you muſt have regard to the bodie whereto it is uſed. For if it be plethorick, an indifferent fomentation will diſtend the part with plenty of ſuperfluous humors; but if it be leane and ſpare, it will make the part more fleſhie and ſucculent. Now it remaines, that we ſay ſomewhat of the fracture of the bones of the feet.

Warme water.

The effects thereof.

Notes of ſhort, juſt, and too long fomenting.

Fomentations hurt plethorick bodies.

Chap.XXXI.

Of the fracture of the bones of the feet.

The bones of the Inſtep, back and toes of the feet, may bee fractured as the bones of the hands may. Wherefore theſe ſhall bee cured like them, but that the bones of the Toes muſt not be kept in a crooked poſture, as the bones of the fingers muſt, leſt their action ſhould periſh or bee depraved. For as we uſe our legges to walk, ſo we uſe our feet to ſtand. Beſides alſo the Patient ſhall keep his bed untill they be knit.

Why the fractured bones of the foot muſt be kept in a ſtrait poſture.

The end of the fifteenth Booke.

OF DISLOCATIONS, OR, LUXATIONS

THE SIXTEENTH BOOKE.

CHAP. I.

Of the kinds and manners of Diſlocations.

A Diſlocation is the departure or falling out of the head of a bone from its proper cavitie, into an unaccuſtomed place beſides nature, hindring voluntarie motion: There is another kinde of Luxation, which is cauſed by a violent diſtention, and as it were a certaine divarication, and dilatation, or extenſion into length and breadth of the ligaments, and all the nervous bodies, which containe, ſtrengthen, and binde together the joynts. Thus thoſe who have beene tormented and racked, have that thick ligament which is in the inner cavitie of the huckle bone too violently extended: Thoſe who have ſuffered the Strappado, have the ligaments, encompaſſing the articulation of the Arme-bone, with the ſhoulder-blade, forcibly and violently diſtended. Such alſo is their affect whoſe foot is ſtrained by ſlipping. There is a third kinde of Luxation, when as thoſe bones which are joyned contiguous, and one (as it were) bound to the ſides of another, gape or flye aſunder: as in the Arme, when the ell parts from the wand; in the legge, when the one focile flyes from the other: yet this may be referred to the ſecond ſort of diſlocations, becauſe it happens not without dilatation, or elſe the breaking of the ligaments. There is alſo a fourth added to theſe, as when the *Epiphyſes* and heads of bones are plucked from the bone whereon they were placed or faſtened: which unproperly called kinde of Luxation, hath place chiefly in the bones of yong people, and it is knowne by the impotencie of the part, and by the noiſe and grating together of the crackling bones when they are handled. Now the bones of yong folks are alſo incident to another caſualtie: for as the bones of old people are broken by violence by reaſon of their drineſſe and hardneſſe, thus the bones of children are bended or crooked in by reaſon of their naturall ſoftneſſe and humiditie.

What a Luxation properly ſo called is.

What a Luxation not properly ſo called is.

The third kind of Diſlocation.

The fourth.

Chap. II.

Of the differences of Diſlocations.

What Luxations are ſimple

What compound.

What a complete Luxation is.

What a ſubluxation or ſtraine.

SOme Diſlocations are ſimple, others compound. We terme them ſimple which have no other preternaturall affect joyned with them; and ſuch compound, as are complicated with one or more preternaturall affects; as when a diſlocation is aſſociated with a wound, fracture, great paine, inflammation, and an abſceſſe. For, through occaſion of theſe we are often compelled ſo long to let alone the luxation, untill theſe bee remitted of themſelves, or by our art. Some Diſlocations are complete and perfect, as when the bone wholly fals out of its cavitie: otherſome are unperfect, as when it is only lightly moved, and not wholly fallen out; wherfore we only call them ſubluxations or ſtrains. Differences of Luxations are alſo drawne from the place: for ſometimes the bone is wreſted forwards, otherwhiles backwards, upwards, downwards; ſomewhiles it may be wreſted, according to all theſe differences of ſite, and otherwhiles onely according to ſome of them. Differences are alſo taken from the condition of the diſlocated Joynt in greatneſſe and littleneſſe, from the ſuperficiarie or deepe excavation of the *ſinus* or hollowneſſe; and laſtly from the time, as if it be lately done, or of ſome long continuance. I have judged it fit to ſet downe all theſe, for that there are ſeverall indications of curing, according to the varietie of each of theſe, as we ſhall teach hereafter.

Chap. III.

Of the cauſes of Diſlocations.

Internall cauſes of diſlocations.

Externall cauſes.

Hereditary cauſes.

Sect.3. ſent.88. & 94 ſect.82. 4. ſent.3. & 4. lib. de art.

Children may have Impoſtumes in their mothers wombs.

THere are three generall cauſes of Luxations, internall, externall, and hereditarie. The internall are excrementitious humors and flatulencies, which, ſettling into the joynts with great force and plentie, doe ſo make ſlipperie, ſoften & relaxe the ligaments which binde together the bones, that they eaſily fall out of their cavities; or elſe they ſo fill and diſtend theſe ligaments, and make them ſo ſhort, that being contracted, they alſo contract the *appendices* of the bones from whence they ariſe, and ſo pluck them from the bone whereon they are placed, or elſe draw the heads of the bones out of their cavities, chiefly if the violence of a noxious humor doth alſo concurre, which poſſeſſing and filling up the cavities of the joynts, puts them from their ſeats, as it oft times happens to the joynt of the hip by Sciaticaes, and to the *Vertebræ* of the ſpine, by whoſe Luxation people become gibbous, or otherwiſe crooked. But externall cauſes of Diſlocations are, fals from high, bruiſing and heavie blowes, the Rack, Strappado, ſlipping in going, and all ſuch like things, which may force the heads of the bones to fly out of their ſeats, or cavities, which alſo happens ſomtimes to infants in their birth, when as they are too careleſly and violently drawne forth by the Midwife, ſo that eyther their armes or legges are put out of joynt. Hereditarie cauſes are ſuch as the Parents transfuſe into their off-ſpring: hence it is, that crooked not neceſſarily, but often times are generated by crooked, and lame by lame. The truth whereof is evident by daily experience. Beſides alſo Hippocrates himſelfe averres, that infants in the very wombe may have their Joynts diſlocated by a fall, blow and compreſſion, & by the too much humidity and looſenes of the Joynts: whence alſo we ſee many crooke legg'd and footed from their nativitie; ſo that none need marvell or make any doubt hereof. We have read it obſerved by Galen *In librum de Artic.* that children may have impoſtumes in their mothers wombs, which may caſt forth quitture, the ulcers being opened of their own accord, and be cicatrized by the only benefit of nature. It alſo happens to many from their firſt conformation, that the cavities of their Joynts are leſſe depreſt than they ſhould bee, and that their verges are more dilated than they ought to be ; whereby it happens that the heads of the bones can the leſſe enter into them. It fals out, that otherſome have the ligaments, appointed by nature for faſtening together the bones of the joynt, whether inſerted or placed about, ſo weake, that from their firſt originall they are not of ſufficient ſtrength, or elſe abound with much phlegme, eyther bred together with them, or flowing from ſome other place; ſo that by their too much ſlipperineſſe they leſſe faithfully containe the knittings or articulations of the bones. In all theſe, as the bones are eaſily diſlocated, ſo they may preſently be eaſily reſtored without the aſſiſtance of a Surgeon, as I have ſometimes obſerved in ſome.

CHAP. IIII.

The ſignes of diſlocations.

The common ſigne of all diſlocations.

SOme of the ſignes whereby we come to the knowledge of a luxated bone, are common to all diſlocations; others are proper only to ſeverall Luxations. It is a common ſigne, that there is alwaies a tumor in that part whereto the bone runnes, and a hollowneſſe on that ſide from whence it is flowne. Now the proper ſignes ſhall be ſhewed, when as we come to treat of the particular kindes of Luxations. We know a perfect Diſlocation by the loſt action of the part, that is to ſay, the loſt motion; paine alſo breeds a ſuſpicion of a diſlocation: for the head of the bone, which (moved out of its place) is forced into another, preſſes the fleſh, and diſtends the nerves alſo moved out of their place. Hereto alſo conduces the comparing of the ſound joynt with that which is hurt, in which collation, it is fit the ſound part, which is compared with the hurt, be no waies, neyther by nature nor any accident, wronged, nor deformed, nor withered or decayed, nor ſwolne above meaſure, otherwiſe it may cozen and deceive you, if you bee leſſe warie. Labour and difficultie of action in moving, is a ſigne of an uncomplete Luxation, or ſtrain. Now we thus know, that the ligaments, ſerving to the connexion of the articulations, are extended and relaxed, if the head of the bone, preſſed with your fingers, be eaſily driven unto the contrary part, and ſuddenly flye thence backe againe; if thruſting your finger into the joynt, it eaſily enter, nothing reſiſting it, as though all were empty within; if the motion be difficult, or none at all.

Signes of an unperfect diſlocation.

CHAP. V.

Of Prognoſticks to be made upon luxations.

What luxations be uncureable.

ALl Joynts may bee perverted or luxated, but all of them cannot in like manner be reſtored. For the head may be diſlocated, but therupon preſent death enſues, by reaſon of the compreſſion of the whole ſpinall marrow preſently at the originall thereof; ſuch alſo is the diſlocation of a *vertebra* of the ſpine, and of the Jaw-bone, which, ſlipped forth on both ſides, hath cauſed inflammation, and a great tumor before that it be ſet. The bones of other Joynts, as they are more or leſſe diſlocated, and moved out of their ſeats, ſo may they bee more eaſily or difficultly reſtored. For, by how much they are the leſſe moved out of their places, by ſo much they are the more quickly, and by how much they are the further, by ſo much they are the more ſlowly and difficultly ſet. Alſo an indication, taken from the figure of the luxated bone, gives a ſigne of the eaſie or hard reſtoring of the diſlocation; as in the Arme, by how much the bones be the more eaſily diſlocated, by ſo much once luxated they are the more eaſily reſtored. Bones doe not eaſily fall out of joynt in fleſhie bodies; but when they chance to be put out, they are not eaſily got in againe. For in ſuch, the articulation is ſtraitly on everie ſide held in by the thickneſſe of the muſcles, and the plenty of the

Why thoſe bones which are hardly diſlocated, are hard to be ſet.

the fat lying thereabouts. On the contrarie, ſuch as are leane, eſpecially thoſe who formerly have beene more fat, have their joynts more laxe, whereby it comes to paſſe, that their bones may eaſily be put forth of joynt: beſides alſo, through the default of the digeſtive facultie, they have their joynts replete with mucous humors; whence it is, that the heads of the bones, as ſtanding in a ſlipperie place, are the leſſe ſtable, as it is recorded by Hippocrates.

Sect.1.de artic. ſent.29.

But ſlender bodies, which are naturally dry, compact and denſe, have their muſcles and ligaments more ſtrong and dry; wherefore their bones are the more difficultly diſplaced; and diſplaced, the more difficultly ſet. Some bones, joyned amongſt themſelves, doe ſometimes flye aſunder, as when the ſhoulder blade flyes from the collar-bone at the *Acromion*, and in the Arme the Ell from the Wand, and in the Legge the one focile from the other, and the Heele-bone from the Ancle.

Celſus lib.8. cap.11.

Bones thus ſeparated will never be joyned together againe, will never recover their former comely figure, never their ſtrength of action. For, then it moſt uſually happens, that the ligaments are either broke aſunder, or elſe reſolved and become laxe. Thoſe whoſe bones are diſlocated by an externall cauſe, they, after they be ſet, may eaſily fall out againe, for that the ligaments, moyſtened and bedewed with an excrementitious humor, cannot firmely hold them: oft times the ligaments are not wholly broken, but onely in ſome portion thereof; and hence the action of the part either periſhes, or is debilitated. Alſo that diſlocation is uncureable, when as the ligaments, ſteeped and ſwolne up with an excrementitious humiditie, are ſo much ſhortened and contracted in their length, as they have acquired in their breadth: and thus they draw away and plucke off the *appendices* of the bones from whence they ariſe, and by reaſon the bone and the *appendix* doe enter and receive each other by manie cavities and prominencies, therefore they cannot, by how ſkilfull hand ſoever they be handled, be againe fitly placed and put together.

Why the plucking of an *appendix* from a bone is uncureable.

Old and inveterate diſlocations, wherin a tough humor poſſeſſing the cavitie is concrete in ſtead of the head of the bone, are not to be reſtored; as neither when the heads of the luxated bones have by continuall attrition made themſelves a new cavitie in the neighbouring bone: neither if they be reſtored, is the reſtitution firme and of continuance; becauſe the naturall cavitie is poſſeſſed by another matter, and the new made neare thereto cannot well and faithfully containe the received head of the bone. Thoſe who have their ſhoulder diſlocated, may uſe their hand for many actions, as well as the oppoſite ſound hand; for the weight of the bodie is not ſuſtained by the hands, as it is by the legs. And by how much the hand is the more exerciſed, by ſo much the arme becoms the more corpulent. Contrarily, if the thigh-bone bee diſlocated, eſpecially if it bee wreſted inwards, the whole legge quickly decayes by an *atrophia*, becauſe the part doth abſolutely loſe all motion: for by the opinion of Hippocrates, the performance of the proper action encreaſes ſtrength, and makes the part in better plight; but idleneſſe debilitates and makes it leane.

Hipp.ſent.88. ſect.3.de art.

If a great wound and fracture bee joyned with a Luxation, there is danger, leſt while wee uſe extenſion for reſtoring the part, we draw the nerves too violently, and ſo break the nerves, veines and arteries, whence would enſue feare of inflammation, convulſion, and other maligne ſymptomes. Wherefore Hippocrates judges it better in ſuch a concourſe and complication of preternaturall affects, abſolutely not to meddle at all with the ſetting of the diſlocated bone: for, by attempting the reſtitution, certaine death; but by omitting it only lameneſſe is to be feared.

Sent.10 ſect.5. lib.6.epid & ſect. 3. de art. ſent 88.

You muſt not endevour to ſet an inflamed joynt.

Everie diſlocation muſt be reſtored before inflammation come; but if it be already preſent, you muſt preſently be carefull to take it away. For other things, let the Patient reſt, leſt if the affect be irritated, the increaſe and exceſſe of paine cauſe a convulſion, gangrene, and laſtly death, as I remember I have ſomtimes obſerved. Therfore when inflammation, and other maligne ſymptomes ſhall be mitigated and corrected, then may you endeavour to reſtore the luxation, eſpecially if the habit of the bodie and member affected may admit it. For if the bodie be ſlender, delicate and tender, then the reſtitution will bee more ſpeedy and facile. But on the contrarie, more difficult, if it be groſſe and compact; And let thus much ſuffice for prognoſticks in Luxations.

CHAP. VI.

Of the generall cure of Diſlocations.

Five intentions in curing diſlocations.

FOr all that I have heretofore delivered the generall methode of curing Fractures and diſlocations, yet it ſhall not bee unprofitable to repeat here in this place, thoſe things which may be accommodated to this Treatiſe of curing Luxations. Now he that will cure Diſlocations, muſt have regard to five intentions, which it will be fitting to performe in order. The firſt is, of Holding; The ſecond, of Drawing or Extending; The third, of Forcing in; The fourth, of Placing in convenient figure and ſite; The fifth, of Correcting the concomitant, or following ſymptomes.

The benefit of holding the member in diſlocations.

The uſe of extenſion.

The manner of ſetting it, or putting it into its place.

Signes that the bone is ſet.

The benefit of fit placing the member.

The manner of binding up the ſet joynt.

The cure of inveterate luxations.

The firſt ſcope, which we ſaid was of Holding, is meant eyther of the whole body, or elſe of ſome part thereof only. The whole bodie muſt bee holden by the ſtrong embracement of your ſervant or attendant, when as the ſhoulder, the *vertebræ*, or the thigh-bones are diſlocated. But in the diſlocation of the Collar-bone, elbow, hand, knee, or foote and legge, it is ſufficient onely to hold the part ſtraitly in your hands. There is neceſſitie of holding eyther the bodie, or elſe ſome part thereof, leſt, while the diſlocated bone is extended, the whole bodie follow by continuance of parts, if there be nothing which may hinder: for if the bodie ſhould follow him that drawes or extends, all the work-maſters labour and endeavour to reſtore it, is to no purpoſe. The uſe of the ſecond ſcope, that is, of Drawing or Extending, is, that there may be a free ſpace and diſtance betweene the luxated bones, by which diſtance the diſlocated bone may the more freely be forced into its cavitie. But the manner of drawing or extending is different in quantity and manner, according to the various ſtrength of the muſcles and ligaments, and diſlocation of the bones to this or that part. Therefore this worke is almoſt alwaies performed by the hands; which when they cannot ſuffice, we muſt uſe the aſſiſtance of inſtruments and engins, whoſe figures you ſhall ſee hereafter delineated. But that you may not doe amiſſe, you may ſo farre uſe extenſion, untill the head of the bone be brought juſt againſt its cavitie. When the Surgeon hath brought it to this paſſe, then muſt he haſten to the third intention, which is, to put the head of the bone firſt moved and gently bended, into its cavitie. For hee muſt have a ſpeciall care, that hee force it no other way than into its proper cavity: for it would be dangerous, leſt he ſhould turne it from one extreme into another, and the bone, for examples ſake, of the thigh, which was diſlocated into the forepart by too violent forcing, by exceeding the middle cavitie, may be driven and diſlocated into the hinder part. To ſhun this, the bone ſhall be put backe the ſame way that it fell out, which may bee eaſily done in freſh and late happening diſlocations. We underſtand that the bone is ſet by the noyſe, or as it were a popp, or ſound like that, which ſolid and ſounding bodies, being fully and forcibly thruſt into their cavities, do make; by the ſimilitude and conſent in figure, magnitude and all conformation of the affected part with the ſound, and laſtly, by the mitigation of the paine. The fourth ſcope, which is of the convenient ſite of the part, muſt bee ſo fulfilled, that the bone after it is ſet may bee kept in its cavity, and not flye forth againe. Wherefore if the arme be diſlocated, it ſhall be carried bound up in a ſcarfe: if the thigh, knee, legge, or foote be luxated, they ſhall be fitly layd in a bed; but in the *interim* the Surgeon, preſently after hee hath ſet them, ſhall have a care, that the affected joynt be wrapped about with ſtoups and clothes, or compreſſes ſteeped in roſe vinegar, and ſpred with convenient medicines; then let it be bound with an artificiall deligation, rowling the ligatures unto the part contrary to that whereto the diſlocated bone flew. For the which purpoſe thicker boulſters ſhall be there applied whence the bone came out, otherwiſe there will be ſome danger, leſt it ſhould be againe diſplaced: when theſe things are done, he ſhall for foure or five dayes ſpace meddle with nothing about the Diſlocation, unleſſe paine, or ſome ſuch like ſymptome happen. For then the fifth ſcope will call us from that ceſſation and reſt, which is, to correct the ſymptomes and complicate affections, as paine, inflammation, a wound, fracture, and others, whereof wee have ſpoken abundantly in our Treatiſe of Fractures. Before wee attempt to ſet inveterate diſlocations, wee muſt endevour to humect the ligaments, tendons and muſcles by fomentations, cataplaſmes, emplaiſters, liniments, and other remedies, that ſo theſe parts may be more obedient to the Surgeons hand: then muſt the diſlocated bones be moved, with a gentle motion up and down, to and againe, that by this meanes the excrementitious humor, which by continuance of time hath flowed downe, may waxe hot, be attenuated, reſolved or made ſlipperie, and alſo the fibres of the muſcles, ligaments, and nervous bodies, placed about the joynt for the defence thereof, may be looſed, that ſo they may preſently be more freely extended. But if a great ſwelling, paine and inflammation urge, we muſt firſt think of aſſwaging and curing them, then of the reſtoring the Diſlocation.

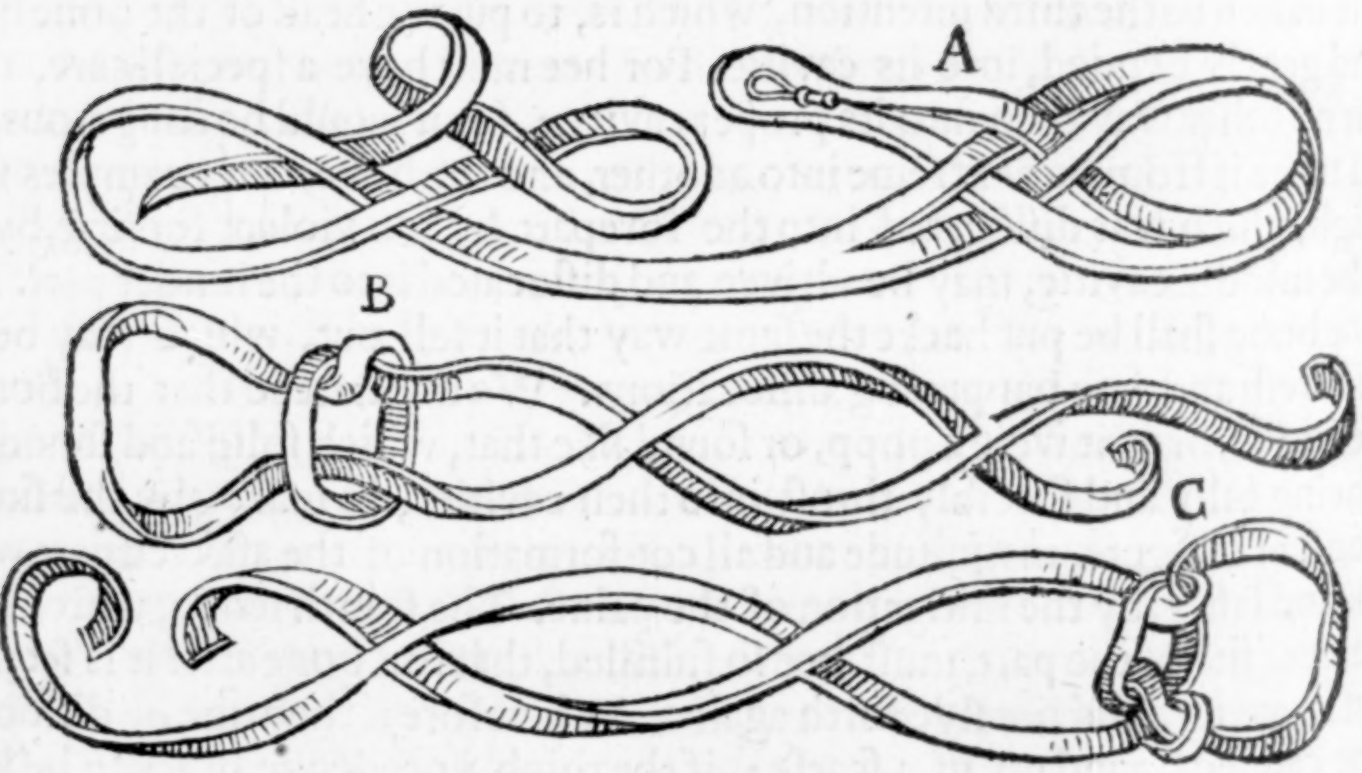
CHAP. VII.

The deſcription of certaine engines, ſerving for the reſtoring of Diſlocations.

Theſe ligatures are not for deligation, but extenſion.

BEfore I come to the particular kinds of Diſlocations, I think it not amiſſe to deſcribe three ſorts of Bandages, and give you their figures, as thoſe which are moſt fit to hold and extend Diſlocations. The firſt Ligature, deſigned by this letter *A*, is made for holding the member. The ſecond, marked with the letter *B*, is fit for drawing or extenſion, and conſiſts of one knot. The third, whereto the letter *C* is put, conſiſting of two knots, is to hold or binde more ſtraitly.

The delineation of the three Ligatures.



I have thought good alſo to delineate the following Engine, made for to draw and extend more powerfully, when the hand will not ſerve. It is made like a Pulley, marked with theſe letters *DD*. Within this there lye hid three wheeles, through whoſe furrowes runnes the rope which is to be drawue, marked with this letter *H*. At the ends of the Pulley are hooks faſtened, the one of which is to faſten the Pulley to a Poſte, the other is to draw the ligature faſtened to the part. The Boxes or Caſes wherein the Pulley is kept, is maked with *BB*. Their covers are marked with *AA*. A ſcrew pin which may be twined, and ſo faſtened to a Poſte, that ſo one of the ends of the Pulley may be hooked thereto, is ſigned with *C*. A Gim-

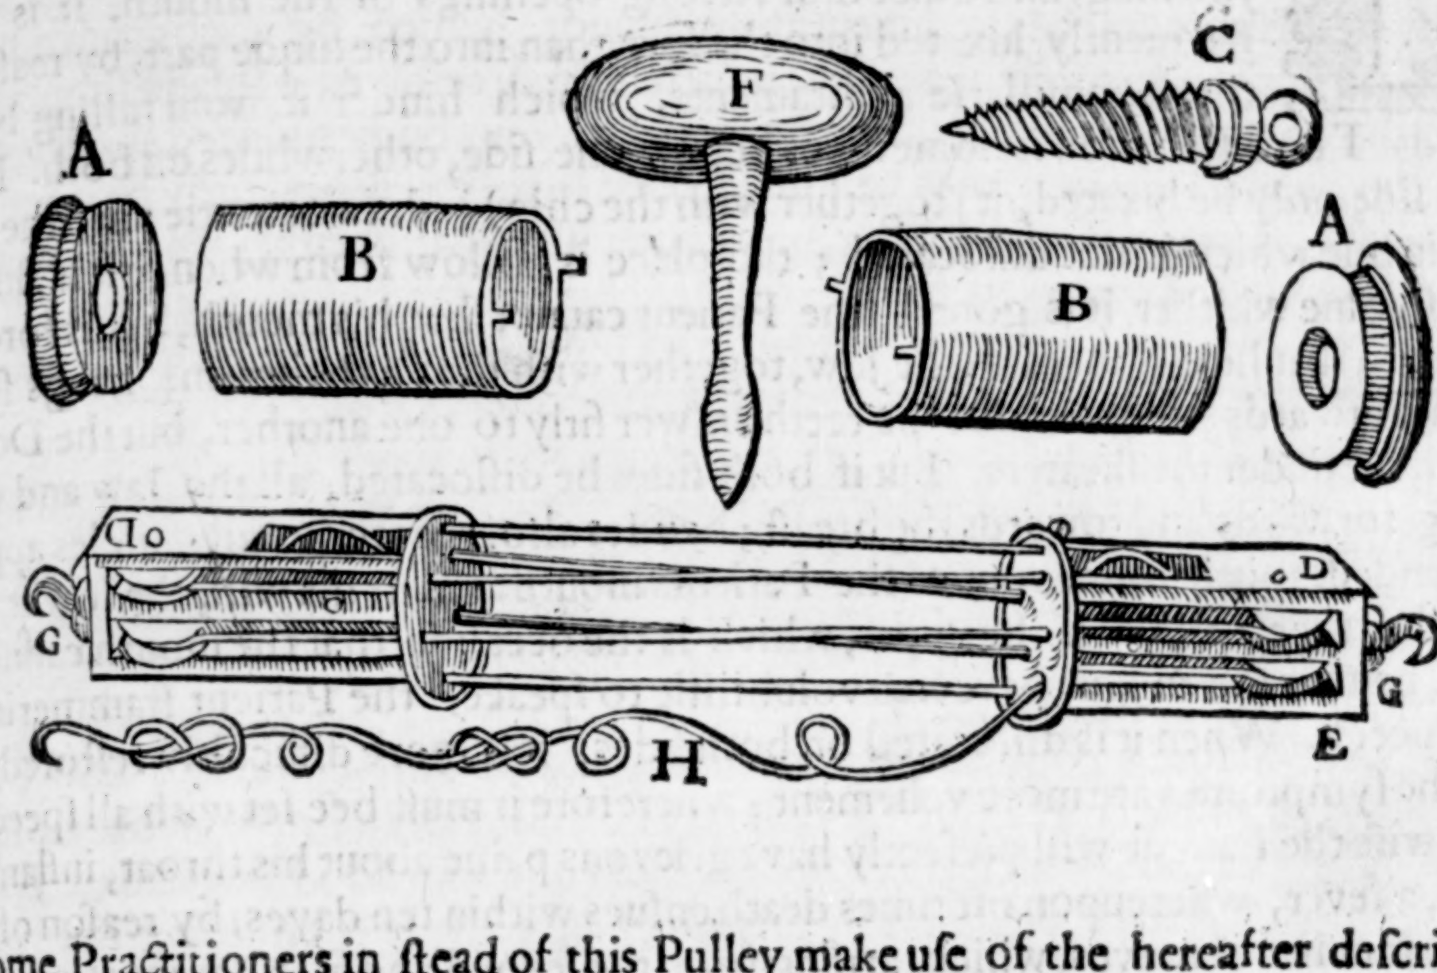
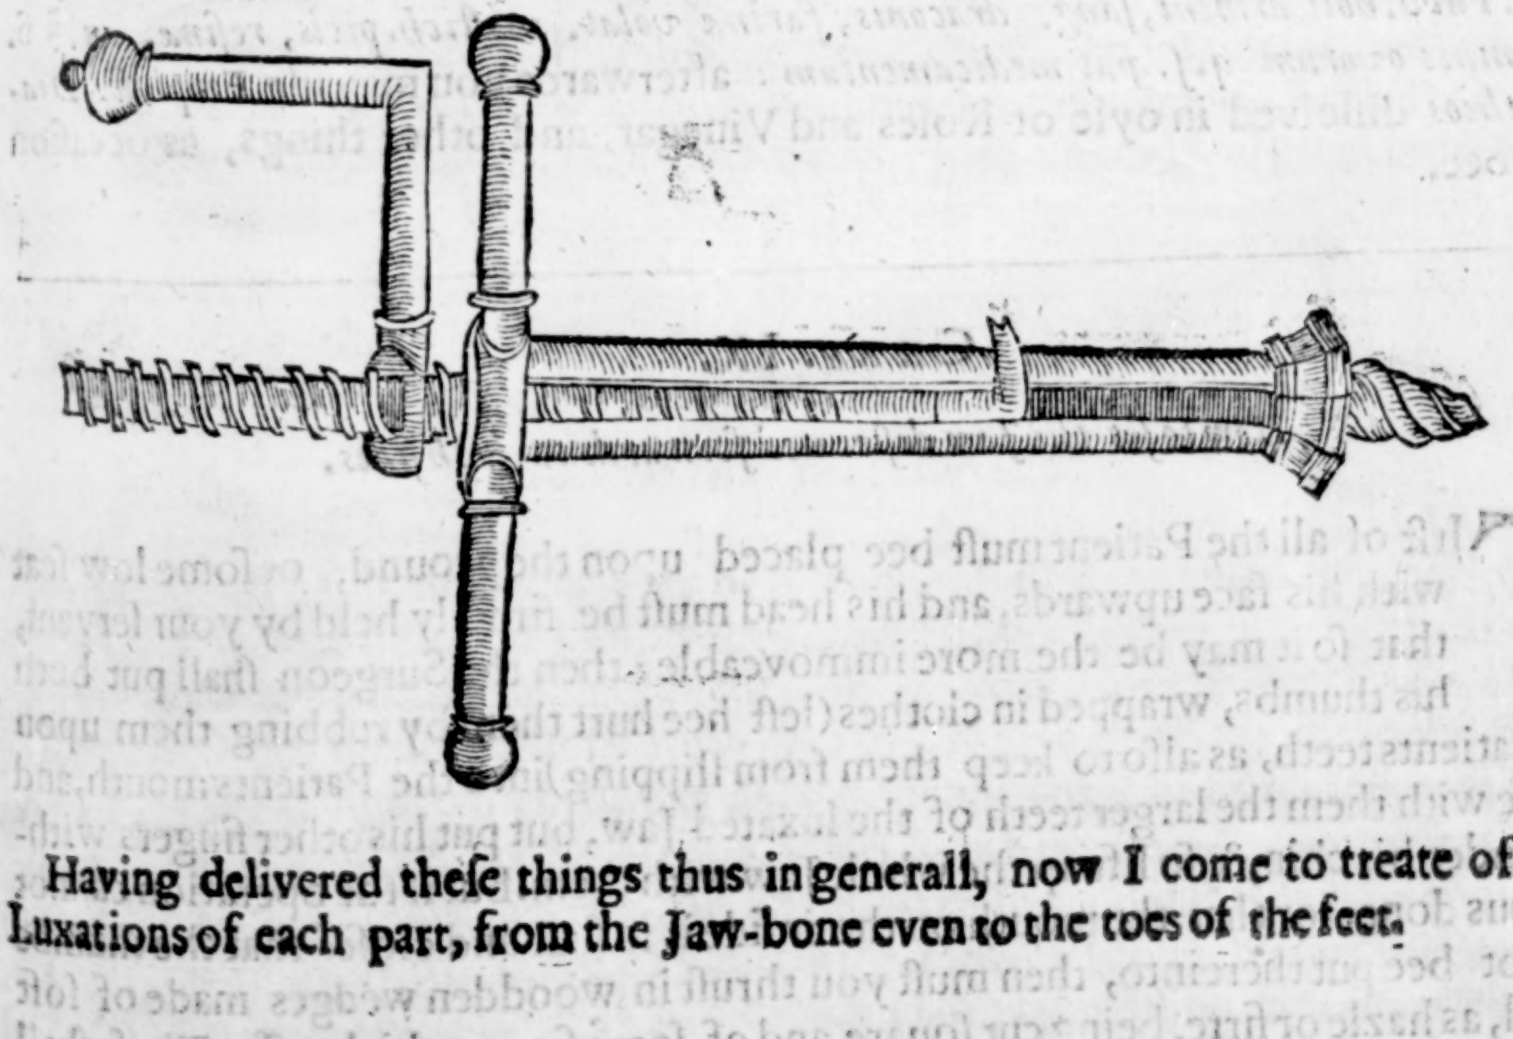
let (marked by *F.*) to make a hole in a Poſte, ſo to let in the ſcrew pin. You may ſee all theſe things expreſt in this following figure.

A Pulley.



Some Practitioners in ſtead of this Pulley make uſe of the hereafter deſcribed Inſtrument, which they terme *Manubrium verſatile*, or a Hand-vice. The end thereof is faſhioned like a Gimblet, and is to be twined into a Poſte. Within that handle lyes a ſcrew with a hooked end, whereto the ſtring or ligature muſt be faſtened. Now the ſcrew-rod or male-ſcrew runnes into the female by the twining about of the handle: and thus the ligature is drawne as much as will ſuffice, for the ſetting the diſlocated bone.

Manubrium verſatile, or, *A Hand-vice.*



Having delivered theſe things thus in generall, now I come to treate of the Luxations of each part, from the Jaw-bone even to the toes of the feet.

CHAP.

CHAP. VIII.

Of the Diſlocation of the Jaw-bone.

The cauſes.

Differences.

Signes that only one part is diſlocated.

Signes that both ſides are diſlocated.

Prognoſticks.

Why death quickely enſues upon the diſlocation of both ſides of the jaw.

THe Jaw-bone is diſlocated by many occaſions, and not ſeldome by yawning, and other more ſtrong openings of the mouth. It is more frequently luxated into the fore, than into the hinde part, by reaſon of the mammillarie additaments, which hinder it from falling backewards. The diſlocation is ſometimes but on one ſide, otherwhiles on both. If the one ſide only be luxated, it (together with the chin) is drawne awrie unto the contrarie ſide which is not diſlocated; the place is hollow from whence it is flowne, but ſwolne whither it is gone; the Patient cannot ſhut his mouth, but is forc't to gape, ſo that he cannot eate; the Jaw, together with the teeth therein, hangs ſomewhat forwards; neyther doe the teeth anſwer fitly to one another, but the Dogge-teeth are under the ſhearers. But if both ſides be diſlocated, all the Jaw and Chin hang forwards and towards the breaſt; beſides alſo, the temporall muſcles appeare diſtended, ſpittle runnes out of the Patients mouth againſt his will, the lower teeth ſtand further forth than the upper, which is the occaſion that the mouth cannot be ſhut, neither the tongue have free volubilitie to ſpeake, the Patient ſtammering in his ſpeech. When it is diſlocated on both ſides, it is more difficultly reſtored, and all the ſymptomes are more vehement; wherefore it muſt bee ſet with all ſpeed, otherwiſe the Patient will preſently have grievous paine about his throat, inflammation, a fever, whereupon oft times death enſues within ten dayes, by reaſon of the five branches of nerves, which, ariſing from the ſecond and fifth conjugation of the braine, are diſtributed into the moving muſcles thereof, which, too violently extended, bring the forementioned ſymptomes. Practitioners affirme, that the Jaw, twelve dayes after it is ſet, is free from the danger of relapſe. If it have beene diſlocated ſome few daies, before you goe about to reſtore it, you muſt uſe ſoftening and relaxing medicines to it: but when it is put in the joynt, apply a medicine made of the whites of egges, and oyle of roſes, to aſſwage paine, and apply clothes dipped in oxycrate. At the ſecond dreſſing you ſhall apply ſuch things as have power to agglutinate and ſtrengthen the ligaments and other relaxed parts, and alſo to keep it being reſtored in its place. This ſhall be the forme of ſuch a medicine.

An aſtringent medicine.

℞. *Pulv. boli armeni, ſang. draconis, farinæ volat. maſtich. picis, reſinæ, an.* ℥.ß. *albuminis ovorum q.ſ. fiat medicamentum:* afterwards you may uſe *Emplaſt. Diacalcitheos* diſſolved in oyle of Roſes and Vinegar, and other things, as occaſion ſhall bee.

CHAP. IX.

How to ſet the Jaw diſlocated forwards on both ſides.

The firſt maner of ſetting a jaw-bone.

Another.

FIrſt of all the Patient muſt bee placed upon the ground, or ſome low ſeat with his face upwards, and his head muſt be firmely held by your ſervant, that ſo it may be the more immoveable: then the Surgeon ſhall put both his thumbs, wrapped in clothes (leſt hee hurt them by rubbing them upon the Patients teeth, as alſo to keep them from ſlipping) into the Patients mouth, and preſſe with them the larger teeth of the luxated Jaw, but put his other fingers without under his chin, & ſo lift up the whole Jaw with them. But if the operation cannot be thus done, for that the mouth on the inſide is ſo ſhut and cloſed that the thumbs cannot bee put thereinto, then muſt you thruſt in woodden wedges made of ſoft wood, as hazle or firre, being cut ſquare, and of ſome fingers thickneſſe. Theſe ſhall bee wedged in on each ſide above the grinders; then caſt a ligature under his chin, whoſe ends your ſervant ſhall hold in his hands, and ſetting his knees upon the Patients ſhoulders, ſhall pull them upwards; then at the ſame time the Surgeon ſhall preſſe downwards the woodden wedges. The Jaw-bones thus reſtored, ſhalbe kept ſo by convenient ligation, and dreſſed with medicines, as it is fitting; and in the meane ſpace you muſt forbid the Patient to ſpeake, or needleſly to open his mouth. Wherefore he muſt abſtaine from hard meats, and ſuch as require much chewing, untill his paine be quite paſſed, and uſe only ſpoone-meats, as Barley-creames, panadoes, jellies, cullaſſes, brothes, and the like.

Diet.

CHAP. X.

Of reſtoring the Jaw diſlocated forwards but on one ſide.

THe Patient muſt be placed on a lowe ſeate, ſo that hee may be under the Surgeon; then your ſervant, ſtanding at his back, ſhall hold his head firme and ſteddie, that it may not follow the Surgeon drawing, extending, and doing other things neceſſarie for reſtoring it. Then the Surgeon, putting his thumb between the grinders, ſhall preſſe down the Jaw, and gently drawing it aſide, force it into its cavitie: in the meane while, alſo the Patient, as much as in him lyes, ſhall helpe forwards the Surgeons endevour, in opening his mouth as little as he can, leſt the muſcles ſhould bee extended; and hee ſhall only gape ſo wide as to admit the Surgeons thumbe, for ſo the temporall muſcles ſhall be reſtored to their place, and favour the reſtitution. If hee open his mouth as wide as hee can, they will be extended after a convulſive manner; if on the contrarie he ſhut his teeth too cloſe, there will be no paſſage for the Surgeons Thumbe unto his grinding teeth. Some there bee which affirme, that the Jaw-bone may ſometimes be diſlocated towards the hinde part, and that then the mouth is ſo cloſe ſhut, that the Patient cannot open it nor gape, and that the lower ranke of teeth ſtands further in, and nearer the throat than the upper. Now for reſtoring it, the Patients head muſt be ſtraitly holden behinde, whilſt the Surgeon, the meane while putting both his thumbs into the Patients mouth, holding his other fingers without under the parties chin, hee ſhall, by ſhakng it, draw it to him, or forwards, and ſo reſtore it to its place. For my own part, I confeſſe I never ſaw this kinde of Luxation, and I eaſily perſwade my ſelfe, that it can ſcarce ever happen, for the reaſon I gave in the former Chapter. But nevertheleſſe, if it by any meanes chance to happen, yet can it not be a perfect Luxation, but an imperfect one; the Jaw being onely but a little thruſt backe to the throat to thoſe mammillarie additaments. And then it may eaſily be reſtored by lifting or drawing forth the Jaw, and ſuddenly forcing it from below upwards.

What the Surgeon.

What the Patient ought to do.

Signes that the Jaw is diſlocated backwards.

The Cure.

CHAP. XI.

Of the Luxation of the Collar-bone.

AS the Collar-bones may be broken, wreſted and crooked, ſo alſo they may be diſlocated. Now they are diſlocated, either againſt the *ſternum*, or againſt the ſhoulder-blade, or *acromion* thereof: yet both theſe kinds of diſlocations are very rare, by reaſon of the ſtrait and firme connexion which the Collar-bone hath with the foreſaid parts; but chiefly where it is joyned to the *ſternum*, it can ſcarce be depreſt, for that it is as it were underpropt with the firſt rib. But it may be diſlocated inwardly, outwardly, and ſide-wiſe, and according to this varietie there muſt be divers waies to reſtore it; yet generally the Collar-bone is put into its place by moving or extending the arme. But if need require, the Patient ſhall be layd upon the ground with his face upwards, a Tray with the bottome upwards, a hard ſtuffed Cuſhion, or the like thing being put under his ſhoulders: for thus it wil ſo come to paſſe, that the ſhoulder and

Differences of the luxated Collar-bones.

The Cure.

cheſt

Com.ad ſent. 61.ſect.1.de art.

cheſt will ſtand ſo forth, that preſently by lifting up, by preſſing downe, or drawing forth the arme forwards or backwards, as the bone ſhalbe flowne out to this or that part, you may reſtore it; for thus the prominencie may bee forced into its cavitie. But it will be requiſite to binde it up, and lay boulſters thereon, and to give it reſt, as if it were fractured. Galen writes, that when hee was five and thirtie yeares old, whilſt he exerciſed himſelfe in the place of Exerciſe, his Collar-bone was ſo farre ſeparated from the *Acromion*, that there was the ſpace of three fingers betweene them. And that this Luxation was reſtored in fortie dayes ſpace, by ſo ſtrait and ſtrong a Ligation, that he perceived the motion of the beating arteries under the bone. But you ſhall finde verie few, who will ſuffer ſuch ſtrait ligation ſo long, though it be never ſo neceſſarie. Verily, this kinde of Luxation is hard to be known, but farre more difficult to be healed. I have known many Surgeons deceived, who have taken the Luxation of the Collar-bone for the diſlocation of the top of the ſhoulder. For then the *Epomis* or toppe of the ſhoulder ſwels, and the place from whence the Collar-bone is flowne, is depreſſed with a manifeſt cavity, with vehement paine, inflammation, and impotencie of lifting up, or otherwiſe moving the arme, or performing other actions which are done by the helpe of the ſhoulder. Certainly, if this bone, when it is diſlocated, be not ſet, the Patient ſhall be lame during his life, ſo that hee ſhall not bee able, neyther to put his hand to his head nor mouth.

Chap.XII.

Of the Luxation of the Spine, or Back-bone.

An anatomicall deſcription of the Spine.

THe Backe-bone conſiſts of many bony *vertebræ*, like rowles or wheeles mutually joynted or knit together, by their ſmoothneſſe and circular forme conſpiring to an aptneſſe of moving or bending forwards. For if it ſhould conſiſt of one bone, we ſhould ſtand continually with the trunk of our bodies immoveable, as thruſt thorough with a ſtake. The *vertebræ* have a hole paſſing through the midſt of them, whereby the marrow, paſſing this way out from the braine as by a pipe, may ſerve for the generation of the ſenſitive and motive nerves, and their diſtribution into all parts beneath the head. For which purpoſe it is perforated with many holes on the ſides, through each whereof certaine conjugations of the nerves paſſe forth into the reſt of the body, and veines and arteries paſſe in for the propagation of nouriſhment and life. The whole exteriour face of the Spine is rough, and as it were armed with foure ſorts of *apophyſes* or proceſſes, whereof ſome ſtand up, others downe; ſome direct, others tranſverſe. Wherefore from theſe thornie and ſharpe proceſſes, the whole hath acquired the name of the *Spina*. The *vertebræ* the further from the neck they are, the greater they grow, ſo that thoſe which are the loweſt, are the largeſt: for it is agreeable to reaſon, that that which beares, ſhould be bigger than that which is borne. Hence we ſee, that the Holy-bone is placed under the reſt as a foundation. The ſide proceſſes of the Rack-bones of the Cheſt, beſides the benefit of defending the ſpinall marrow ſhut up therein from externall injuries, have alſo another, which is, they firme and faſten the bones of the ribbs by a ſtrong tye. There lyes a griſtle, and a tough, and (as it were) albuminous humor betweene the *vertebræ*, which makes them, as alſo all the other joynts of the bodie, ſlipperie, and fit for motion: the Spine is flexible with notable agilitie forwards onely, but not backewards, for that ſo there would be continuall danger of breaking the Hollow aſcendent veine, and the great deſcending arterie running thereunder. Therefore the dearticulations of the *vertebræ*, mutually ſtrengthned with ſtrong ligaments, doe looke more backewards. I have thought good to premiſe theſe things of the nature of the Spine, before I come to the Diſlocations happening thereto: I willingly omit divers other things which are moſt copiouſly delivered by Galen, content onely to adde thus much;

The variety of the proceſſes of the Spine.

Gal.cap.7.lib.13. de uſu partium.

Lib.13. de uſu partium.

much; That there is nothing to bee found in the whole ſtructure of Mans bones, which more clearly manifeſts the induſtrie of Gods great workmanſhip, than this compoſure of the Spine and the *vertebræ* thereof.

Chap. XIII.

Of the Diſlocation of the Head.

The connexion of the head with the firſt Rack-bone of the necke.

Prognoſticks.

THe head ſtands upon the necke knit by dearticulation to the firſt *vertebra* thereof, by the interpoſition of two proceſſes which ariſe from the *baſis* thereof, neare the hole through which the marrow of the braine paſſes downe into the backe bone, and they are received by fit cavities, hollowed in this firſt *vertebra*. Theſe proceſſes ſometimes fall out of their cavities, and cauſe a diſlocation behinde, whereby the ſpinall marrow is too violently and hard compreſſed, bruiſed and extended, the chin is faſtened to the breaſt, and the Patient can neyther drinke nor ſpeake: wherefore death ſpeedily followes upon this kinde of Luxation, not through any fault of the Surgeon, but by the greatneſs of the diſeaſe, refuſing all cure.

Chap. XIV.

Of the Diſlocation of the vertebræ, *or Racke-bones of the necke.*

The danger hereof.

Signes and ſymptomes of their ſubluxation.

The Cure.

Signes of their reſtitution.

THe other *vertebræ* of the necke may bee both diſlocated and ſtrained. Diſlocation verily, unleſſe it be ſpeedily helped, brings ſudden death: for, by this meanes the ſpinall marrow is preſently oppreſt at the verie originall thereof, and the nerves, there-hence ariſing, ſuffer alſo together therewith, and principally thoſe which ſerve for reſpiration; whereby it commeth to paſſe, that the *animal* ſpirit cannot come and diſperſe its ſelfe into the reſt of the bodie lying thereunder; hence proceede ſudden inflammation, the ſquinſie, and a difficultie, or rather a defect of breathing. But a ſtraine or incomplete Luxation brings not the like calamitie: by this the *vertebræ*, a little moved out of their ſeats, are turned a little to the hinde or forepart, then the necke is wreſted aſide, the face lookes blacke, and there is difficultie of ſpeaking and breathing. Such, whether diſlocation or ſtraine, is thus reſtored. The Patient muſt be ſet upon a lowe ſeat, and then one muſt leane and lye with his whole weight upon his ſhoulders; and the meane while the Surgeon muſt take the Patients head, about his eares, betwixt his hands, and ſo ſhake and move it to everie part, untill the *vertebra* be reſtored to its place. We may know it is ſet by the ſudden ceaſing of the pain, which before grievouſly afflicted the Patient, and by the free turning and moving his head & neck everie way. After the reſtoring it, the head muſt be inclined to the part oppoſite to the Luxation, and the neck muſt bee bound up about the dearticulation of the ſhoulder; but yet ſo, that the ligature bee not too ſtrait, leſt by preſſing the weazon and gullet, it ſtraiten the paſſages of breathing and ſwallowing.

Chap. XV.

Of the Diſlocated Vertebræ *of the Back.*

Differences and ſignes.

Cauſe.

THe Rack bones of the backe may bee diſlocated inwards, outwards, to the right ſide, and to the left. We know they are diſlocated inwards, when as they leave a depreſſed cavitie in the ſpine; outwardly, when they make a bunch on the backe; and wee know they are luxated to the right or left ſide, when as they obliquely bunch forth to this or that ſide. The *vertebræ* are diſlocated by a cauſe eyther internall, or externall, as is common to all other Luxations; the internall is eyther the defluxion of humors from the whole bodie, or any part to them and their ligaments; or elſe a congeſtion proceeding from the proper and native weakeneſſe of theſe parts; or an attraction ariſing from paine and heat. The externall is a fall from high upon ſome hard bodie, a heavie and bruiſing blow, much and often ſtooping, as in Dreſſers and Lookers to Vineyards, and Paviers, decrepite old men; and alſo ſuch, as through an incureable diſlocation of the Thigh-bone, are forced in walking to ſtoope downe, and hold their hand upon their thigh. But a *vertebra* cannot be forced or thruſt inwards, unleſſe by a great deale of violence; and if it at any time happen, it is not but with the breaking of the tyes and ligaments, for they will breake rather than ſuffer ſo great extenſion. Such a diſlocation is deadly, for that the ſpinall marrow is exceedingly violated by too ſtrait compreſſion, whence proceeds dulneſſe, and loſſe of ſenſe in the members lying thereunder. Neyther is reſtitution to bee hoped for, becauſe wee cannot through the belly force it into its place: the urine is then ſuppreſt, as alſo the excrements of the belly; ſometimes on the contrarie, both of them breake forth againſt the Patients minde, the knees and legges grow cold, their ſenſe and motion being loſt. Such things happen more frequently, when the ſpine is luxated inwards, than when it is diſlocated outwards, for that the nerves, thence ariſing, runne and are carried more inwardly into the bodie. Beſides, the preſſed Spinall marrow becomes inflamed; and that being inflamed, the parts of the ſame kinde, and ſuch as are joyned thereto, are alſo inflamed by conſent, whence it happeneth, that the bladder cannot caſt forth the urine. Now where the ſinewes are preſſed, they can no more receive the irradiation of the animal facultie. Hence followes the deprivation of the ſenſe and motion in the parts whereto they are carried, therefore the contained excrements doe no more provoke to expulſion by their troubleſome ſenſe, neither are preſſed to keep them in; thence proceeds their ſuppreſſion, and hence their breaking forth againſt their wils. But the ſpine outwardly diſlocated, ſcarce cauſes any compreſſion of the marrow or nerves.

The danger of a *vertebra* diſlocated inwards.

Hipp. ſent. 51. ſect. 3. de art. & Gal. in com.

CHAP. XVI.

How to reſtore the Spine outwardly diſlocated.

The cure.

THe *vertebræ* outwardly diſlocated, when as they ſtand bunching forth, then it is fit to lay and ſtretch forth the Patient upon a table, with his face downe-wards, and ſtraitly to binde him about with towels under the arm-pits, & about the flanks and thighes. And then to draw and extend, as much as we can, upwards and downe-wards, yet without violence: for unleſſe ſuch extenſion be made, reſtitution is not to be hoped for, by reaſon of the proceſſes and hollowed cavities of the *vertebræ*, wherby, for the faſter knitting, they mutually receive each other. Then muſt you lye with your hands upon the extuberancie, and force in the prominent *vertebra*. But if it cannot be thus reſtored, then will it bee convenient to wrap two pieces of wood, of foure fingers long, and one thick, more or leſſe, in linnen clothes, and ſo to apply one on each ſide of the diſlocated *vertebræ*, and ſo with your hands to preſſe them againſt the bunching forth *vertebræ*, untill you force them backe into their ſeats, juſt after the manner you ſee it here delineated.

In the meane while have a care, that you touch not the proceſſes which ſtand up in the ridge of the Spine, for they are eaſily broken. You may know that the *vertebræ* are reſtored by the equall ſmoothneſſe of the whole Spine. It is fit, after you have reſtored it, to binde up the part, and lay ſplints or plates of Lead neatly made for that purpoſe upon it; but ſo, that they may not preſſe the criſts or middle proceſſes of the *vertebræ*, which I formerly mentioned, but only the ſides: then the Patient ſhall be layd upon his backe in his bed, and the ſplints long kept on, leſt the *vertebræ* ſhould fall out againe.

How to keep the reſtored *vertebræ* in their places.

Chap. XVII.

A more particular inquirie of the Diſlocation of the Vertebræ, *proceeding from an internall cauſe.*

THe *vertebræ* are in like ſort luxated by the antecedent cauſe, as wee have formerly ſaid, which is cauſed by the naturall imbecillitie of the parts; principally of the nervous ligament, by which all the *vertebræ* are bound each to other; this ligament comes not to the ſpinall marrow, but onely bindes together the *vertebræ* on their outſides. For, beſides the two membranes proceeding from the two *Meninges* of the Braine, wherewith the marrow is covered, there is a third ſtrong and nervous coate put upon it, leſt, whileſt the ſpine is diverſly bended, the bended marrow ſhould bee broken. This third coate ariſes from the *pericranium*, as ſoone as it arrives at the firſt *vertebra* of the necke. Now that Ligament, wherewith we ſaid the joynts of the *vertebræ* were mutually knit and faſtened, is encompaſſed with a tough and glutinous humor for the freeer motion of the *vertebræ*. Sometimes another cold, crude, groſſe and viſcide humor, confuſed and mixed herewith by great defluxions and catarrhes, begets a tumor, which doth not only diſtend the nerves proceeding forth of the holes of the *vertebræ*, but alſo diſtends the ligaments wherewith they are bound together: which ſo diſtended, and (as it were) drawne aſide, do draw together with them the *vertebræ*, one while towards the right ſide, another while to the left, ſomewhiles inwards, otherwhiles outwards, and thus move them out of their ſeats, and diſlocate them. A diſlocated *vertebra*, ſtanding forth and making a bunch, is termed in Greeke *Cyphoſis*, (Thoſe thus affected we may call, *Bunch-backt.*) But when it is depreſſed, it is named *Lordoſis*, (Such we may terme, *Saddle-backt.*) But when the ſame is luxated to the right or left ſide, it maketh a *Scolioſis* (or *Crookedneſſe*,) which wreſting the ſpine, drawes it into the ſimilitude of this letter S. Galen addes a fourth default of the *vertebræ*, which is, when their joynts are moved by reaſon of the looſeneſſe of their

Seiſis.

The ſeparation of the ſpinall marrow from the encompaſſing *vertebræ.*

The error of Nurſes in binding and lacing of Children.

ligaments, the *vertebræ* yet remaining in their places, and he cals it a *Seiſis* (or ſhaking). They alſo note another defect peculiar to the Spinall marrow, which is, when as it (the *vertebræ* being not moved whereto it adheres) is plucked and ſevered from them: this diſeaſe is occaſioned by a fall from on high, by a great ſtroake, and by all occaſions which may much ſhake, and conſequently depreſſe the ſpinall marrow, or by any other meanes remove, or put it forth of its place. Scarce any recovers of this diſeaſe, for many reaſons, which any exerciſed in the art, may eaſily thinke upon: But let us returne to the internall cauſe of Luxations. Fluid and ſoft bodies, ſuch as Childrens, uſually are very ſubject to generate this internall cauſe of defluxion. If externall occaſions ſhall concurre with theſe internall cauſes, the *vertebræ* will ſooner be diſlocated. Thus Nurſes, whilſt they too ſtraitly lace the breaſts and ſides of girles, ſo to make them ſlender, cauſe the breaſt-bone to caſt its ſelfe in forwards or backwards, or elſe the one ſhoulder to bee bigger or fuller, the other more ſpare and leane. The ſame error is committed, if they lay children more frequently and long upon their ſides, than upon their backs; or if, taking them up when they wake, they take them only by the feete or legges, and never put their other hand under their backs, never ſo much as thinking that children grow moſt towards their heads.

Chap. XVIII.

Prognoſticks of the Diſlocated Vertebræ *of the backe.*

Hipp. ſent. 6. ſect. 3. de art.

IF in Infancie it happen that the *vertebræ* of the backe ſhall bee diſlocated, the ribbs will grow little or nothing in breadth, but runne outwards before; therefore the cheſt loſeth its naturall latitude, and ſtands out with a ſharpe point. Hence they become aſthmaticke, the lungs and muſcles which ſerve for breathing, being preſſed together and ſtraitened; and that they may the eaſlier breathe, they are forced to hold up their heads, whence alſo they ſeeme to have great throats. Now becauſe the weazon being thus preſſed, the breath is carried through a ſtrait paſſage; therefore they wheaſe as they breath, and ſnort in their ſleepe, for that their lungs, which receive and ſend forth the breath or ayre, be of leſſe bigneſſe: beſides alſo, they are ſubject to great diſtillations upon their lungs, whereby it commeth to paſſe, that they are ſhorter lived. But ſuch as are bunch-backed below the midriffe, are incident to diſeaſes of the kidneyes and bladder, and have ſmaller and ſlenderer thighes and legges, and they more ſlowly and ſparingly caſt forth haire and have beards; to conclude, they are leſſe fruitfull, and more ſubject to barrenneſſe, than ſuch as have their crookedneſſe above their midriffe. The Bunches which proceede from externall cauſes are oft times cureable; but ſuch as have their originall from an inward cauſe are abſolutely uncureable, unleſſe they be withſtood at the firſt with great care & induſtrie. Wherefore ſuch as have it by kinde, never are helped. Such as, whileſt they are yet Children, before their bodies bee come to perfect growth, have their Spine crooked and bunching out, their bodies uſe not to grow at the Spine, but their legges and armes come to their perfect and full growth; yet the parts belonging to their breaſts and backe, become more ſlender. Neither is it any wonder, for ſeeing the veines, arteries, and nerves are not in their places, the ſpirits doe neither freely, nor the alimentarie juices plenteouſly flow by theſe ſtraitned paſſages, whence leanneſſe muſt needs enſue: but the limbs ſhall thence have no wrong, for that not the whole bodie, but the neighbouring parts onely are infected with the contagion of this evill. When divers *vertebræ*, following each other in order, are together and at one time diſlocated, the diſlocation is leſſe dangerous, than if one alone were luxated. For, when one only *vertebra* is diſlocated, it carries the Spinall marrow ſo away with it, that it forces it almoſt into a ſharpe angle; wherefore being more ſtraitly preſſed, it muſt neceſſarily bee eyther broken or hurt, which is abſolutely

Why, when the ſpine is luxated, the parts belonging to the cheſt are nouriſhed and grow the leſſe.

deadly, for that it is the braines ſubſtitute. But when divers *vertebræ* are diſlocated at once, it muſt of neceſſity be forced only into an obtuſe angle, or rather a ſemicircle; by which compreſſion it certainly ſuffers, but not ſo, as that death muſt neceſſarily enſue thereof. Hereto may ſeeme to belong that which is pronounced by Hippocrates; A circular moving of the *vertebræ* out of their places is leſſe dangerous than an angular. *Sent. 51. ſect. 3. lib. de art.*

Chap. XIX.

Of the Diſlocation of the Rumpe.

The Rumpe oft times is after a ſort diſlocated inwards by a violent fall upon the buttocks, or a great blow; in this affect the Patient cannot bring his heele to his buttockes, neither, unleſſe with much force, bend his knee. Going to ſtoole is painefull to him, neyther can he ſit unleſſe in a hollow chaire. *The ſignes.* That this (as it were) diſlocation may bee reſtored, you muſt thruſt your finger in by the Fundament, even to the place affected, as we have ſaid in a fracture: *The Cure.* then muſt you ſtrongly raiſe up the bone, and with your other hand at the ſame time joyne it rightly on the outſide with the neighbouring parts; laſtly it muſt be ſtrengthened with the formerly mentioned remedies, and kept in its place. Now it will bee recovered about the twentieth day after it is ſet. During all which time the Patient muſt not goe to ſtoole, unleſſe ſitting upon a hollow ſeat, leſt the bone, as yet ſcarce well recovered, ſhould fall againe out of its place.

Chap. XX.

Of the Luxation of the Ribs.

The Ribs may by a great and bruiſing ſtroake bee diſlocated, and fall from the *vertebræ* whereto they are articulated, and they may bee driven inwards, or ſide-waies. *Cauſes.* Of which kinde of Luxation, though there be no particular mention made by the Ancients, yet they confeſſe, that all the bones may fall, or be removed from their ſeats or cavities, wherin they are received and articulated. The ſigne of a Rib diſlocated and ſlipped on one ſide, is, a manifeſt inequality, which here makes a hollowneſſe, and there a bunching forth; *Signes.* but it is a ſigne that it is driven in, when as there is only a depreſſed cavitie where it is knit and faſtened to the *vertebræ*. Such diſlocations cauſe divers ſymptomes, as difficulty of breathing, the hurt rib hindring the free moving of the cheſt; a painfulneſſe in bowing downe, or lifting up the bodie, occaſioned by a paine counterfeiting a pleuriſie; the riſing or puffing up of the muſculous fleſh about the rib, by a mucous and flatulent humor there generated: the reaſons whereof we formerly mentioned in our Treatiſe of Fractures. To withſtand all theſe, the diſlocation muſt bee forthwith reſtored, *Cure.* then the puffing up of the fleſh muſt bee helped. Wherefore, if the diſlocated Rib ſhall fall upon the upper ſide of the *vertebra*, the Patient ſhall be ſet upright, hanging by his armes upon the toppe of ſome high doore or window: then the head of the rib, where it ſtands forth, ſhalbe preſſed downe, untill it be put into its cavity. Againe, if the rib ſhall fall out upon the lower ſide of the *vertebra*, it will be requiſite, that the Patient bend his face downewards, ſetting his hands upon his knees; then the diſlocation may be reſtored by preſſing or thruſting in the knot or bunch which ſtands forth. But if the luxated rib fall inwards, it can no more be reſtored or drawn forth by the hand of the Surgeon, than a *vertebra* which is diſlocated towards the inſide, for the reaſons formerly delivered. *Gal. Com. ad ſent. 3. ſect. 1. de art.*

Chap. XXI.

Of a Diſlocated ſhoulder.

Why there is no internall ligament from the arme-bone to the ſhoulder blade.

Differences of a luxated ſhoulder.

Sent.1.ſect.1. lib.de art.

Signes of the ſhoulder diſlocated downewards.

The waies to reſtore it.

THe ſhoulder is eaſily diſlocated, becauſe the ligaments of its dearticulation are ſoft and looſe; as alſo for that the cavitie of the ſhoulder-blade is not very deepe; and beſides, it is every where ſmooth and polite, no otherwiſe than that of the ſhoulder-bone, for that it is herein received. Adde hereunto, that there is no internall ligament from bone to bone, which may ſtrengthen that dearticulation, as is in the legge and knee. Wherein notwithſtanding, we muſt not thinke nature defective, but rather admire Gods providence in this thing; for that this articulation ſerves not onely for extenſion and bending, as that of the Elbow, but beſides, for a round or circular motion, as that which carries the arme round about, now up, then downe, according to each difference of ſite. The ſhoulder-bone, which Hippocrates cals the Arme-bone, may be diſlocated foure manner of waies; upwards, downe-wards, or into the Arme-pit, forwards and outwards, but never backwards, or to the hinde part. For, ſeeing that there the cavitie of the blade-bone, which receives the head of the arm-bone, which Hippocrates cals a Joynt, lyes and ſtands againſt it; who is it that can but imagin any ſuch diſlocation? In like ſort it is never diſlocated inwardly, for on this part it hath the fleſh of a ſtrong muſcle, termed *Deltoides*, lying over it; beſides alſo the backe and *acromion* of the Blade, and laſtly, the anker-like or beake-like proceſſe, all which foure hinder this joynt from ſlipping inwards. Now Hippocrates ſaith, that he hath only ſeene one kinde of Diſlocation of this bone, to wit, that which is downe-wards or to the arme-pit: and certainly it is the moſt uſuall and frequent; wherefore we intend to handle it in the firſt place. When the ſhoulder is diſlocated down-wards into the Arme-pit, a depreſſed cavitie may bee perceived in the upper part of the joynt; the *acromion* of the Blade ſhewes more ſharpe and ſtanding forth than ordinarie, for that the head of the ſhoulder-bone is ſlipt downe, and hid under the arme-pit, cauſing a ſwelling forth in that place; the Elbow alſo caſts it ſelfe (as it were) outwards, and ſtands further off from the ribs; and though you force it, yet can you not make it to touch them; the Patient cannot lift up his hand to his eare on that ſide, neyther to his mouth, nor ſhoulder. Which ſigne is not peculiar to the luxated ſhoulder, but common to it, affected with a contuſion, fracture, inflammation, wound, abſceſſe, *ſcirrhus*, or any defluxion upon the nerves, ariſing out of the *vertebræ* of the neck, and ſent into the arme: alſo this arme is longer than the other. Laſtly (which alſo is common to each difference of a luxated ſhoulder) the Patient can move his arme by no kinde of motion without ſenſe of paine, by reaſon of the extended and preſſed muſcles, ſome alſo of their fibres being broken. There are ſixe wayes to reſtore the ſhoulder luxated down-wards into the arme-pit. The firſt is, when it is performed with ones fiſt, or a towell. The ſecond, with a clew of yarne, which put under the arme-pit, ſhall be thruſt up with ones heele. The third, with ones ſhoulder put under the Arme-hole, which maner, together with the firſt, is moſt fit for new and eaſily to be reſtored luxations, as in thoſe who have looſe fleſh, and effeminate perſons, as children, eunuches, and women. The fourth, with a ball put under the Arme-pit, and then the Arme caſt over a piece of wood held upon two mens ſhoulders, or two ſtanding poſts. The fifth, with a Ladder. The ſixth, with an Inſtrument, called an *Ambi*. Wee will deſcribe theſe ſixe waies, and preſent them to your view.

Chap. XXII.

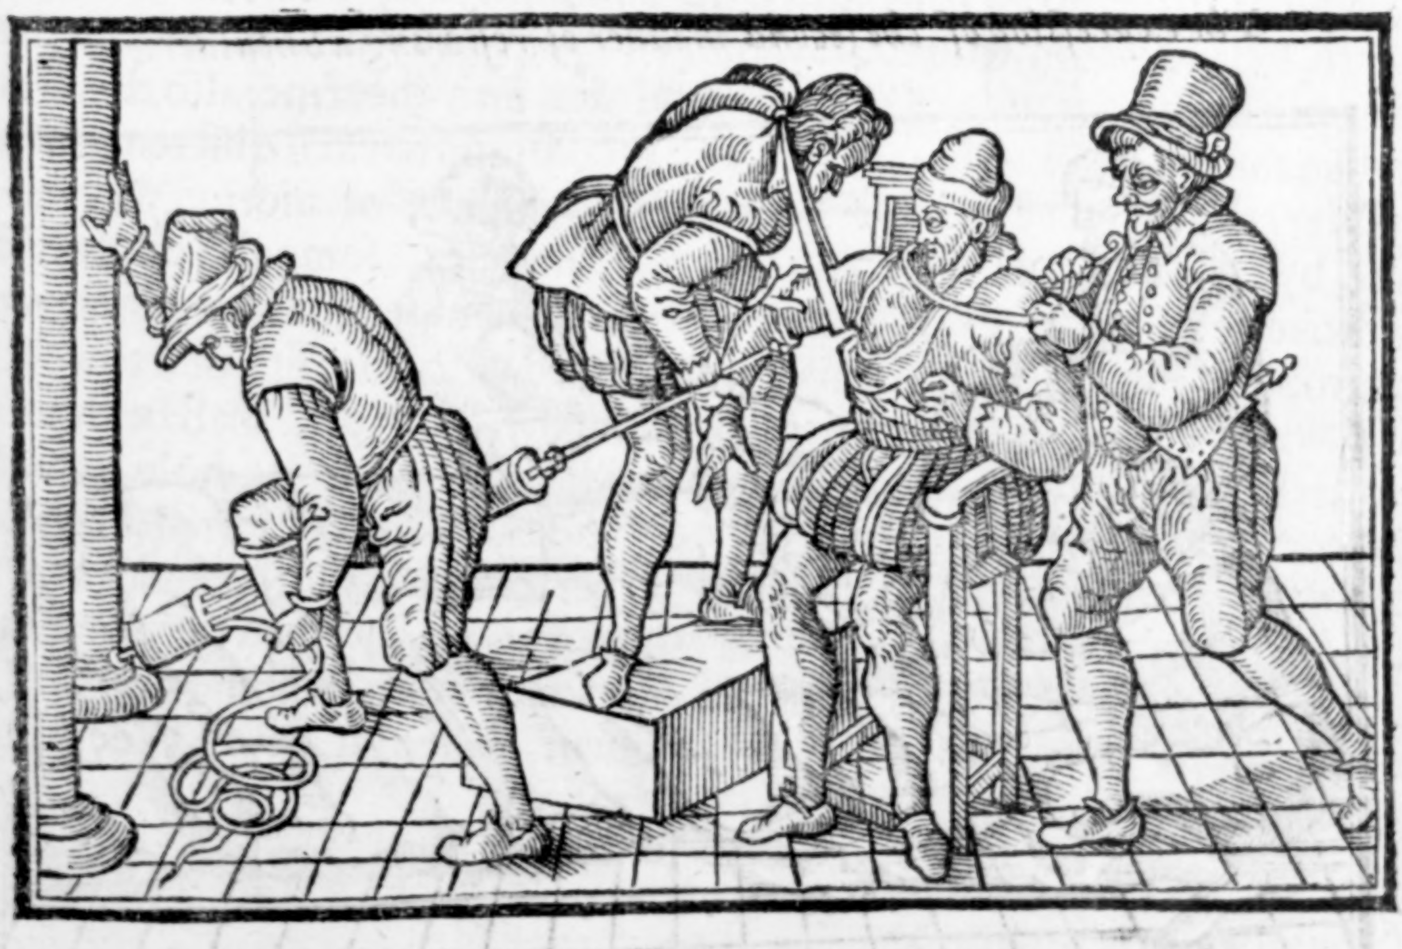
Of the firſt manner of ſetting a Shoulder, which is with ones fiſt.

FIrſt, let one of ſufficient ſtrength, placed on the oppoſite ſide, firmly hold the Patient upon the joynt of the Shoulder, leſt he move up and downe with his whole bodie, at the neceſſarie extenſion, working and putting it in: then let another, taking hold of his arme above the elbow, ſo draw and extend it downe-wards, that the head thereof may be ſet juſt againſt its cavitie, hollowed in the blade-bone. Then at laſt let the Surgeon lift and force up with his fiſt the head of the bone into its cavitie. Here this is chiefly to be obſerved, that in freſh luxations, eſpecially in a bodie ſoft, effeminate, moiſt, and not over corpulent, that it ſometimes comes to paſſe, that by the only meanes of juſt extenſion, the head of the bone, freed from the muſcles and other particles wherewith it was, as it were, intangled, will betake it ſelfe into its proper cavitie; the muſcles being by this meanes reſtored to their place and figure, and drawing the bone with them, as they draw themſelves towards their heads, as it were with a ſudden gird or twitch: wherefore in many, whileſt we thought no ſuch thing, it ſufficed for reſtitution only to have extended the arme. But if the Luxation bee inveterate, and the hand cannot ſerve, then muſt the Patients ſhoulder be faſtned to a Poſte with the forementioned Ligature, or elſe committed to ones charge, who may ſtand at his backe, and hold him faſt. Then the arme ſhall preſently be tyed about, a little above the elbow, with a fillet, whereto a cord ſhall be faſtened; which, being put or faſtened to the Pulley, ſhall be drawne or ſtretched forth, as much as need ſhall require. Laſtly the Surgeon, with a towell, or ſuch like Ligature, faſtened about his necke, and hanging down, and ſo put under the Patients arme-pit neare to the Luxation, ſhall, raiſing himſelfe upon his feete with the whole ſtrength of his necke, lift up the ſhoulder, and alſo at the ſame time bringing his arme to the Patients breaſt, ſhall ſet the head of the ſhoulder-bone, forced with both his hands into its cavitie, as you may ſee by this enſuing figure.

Gal. com. ad ſen. 23. ſect. 1. de art.

A perfect ſetting the luxated ſhoulder by extenſion only.

An expreſſion of the firſt manner of putting a Shoulder into Joynt.



Then muſt you cover all the adjacent parts with a medicine made *ex farina volatili, bolo armenio, myrtillis, pice, reſina & alumine,* beaten into powder, and mixed with the white of an egge. Then muſt the hollowneſſe under the arm be filled with a clew of Woollen or Cotton yarne, or a linnen cloth ſpred over with a little oyle of Roſes or Myrtles, a little vinegar, and *unguentum roſatum,* or *infrigidans Galeni,* leſt it ſticke to the haires, if there be any there. The part muſt afterwards be bound up with a ligature, conſiſting of two heads, of ſome five fingers breadth, and two ells long, more or leſſe, according as the bodie ſhall require. The midſt thereof ſhall be put immediately under the arme-pit, and then croſſed over the lame ſhoulder, and ſo croſſing it as much as ſhalbe fit, it ſhall be wrapped under the oppoſite arme. And laſtly, the arme ſhall be layd upon the breaſt, and put in a ſcarfe, in a middle figure almoſt to right angles, ſo that by lifting up the hand hee may almoſt touch his ſound ſhoulder, leſt the bone, newly ſet, may fall out againe; neyther ſhall the firſt dreſſing be ſtirred, untill foure or five daies be paſt, unleſſe the greatneſſe of ſome happening ſymptome divert us from this our purpoſe.

Chap. XXIII.

Of the ſecond manner of reſtoring a Shoulder, that is, with the heele; when as the Patient by reaſon of paine can neither ſit, nor ſtand.

Hipp. ſent. 12. ſect. 1. de art.

THe Patient muſt be layd with his backe on the ground upon a Cover-lid, or Mat, and a clew of yarne or leathern-ball, ſtuffed with tow or cotton, of ſuch bigneſſe as may ſerve to fill up the cavitie, muſt be put under his arm-pit, that ſo the bone may ſtraight-wayes the more eaſily be forced by the heele into its cavitie. Then let the Surgeon ſit beſide him, even over againſt the luxated ſhoulder; and if his right ſhoulder be luxated, he ſhall put his right heele to the ball, which filled up the arme-pit; but if the left, then the left heele: then let him forthwith draw towards him the Patients arme, taking hold thereof with both his hands, and at the ſame inſtant of time ſtrongly preſſe the arme-pit with his heele. Whilſt this is in doing, one ſhall ſtand at the Patients backe, who ſhall lift up his ſhoulder with a towell, or ſome ſuch thing fitted for that purpoſe, and alſo with his heele preſſe downe the top of the ſhoulder-blade: another alſo ſhall ſit on the other ſide of the Patient, who, holding him, ſhall hinder him from ſtirring this way or that way, at the neceſſary extenſion in ſetting it, as you may ſee it expreſt by the following figure.

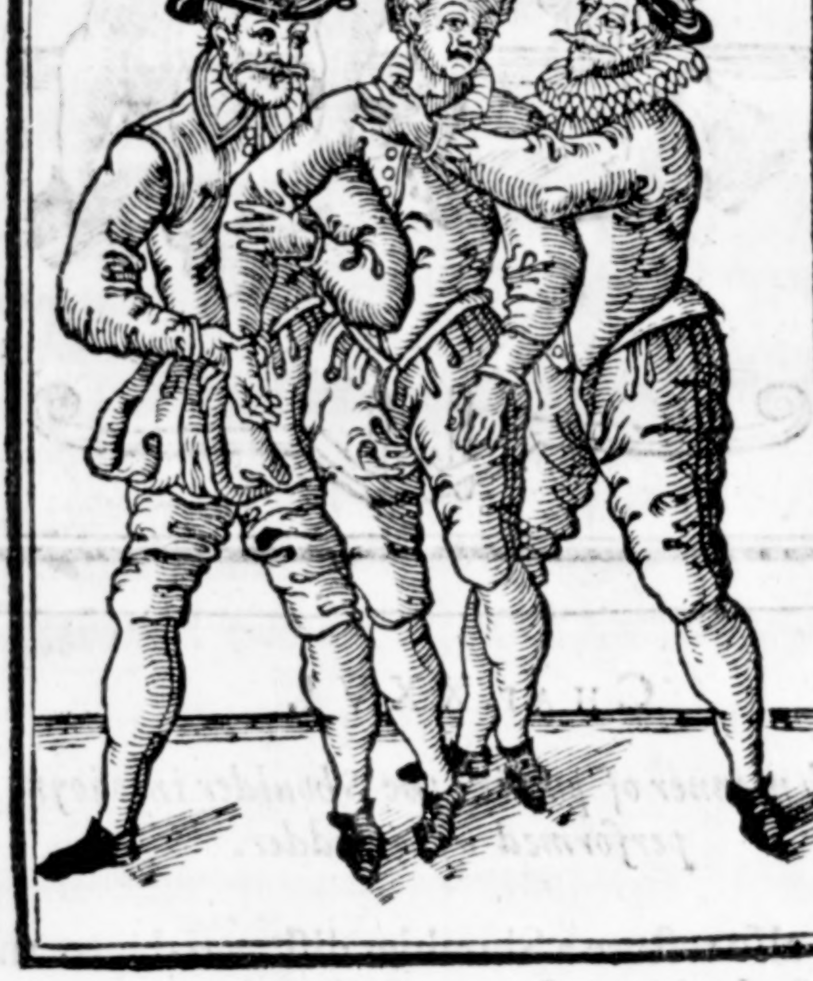
CHAP. XXIV.

Of the third manner of reſtoring a Shoulder.

Some one who is of a competent height and ſtrength ſhall put the ſharpe part of the toppe of his ſhoulder under the Patients arme-pit, and alſo at the ſame time ſhall ſomewhat violently draw his arme towards his owne breaſt, ſo that the Patients whole bodie may (as it were) hang thereby. In the meane time another, for the greater impreſſion, ſhall lay his weight on the luxated ſhoulder, ſhaking it with his whole bodie. Thus the ſhoulder, drawne downe-wards by the one which ſtands under the arme-hole, and moved and ſhaken by the other, who hangs upon it, may bee reſtored into its ſeat, by the helpe of the Surgeon concurring therewith, and with his hand governing theſe violent motions, as the following figure ſhews.

The figure of the third manner of putting a Shoulder into Joynt.

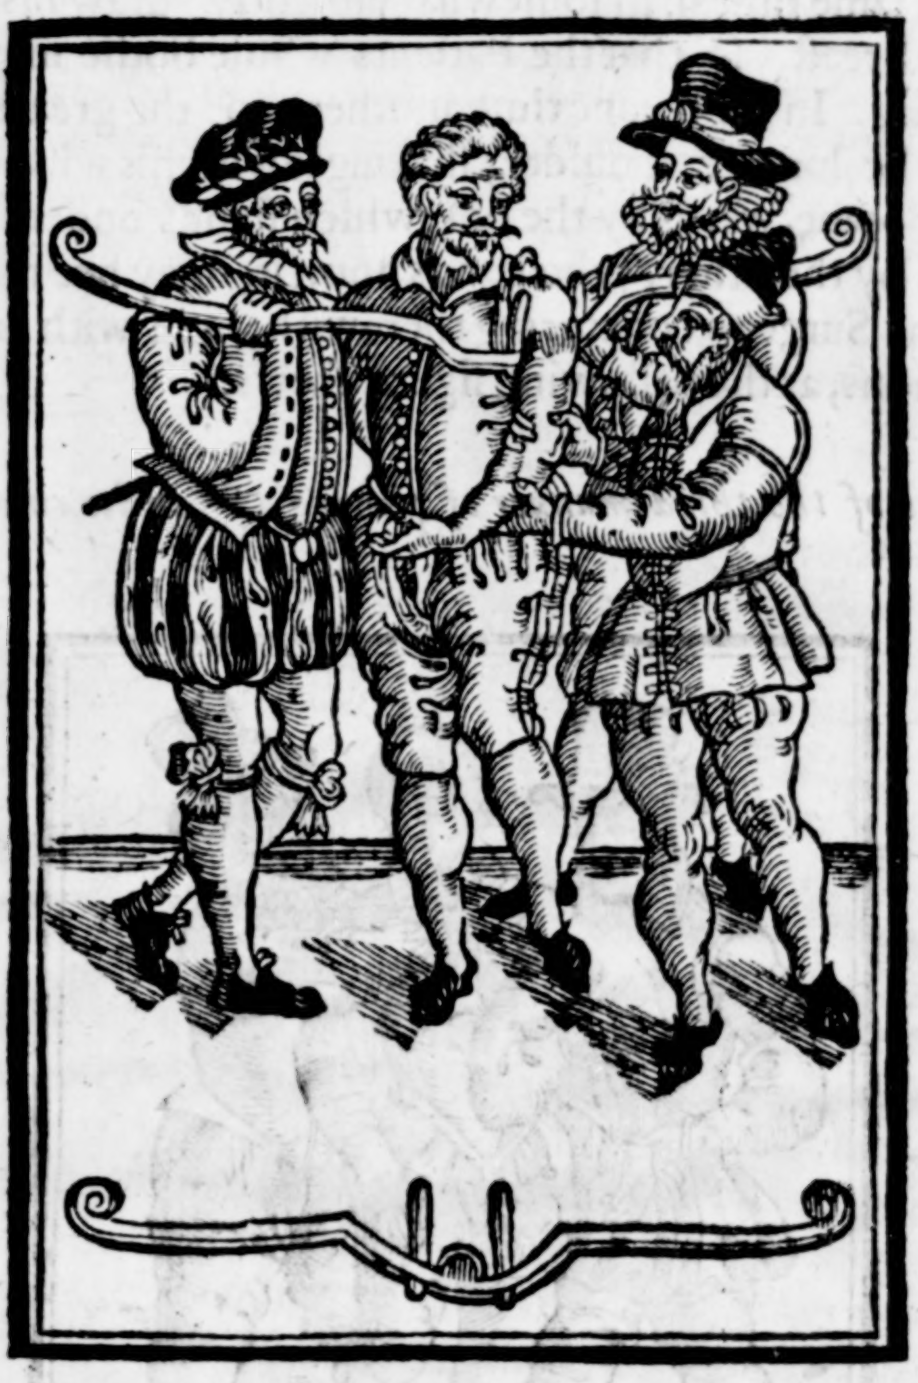


CHAP. XXV.

Of the fourth manner of reſtoring a diſlocated Shoulder.

You muſt take a perch, or piece of Wood (ſomewhat reſembling that which the Water-bearers of Paris uſe to put on their ſhoulders) ſome two inches broad, and ſome ſixe foote long; in the midſt hereof let there bee faſtened a clew of yarne, or ball of ſufficient bigneſſe to fill up the cavitie of the arme-hole. Let there be two pins put in, one on each ſide of the ball, each alike diſtant there-from, with which, as with ſtayes, the ſhoulder may be kept in, and upon the ball, that it ſlip not away from it. Let two ſtrong men, taller than the Patient, eyther by nature or art, put this perch upon their ſhoulders; then let the Patient put his arme-pit upon that place where the ball ſtands up; the Surgeon muſt be ready to pull his hanging arme downe-wards. Thus the Patient ſhall (as it were) hang on the perch with his ſhoulder, and ſo the head of the bone ſhall bee forced into its cavitie, as this enſuing Figure declares; wherein you may ſee the perch or yoake, with the two woodden pins and ball faſtened in the midſt, delineated by its ſelfe.

The figure of the fourth manner of reſtoring the Shoulder.



Chap. XXVI.

Of the fifth manner of putting the Shoulder into joynt, which is performed by a Ladder.

YOu may alſo reſtore a Shoulder diſlocated into the Arme-pit, by the helpe of a Ladder, after the following manner. Let ſome round body, as a ball, or clew of yarne, which (as we formerly ſaid) may ſerve to fill the Arme-pit, be faſtened upon one of the upper ſteps of a Ladder; at the foot of the Ladder ſet a low ſtoole, whereupon let the Patient mount; then binde both his legges, and alſo his ſound arme behind his back, leſt, when you are about your operation, he hinder and ſpoyle all you doe, by laying his hand, or ſetting his foote upon the Ladder. Then let his Arme be preſently put over the ſtep of the Ladder, and his Arme-pit put upon the there faſtened bal, the Patient in the meane while being wiſhed to come with his whole body as neare unto the ſteps of the Ladder as he is able; for otherwiſe, beſides that there is no other hope of reſtoring the Luxation, there would bee no ſmall danger of breaking the ſhoulder-bone. Alſo let him take heede, that he put not his head betweene the ſteps. Then his Arme, bound above the Elbow with filletting, or ſome other ligature fit for that purpoſe, ſhall be drawne downe by the hand of ſome that aſſiſt you, and at the ſame time let the ſtoole be plucked from under his feet, ſo that hee may hang upon the Ladder. Thus by this meanes the head of the Shoulder will bee reſtored by its ſelfe, the endeavour of the Surgeon aſſiſting, and preſſing downe the

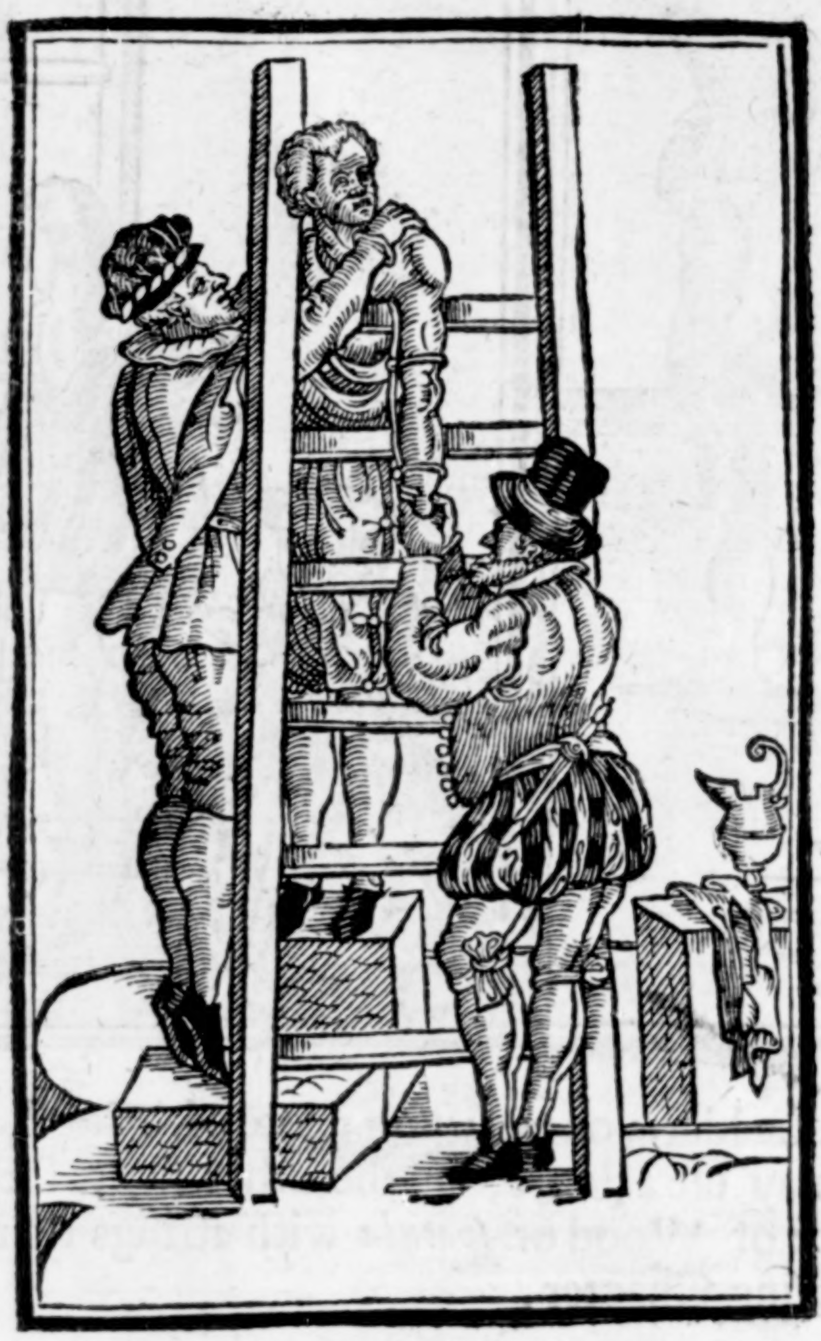
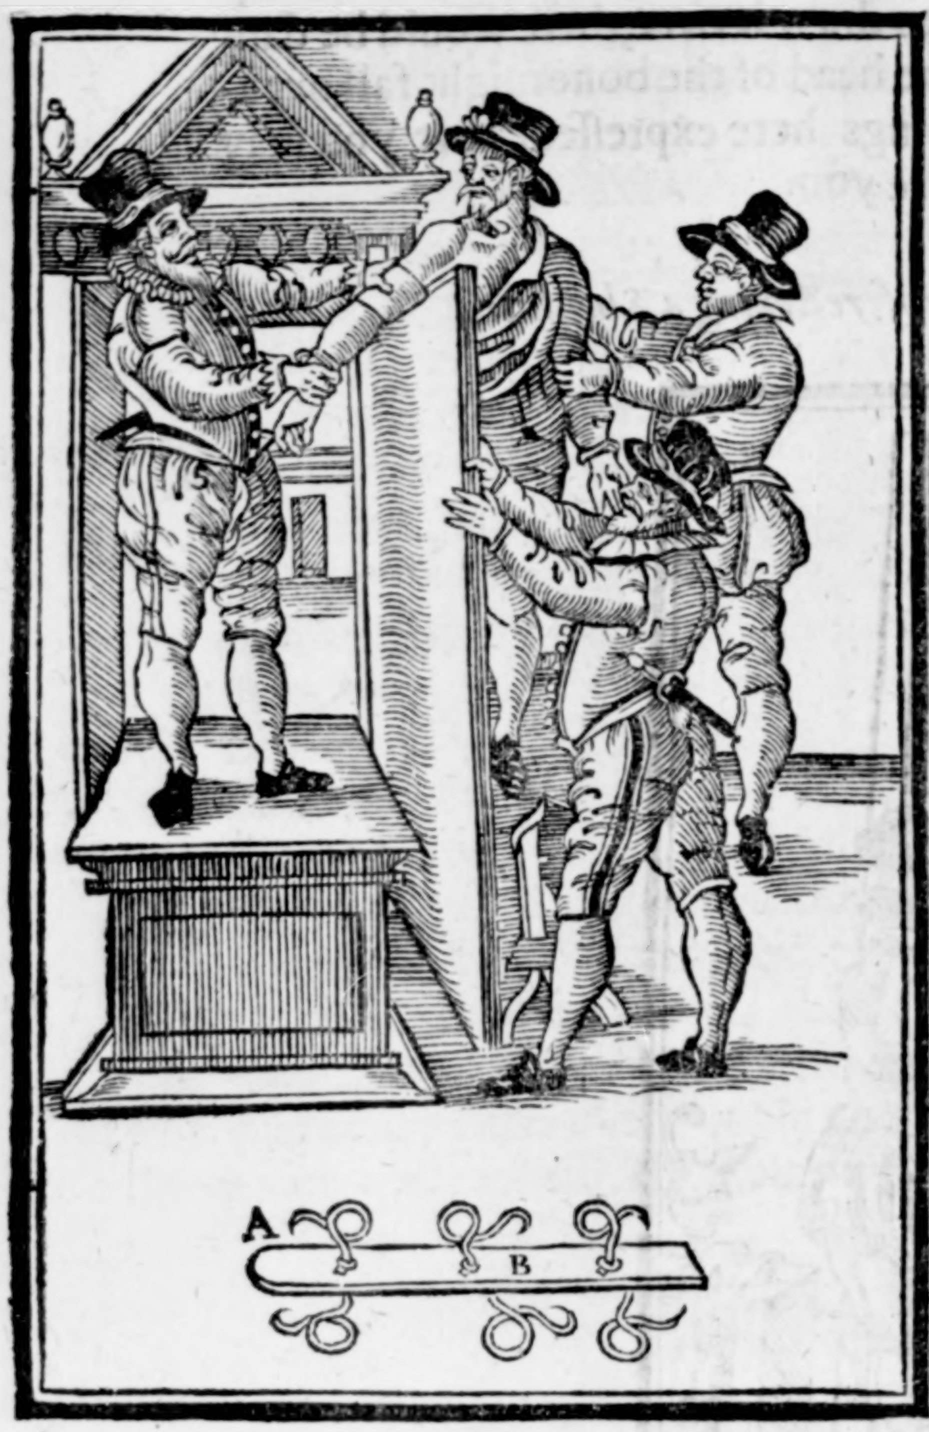
ſhoulder-blade, and moving it to and againe. The bone being ſet, the ſtoole, which a little before was plucked from under the Patients feet, ſhall be put there againe, that he may, with the more eaſe and leſſe paine, pull backe his Arme from the ſtep of the Ladder. For if he ſhould lift it high up to draw it over, there would be danger, leſt being newly ſet, and not well ſtayed, the head of the bone might fall out againe. I have thought good to have all theſe things here expreſſed, that you may learne this operation, as if you ſee it done before you.

The delineation of the fifth manner of reſtoring a Shoulder.

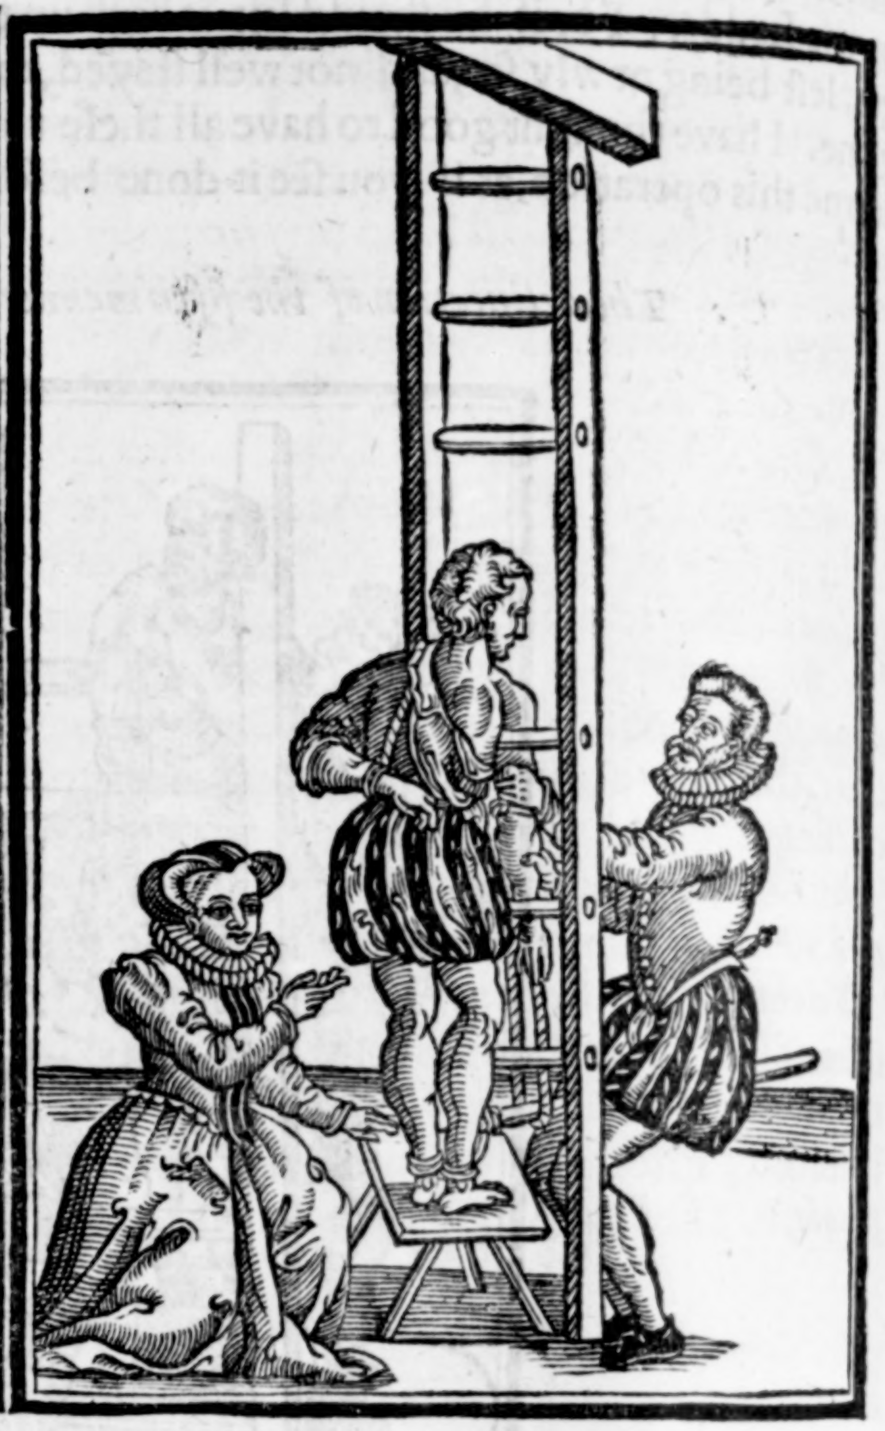


I have not thought fit in this place to omit the induſtrie of Nicholas Picart, the Duke of Guiſe his Surgeon; who being called to a certaine Countrey-man to ſet his Shoulder being out of joynt, and finding none in the place beſides the Patient and his wife, who might aſſiſt him in this worke, hee put the Patient, bound after the forementioned manner, to a Ladder; then immediately hee tyed a ſtaffe at the lower end of the Ligature, which was faſtened about the Patients arme above his Elbow; then put it ſo tyed under one of the ſteps of the Ladder, as low as he could, and got aſtride thereupon, and ſate thereon with his whole weight, and at the ſame inſtant made his wife to plucke the ſtoole from under his feet: which being done, the bone preſently came into its place, as you may ſee by the following figure.

Another figure expreſsing the fourth manner of reſtoring a diſlocated Shoulder.



Another figure to the ſame purpoſe.



If you have never a Ladder, you may uſe a peece of Wood, layd a-croſſe upon two Poſts. Alſo you may uſe a doore, as the other figure ſhewes, wherein you muſt obſerve a flat piece of Wood or *ſpatula* with ſtrings thereat, whoſe uſe ſhal be ſhowne in the following Chapter.

Chap. XXVII.

The ſixth manner of reſtoring a Shoulder, luxated into the Arme-pit.

Sect.1. lib.1. de artic. ſent.19.

The deſcription of the *Gloſſocomium* termed *Ambi.*

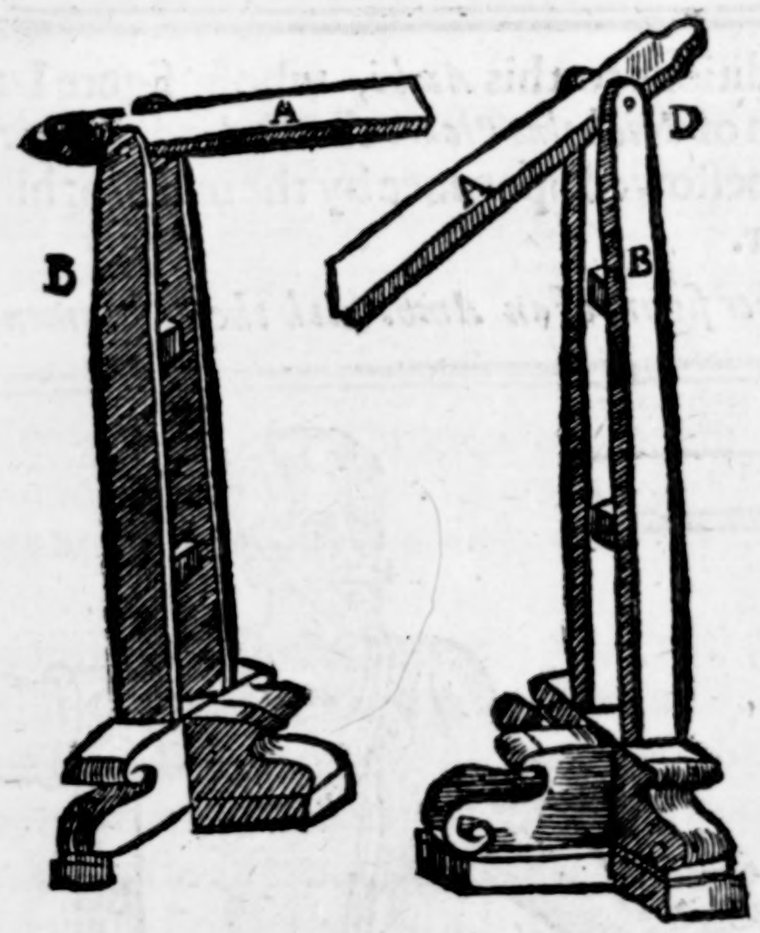
HIppocrates writes, that this is the beſt way of all to reſtore a diſlocated Shoulder. You muſt take a woodden *ſpatula* of ſome foure or five fingers breadth, and ſome two fingers thickneſſe or leſſe, but ſome yard or thereupon long; the one end thereof muſt bee narrow and thin, with a round head ſtanding up and lightly hollowed, that put under the Arme-pit, it may receive part of the head of the ſhoulder-bone, the which for that purpoſe muſt not bend towards the ribs, but to the top of the Shoulder. This upper part of the *ſpatula* muſt bee wrapped about with a linnen or woollen ragge, or ſome ſuch ſoft thing, that it may be the ſofter, and hurt the leſſe; and then it muſt be ſo thruſt under the Arme-pit, that it may throughly penetrate into the inner part betweene the ribs, and the head of the Shoulder-bone. There muſt, beſides in this *ſpatula*, be two holes in three ſeverall places, each alike diſtant from other, through which let ſoft ſtrings be put, whereby it may be tyed to the arme, ſtretched all the length thereof even to the fingers, in one place a little below the head of the ſhoulder-bone, in another a little above the elbow, and the third at the wreſt, that ſo they may hold it firme. Therefore let the diſtances of the holes bee fitted to this purpoſe; but principally you muſt have a care of this, that the upper part of the *ſpatula* reaching beyond the head of the arme, enter even to the innermoſt Cavity of the arme-pit; then, a croſſe pin or piece of wood muſt be made faſt through two poſtes or a frame, & well faſtened thereto, and therupon the Arme with the *ſpatula* muſt be ſo put over, that the pin may be under the arme-pit, the body weighing one way, and the arme another: which being done, the arme muſt be drawn down one way, and the body another about the pin. Now this croſſe pin muſt bee put on ſuch a height that the patient may ſtand on tipp-toes. Now this is the very beſt way of reſtoring a ſhoulder. In ſtead of two poſts or a frame, you may make ſhift with a ladder, doore, beds poſtes, and ſuch like things as ſhall bee there preſent. I have heard *Henry Arvet*, a very good ſurgeon of *Orleans* ſay, that he never attempted this manner of putting into joint a ſhoulder diſlocated into the arme-pit without good ſucceſſe, unleſſe by chance (which alſo is noted by *Hippocrates*) that the fleſh is growne into the cavity, and the head of the bone hath made it ſelfe another cavity in the place whereinto it is fallen; for in this caſe the bone will either not bee reſtored, or elſe not remaine in its place, but fall backe notwithſtanding into the new hollowed cavity, which ſerves it in ſtead of its naturall ſocket or cavity. But I muſt here admoniſh young Surgeons, that if the bone be not reſtored at the firſt endeavour and onſet, that they doe not deſpaire and preſently deſiſt from their entended operation, but they muſt winde about, and gently move the joint: for ſo at the length it will bee more eaſily moved, and enter into the naturall cavity. When it is in, it muſt bee bound up with compreſſes and rowlers after the forementioned manner.

Sect.1. de art. ſent. 21.

To the former figures I have thought good to adde this, which expreſſeth the maner of reſtoring a ſhoulder luxated into the arme-pit with a *ſpatula*, after the manner of *Hippocrates*. This *ſpatula* faſtened with an iron pin to the ſtanding frame may be turned, lifted up, and preſſed downe at your pleaſure. A. ſhewes the wooden *ſpatula*. B. The frame or ſtanding poſtes.

Hip. ſent. 6
4 de artic.

Hippocrates his Gloſſocomium termed Ambi.

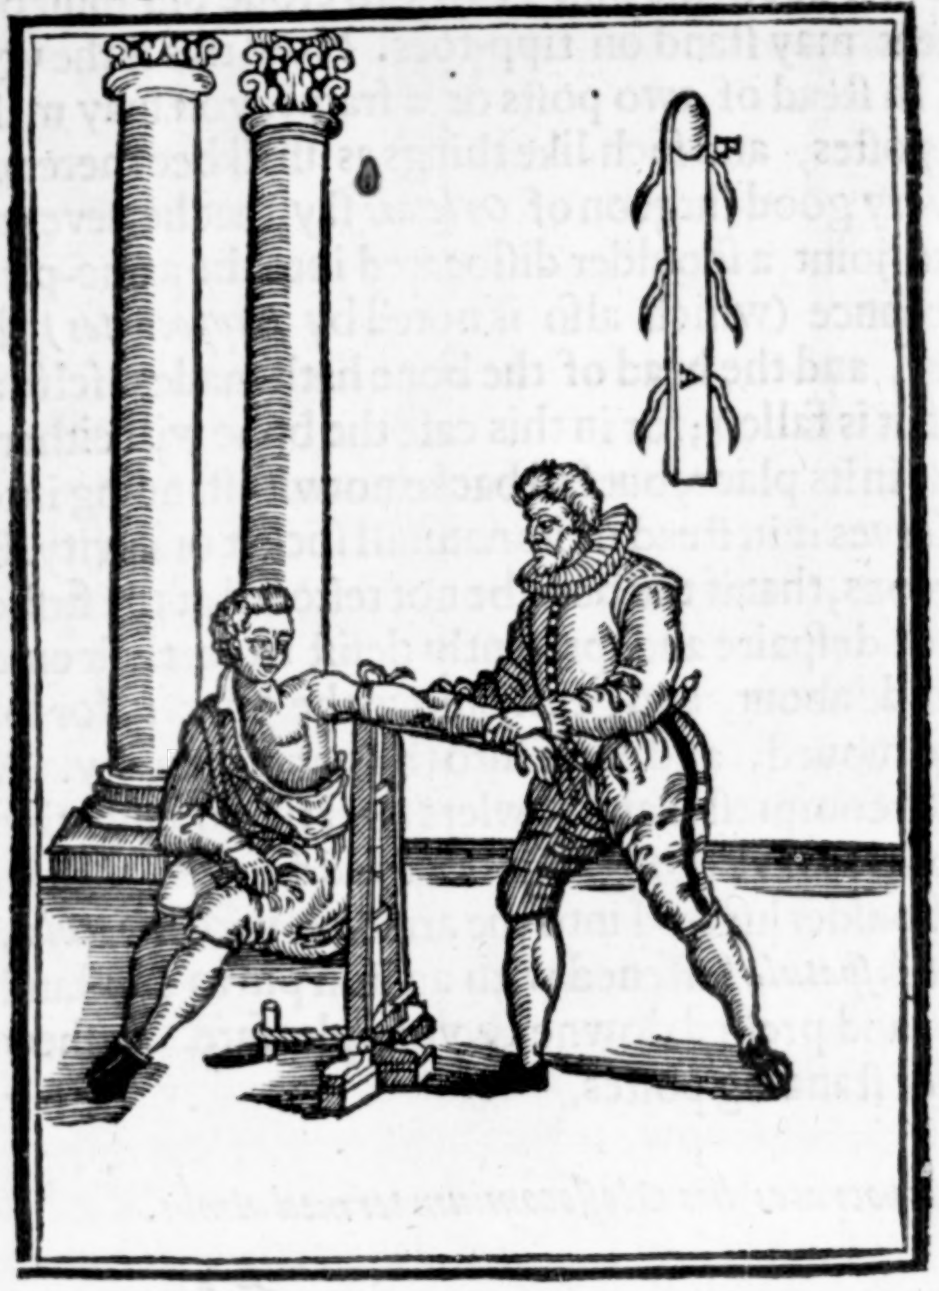


For the more certaine uſe of this inſtrument the patient muſt ſit upon a ſeate which muſt be ſomewhat lower than the ſtanding frame, that ſo the *ſpatula* which is thruſt into the arme-pit may be the more forcibly depreſt, ſo to force in the head of the ſhoulder-bone; the patients feete muſt alſo be tyed, that hee may not raiſe himſelfe up whileſt the Surgeon endevours to reſtore it. Now he ſhall then endevour to reſtore it, when he ſhall have bound the ſtretched forth arme of the diſlocated ſhoulder unto the *ſpatula*, & thruſt the one end therof under the ſlipped forth head of the ſhoulder bone, as wee have formerly ſhewed; for then by preſſing downe the other end of the *ſpatula* which goes to the hand, the bone is forced into its cavity. You muſt diligently obſerve the wooden *ſpatula*, which therefore I have cauſed to be expreſ-

How to make uſe of the *Ambi*.

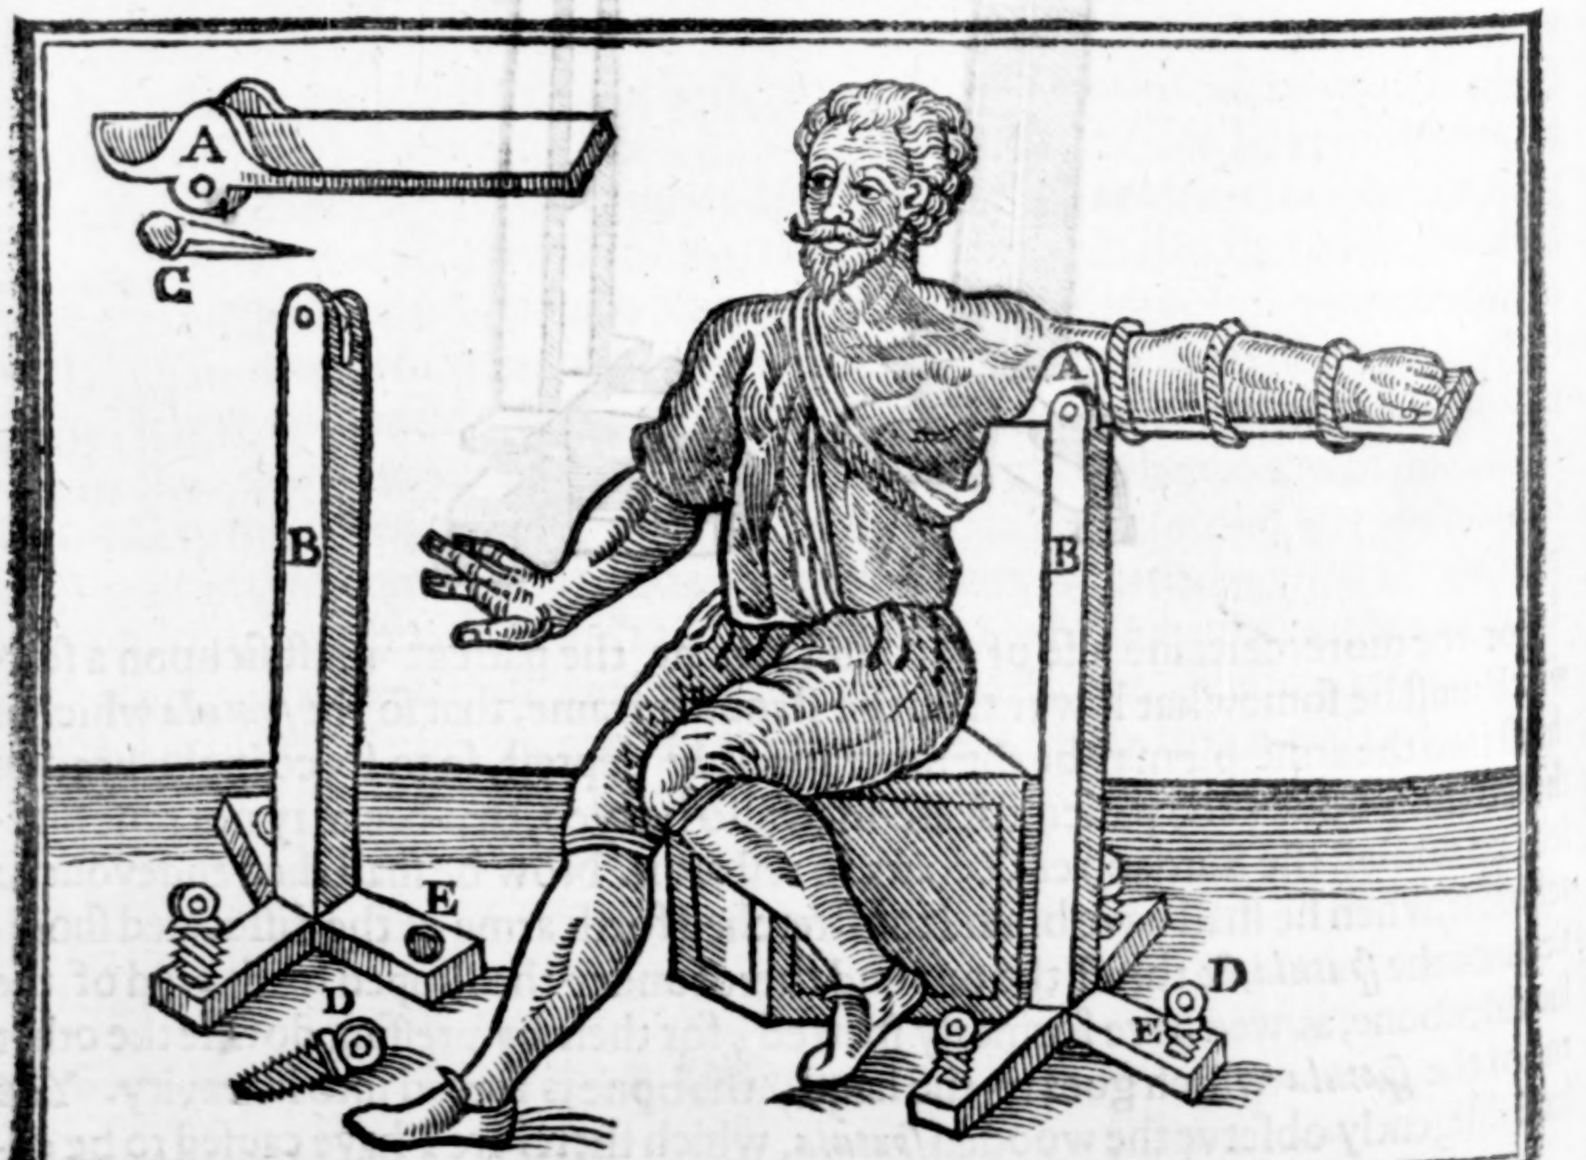
preſſed by it ſelfe, which *Hippocrates* calleth *Ambi*, whoſe head is a little hollowed where it is noted with this letter B. The whole *ſpatula* is marked with this letter A. with three ſtrings hanging thereat, provided for the binding of the arme, that it may be kept ſteddy, as you may perceive by the enſuing figure.

The figure of an Ambi fitted to a diſlocated ſhoulder.



There are other additions to this *Ambi*, whoſe figure I now exhibited to your view, by the invention of *Nicholas Picart* the Duke of *Lorrain's* Surgion, the uſe and knowledge whereof, beſtowed upon mee by the inventor himſelfe, I would not envie the ſtudious reader.

Another figure of an Ambi with the additaments.



AA. Shew the two eares, as it were, ſtops made to hold and keep in the top of the ſhoulder, leſt it ſhould ſlippe out when it is put into the frame or ſupporter.
BB. The frame or ſupporter whereon the *Ambi* reſts.
CC. The pin or axeltree which faſtens the *Ambi* to the ſupporter.
DD. Screw-pinnes to faſten the foote of the ſupporter that it ſtirre not in the operation.
EE. The holes in the foote of the ſupporter, whereby you may faſten the ſcrew-pins to the floore.

CHAP. XXVIII.

How to reſtore a ſhoulder diſlocated forewards.

IT is ſeldome that the ſhoulder is luxated towards the foreſide; yet there is nothing ſo ſtable and firme in our bodies which may not be violated by a violent aſſault; ſo that thoſe bones doe alſo fall out of joint, whoſe articulations are ſtrengthened for the firmer connexion with fleſhly, nervous, griſtly and bony ſtayes or barres. This you may perceive by this kinde of diſlocated ſhoulder, ſtrengthened as it were with a ſtrong wall on every hand; to wit, the *Acromium* and the end of the collar bone, ſeeming to hinder it, as alſo the great and ſtrong muſcles, *Epomis* and *Biceps*. *Hippocrates*, ſhut up within the ſtrait bounds of the leſſer *Aſia*, never ſaw this kinde of diſlocation, which was obſerved five times by *Galen*. I profeſſe I have ſeene it but once, and that was in a certaine Nun, which weary of the Nunnery, caſt her ſelfe downe out of a window, and bore the fall and weight of her body upon her elbow, ſo that her ſhoulder was diſlocated forewards. *Com. ad ſen. 2 & 23. ſect. 1 de articulis.*

This kinde of diſlocation is knowne by the depravation of the conformation or figure of the member, by the head of the ſhoulder wreſted out towards the breaſt, as alſo the patient cannot bend his elbow. Signes. It is reſtored by the ſame meanes as other luxations of other parts, to wit, by ſtrait holding, extending, and forcing in. Cure. Therefore the patient muſt bee placed upon the ground with his face upwards, and then you muſt extend the ſhoulder otherwiſe than you doe when it is luxated into the arme-pit. For when it falleth into the arme-hole, it is firſt drawne forewards, then forced upwards, untill it bee brought juſt againſt the cavity whereinto it muſt enter. But in this kinde of luxation, becauſe the toppe of the ſhoulder is in the fore parts of the dearticulation ſhut up with muſcles, opened both to the outer, as alſo to the inner part, you muſt worke to the contrary; to wit, to the hinde part. But firſt of all you muſt place a ſervant at the backe of the patient, who may draw backe a ſtronge and broade Bandage caſt about the arme-pit (ſuch as is the *Carcheſius*, which conſiſts of two contrary and continued ſtrings) leſt that when the arme ſhall be extended, the ſhoulder follow: alſo you muſt put a clew of yarne to fill up the armepit. *Sent. 23. ſect. 1. de art.* Then muſt you extend the arme, caſting another ligature a little above the elbow, and in the interim have a care that the head thereof fall not into the arme-pit, which may be done both by putting the forementioned clew under the arme, and drawing the head another way; then muſt you permit, by ſlacking your extenſion, the joint freed from the encompaſſing muſcles, to be drawne and forced into its cavity, by the muſcles forcible recoiling, as with an unanimous conſent, into themſelves and their originals, for thus it will eaſily bee reſtored, and ſuch extenſion onely is ſufficient thereto.

CHAP. XXIX.

Of the ſhoulder luxated outwardly.

Signes.

The cure.

What to bee done to hold in the ſhoulder after it is reſtored.

THe diſlocation alſo of the ſhoulder to the outward parts ſeldom happens; but yet, if it may at any time happen, the extenſion of the arme will bee very difficult, but yet more difficult towards the outward part than towards the inward; there is a depreſſed cavity perceived towards the cheſt; but externally a bunching forth, to wit, in that part from whence the head of the ſhoulder-bone is fled. For the reſtoring hereof, the patient muſt bee laid flat on his belly, and the elbow muſt be forcibly drawne contrary to that whereto it is fled, to wit, inwardly to the breſt; and alſo the ſtanding forth head of the arme-bone, muſt bee forced into its cavity, for thus it ſhall bee eaſily reſtored. But into what part ſoever the ſhoulder-bone is diſlocated, the arme muſt be extended and drawne directly downewards. After the reſtitution fitting medicines ſhall be put about the joint. Let there bee ſomewhat put into the arme-pit which may fill it up, and let compreſſes or boulſters bee applyed to that part to which the luxated bone fell; then all theſe things ſhall be ſtrengthened and held faſt with a ſtrong and broad two headed ligature put under the armepit, and ſo brought acroſſe upon the joint of the ſhoulder, and thence carried unto the oppoſite arme-pit by ſo many windings as ſhall be judged requiſite. Then the arme muſt be put and carried in a ſcarfe to right angles, which figure muſt be obſerved not onely in every luxation of the ſhoulder, but in each fracture of the arme alſo, for that it is leſſe painefull, and conſequently, ſuch as the arme may ſtand the longeſt therein without moving.

CHAP. XXX.

Of the ſhoulder diſlocated upwards.

Signes.

Cure.

THe head of the ſhoulder alſo may ſometimes bee luxated into the upper part. Which when it happens, it ſhewes it ſelfe by bunching forth at the end of the Collar bone, the hollownes of the arme-pit is found larger than uſuall, the elbow flyes further from the ribs than when it fell downewards, now the arme is wholly unable to performe the uſuall actions. It is fit for the reſtitution of ſuch a luxation, that the Surgeon ſtoope downe, and put his ſhoulder under the patients arme, and then ſtand up as high as he can upon his feete, and therewithall preſſe downe the head of the ſhoulder-bone into the cavity, or elſe make ſome other to doe it. Otherwiſe it is fit to lay the Patient upon his backe on the ground, and whileſt ſome one extends the affected arme by drawing it downewards, the Surgeon with his owne hand may force downe the head of the bone into its cavity. The operation performed, the ſame things ſhall bee done as in other luxations, compreſſes being applyed to that part whereto the bone flew, and it being alſo bound up with ligatures. Now you may underſtand in theſe foure forementioned kindes of diſlocations, that the bone which was luxated is reſtored, by the ſound which ſhall bee heard as you force it in, by the reſtitution of the accuſtomed actions, which are perceived by the bending, extending, and lifting it up, by the mitigation of the paine, and laſtly by the collation and comparing of the affected arme with the ſound, and by its ſimilitude and equality therewith.

CHAP.

Chap. XXXI.

Of the diſlocation of the Elbow.

THe Elbow may alſo be foure manner of wayes diſlocated, to wit, inwardly, outwardly, upwards and downewards. By the part which is inwards, I meane that which lookes towards the center of the body, when as the arme is placed in a naturall ſite, to wit, in a middle figure betweene prone and ſupine; I make the outward part, that which is contrary thereto. By the upper part I meane that which is towards the heaven, and by the lower that which is next to the earth: and by how much the joint of the elbow conſiſts of more heads and cavities, than that of the ſhoulder, by ſo much when it is luxated it is the more difficultly ſet, and it is alſo more ſubject to inflammation, and to grow hard thereupon, as *Hippocrates* ſaith. Now the joint of the elbow is more difficultly diſlocated than that of the ſhoulder, and more hardly ſet, for that the bones of the cubit and arme doe receive and enter each other by that manner of articulation which is termed *Ginglymus*, as wee have formerly more at large treated in our Anatomy, and a little before in our treatiſe of fractures. The Elbow is therefore diſlocated, for that the proceſſes thereof are not turned about the ſhoulder-bone in a full orbe, and by an abſolute turning. Wherefore if at any time the cubit be bended more ſtraitly and cloſely than that the inner proceſſe can retaine its place and ſtation in the bottom of its *ſinus*, the hinde proceſſe falleth out and is diſlocated backwards. But when as the foreproceſſe is extended more violently, and forced againſt the bottom of its cavity, it flyes and departs out of its place as beaten or forced thence, and this kinde of luxation is farre more difficultly reſtored than the former: adde hereunto that the utter extremitie of the cubite, which is called *Olecranum*, is the higher, but the other inner is the lower; whence it is that every one can better and more eaſily bend than extend their cubits. Therfore ſuch a diſlocation is cauſed by a more violent force, than that which is made to the inner ſide. The ſigne of this luxation is, the arme remaines extended, neither can it be bended, for the inner proceſſe ſtayes in the externall cavity, which is hollowed in the bottom of the ſhoulder-bone, which formerly was poſſeſſed by the inner part of the *Olecranum*; which thing makes the reſtitution difficult, for that this proceſſe is kept, as it were, impriſoned there. But when it falleth out diſlocated to the fore part, the arme is crooked, neither is it extended, and it is alſo ſhorter than the other. But if the elbow bee fallen out of its place according to the other manner of diſlocations, to wit, upwards or downewards, the naturall figure thereof is perverted, for the arme is ſtretched forth, but little notwithſtanding bended towards that part from whence the bone went, that is, figured after a middle manner betweene bending and extending thereof. What kinde ſoever of diſlocation ſhall befall it, the action of the Elbow will either not bee at all, or certainely not well untill that it be reſtored to its former place; there is a ſwelling in the part wherinto iu it flowne, and a cavity there from whence it is fled, which alſo happens in the diſlocations of all other parts. Furthermore, one diſlocation of the Elbow is compleat and perfect, another imperfect. The latter as it eaſily happens, and through a ſmall occaſion, ſo it is eaſily reſtored; but on the contrary a perfect, as it hardly happens, and not unleſſe with great violence, ſo it is not ſo eaſily reſtored againe, eſpecially if that you doe not prevent inflammation, for being inflamed it makes the reſtitution either difficult, or wholly impoſſible, principally that which falleth outwards.

The Author ſeems not to agree with *Hipp. Sent. ult. Sect.* 3. *fract.* and *Celſus* in the ſetting down the kinds of a diſlocated Elbow.

The Author doth not agree with *Hippocrates* and *Celſus*, in ſetting downe the notes of theſe diſlocations: for thoſe notes which are here attributed to an outward and inward luxation, theſe *Celſus* hath given to an elbow diſlocated towards the fore and out part; and thoſe which are here attributed to the elbow diſlocated upwards & downwards; thoſe *Celſus* hath attributed to a diſlocation to the out and in ſides.

Inflamation hinders repoſition.

Chap. XXXII.

How to reſtore the Elbow, diſlocated outwardly.

YOu may know that the elbow is diſlocated outwardly, if at any time you ſhall obſerve the arme to be diſtended, and not able to be bended. Wherefore you muſt forthwith undertake the reſtitution thereof, for feare of defluxion and inflammation, which the bitterneſſe of pain uſually cauſeth, upon what part ſoever the luxation happen. There is one manner of reſtoring it,

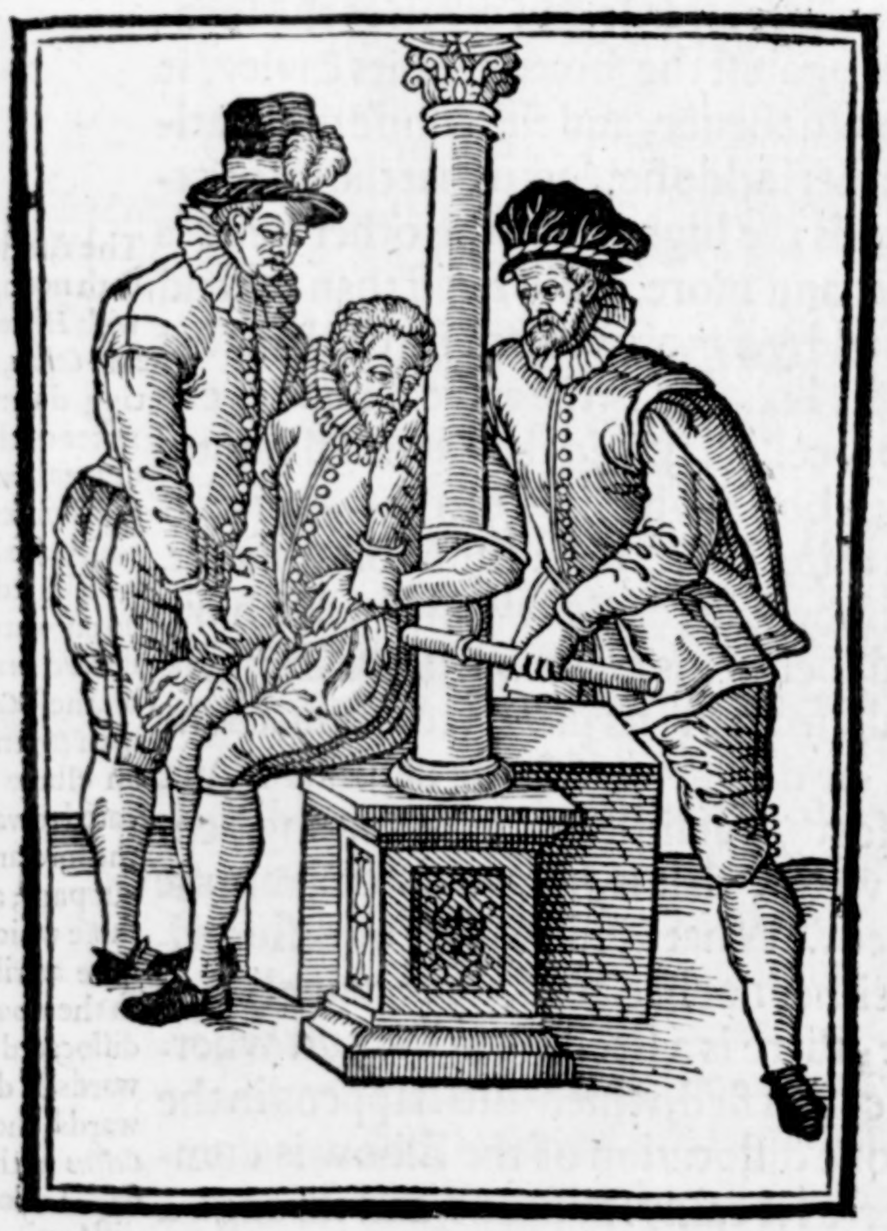
Signe.

Cure.

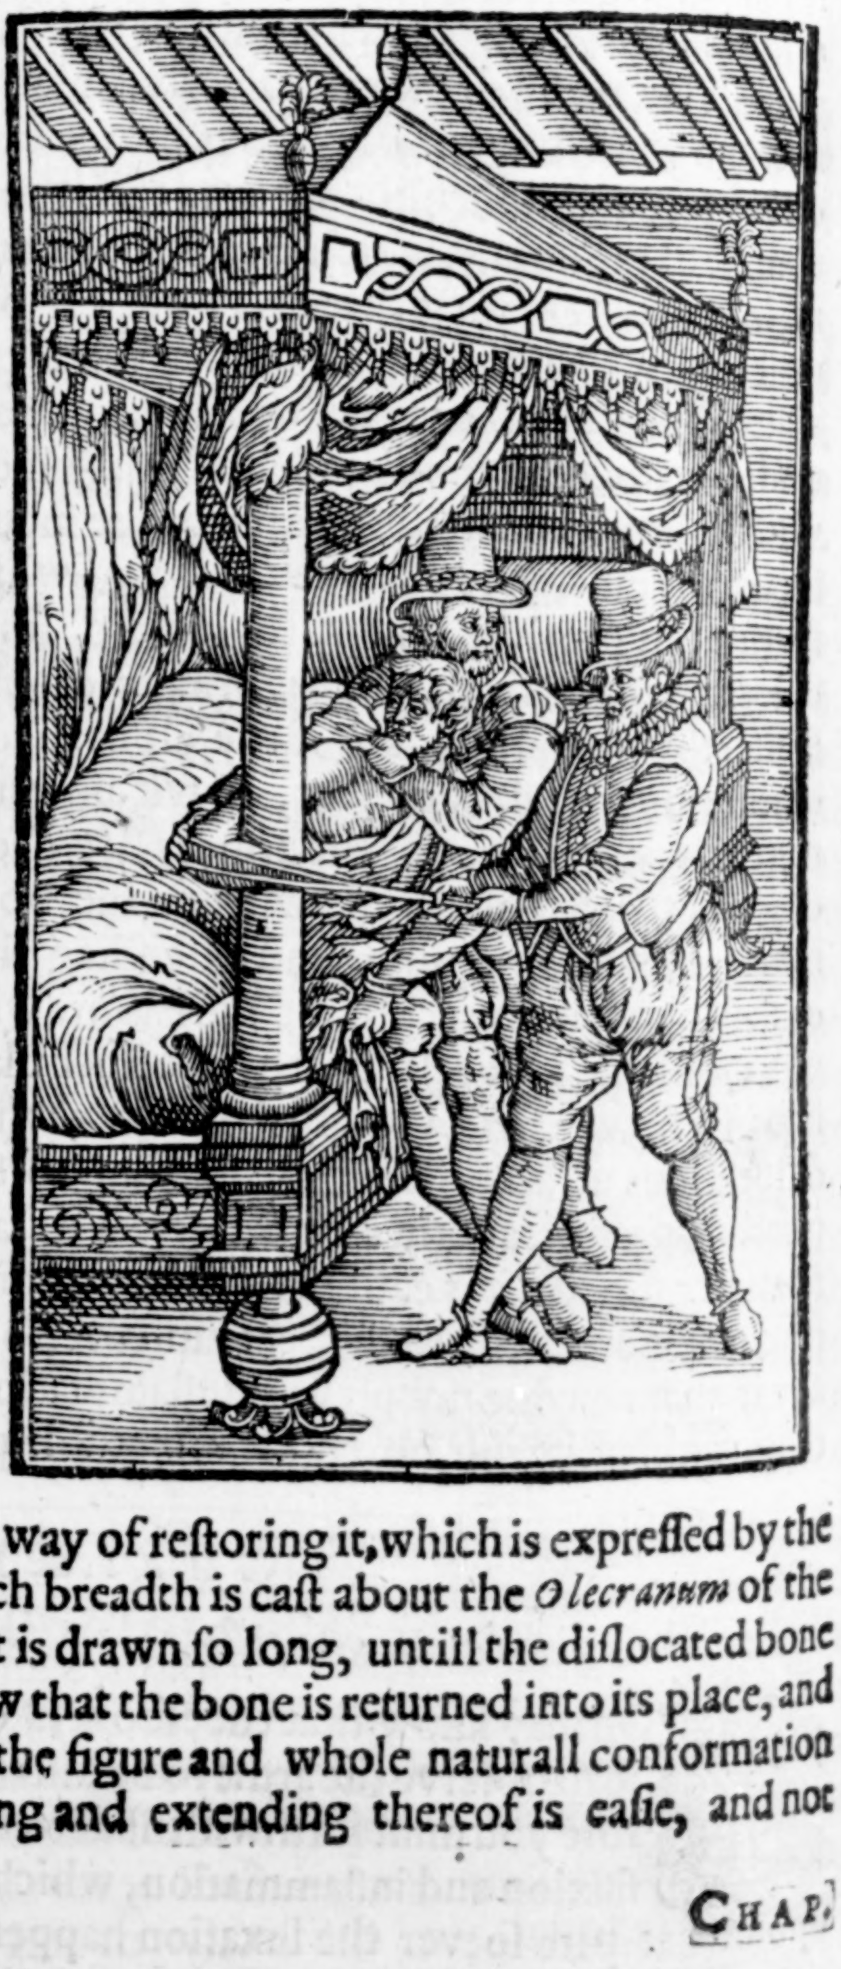
which is, you muſt cauſe one to hold hard and ſteddy the patients arme a little under the joint of the ſhoulder, and in the meane while let the Surgeon draw the arme, taking hold thereof with his hand, and alſo force the ſhoulder-bone outwards, and the eminency of the cubit inwards, but let him by little and little draw and extend the arme, wreſting it gently this way and that way, that he may bring back the bone which fell out into its cavity. I have thus expreſſely delivered this, that the young Surgeon may underſtand, that the arme muſt not be bended for the reſtoring of this kinde of diſlocation; for reſtitution cannot ſo be hoped for, becauſe by this kind of luxation the inner proceſſe of the cubit poſſeſſeth the place of the exteriour proceſſe in the cavity of the ſhoulder-bone. Wherefore, whileſt the arme is bended or crooked, the cubit is onely lifted up, and not drawne into its ſeat. But if wee cannot attaine to the reſtitution thereof with our hands alone, you muſt cauſe the diſlocated arme lightly bended to embrace a poſte, then muſt the end of the cubit called *Olecranum* be tyed or bound about with a ſtrong ligature or line, and then wreſted into its cavity by putting a battoon or ſtaffe into the ligature, as is demonſtrated by this enſuing figure.

A Caution.

A figure which ſhewes the way how to reſtore the Elbow, by putting it about a poſte, with a battoone.



A figure which ſhewes how to reſtore the elbow by only caſting a line about it.



There is alſo another more exquiſite way of reſtoring it, which is expreſſed by the latter figure, wherein a line of ſome inch breadth is caſt about the *Olecranum* of the arme, embracing a poſte or pillar, and it is drawn ſo long, untill the diſlocated bone be brought into its ſeat. Now wee know that the bone is returned into its place, and reſtored, when the paine ceaſeth, and the figure and whole naturall conformation is reſtored to the arme, and the bending and extending thereof is eaſie, and not painefull.

CHAP.

CHAP. XXXIII.

Of the diſlocation of the Elbow to the inſide, and of a compleat and uncompleat luxation.

The cure.

IF the Elbow be diſlocated to the inner part, the arme muſt be ſtrongly and powerfully extended, then bended quickly and with ſudden violence, ſo that his hand may ſmite upon his ſhoulder. Some put ſome round thing into the bought of the Elbow, and upon that doe ſuddenly force the Elbow to the ſhoulder, as we have formerly ſaid. If the Cubit bone be onely lightly moved out of its place into the upper or lower place, it is eaſily reſtored by drawing and forcing it into its cavity, after this following manner. Let two extend the arme, taking holde thereof at the ſhoulder and wreſt, and each draw towards himſelfe; and alſo the Surgeon (who ſhall there be preſent) ſhall force the bone which is diſlocated from that part whereunto it is bended, unto the contrary: after he ſhall thus have reſtored it, he ſhall lay the arme in a ſtraight angle, and ſo binde it up, and apply fit medicines formerly mentioned, and ſo let him carry it in a ſcarfe put about his necke, as wee ſaid in the diſlocation of the ſhoulder. *Hippocrates* bids, that the patient, after it is ſet, ſhall often endeavour to bend his hand upwards and downewards, and alſo extend and bend his arme, yea, and alſo to attempt to lift up ſome heavie thing with his hand; for ſo it will come to paſſe, that the ligaments of this joynt may become more ſofte, ready, and able to performe their accuſtomed functions, and alſo the bones of the cubite and ſhoulder ſhall bee freed from the affect termed *Ancyloſis*, whereto they are incident by the luxations of this part. Now *Ancyloſis* is a certaine preternaturall agglutination, co-agmentation, and as it were union of ſundry and ſeverall bones in the ſame joynt, which afterwards hinders the bending and extenſion thereof. Now, a *Callus* is generated in the Elbow ſooner than in any other articulation, whether it remaineth out, or be put into joynt, by reaſon that by reſt and ceſſation from the accuſtomed actions, a viſcide humor which is placed naturally in the joynts, as alſo another which is preternaturall, drawne thither by paine, floweth downe, and is hardned, and gleweth the bones together, as I have obſerved in many, by reaſon of the Idleneſſe and too long reſt of this part. Wherefore, that we may withſtand this affect, the whole ligation muſt be looſed ſooner and oftner than otherwiſe, that is to ſay, every third day, and then the patients arme muſt bee gently moved every way. Within the ſpace of twenty, or twenty five dayes, theſe reſtored bones recover their ſtrength, ſooner or later, according to the happening accidents. It is neceſſary alſo that the Surgeon know that the *Radius* or Wand ſometimes falleth out when the cubite or Ell is wholly diſlocated; wherefore hee muſt bee mindfull in ſetting the cubit, that hee alſo reſtore the Wand to its place; in the upper part it hath a round proceſſe lightly hollowed, wherein it receiveth the ſhoulder-bone: it hath alſo an eminencie which admitteth the two-headed muſcle.

Sent.63.ſect.3. de fract.

Why the elbow is moſt ſubject to *Ancyloſis.*

CHAP. XXXIV.

Of the diſlocation of the Styliformis or bodkin-like proceſſe of the cubit or ell.

Differences and cauſes.

Cure.

THe proceſſe of the Ell called *Styloides*, being articulated to the wreſt by *Diathroſis*, by which it is received in a ſmall cavity, is diſlocated, and falleth out ſometimes inwards, ſomewhiles outwards. The cauſe uſually is the falling of the body from high upon the hands. It is reſtored, if that you force it into its ſeat, diligently bind it, & apply thereto very aſtringent & drying medicines. But yet, though you ſhall diligently performe all things which may bee done in diſlocations, yet you ſhall never ſo bring it to paſſe that this bone ſhall bee perfectly reſtored, and abſolutely put into the place where hence it went: which

Sent. 1. ſect. 2. & ſent. ult. ſect. 3. de fract.

thing we have read, obſerved by *Hippocrates*; when (ſaith he) the greater bone, to wit the Ell, is removed from the other, that is the wand, it is not eaſily reſtored to its owne nature againe; for that, ſeeing that neither any other common connexion of two bones, which they call *Symphyſis* or union, when it is drawne aſunder and deſtroyed, may bee reduced into its former nature, by reaſon theſe ligaments wherewith they were formerly contained, and as it were continued, are too violently diſtended and relaxed, whence it happens, that I have in theſe caſes often obſerved, that the diligence and care of the Surgeon hath nothing availed.

Chap. XXXV.

Of the diſlocation of the Wreſt.

Here, as before chap. 31, the Author diſſents from *Celſus* and *Hippocrates* in expreſſing the names and ſignes of theſe diſlocations.

WEe underſtand by the wreſt, a certaine bony body, conſiſting of a compoſure of eight bones knit to the whole cubit by *Diarthroſis*. For the wreſt conſidered wholly in its ſelfe, is knit and articulated with the Ell & wand: with that, againſt the little finger; with this, againſt the thumb: for thus as it were by two connexions, the joint is made more firme. Yet may it be diſlocated inwardly, outwardly, & towards the ſides. We ſay it is luxated inwardly when the hand ſtands upwards, but outwardly, when it is crookt in & cannot be extended. But if it chance to be diſlocated ſidewayes, it ſtands awry either towards the little finger, or elſe towards the thumbe, as the luxation befals to this or that ſide. The cauſe hereof may ſeem to depend upon the different dearticulation of the Ell and wand with the hand or wreſt. For the wand, which is articulated on the lower part with the wreſt at the thumbe, by its upper part, whileſt it receives the outward ſwelling or condyle of the Ell in its cavity, performs the circular motions of the hands. But the cubit or ell, which in like ſort is connected on the lower part by *Diarthroſis* at the little finger with the wreſt, being articulated on the upper part with the ſhoulder-bone bends and extends, or ſtretches forth the hand. There is one way to reſtore the formerly mentioned diſlocations. The arm on one ſide and the hand on another muſt be extended upon a hard reſiſting and ſmooth place, ſo that it may lye flat; and you muſt have a care that the part whence the diſlocated bone fell bee the lower in its ſite and place, and the part whether it is gone, the higher. Then to conclude, the prominencies of the bones muſt be preſſed down by the hand of the Surgeon, untill by the force of compreſſion and ſite the luxated bones be thruſt and forced into their places and cavities.

Chap. XXXVI.

Of the diſlocated bones of the Wreſt.

Signe.

THe wreſt conſiſts of eight bones, which cannot unleſſe by extraordinary violence bee put or fall out of their places. Yet if they ſhall at any time fall out, they will ſhew it by the tumor of the part wherto they are gone, and by the depreſſion of that wherefrom they are fled. They may bee reſtored, if the diſeaſed hand bee extended upon a table; and if the bones ſhall be diſlocated inwards, the hand ſhall bee placed with the palme upwards, then

Cure.

the Surgeon ſhall, with the palme of his hand, preſſe downe the eminencies of the bones, and force each bone into its place. But if the luxation bee outwards, he ſhall lay the palme next to the table, and preſſe it after the ſame manner. To conclude, if the luxation ſhall be toward either ſide, the luxated bones ſhall be thruſt towards the contrary, and the reſtored bones ſhall be preſently conteined in their places with fit remedies, binding, rowling, and carrying the hand in a ſcarfe.

Chap.

Chap. XXXVII.

Of the diſlocated bones of the After-wreſt.

THere are foure bones in the Palme or After-wreſt, the two middlemoſt whereof cannot be diſlocated ſidewayes, becauſe they are hindred and kept from falling aſide by the oppoſition of the parts, as it were reſiſting them. Neither can that which anſwereth to the little finger, nor that whereon the forefinger reſts, bee diſlocated towards that ſide which is next the middle bones, whereof wee now ſpake, but onely on the other ſide, freed from the neighbour-hood of the bones: but all of them may be diſlocated inwardly and outwardly. They may be reſtored as thoſe of the Wreſt.

Celſus lib. 8. Cap. 18.

Chap. XXXVIII.

Of the diſlocated Fingers.

ALſo the bones of the fingers may bee foure ſeverall waies diſlocated, inwardly, outwardly, and towards each ſide. To reſtore them, they muſt bee laid ſtraight upon a table, and ſo put into joint againe. For thus they may bee eaſily reſtored, by reaſon their ſockets are not deepe, and their joints are ſhorter, and ligaments leſſe ſtronge. In twelve dayes ſpace they will recover their ſtrength, as alſo thoſe diſlocations that happen to the Wreſt and After-wreſt.

Why the diſlocated fingers may be eaſily reſtored.

Chap. XXXIX.

Of a diſlocated Thigh or Hipp.

THe Thigh or Hipp may be diſlocated, and fall forth towards all the foure parts. But moſt frequently inwards, next to that outwards, but very ſeldom either forwards or backwards. A ſubluxation cannot happen in this joint, as neither in the ſhoulder, eſpecially from an externall cauſe, contrary to which it uſually happens in the elbow, hand, knee, and foot. The cauſe hereof is, for that the heads of the thigh and ſhoulder-bone are exactly round, and the ſockets which receive them have certaine borders and edges encompaſſing them: hereunto may be added, that ſtrong muſcles encompaſſe each dearticulation, ſo that it cannot come to paſſe that part of the heads of ſuch bones may bee conteined in the cavity, and other parts ſtand or fall forth, but that they will quickly bee reſtored to their places by the motion and wheeling about of the joint, and the ſtrength of the encompaſſing muſcles. But a ſubluxation may ſeeme to happen in theſe parts from an internall cauſe. For then the ligaments and tyes being ſoftened and relaxed, cannot draw and carry back the head of the bone ſtanding forth ſo far as the edges of the ſocket. If the Hip be diſlocated towards the inner part, that leg becomes longer and larger than the other, but the knee appeares ſomewhat lower, and looks outwardly with the whole foote, neither can the patient ſtand upon his leg. To conclude, the head of the Thigh-bone bewrayes it ſelfe lying in the groin, with a ſwelling manifeſt both to the eye and hand; now the legge is longer than that which is ſound, for that the head of the thigh is out of its ſocket or cavity, and ſituated lower, to wit, in the groin, therefore the leg is made by ſo much the larger. Now the knee ſtands forth, becauſe neceſſarily the lower head of the thigh-bone ſtands contrary to the ſocket. For this is common to all diſlocated bones, that when as the diſlocation happens towards the one ſide, the other end of the bone flyes out to the contrary.

Hip. ſent. 68. ſect. 3. de art.

Gal. com. ad ſent. 47. ſect. 4. de art.

A ſubluxation may befall the Thigh from an internall cauſe.

Whence it is, that if the upperhead of the Thigh-bone ſhall fall inwards, then the other head, which is at the knee, muſt neceſſarily looke outwards. The like happens in other diſlocations. The leg cannot be bended towards the groine, for that the diſlocated bone holds the extending muſcles of the ſame part ſo ſtiffely ſtretched out, that they cannot yeeld, or apply themſelves to the benders. For flexion or bending ought to precede extenſion, and extenſion flexion.

Chap. XL.

Prognoſticks belonging to a diſlocated Hipp.

Why the thigh-bone diſlocated is difficultly reſtored, or reſtored eaſily falls out againe.

THere is this danger in the diſlocations of the Hipp, that either the bone cannot bee put into the place againe, at leaſt unleſſe with very much trouble, or elſe being put in, that it may preſently fall out againe. For if the tendons of the muſcles, the ligaments, and other nervous parts of the member be hard and ſtrong, they by reaſon of their contumacy and ſtiffeneſſe will hardly ſuffer the bone to returne to its place. If that they bee ſoft, looſe, effeminate and weake, they will not containe the reſtored bone in its place. Neither will it be any better contained, if that ſhort, but yet ſtrong and round, ligament, which faſtens the head of the Thigh-bone on the inſide in the Socket or Cavity of the huckle bone, bee broken or relaxed. Now it may be broken by ſome violent ſhocke or accident, it may bee relaxed by the congeſtion and long ſtay of ſome excrementitious, tough, and viſcous humour lying about the joint, through which meanes it waxeth ſoft. But if it be broken, how often ſoever the bone be reſtored, it will preſently fall out againe. If it bee relaxed, there is onely this hope to containe the reſtored bone, that is, to conſume and draw away the heaped up humidity by application of medicines and Cauteries of both kindes, for which purpoſe thoſe are more effectuall which doe actually burne, for that they dry and ſtrengthen more powerfully. Leaneneſſe of the body, and the want of *Aponeuroſes*, that is, of broad tendont and externall ligaments, whereof many encompaſſe the knee, encreaſes the difficulty of containing it in theplace. But the parts adjoyning to the diſlocated & not ſet bone fall away by little & little, and conſume with an *Atrophia* or want of nouriſhment; both becauſe the part it ſelf is forced to deſiſt from the accuſtomed actions and functions, as alſo for that the veines, arteries, and nerves being more ſtraitned and put out of their places, hinder the ſpirits and nouriſhment from flowing ſo freely as they ought, to the part: whence it comes to paſſe, that the part it ſelf made more weak, the native heat being debilitated through idleneſſe, it can neither attract the alimentary juice, neither can it digeſt & aſſimulate that little therof which flowes and falleth thereto. Verily the Thigh-bone, as long as it is forth of the cavity, growes no more, after the manner as the other bones of the body doe, and therefore in ſome ſpace of time you may perceive it to bee ſhorter than the ſound bone. Notwithſtanding the bones of the legge and foote are not hindered of their growth, for that they are not out of their proper places. Now for that the whole leg appears more ſlender, you muſt think that happens only by the extenuation & leanneſſe of the proper muſcles thereof. The ſame thing happens to the whole hand, in the largeſt acception, when as the ſhoulder is out of joint, unleſſe that the calamity and loſſe hereof is the leſſe. For the ſhoulder being forth of joint you may do ſomething with your hand, whereby it will come to paſſe that no ſmall portion of nouriſhment may flow downe into theſe parts. But the Thigh-bone being diſlocated, eſpecially inwards in a child unborn, or an infant, much leſſe alimentary nouriſhment flowes to that part, becauſe it can much leſſe uſe the foot and legge by reaſon of the diſlocation of the Hipp, than it can doe the hand by a luxation of the ſhoulder. But now wee muſt thus underſtand that which is ſaid by *Hippocrates*, That diſlocated bones and not reſtored doe decreaſe or are hindred from their juſt growth, to bee onely in thoſe who have not yet attained to their full and naturally appointed

The breaking and relaxation of the internall ligament.

CHAP. XLI.

Of the ſignes of the Hipp, diſlocated outwardly or inwardly.

The thigh-bone or Hipp when it is diſlocated outwardly, and not reſtored, after ſome time the paine is aſſwaged, and fleſh growes about it, the head of the bone weares it ſelfe a new cavity in the adjoyning Hipp, whereinto it betakes it ſelfe, ſo that at the length the patients may go without a ſtaffe, neither ſo deformed a leanneſſe will waſte their legge. But if the luxation happen inwards, a greater leanneſſe will befall them, by reaſon that the veſſels naturally run more inwardly, as *Galen* obſerves in the diſlocation of the *Vertebræ* to the inſide; therefore it comes to paſſe that they are more grievouſly oppreſſed: beſides the thigh-bone cannot wagge or once ſtirre againſt the ſhare-bone: wherefore if the bone thus diſlocated bee not reſtored to its joynt againe, then they muſt caſt their legge about as they walke, juſt as wee ſee oxen doe. Wherefore the ſound legge whileſt they go, takes much leſſe ſpace than the lame, becauſe this, whileſt it ſtirreth or moveth, muſt neceſſarily fetch a compaſſe about, but that performeth its motion in a right line. Beſides, whileſt the patients ſtand upon their lame legge to put forwards the ſound, they are forced to ſtand crooked, whereupon they are forced to ſtay themſelves with a ſtaffe that they fall not.

Ad ſent.51.ſect.3 de art.

Furthermore thoſe who have this bone diſlocated either backwards or outwards, ſo that it cannot bee reſtored, have the part it ſelfe grow ſtiffe and hard; which is the cauſe why the ham may bee bended without great paine, and they may ſtand, and goe upon the tops of their toes; beſides alſo, when they deſire ro goe faſter, they are forced to ſtoope, and ſtrengthen themſelves by laying their hand on their lame thigh at every ſtep, both for that their lame legge is the ſhorter, as alſo becauſe the whole weight of the body ſhould not lye wholly or perpendicularly upon the joynt or head of the thigh-bone. Yet in continuance of time, when they are uſed to it, they may goe without any ſtaffe in their hands. Yet in the interim, the ſound leg becomes more deformed in the compoſure & figure, becauſe, whileſt it ſuccours the oppoſite and lame leg by the firme ſtanding on the ground, it beares the weight of the whole body, in performance whererof the ham muſt neceſſarily now and then bend. But on the contrary, when as the head of the thigh being diſlocated inwards is not put into the joynt, if the patient be arrived at his full growth, after that the head of the bone hath made it ſelfe a cavity in the neighbouring bone wherein it may reſt, he may bee able to walke without a ſtaffe, becauſe the diſlocated leg cannot eaſily be bended towards the groine or ham, and he will ſooner reſt upon his heele than upon his toes. This kinde of diſlocation if it bee inveterate, can never be reſtored. And theſe things happen, when as the thigh-bone is diſlocated inwards, or when the internall ligament which faſtens the dearticulation ſhall be broken or relaxed. But the contrary ſhall plainely appeare if the diſlocation ſhall happen to bee outwards; for then the lame legge becomes the ſhorter, becauſe the head of the thigh flyes into a place higher than its cavity, aud the muſcles of that part are contracted towards their originall, and convulſively draw the bone upwards together with them. The whole leg, together with the knee and foot looketh inwards, they cannot goe upon their heels, but upon the ſetting on of the toes. The legge may bee bended, which it cannot bee in a diſlocation of the thigh inwards, as *Paulus* ſhewes. Therefore wee muſt diligently obſerve that ſentence of *Hippocrates* which is read with a negative, in theſe words. *Sed neque conflectere quemadmodum ſanum crus poſſunt*, that they ought to bee read with an affirmative after this manner. *Sed conflectere &c. quin & crus ipſum &c.* But now the lame legge will better ſuſtaine the weight of the body in an externall, than in an internall diſlocation; for then the head of the thigh is more per-

Signes of the thigh-bone diſlocated outwards.

Paul. Æg. lib. 6. cap 8. Hip ſent. 91. ſect 3. lib. de artic.

pendicularly ſubject to the whole weight of the body. Therefore when in ſucceſſe of time it ſhall by wearing have made it ſelfe a cavity in the neighbouring bone, which in time will be confirmed, ſo that there will remaine no hope of reſtoring the diſlocation, nevertheleſſe the patient ſhall be able to goe without a ſtaffe, for that then no ſenſe of paine will trouble him; whence it followes, that the whole leg alſo will become leſſe leane, for that going is leſſe painfull, neither are the veſſels ſo much preſſed as in that diſlocation which is made inwardly.

Chap. XLII.

Of the thigh-bone diſlocated forewards.

IT ſeldome happeneth that the thigh is diſlocated forwards; yet when as it ſhall happen, it is knowne by theſe ſignes. The head of the thigh lyeth towards the ſhare; whence the groines ſwell up, and the buttocke on the contrary is wrinkled and extenuated by reaſon of the contraction of the muſcles; the patient cannot extend his leg without paine, no verily, not ſo much as bend it towards the groine, for that the fore muſcle which ariſeth from the haunch-bone, is ſo preſſed by the head of the thigh, that it cannot be diſtended; neither can the ham be bended without very much paine. But the lame legge is equall at the heel with the other leg, yet the patient cannot ſtand upon the ſetting on of the toes; therefore when he is forced to goe, hee toucheth the ground with his heel only, yea, verily the ſole of his foot is leſſe inclined to the fore ſide, neither doth it ſeldome happen, that the urine, by this accident, is ſuppreſt; because the head of the thigh oppreſſes the greater nerves from whence thoſe ariſe which are carryed to the bladder, which through the occaſion of this compreſſion is pained and inflamed by conſent: now when inflammation ſhall ſeaze upon the *Sphinct* muſcle, the urine can ſcarcely flow out, for that it is hindred by the ſwelling.

Stopping of urine by reaſon of an internall diſlocation of the thigh-bone.

Chap. XLIII.

Of the thigh-bone diſlocated backwards.

Signes

SEldome alſo is the thigh-bone diſlocated backwards, becauſe the hind part of the cavity of the huckle-bone is deeper and more depreſſed than the fore; whence it is that the diſlocation of the thigh to the inner part is more frequent than the reſt. The patient can neither extend nor bend his legge by reaſon of the much compreſſion and tenſion of the muſcles which encompaſſe the head of the thigh by this kind of luxation. But the pain is encreaſed when he would bend his ham, for that then the muſcles are the more ſtrongly extended. The lame leg is ſhorter than the ſound: when the Buttocks are preſſed, the head of the thigh is perceiued hid amongſt the muſcles of that part; but the oppoſite groine is laxe, ſoft, and depreſt with a manifeſt cavity. The heele touches not the ground, for that the head of the thigh is plucked backe againe by the muſcles of the buttocks amongſt which it lyeth hid, but principally by that which is the larger, and which is ſaid to make as it were the pillow or cuſhion of the buttocks; for this is much more preſſed in this kinde of diſlocation than the reſt: whence it is, that the patient cannot bend his knee, becauſe the extenſion of the nervous production or large tendon which covers the knee is ſo great. But if the patient will ſtand upon the foot of his luxated legge without a ſtaffe, he ſhall fall down backwards, for that the body is inclined to that part, the head of the thigh being not directly underneath for the propping or bearing up of the body; wherefore he is forced to ſuſtaine himſelfe upon a crutch on his lame ſide. Having premiſed theſe things of the differences, ſignes, ſymptomes and prognoſticks, it now remaineth, that we briefly deſcribe

the different wayes of reſtoring them, according to the difference of the parts whither it is fallen. First, you muſt place the patient upon a bench or table, groveling, or with his face upwards, or upon one ſide, laying ſome ſoft quilt or coverlid under him, that he may lye the eaſier. Now you muſt place him ſo, that the part unto which the bone is flown, may be the higher, but from whence it is fled, the lower. For if the thigh-bone bee diſlocated outwards or backwards, then muſt the patient bee laid groveling; if inwardly, upon his backe; if forwards, then upon his ſide. Then muſt extenſion and impulſion be made towards the cavity, that ſo it may bee forced thereinto: but if the diſlocation be freſh, & in a ſoft body, as a woman, childe, and ſuch like, whoſe joynts are more laxe, it ſhall not bee any waies needefull to make great extenſion with ſtrong ligatures for the reſtoring it; the Surgeons hand ſhall ſuffice, or a Liſt or towell caſt about it. In the interim the bone ſhall bee kept faſt with compreſſes applyed about the joynt: then the Surgeon ſhall extend the thigh, taking hold thereof above the knee, in a ſtraight line, and ſo ſet it directly againſt the cavity, and then preſently thruſt it thereinto. For thus ſhall he reſtore it, if ſo bee that in thruſting it, hee lift up the head thereof ſomewhat higher, leſt the lips of the cavity force it backe, and hinder it from entring. Now becauſe unleſſe there bee juſt extenſion, there can be no reſtitution hoped for, it is farre better in that part, that is, to extend it ſomewhat more than is neceſſary, yet ſo, that you doe not endanger the breaking of any muſcles, tendon or other nervous body. For, as *Hippocrates* writes, when as the muſcles are ſtrong and large, you may ſafely extend them, if ſo be that you diſplace nothing by the force of the extenſion. If your hand will not ſuffice to make juſt extenſion, you muſt uſe the helpe of an Engine, ſuch as is our Pulley, faſtened to two poſtes, ſo much of the rope being let forth, and drawn up again, as ſhall ſuffice for the buſineſſe in hand; in the performance whereof, it is fit that the patients friends abſent themſelves from this ſad ſpectacle, and that the Surgeon bee reſolute, and not deterred from his buſineſſe by no lamentation, neither of the patient nor his friends. But for that we write theſe things chiefely for the benefit of young practicioners, it ſeemeth meet, that having delivered theſe things in general, of reſtoring the thigh-bone, that we run over theſe generalities in each particular, beginning with that diſlocation which is made inwardly.

The generall cure.

Sect.2. lib. de fract.

Chap. XLIV.

Of reſtoring the Thigh-bone diſlocated inwards.

IT is fit to place the patient after the foreſaid manner, upon a table or bench, in the midſt wherof ſhall ſtand faſtned a woodden pin of a foots length, and as thick as the handle of a ſpade uſeth to be; but it muſt be wrapped about with ſome ſoft cloth, leſt the hardneſſe hurt the buttocks, betwixt which it muſt ſtand, as we read that *Hippocrates* did in the extenſion of a broken leg. The woodden pin hath this uſe, to hold the body that it may not follow him that draweth or extendeth it; & that the extenſion being made as much as is requiſie, it may go between the *perinæum* & the head of the diſlocated thigh. For thus there is no great need of counter-extenſion towards the upper parts; and beſides it helpeth to force back the bone into its cavity, the help of the Surgeon concurring, who twining ſomewhiles to this, & otherwhiles to that ſide, doth direct the whole work. But when the extenſion hath need of counter-extenſion, then it is needfull you have ſuch ligatures at hand, as we have mentioned in the reſtoring of a diſlocated ſhoulder, to be drawn above the ſhoulder. One of theſe ſhall be faſtned above the joynt of the hip, & extended by a ſtrong man; another ſhalbe caſt above the knee by another with the like force. But if you cannot have a wooden pin, another ſtrong & like ligature ſhalbe put upon the joynt directly at the hip, & held ſtiffe by the hands of a ſtrong man, yet ſo that it may not touch the head of the thigh by preſſing it, for ſo it would hinder the reſtoring thereof. This manner of extenſion is common to foure kinds of luxation of the thigh-bone. But the maner of forcing the bone into its cavity, muſt be varied in each, according to the different condition of the parts where-

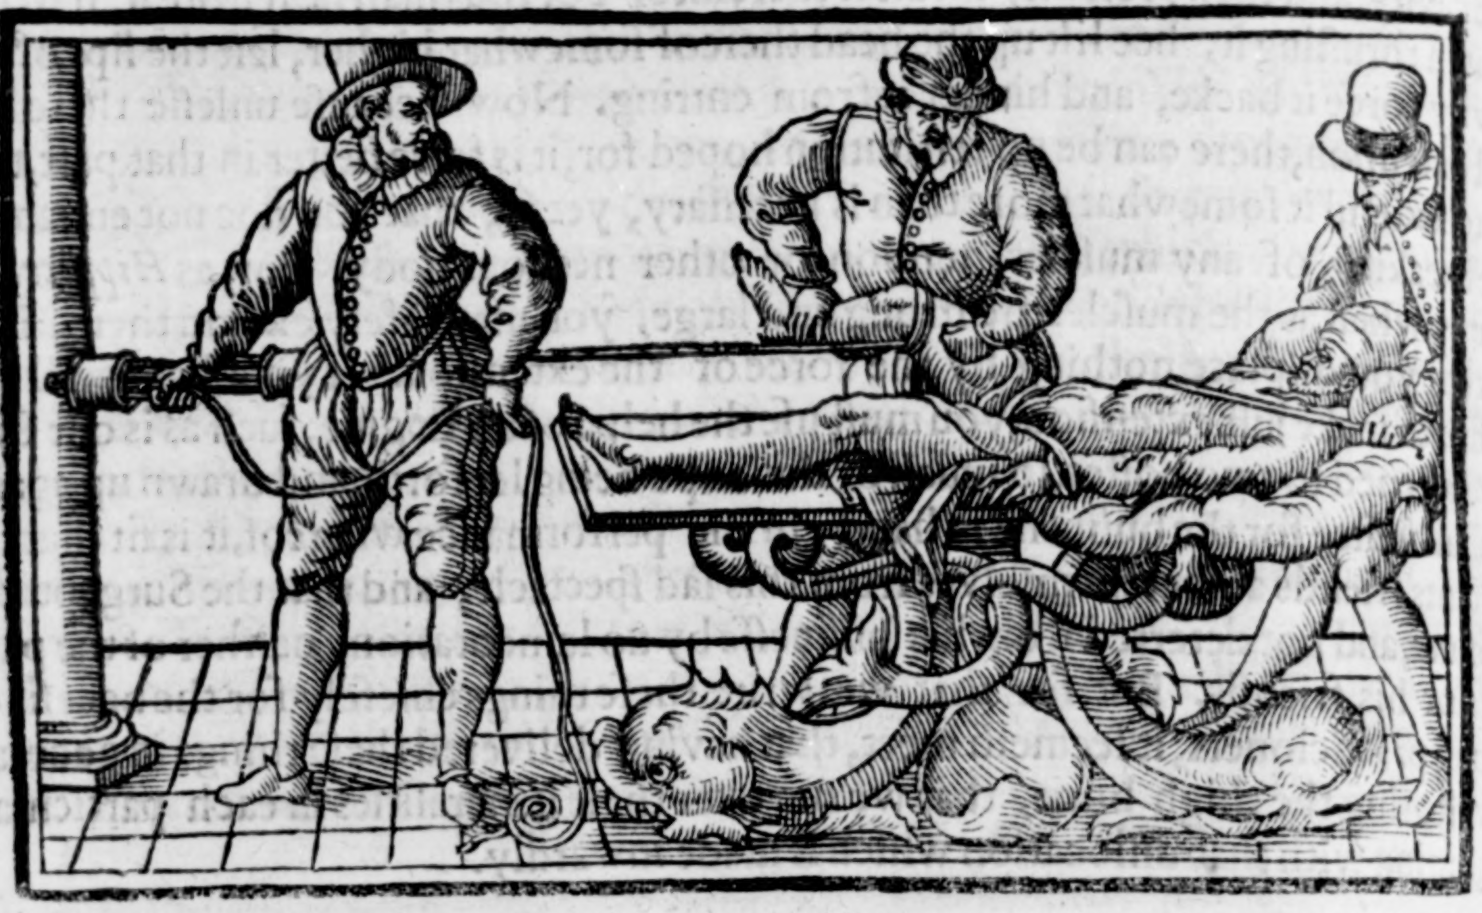
Sect.2. lib. de fract.

How to make extenſion and counter-extenſion in this kind of fracture.

Ligatures made for extenſion muſt be faſtened neere the part to be extended.

whereunto the head inclineth; to wit, it muſt be forced outwards if it bee fallen inwards, and contrary in the reſt, as the kind of the diſlocation ſhall bee. Some too clowniſh and ignorant knot-knitters faſten the lower ligature below the ankle, and thus the joynts of the foot and knee are more extended than that of the hipp or huckle-bone, for that they are neerer to the ligature, & conſequently to the active force: but they ought to doe otherwiſe; therefore in a diſlocated ſhoulder, you ſhall not faſten the ligatures to the hand or wreſt, but above the elbow. But if the hands ſhall not be ſufficient for this worke, then muſt you make uſe of engines. Wherefore then the patient being placed as is fit, and the affected part firmely held, ſome round thing ſhall be put into the groine, and the patients knee, together with his whole leg ſhall be drawne violently inwards, towards the other leg. And in the meane while, the head of the thigh ſhall bee ſtrongly forced towards the cavity of the huckle-bone, and ſo at length reſtored, as the following figure ſhewes.

A figure which manifeſteth the way of reſtoring the thigh-bone diſſocated inwards.



A generall precept.

When the head of the thigh by juſt extenſion is freed from the muſcles wherewith it was infolded, and the muſcles alſo extended that they may give way and yeeld themſelves more pliant, then muſt the rope be ſomewhat ſlaked, and then you muſt alſo deſiſt from extending, otherwiſe the reſtitution cannot bee performed, for that the ſtronger extenſion of the engine wil reſiſt the hand of the Surgeon, thruſting and forcing it into the cavity. This precept muſt bee obſerved in the reſtoring of this & other diſlocations. You ſhall know that the thigh is reſtored by the equality of the legs, by the free & paineleſſe extenſion & inflection of the lame leg. Laſtly, by the application of agglutinative medicines (whereof we have formerly ſpoken) the reſtored bone ſhal be confirmed in its place; to which purpoſe ligation ſhal be made, the ligature being firſt caſt upon the place whereinto the head of the thigh fell, and thence brought to the oppoſite or ſound ſide by the belly and loynes. In the meane while the cavity of the groine muſt bee filled with ſomewhat a thicke bolſter which may keep the head of the bone in the cavity. Neither muſt you omit junks ſtretched down even to the ankles, as we have obſerved in the fracture of the thigh. Then muſt both the thighs be bound together, wherby the diſlocated member may be unmoveable, and more & more ſtrengthned. Neither muſt this dreſſing be looſed, until foure or five dayes be paſſed, unleſſe peradventure the ſudden happening of ſome other more grievous ſymptome ſhall perſwade otherwiſe. To conclude, the patient muſt bee kept in his bed for the ſpace of a moneth, that the relaxed muſcles, nerves and ligaments may have ſpace; to recover their former ſtrength, otherwiſe, there is danger leſt the bone may againe fall out by the too forward and ſpeedy walking upon it.

Sect.2.lib.de fract.

For the ſite of the thigh it muſt be placed and kept in a middle figure, yet this middle figure conſiſts in the extenſion, not in the flexion, as it is demonſtrated by *Hippocrates*, for that ſuch a figure is familiar and accuſtomable to the legge.

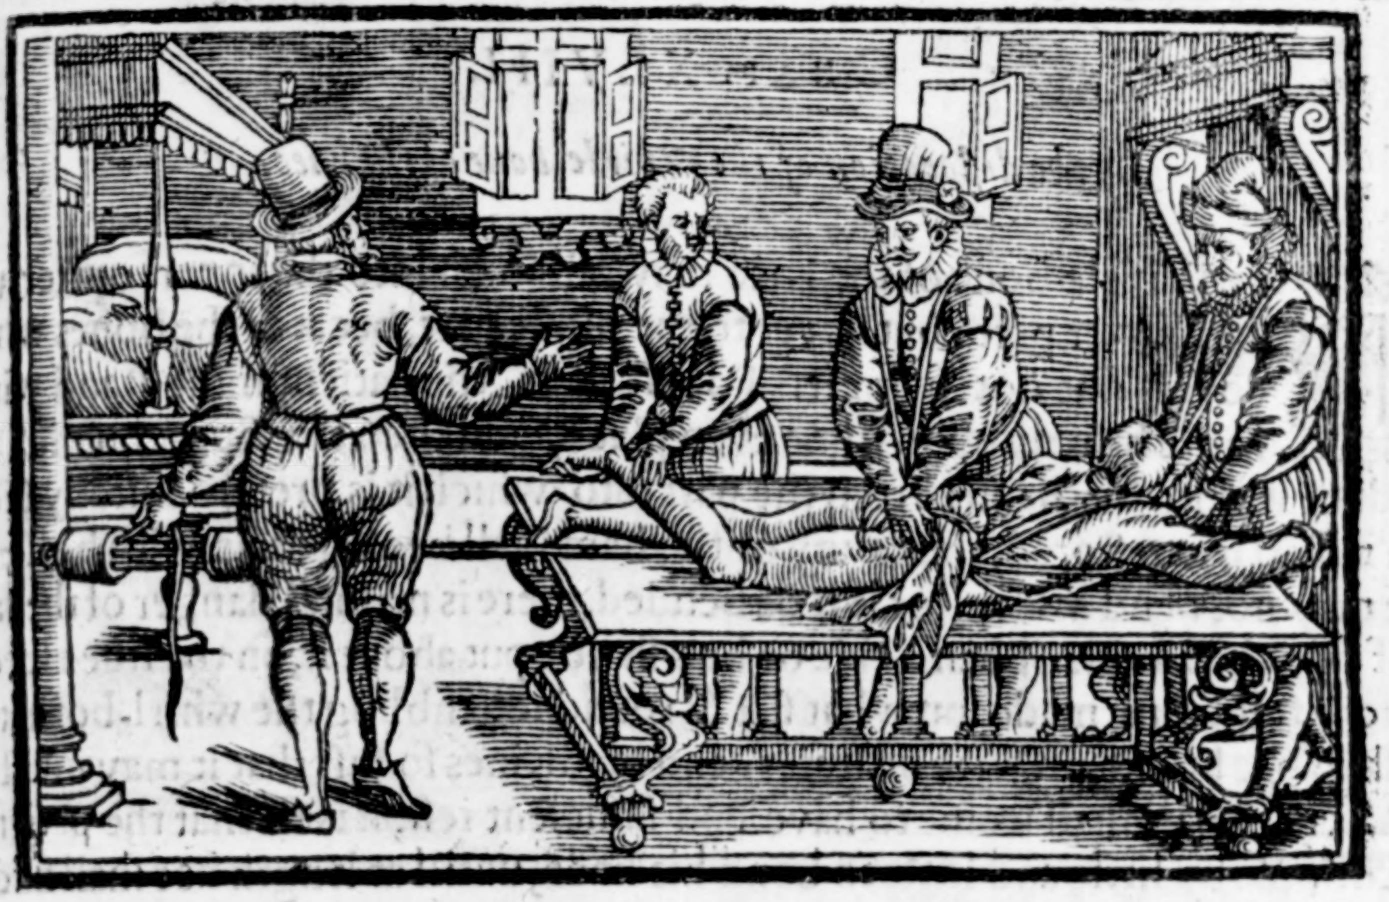
CHAP.

Chap. XLV.

Of reſtoring the Thigh diſlocated outwardly.

THE patient muſt bee placed groveling upon a table in this kinde of diſlocation alſo, and ligatures as before, caſt upon the hip and lower part of the thigh, then extenſion muſt be made downewards, and counter-extenſion upwards; then preſently the head of the bone muſt bee forced by the hand of the Surgeon into its place. If the hand bee not ſufficient for this purpoſe, our pulley muſt be uſed, as the following figure ſheweth.

A figure which expreſſeth the manner of reſtoring the Thigh luxated outwards.



When it is that onely extenſion ſerves for the reſtoring the diſlocated thigh.

This kind of diſlocation is the eaſilyeſt reſtored of all theſe which happen in the thigh or hip, ſo that I have divers tmes obſerved the head of the thigh to have been drawne backe into its cavity by the onely regreſſe of the extended muſcles into themſelves towards their originals, ſomewhiles with a noyſe or pop, otherwhiles without, which being done, laying a compreſſe upon the joynt, you ſhall perform all other circumſtances as before in an internall diſlocation.

Chap. XLVI.

Of reſtoring the Thigh diſlocated forewards.

WHen the thigh is luxated forewards, the patient muſt bee laid upon his ſound ſide, and tyed as wee have formerly delivered. Then the Surgeon ſhall lay a Boulſter upon the prominent head of the bone, and have a care that his ſervant firmely hold it: then immediately juſt extenſion being made, he ſhall with his hand force the bone into the cavity; but if his hand will not ſerve, he ſhall attempt it with his knee. Then to conclude he ſhall uſe the reſt of the things formerly mentioned to containe the reſtored bone.

Chap. XLVII.

Of reſtoring the Thigh diſlocated backwards.

THe patient ſhall be placed groveling upon a table or bench, and the member extended, as in the reſt, one ligature ſtretched from the groine, another from the knee; then the Surgeon ſhall endeavour to force back with his hand that which ſtands up, and alſo to draw away the knee from the ſound legge. The bone thus placed and reſtored, the cure requires nothing elſe, than to be bound up and kept long in bed, leſt that the thigh, if it ſhould be moved, the nerves being yet more looſe, might againe fall out. For the thigh is in great danger of relapſe, for that the cavity of the Huckle-bone is onely depreſt, as farre as it goes in, and the burden of the hanging or adjoyning Thigh is heavie.

Chap. XLVIII.

Of the diſlocation of the Whirle-bone of the knee.

The differences.

The cure.

THe Whirle-bone of the knee may fall forth into the inner, outter, upper and lower part; but never to the hinde part, becauſe the bones which it covers doe not ſuffer it. To reſtore it, the patient muſt ſtand with his foote firmely upon ſome even place, and then the Surgeon muſt force and reduce it with his hands from the part into which it is preternaturally ſlidden. When it ſhall bee reſtored, the cavity of the ham ſhall bee filled up with bolſters, ſo that he may not bend his leg, for if it be bended, there is no ſmal danger of the falling back of the whirl-bone. Then a caſe or box ſhalbe put about it, on the ſide eſpecially whereto it fell, being made ſomwhat flat & round reſembling the whirl-bone its ſelf, and it ſhall bee bound on with ligatures, and medicines ſo faſt that it may not ſtirre a jot. After the part ſhall ſeeme to have had ſufficient reſt, it is fit that the patient try and accuſtome by little and little to bend his knee, untill at length hee ſhall finde that he may eaſily and ſafely move that joint.

Chap. XLIX.

Of the diſlocated Knee.

The differences.

THe knee alſo may be diſlocated three manner of waies, that is, into the inner, outer, and hinde part, but very ſeldom towards the foreſide and that not without ſome grievous and forcible violence; for the Whirle-bone lying upon it, hinders it from ſlipping out, and holds it in. The other wayes are eaſie, becauſe the cavity of the leg-bone is ſuperficiary and very ſmooth, but the cavity of the lower end of the thigh-bone is made in the maner of a ſpout or gutter, & beſids the head therof is very ſmooth and ſlippery; but the whole joint is much more laxe than the joint of the Elbow: ſo that as it may be the more eaſily diſlocated, ſo may it the better be reſtored; and as it may be the more eaſily, ſo may it be the more ſafely diſlocated, for that inflammation is leſſe to bee feared here, as it is obſerved by *Hippocrates*. Falls from high, leaping, and too violent running are the cauſes of this diſlocation. The ſigne thereof is the diſability of bending or lifting up the legge to the thigh, ſo that the patient cannot touch his buttocke with his heele.

Ad finem ſect. 3. de fract.

How to reſtore a knee diſlocated backwards.

The diſlocation of the knee which is inwardly and outwardly is reſtored with indifferent extenſion and forcing of the bones into their ſeats from thoſe parts whereunto they have fallen. But to reſtore a diſlocation made backwards, the patient ſhall be placed upon a bench of an indifferent height, ſo that the Surgeon may be behind him who may bend with both his hands & bring to his buttocks the patients leg put betwixt his owne legges. But if the reſtitution doe not thus ſucceed, you muſt make a clew of yearn, and faſten it upon the midſt of a ſtaffe, let one put this into the cavity of his ham, upon the place whereas the bone ſtands out, and ſo force it forwards; then let another caſt a ligature of ſome three fingers breadth upon his knee, and draw it upwards with his hands, then preſently and at once they all ſhall ſo bend and crooke the lame legge that the heele thereof may touch his buttocks.

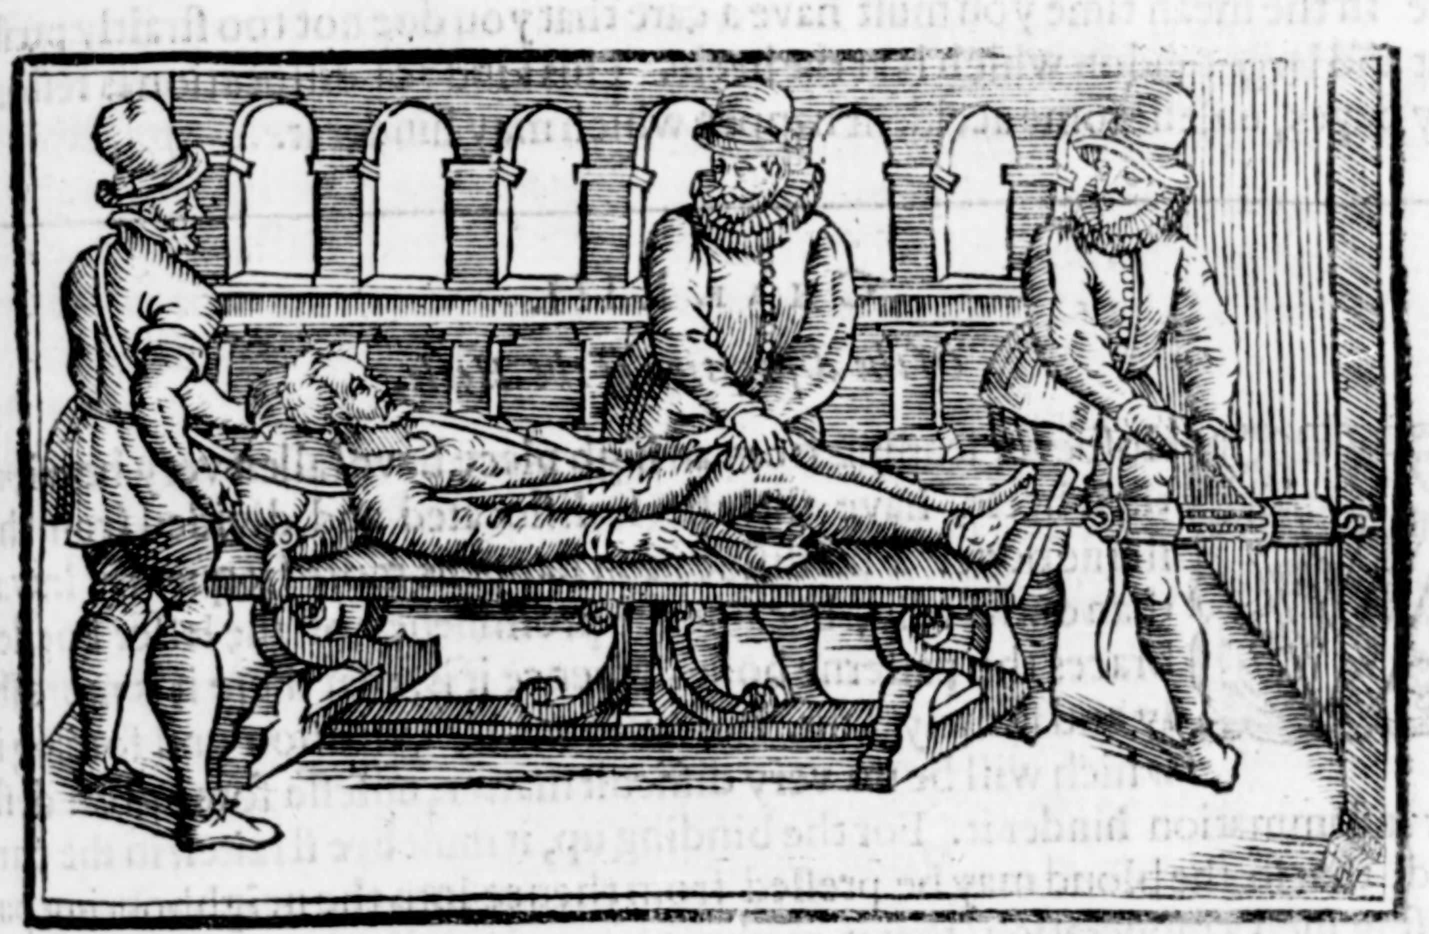
Chap. L.

Of a knee diſlocated forewards.

But if the knee bee diſlocated forwards (which ſeldome happens) the patient ſhall be placed upon a table and a convenient ligation made above, and another cloſe beneath the knee. Then the Surgeon ſhall ſo long preſſe downe with both his hands the bone which is out of joint, untill it ſhall returne to its place againe. To which purpoſe if the ſtrength of the hand will not ſerve to make juſt extenſion each way, you may make uſe of our engine, as you may perceive by this following figure.

The cure.

A figure ſhewing the manner of reſtoring a knee diſlocated forwards.



You ſhall know that the bone is reſtored by the free and paineleſſe extenſion of the legge; then will their bee place for medicines, boulſters and ſtrengthening ligatures. In the meane ſpace the patient ſhall forbeare going, ſo long as the part ſhall ſeeme to require.

Chap. LI.

Of the ſeparation of the greater and leſſer Focile.

The joyning of the leg and ſhin bones.

The *Fibula* or leſſer Focile is faſtened and adheres to the *Tibia*, leg-bone, or greater Focile without any cavity, above at the knee and below at the ankle. But it may bee pluckt or drawne aſide three manner of waies, that is, forwards, and to each ſide: this chance happens when in going we take no ſure footing, ſo that wee ſlip with our feete this way and that way as in a ſlippery place, and ſo wreſt it inwards or outwards; for then the weight of our body lying open upon it, drawes the legge, as it were, inſunder, ſo that the one Focile is diſlocated or ſeparated from the other. The ſame may happen by a fall from an high place, or ſome grievous and bruiſing blow: beſides alſo, their appendices are ſomtimes ſeparated from them. For the reſtoring of all theſe into their proper places, it is fit they bee drawne and forced by the hand of the Surgeon into their ſeats: then ſhall they be ſtraitly bound up, putting compreſſes to that part unto which the *Fibula* flew; beginning alſo your ligation at the very luxation, for the forementioned reaſons. The patient ſhall reſt forty daies, to wit, as long as ſhall bee ſufficient for the ſtrengthening of the ligaments.

The cure.

CHAP. LII.

Of the Leg-bone or greater Focile diſlocated and divided from the Paſterne bone.

Differences and ſignes.

ALſo the Leg-bone is ſometimes diſlocated, and divided from the paſterne bone, as well inwardly, as outwardly; which may bee knowne by the ſwelling out of the bone to this or that part; if it be onely a ſubluxation or ſtraine, it may bee eaſily reſtored, by gently forcing it into the place againe. After the bone ſhall be reſtored, it ſhall be kept ſo by compreſſes and fit deligation, by croſſe and contrary binding to the ſide oppoſite to that towards which the bone fell, that ſo alſo in ſome meaſure it may bee more and more forced into its place. In the mean time you muſt have a care that you doe not too ſtraitly preſſe the great and large tendon which is at the heele. This kinde of diſlocation is reſtored in forty dayes, unleſſe ſome accident happen which may hinder it.

CHAP. LIII.

Of the diſlocation of the Heele.

Cauſes and differences.

WHoſoever leaping from an high place have fallen very heavie upon their heele, have their heele diſlocated and divided from the paſterne bone. This diſlocation happens more frequently inwardly than outwardly, becauſe the prominency of the leſſer Focile embraces the paſterne bone; whence it is, that there it is more ſtraitly and firmely knit. It is reſtored by extenſion and forcing it in, which will be no very difficult matter, unleſſe ſome great defluxion or inflammation hinder it. For the binding up, it muſt bee ſtraiteſt in the part affected, that ſo the bloud may be preſſed from thence into the neighbouring parts; yet uſing ſuch a moderation, that it may not bee painefull, nor preſſe more ſtraitly than is fit, the nerves and groſſe tendon which runnes to the heele. This diſlocation is not confirmed before the fortieth day, though nothing happen which may hinder it. Yet uſually it happeneth that many ſymptomes enſue by the vehemency of the contuſion. Wherefore it will not be amiſſe to handle them in a particular chapter.

The cure.

CHAP. LIV.

Of the Symptomes which follow upon the contuſion of the Heel.

Why bloud-letting neceſſary in the fracture of a heele.

IT happeneth by the vehemency of this contuſion, that the veines and arteries do as it were vomit up bloud both through the ſecret paſſages of their coates, as alſo by their ends or orifices, whence an *Ecchymoſis* or blackneſſe over all the heel, paine, ſwelling, and other the like enſue, which implore remedies, & the Surgeons helpe, to wit, convenient diet, and drawing of bloud by opening a veine (of which though *Hippocrates* makes no mention, yet it is here requiſite by reaſon of the feaver and inflammation) and if need require purgation, princi-

Hip. ſect. 3. de fracturis.

principally ſuch as may divert the matter by cauſing vomit, and laſtly, the application of locall medicines, chiefly ſuch as may ſoften and rarifie the skin under the heel, otherwiſe uſually hard and thick (ſuch as are fomentations of warme water & oile) ſo that divers times wee are forced to ſcarifie it with a lancet, ſhunning the quicke fleſh. For ſo at length the blood poured forth into the part, and there heaped up, is more eaſily attenuated and at length reſolved. But theſe things muſt all bee performed before the inflammation ſeaze upon the part, otherwiſe there will be danger of a convulſion. For the bloud, when it falls out of the veſſels, readily putrefies, by reaſon the denſity of this part hinders it from ventilation and diſperſing to the adjacent parts. Hereto may be added that the large and great Tendon which covers the heele, is endued with exquiſite ſenſe, and alſo the part it ſelfe is on every ſide ſpred over with many nerves. Beſides alſo there is further danger of inflammation by lying upon the backe and heele, as we before admoniſhed you in the Fracture of a leg. Therefore I would have the Surgeon to bee here moſt attentive and diligent to performe theſe things which we have mentioned, leſt by inflammation a Gangrene and mortification (for here the ſanious fleſh preſently falls upon the bone) happen together with a continued and ſharp feaver, with trembling, hicketting and raveing. For the corruption of this part firſt by contagion aſſailes the next, and thence a feaver aſſailes the heart by the arteryes preſſed and growing hot by the putride heat, & by the nerves and that great and notable tendon made by the concourſe of the three muſcles of the calfe of the legge, the muſcles, braine and ſtomach are evilly affected and drawne into conſent, and ſo cauſe convulſions, raving and a deadly hicketting.

Why the heele is ſubject to inflammation.

Gal. ad ſent. 33 ſect. 2. lib. de fract.

Chap. LV.

Of the diſlocated paſterne or Ancle-bone.

Signes.

THe *Aſtragalus* or Paſterne bone may bee diſlocated and fall out of its place to every ſide. Wherefore when it falls out towards the inner part, the ſole of the foot is turned outwards, when it flyes out to the contrary, the ſign is alſo contrary: if it be diſlocated to the foreſide, on the hinde ſide the broad Tendon comming under the heel is hardened and diſtended; but if it be luxated backwards, the whole heel is as it were hid in the foot: neither doth this kinde of diſlocation happen without much violence. It is reſtored by extending it with the hands, and forcing it into the contrary part to that from whence it fell. Being reſtored it is kept ſo by application of medicines and fit ligation. The patient muſt keepe his bed long in this caſe, leſt that bone which ſuſteines and bears up the whole body, may againe ſinke under the burden, and breake out, the ſinewes being not well knit and ſtrengthened.

Cure.

Chap. LVI.

Of the diſlocation of the Inſtep and backe of the foot.

THe bones alſo of the Inſtep and backe of the foot may be luxated, and that either upwards or downwards, or to one ſide, though ſeldome ſidewiſe, for the reaſon formerly rendred, ſpeaking of the diſlocation of the like bones of the hand. If that they ſtand upwards, then muſt the patient tread hard upon ſome plaine or even place, and then the Surgeon by preſſing them with his hand ſhall force them into their places; on the contrary, if they ſtand out of the ſole of the foote, then muſt you preſſe them thence upwards, and reſtore each bone to its place. They may bee reſtored after the ſame manner if they bee flowne out to either ſide. But you muſt note that although the ligatures conſiſt but of one head

Cure.

in

Sent.14. ſect.2. lib. de fract.

in other diſlocatious, yet here *Hippocrates* would have ſuch uſed as have two heads, for that the diſlocation happens more frequently from below upwards, or from above downewards, than ſidewiſe.

Chap. LVII.

Of the diſlocation of the Toes.

The differences.

Cure.

NOw the Toes may bee foure waies diſlocated, even as the fingers of the hand; and they may be reſtored juſt after the ſame manner, that is, extend them directly forth, and then force each joint into its place, and laſtly bind them up as is fitting. The reſtitution of all of them is eaſie, for that they cannot farre tranſgreſſe their bounds. To conclude, the bones of the feet are diſlocated and reſtored by the ſame meanes as thoſe of the hands, but that when as any thing is diſlocated in the foote, the patient muſt keepe his bed, but when any thing is amiſſe in the hand, he muſt carry it in a ſcarfe. The patient muſt reſt twenty dayes, that is, untill he can firmely ſtand upon his feet.

Chap. LVIII.

Of the ſymptomes, and other accidents which may befall a broken or diſlocated member.

MAny things may befall broken or diſlocated members by the meanes of the fracture, or diſlocation; ſuch as are bruiſes, great paine, inflammation, a fever, impoſtume, gangrene, mortification, ulcer, *fiſtula*, and *atrophia*, all which require a skilfull and diligent Surgeon for their cure. A contuſion happens by the fall of ſome heavie thing upon the part, or by a fall from high, whence followes the effuſion of bloud poured out under the skinne: which if it be poured forth in great plenty, muſt be ſpeedily evacuated by ſcarification, and the part eaſed of that burden, leſt it ſhould thence gangrenate. And by how much the bloud ſhall appear more thick and the skin more denſe, by ſo much the ſcarification ſhall be made more deepe. You may alſo for the ſame purpoſe apply leaches.

Remedies for a contuſion.

What may happen by paine.

Concerning paine wee formerly ſaid, that it uſually happens by reaſon that the bones are moved out of their places, whence it happeneth that they become troubleſome to the muſcles and nerves by pricking and preſſing them. Hence enſue inflammations, as alſo impoſtumation and a feaver, oft times a gangrene, and in concluſion a mortification corrupting and rotting the bones; otherwhiles a ſinuous ulcer or *fiſtula*. But an *Atrophia* and leaneneſſe ariſeth by the ſloth and idleneſſe of the member decaying all the ſtrength therof, and by too ſtrait ligation intercepting the paſſages of the bloud otherwiſe ready to fall and flow thither.

Remedies for the leaneneſſe or *Atrophia* of any member.

Now the leanneſſe which is occaſioned by too ſtrait ligation receives cure by the ſlackening of the ligatures wherewith the member was bound. That which proceeds from idleneſſe is helped by moderate exerciſe, by extending, bending, lifting up and depreſſing the member, if ſo bee that he can away with exerciſe. Otherwiſe he ſhall uſe frictions and fomentations with warme water. The frictions muſt be moderate in hardeneſſe and gentleneſſe, in length and ſhortneſſe. The ſame moderation ſhall be obſerved in the warmneſs of the water, and in the time of fomenting. For too long fomenting reſolves the blood that is drawne. But that which is too little or ſhort a ſpace drawes little or nothing at all: after the fomentation, hot and emplaſtick medicines made of pitch, turpentine, *euphorbium*, pellitory of Spaine, ſulphur, and the like, ſhall bee applyed. They ſhall bee renued every day more often or ſeldome, as the thing it ſelfe ſhall ſeeme to require.

What meaſure to be uſed in fomenting.

A dropax.

Binding of the ſound part oppoſite to the emaciated.

Theſe medicines are termed *Dropaces*; whoſe forme is thus. ℞ *picis nigræ, ammoniaci, bdelii, gummi elemi in aqua vitæ diſſolutorum an.* ℥ii. *olei laurini* ℥i. *pulveris piperis, Zinziberis, granorum paradiſi, baccarum lauri et juniperi, an.* ʒii *fiat emplaſtrum ſecundum artem, extendatur ſuper alutam.* It is alſo good to binde about the oppoſite ſound part with a ligature, yet without pain; as if the right arme ſhall decay for want of nouriſhment, the left ſhall bee bound, beginning your ligation at the hand, and continuing it to the Arme-pit. If this miſchance ſhall ſeaze upon the right leg, then the left ſhall be ſwathed up from the ſole of the foote to the groine. For thus a great portion of the bloud is forced back into the *vena cava*, or hollow veine, and from this being diſtended and over full, into the part affected and gaping with the veſſels almoſt empty; beſides alſo it is convenient to keepe the ſound part in reſt, that ſo it may draw the leſſe nouriſhment, and by that meanes there will bee more ſtore to refreſh the weake part.

How to bind up the emaciated part.

Some wiſh alſo to bind up the decaying member with moderate ligation; for thus, ſay they, the bloud is drawne thither; for when as wee intend to let blood by opening a veine with a lancet, we bind the arme. Alſo it is good to dip it into water ſomewhat more than warme, and hold it there untill it grow red and ſwell; for thus bloud is drawne into the veines, as they find, which uſe to draw blood of the *ſaphena* and *ſalvatella*. Now if, when as theſe things and the like bee done, the lame part grow hot, red and ſwollen, then know that health is to be hoped for; but if the contrary happen, the caſe is deſperate, wherefore you need attempt nothing further.

Signes that an *Atrophia* is cureable.

Furthermore, there is ſometimes hardneſſe left in the joints, after fractures and diſlocations are reſtored. It is fit to ſoften this, by reſolving the conteined humor by fomentations, liniments, cataplaſmes, emplaſters made of the roots of Marſh-mallowes, briony, lillies, line ſeed, fenugreek ſeed, and the like, and alſo of gums diſſolved in ſtrong vineger, as *Ammoniacum, bdelium, opopanax, labdanum, ſagapenum, ſtyrax liquida*, and *Adeps anſerinus, gallinaceus, humanus, oleum liliorum*, and the like. Alſo you muſt wiſh the patient to move the part ever now and then, every day, yet ſo, that it be not painefull to him, that ſo the pent up humour may grow hot, bee attenuated, and at length diſcuſſed, and laſtly, the part it ſelfe reſtored as farre as art can perform it; for oft times it cannot be helped any thing at all. For if the member be weake and lame by reaſon that the fracture happened neere the joint, for the reſidue of his life the motion thereof uſeth to bee painefull and difficult, and oft times none at all, eſpecially if the *Callus* which grows there be ſomewhat thick and great; and laſtly, if the joint it ſelfe ſhall bee contuſed and broken by the ſtroake, as it ofttimes happens in wounds made by Gun-ſhot.

The End of the ſixteenth Booke.

OF DIVERS OTHER PRETERNATURALL AFFECTS, WHOSE CURE IS COMMONLY PERFORMED BY SURGERY.

THE SEVENTEENTH BOOKE.

CHAP. I.

Of an Alopecia, *or the falling away of the haires of the head.*

AN *Alopecia* is the falling away of the haire of the head, and ſometimes alſo of the eye-browes, chin and other parts; the French commonly call it the *Pelade*. Phiſicians terme it the *Alopecia*, for that old Foxes ſubject, by reaſon of their age, to have the ſcab, are troubled oft times with this diſeaſe. This affect is cauſed either through defect of nouriſhment fit to nouriſh the haires, as in old age through want of the radicall humidity, or by the corruption of the alimentary matter of the ſame, as after long fevers, in the *Lues venerea*, leproſie, the corruption of the whole body and all the humours, whence followeth a corruption of the vapours and fuliginous excrements; or elſe by the vitious conſtitution of the pores in the skin in rarity, and conſtriction or denſity, as by the too much uſe of hot oyntments made for colouring the hair, or ſuch as are uſed to take off haire, therefore called *Depilatoria*, or by the burning of the skin, or loſſe thereof, having a ſcarre in ſtead thereof, by reaſon of whoſe denſity the haire cannot ſpring out, as by too much laxity the fuliginous matter of the haire ſtayes not, but preſenly vaniſheth away. The *Alopecia* which comes by old age, a conſumption, burne, baldneſſe, leproſie and a ſcald head, is uncurable: that which admits of cure, the cauſe being taken away, is helped. Wherefore, if it proceed from the corruption of humours, let a Phiſician bee called, who as hee ſhall thinke it fit, ſhall appoint diet, purging and phlebotomie. Then the Surgeon ſhall ſhave off that haire which is remaining, and ſhall firſt uſe reſolving fomentations, apply Leaches and Horns to digeſt the vicious humour which is under the skin, then ſhall he waſh the head to take away the filth with a lye wherein the roots of Orris and Aloes have been boyled. Laſtly, hee ſhall uſe both attractive fomentations and medicines for to draw forth the humour which is become laudable in the whole body by the benefit of diet fitly appointed. But if the *Alopecia* ſhall happen through defect of nouriſhment, the part ſhall bee rubbed ſo long

Gal. c. 2. lib. 1. de comp. med. ſecun. locos.

The cauſe.

What *Alopecia* uncurable. What curable, and how.

with a courſe linnen cloth, or a figge leafe, or onions, untill it waxe red; beſides alſo the skin ſhall bee pricked in many places with a needle, and then ointments applied made of *Labdanum*, pigeons dung, ſtaviſager, oile of bayes, turpentine and waxe, to draw the bloud and matter of the haires. If the haire be loſt by the *Lues venerea*, the patient ſhall be annointed with quickſilver to ſufficient ſalivation. To conclude, as the cauſes of this diſeaſe ſhall be, ſo muſt the remdies be fitted which are uſed.

CHAP. II.

Of the Tinea, *or ſcalde Head.*

Lib.1.de comp. med.ſect.locos.

Cap.8.lib.citati.

The cure.

For a ſcaly ſcall.

An oyntment for a ſcalled head.

THE *Tinea* (let me ſo terme it in Latine, whilſt a fitter word may be found) or a ſcald head, is a diſeaſe poſſeſſing the muſculous skin of the head or the hairy ſcalpe, and eating thereinto like a moth. There are three differences thereof, the firſt is called by *Galen* ſcaly or branlike, for that whilſt it is ſcratched it caſts many branlike ſcales: ſome Practitioners terme it a dry ſcall, becauſe of the great aduſtion of the humour cauſing it. Another is called *ficoſa*, a fig-like ſcall, becauſe when it is diſpoyled of the cruſt or ſcab which is yellow, there appeare graines of quick and red fleſh, like to the inner ſeeds or graines of figges, and caſting out a bloudy matter. *Galen* names the third *Achor*, and it is alſo vulgarly termed the corroſive or ulcerous ſcall, for that the many ulcers wherewith it abounds are open with many ſmall holes flowing with liquid *ſanies* like the waſhing of fleſh, ſtinking, corrupt and carrion-like, ſomewhiles livid, ſomewhiles yellowiſh. Theſe holes, if they be ſomewhat larger, make another difference which is called *Cerion* or *Favoſa* (that is, like a hony combe) becauſe as *Galen* thinks, the matter which floweth from theſe, reſembleth hony in colour and conſiſtence. They all proceed of an humour which is more or leſſe vicious, for a leſſe corrupt humour cauſeth a ſcaly, a more corrupt, the fig-like, but the moſt corrupt produceth the ulcerous. If it ſhall happen to an infant by reaſon of the fault and contagion of the nurſe, or elſe preſently after it is borne, it ſcarce admits of cure; neither muſt we attempt that before the child come to that age, that he may be able to endure the cure & medicines. But you may in the meane while apply the leaves of Colworts or beets beſmeared with freſh butter, or other gentle medicine having a faculty to mollifie and open the paſſage for the ſhut up matter. Thoſe who are of ſufficient age to away with medicines, may bleed, purge, bathe, according to art by the advice of a Phiſician. For locall medicines in a ſcaly ſcall, ſoftning and diſcuſſing fomentations ſhall bee appointed, made of the roots of marſh-Mallowes, Lillies, Docks, Sorrell boyled in lye with a little vineger added thereto. The head ſhall bee twice in a day fomented with ſuch a decoction, and on the ſixth day the haire being ſhaven off, it ſhall bee ſcarified, and then leaches and hornes put to it ſo ſcarified. Then it ſhall be forthwith annoynted with oyle of ſtaviſager mixed with blacke ſope, both to draw & repreſſe the malignity of the humour impact in the part. You may alſo uſe the following medicine even to the perfect cure of the diſeaſe, as that which is much commended in this kind of diſeaſe by *Vigo*, *Gordonius*, and *Guido*; it is thus made. ℞. *elleb albi & nigri, attrament. auripigmenti, lithargyri auri, calcis vivæ, vitriol. alum. galla. fulig. ciner. fæcis vini uſti, an* ℥ ß. *argenti vivi extincti*, ℥iii *æruginis æris* ℥ii. *fiat pulvis qui incorporetur cum ſucco boraginis, ſcabioſæ, fumariæ, oxylapathi, aceti, an. quart.* i. *olei antiqui lib.*i. *bulliant uſque ad conſumpt. ſuccorum, in fine decoctionis cineres ponantur, addendo picis liquidæ* ℥ ß. *ceræ quantum ſufficit, fiat unguentum*: Theſe authors teſtifie that this will heale any kind of ſcall. Certainely none can diſallow of it who well conſidereth the engredients and compoſure thereof.

The cure of a cruſty ſcall.

A poultis of Creſſes.

A cruſty alſo or fig-like ſcall ſhall bee ſo long fomented with the preſcribed fomentation, untill the cruſts or ſcabs fall off, yet there is nothing ſo good and effectuall as Creſſes beaten or tryed with hogs ſuet. For it will make it fall off in the ſpace of foure and twenty houres, beſides, if it be continued it will heale them throughly, as I have knowne by experience, and reaſon alſo ſtands therewith; for according to

Lib.7.ſimpl.

Galen, Creſſes are hot and dry. When the cruſts ſhall bee fallen away, the parts affected ſhall bee annoynted with the formerly preſcribed ointment. I have cured many with a little oyle of vitrioll, and ſometimes alſo with *Ægyptiacum* made ſomewhat more ſtrong than ordinary. But if the root of the haires appeare rotten, they ſhall bee plucked out one by one; yet if ſuch putrefaction ſhall poſſeſſe the whole hairy ſcalpe, and trouble all the roots of the haire, that you may plucke them out the more readily, & with leſſe paine, you may beſmeare a cotten cloth on the rougher ſide with this following medicine. ℞. *picis nigra* ℥vi. *picis reſ.* ℥ii *pul. viridis æris, & vitriol. rom. an.* ℥i. *vel* ℥ß. *ſulphur. viv.* ʒß. *coquantur omnia ſimul in aceti acerrimi quantitate ſufficiente, fiat medicamentum ad uſum:* let it be applyed to the head, and remaine on for two dayes; then let it bee quickly and forcibly plucked away againſt the haire, that ſo the haires ſticking to the plaiſter may by that meanes be plucked away therewith: you ſhall uſe this medicine ſo long as need ſhall ſeem to require.

A plaiſter to pluck away the haire at once.

The cure of an ulcerous ſcall.

For the third kind of ſcall which is termed a Corroſive or ulcerous, the firſt indication is to cleanſe the ulcers with this following ointment. ℞. *unguenti enulati cum mercurio duplicato, ægyptiaci, an.* ℥iii. *vitriol. albi in pulverem redacti* ʒi. *incorporentur ſimul, fiat unguentum ad uſum*; alſo you may uſe the formerly deſcribed ointment. But if any paine or other accident fall out, you muſt withſtand it by the aſſiſtance and direction of ſome good Phiſitian; verily theſe following medicines againſt all kinds of Scalls have been found out by reaſon, and approved by uſe. ℞. *Camphur.* ℥ß. *alum. roch. vitriol. vir. æris, ſulph. vivi, fulig. forn. an.* ʒvi. *olei amygd. dulcium & axungiæ porci, an.* ʒii. *incorporentur ſimul in mortario, fiat unguentum.* Some take the dung which lyeth rotting in a ſheep-fold; they uſe that which is liquid, & rub it upon the ulcerated places, & lay a double cloth dipped in that liquor upon it. But if the patient cannot be cured with all theſe medicines, & that you find his body in ſome parts therof troubled in like ſort with cruſty ulcers, I would wiſh that his head might be anointed with an ointment made of *Axungia, argentum vivum*, & a little *Sulphur*, & then fit ſom *emplaſtrum Vigonis cum mercurio* into the faſhion of a cap; alſo ſome plaiſters of the ſame may be applyed to the ſhoulders, thighs and legs, and ſo let him be kept in a very warme chamber, and all things done as if he had the *Lues venerea*. This kinde of cure was firſt (that I know of) attempted by *Simon Blanch* the Kings Surgeon, upon a certaine young man, when as he in vaine had diligently tryed all other uſuall medicines. A ſcalled head oft-times appeareth very loathſome to the eye, caſting forth virulent and ſtinking *ſanies*; at the firſt it is hardly cured, but being old, far more difficultly. For divers times it breaketh out afreſh, when you thinke it kild, by reaſon of the impreſſion of the maligne putrefaction remaining in the part, which wholly corrupts the temper thereof. Moreover, oft-times being healed, it hath left an *Alopecia* behind it, a great ſhame to the Surgeons. Which is the reaſon, that moſt of them judge it beſt to leave the cure thereof, to Empericks and women.

A contumacious ſcall muſt be cured as we cure the *Lues Venerea*.

CHAP. III.

Of the Vertigo, *or Giddineſſe.*

What the *Vertigo* is, and the cauſes thereof.

THE *Vertigo* is a ſudden darkening of the eyes and ſight by a vaporous & hot ſpirit which aſcendeth to the head by the ſleepy arteryes, and fils the braine, diſturbing the humours and ſpirits which are conteyned there, & toſſing them unequally, as if one ran round, or had drunk too much wine. This hot ſpirit oft-times riſeth from the heart upwards by the internall ſleepy arteryes to the *Rete mirabile*, or wonderfull net; otherwhiles it is generated in the brain, its ſelfe being more hot than is fitting; alſo it oft-times ariſeth from the ſtomack, ſpleen, liver and other entrals being too hot. The ſigne of this diſeaſe is the ſudden darkening of the ſight, and the cloſing up as it were of the eyes, the body being lightly turned about, or by looking upon wheeles running round, or whirle pits in waters,

The ſignes.

Lib.6.

A criticall *Vertigo.*

ters, or by looking downe any deepe or ſteep places. If the originall of the diſeaſe proceed from the braine, the patients are troubled with the head-ach, heavineſſe of the head, and noyſe in the eares, and oft-times they loſe their ſmell. *Paulus Ægineta* for the cure bids us to open the arteries of the temples. But if the matter of the diſeaſe ariſe from ſome other place, as from ſome of the lower entrals, ſuch opening of an artery little availeth. Wherefore then ſome skilfull Phiſitian muſt be conſulted with, who may give directions for phlebotomie, if the original of the diſeaſe proceed from the heat of the entrals; by purging, if occaſioned by the fouleneſſe of the ſtomack. But if ſuch a *Vertigo* be a criticall ſymptome of ſome acute diſeaſe affecting the *Criſis* by vomit or bleeding, then the whole buſineſſe of freeing the patient thereof muſt be committed to nature.

CHAP: IV.

Of the Hemicrania, *or Megrim.*

The differences.

In what kind of Megrim the opening of an Artery is good.

A hiſtory.

THE Megrim is properly a diſeaſe affecting the one ſide of the head, right, or left. It ſometimes paſſeth no higher than the temporall muſcles, otherwhiles it reacheth to the toppe of the crowne. The cauſe of ſuch paine proceedeth eyther from the veynes and externall arteryes, or from the *meninges*, or from the very ſubſtance of the braine, or from the *pericranium*, or the hairy ſcalpe covering the *pericranium*, or laſty, from putride vapours ariſing to the head from the ventricle, wombe, or other inferiour member. Yet an externall cauſe may bring this affect, to wit, the too hot or cold conſtitution of the encompaſſing ayre, drunkenneſſe, gluttony, the uſe of hot and vaporous meates, ſome noyſome vapour or ſmoake, as of Antimony, quick-ſilver, or the like, drawne up by the noſe, which is the reaſon that Goldſmythes, and ſuch as gilde mettals are commonly troubled with this diſeaſe. But whence ſoever the cauſe of the evill proceedeth, it is either a ſimple diſtemper, or with matter; with matter, I ſay, which againe is either ſimple or compound. Now, this affect is either alone, or accompanied with other affects, as inflammation and tenſion. The heavineſſe of head argues plenty of humour; pricking, beating and tenſion ſhewes that there is plenty of vapours mixed with the humours, and ſhut up in the nervous, arterious, or membranous body of the head. If the paine proceed from the inflamed *meninges*, a fever followeth thereon, eſpecially, if the humour cauſing paine doe putrefie. If the paine be ſuperficiary, it is ſeated in the *pericranium*. If profound, deepe and piercing to the botome of the eyes, it is an argument that the *meninges* are affected, and a feaver enſues, if there be inflammation, and the matter putrefie; and then oft-times the tormenting paine is ſo great and grievous, that the patient is affraid to have his head touched, if it be but with your finger, neither can hee away with any noiſe, or ſmall murmuring, nor light, nor ſmels however ſweet, no nor the fume of Vine. The paine is ſometimes continuall, otherwhiles by fits. If the cauſe of the pain proceed from hot, thin & vaporous bloud, which will yeeld to no medicines, a very neceſſary, profitable & ſpeedy remedy may be had by opening an artery in the temples, whether the diſeaſe proceed from the internall or externall veſſels. For, hence alwayes enſueth an evacuation of the conjunct matter, bloud and ſpirits. I have experimented this in many, but eſpecially in the Prince de la *Roche-ſur-you*. His Phyſitians, when hee was troubled with this grievous Megrim, were *Chaplaine*, the Kings, and *Caſtellane*, the Queenes chiefe Phiſitians, and *Lewes Duret*, who notwithſtanding could helpe him nothing by bloud-letting, cupping, bathes, frictions, diet or any other kind of remedy either taken inwardly or applyed outwardly. I being called, ſaid, that there was onely hope one way to recover his health, which was to open the artery of the temple in the ſame ſide that the paine was; for I thought it probable, that the cauſe of his pain was not contained in the veins, but in the arteries, in which caſe by the teſtimony of the ancients, there was nothing better than the opening or bleeding of an artery, whereof I had made tryall upon my ſelfe to my great good. When as the Phyſitians had approved of this my advice, I preſently betake my ſelfe to the work, and chooſe out the artery in the pained temple; which was both the more ſwolne and beat more vehemently than the reſt. I open this, as wee uſe to doe in the bleeding of a veine, with one inciſion, and take more than two ſawcers of blood flying out with great violence, and leaping; the paine preſently ceaſed, neither did it ever moleſt him againe. Yet this opening of an Artery is ſuſpected by many, for that it is troubleſome to ſtay the guſhing forth bloud, and cicatrize the place, by reaſon of the denſity, hardneſſe, and continuall pulſation of the artery, and laſtly, for that when it is cicatrized there may be danger of an *Aneuriſma*. Wherefore they thinke it better firſt to divide the skin, then to ſeparate the artery from all the adjacent particles, and then to binde it in two places, and laſtly divide it, as we have formerly told you muſt be done in *Varices*. But this is the opinion of men who fear all things where there is no cauſe; for I have learnt by frequent experience that the apertion of an artery, which is performed with a Lancet, as wee doe in opening a veine, is not at all dangerous; and the conſolidation or healing is ſomewhat ſlower than in a veine, but yet will bee done at length, but that no flux of bloud will happen, if ſo bee that the ligation be fitly performed, and remaine ſo for foure dayes with fitting pledgets.

No danger in opening an artery.

CHAP. V.

Of certaine affects of the eyes, and firſt of ſtaying up the upper eye-lidde when it is too laxe.

OF the diſeaſes which befall the eies, ſome poſſeſs the whole ſubſtance thereof, as the *Ophthalmia*, a *Phlegmon* therof: others are proper and peculiar to ſome parts thereof, as that which is termed *Gutta ſerena* to the opticke nerve. Whence *Galen* made a threefold difference of the diſeaſes of the eyes, as that ſome happened to the eye by hurting or offending the chiefe organ thereof, that is, the cryſtalline humour; others by hindering the animall faculty, the chiefe cauſer of ſight, from entring into them; and laſtly, other ſome by offending the parts ſubſervient to the prime organ or inſtrument. Now of all theſe diſeaſes, the eye hath ſome of them common with the other parts of the body, ſuch as are an ulcer, wound, *phlegmon*, contuſion and the like: other ſome are peculiar and proper to the eye, ſuch as are the *Ægilops*, *Cataracta*, *Glaucoma*, and divers others of this kinde. Some have their upper eie-lid fall down, by reaſon that the upper skin thereof is relaxed more than is ſufficient to cover the eye, the griſtle in the meane while not relaxing it ſelfe together therewith. Hence proceeds a double trouble; the firſt, for that the eye cannot bee eaſily opened; the other, becauſe the haires of the relaxed eye-lid run in towards the eye, and become troubleſome thereto by pricking it. The cauſe of ſuch relaxation is either a particular palſie of that part, which is frequent in old people, or the defluxion or falling downe of a watriſh humour, and that not acride or biting; which appeares by this, that thoſe who are thus affected have a ranke of haires growing under the naturall ranke, by reaſon of the aboundance of heaped up humour, as it is moſt probable. For thus a wet and mariſh ground hath the greateſt plenty of graſſe. Now if this ſame humour were acride, it would cauſe an itching, and conſequently become troubleſome to the patient, and it would alſo fret in ſunder and deſtroy the roots of the other haires, ſo farre it is from yeelding matter for the preternaturall generation of new. It is fit, before you doe any thing for the cure, that you marke with inke the portion thereof which is ſuperfluous, and therefore to be cut away, leſt if you ſhould cut off more than is requiſite, the eye-lid ſhould remaine turned up, and ſo cauſe another kinde of affect, which the ancients have called *Ectropion*. Then the eye being covered, take and lift up with your fingers the middle part of the skin of the eye-lid, not taking hold of the griſtle beneath it, and then cut it athwart, taking away juſt ſo much

Differences.

Paul. Ægin. lib. 6. cap. 6.

The cauſe.

The cure.

as ſhall be neceſſary to make it as it were naturall; laſtly, joine the lips of the wound together with a ſimple ſuture of three or foure ſtiches, that ſo it may bee cicatrized; for the cicatrization reſtraines the eie-lid from falling downe ſo looſly, at leaſt ſome part thereof being taken away. There ought to be ſome meaſure, and heed taken in the amputation, otherwiſe you muſt neceſſarily run into the one or other inconvenience, as if too much be cut away, then the eye will not bee covered, if too little, then you have done nothing, and the patient is troubled to no purpoſe. If there ſhall bee many haires growne preternaturally, you ſhall plucke them away with an inſtrument made for the ſame purpoſe; then their roots ſhall be burned with a gentle cautery, the eye being left untoucht, for a ſcar preſently ariſing will hinder them from growing againe.

CHAP. VI.

Of Lagophthalmus, *or the Hare eye.*

Paulus Ægin. lib.6.cap. 10.

SUch as have their eie-lids too ſhort, ſleep with their eyes open, for that they cannot be covered by the too ſhort skin of the eye-lids: the Greekes terme this affect, *Lagophthalmos*. The cauſe is either internall or externall: internall, as by a Carbuncle, Impoſtume, or Ulcer: externall, as by a wound made by a ſword, burn, fall, & the like. If this miſhap proceed by reaſon of a cicatrization, it is cureable, if ſo that the ſhort eye-lid be of an indifferent thickneſſe. But if it have bin from the firſt conformation, or by ſome other meanes, whereby much of the ſubſtance is loſt, as that which happens by burning and a carbuncle, then it is uncureable. For the cure, you ſhall uſe relaxing and emollient fomentations, then the skinne ſhall be divided above the whole ſcarre, in figure of an halfe moon, with the hornes looking downewards. Then the edges of the inciſion ſhall bee opened, and lint put into the middle therof, that ſo it may hinder the lips from joyning together againe. Then ſhall you apply a plaſter upon the lint, and ſo bind up the part with a fitting ligature that may ſomewhat preſſe upon the whole eye, leſt it ſhould lift it ſelfe ſomewhat upwards againe, and ſo returne into its ancient, but not naturall figure. But in cutting the skinne, you muſt take care that your inciſion harme not the griſtle; for if it be cut, the eie-lid falls downe, neither can it be afterwards lifted up. But now for the lower eye-lid: it is ſubject to ſundry diſeaſes, amongſt which there is one which anſwereth in proportion to that, which we late mentioned, which is, when as it is lifted upwards little or nothing, but hangs and gapes, and cannot bee joyned with the upper, and therefore it doth not cover the eye, which affect is familiar to old people; it is called *Ectropion*, and it may be helped by the means formerly delivered.

The cure.

Ectropion, or the turning up or out of the Eye-lid.

CHAP. VII.

Of the Chalazion, *or Haile-ſtone, and the* Hordeolum *or Barly-corne of the eye-lids.*

Paul. cap. 16. lib. 6.

THe *Chalazion* is a round and cleere pimple which growes upon the upper eie-lid, it is alſo moveable and may be ſtirred this way and that way with your fingers: the Latines call it *Grando*, for that it reſembles a Hail-ſtone. Another pimple not much unlike this growes ſomtimes upon the verges of the eye-lids above the place of the haires. It is termed *Hordeolum*, by reaſon of the ſimilitude it hath with a barly corne. The matter of theſe is contained in its proper ciſt or skin, and therefore is hardly brought to ſuppuration. At the firſt beginning it may be reſolved and diſcuſſed. But when as it is once growne and concrete into a plaſter or ſtone-like hardneſſe, it is ſcarce cureable. Wherefore it is beſt to performe

The cure.

performe the cure by opening them, that ſo the contained matter may flow, or bee preſſed forth. If the pimple or ſwelling bee ſmall, then thruſt it through with a needle and thread, and leave the thread therein of ſuch length that you may faſten the ends thereof with a little of the emplaſter called *Gratia Dei* like glew to the forehead, if it be on the upper eye-lid; or to the cheeks, if on the lower. You muſt draw through a freſh one every ſecond day, as is uſually done in chirurgicall ſetons. For thus at length the ſwelling will be deſtroyed and made plaine.

CHAP. VIII.

Of the Hydatis *or Fatneſſe of the Eye-lids.*

What *Hydatis* is.

THe *Hydatis* is a certaine fatty ſubſtance like a peece of fat ſeated and lying under the ſkinne of the upper eye-lid. It is a diſeaſe incident to children, who are of a more humid nature: wherefore it is a ſoft and looſe tumour making the whole eye-lid, which it poſſeſſeth, œdematous; ſo that, as if depreſſed with a weight, it cannot be lifted up. It hath its name, for that it hath as it were a bladder diſtended with a whayiſh humour, which kinde of fault is obſerved by *Galen* in the liver. *Com. ad aphor. 55. ſect. 7.* Thoſe, who are thus affected, have their eyes looke red, and flow with teares, neither can they behold the ſun, or endure the light. The cure. The cure is performed by cutting off the ſuperfluous ſubſtance, not hurting the neighbouring parts; and then preſently put ſome ſalt into the place whence it was taken out (unleſs the vehemency of paine hinder) that ſo the place may bee dryed and ſtrengthened, and the reſt of the matter (if any ſuch be) may be conſumed, and hindred from growing againe. Laſtly, you ſhall cover the whole eye with the white of an Egge diſſolved in roſe-water, or ſome other repercuſſive.

CHAP. IX.

Of the Eye-lids faſtened or glewed together.

SOmetimes it commeth to paſſe that the upper eye-lid is glewed or faſtened to the under, ſo that the eye cannot be opened, or ſo that the one of them may ſticke or bee faſtened to the white coat of the eye, or to the horny. *Paulus cap. 15. lib. 6.* This fault is ſometimes drawne from the firſt originall, that is, by the default of the forming faculty in the wombe (for thus many infants are born with their fingers faſtened together, with their fundaments, privities and eares unperforated) the eye in all other reſpects being well compoſed. The cauſe. The cauſe of this affect ſomtimes proceeds from a wound, otherwhiles from a burn, ſcald or impoſtumation, as the breaking of the ſmall pox. It is cured by putting in a fit inſtrument, & ſo opening them; but with ſuch moderation, that you touch not the horny coat, for otherwiſe it would fall out. The cure. Therefore you muſt put the end or point of your probe under the eye-lids, and ſo lifting them up (that you hurt not the ſubſtance of the eie) divide them with a crooked inciſion knife.

The inciſion made, let the white of an egge beaten with ſome roſe-water be put into the eye; let the eye-lids be kept open, yea let the patient himſelf be carefull that he often turne it upwards, and lift it up with his fingers, not onely that the medicine may bee applyed to the ulcer, but alſo that they may not grow together againe. In the night time let a little pledget dipped in water, and that either ſimple, or wherein ſome vitrioll hath bin diſſolved, bee laid thereon. For thus you ſhall hinder the eye-lids from joyning together againe. Then on the third day the parts or edges of the eie-lids ſhall be touched with waters drying without biting or acrimony, that ſo they may be cicatrized. But if the eye-lid adhere to the horny coate at the *pupilla* or apple of the eye, the patient will either bee quite blind, or very ill of ſight. For the ſcarre which enſues will hinder the ſhapes of things from entring to the cryſtalline humour, and the viſive ſpirits from paſſing forth to the objects. For prognoſtickes, you may learne out of *Celſus*, that this cure is ſubject to a relapſe, ſo that it may bee ſhunned neither by diligence nor induſtry, but that the eye-lid will alwayes adhere and cleave to the eye.

A diſeaſe ſubject to relapſe.

Chap. X.

Of the itching of the Eye-lids.

MAny have their Eye-lids itch vehemently by reaſon of ſalt phlegme, which often times excoriating and exulcerating the parts themſelves, yeelds a *ſanies*, which joynes together the eye-lids in the night time as if they were glewed together, and maks them watry and bleared. This affect doth ſo torment the patients, that it oft times makes them require the Phyſitians helpe. Wherefore generall medicines being premiſed, the Ulcers ſhall be waſhed with the following *Collyrium.* ℞. *aquæ mellis in balneo mariæ deſtillatæ* ℥iii. *ſacchari candi.* ʒi. *aloës lotæ & in pollinem redactæ* ʒß. *fiat collyrium.* Which if it doe no good, you may uſe this which followes. ℞. *Ung. Ægyptiac.* ʒi. *diſſolve in aquæ plantaginis quantitate ſufficienti.* Let the ulcerated eie-lids be touchd with a ſoft linnen rag dipped therin, but with care that none therof fall upon the eye. But when the patient goes to bed, let him cauſe them to be anointed with the following ointment, very effectuall in this caſe. ℞. *axungiæ porci et butyri recentis, an.* ℥ß. *tuth. præpar.* ʒß. *antimon. in aquæ euphraſiæ præparati,* ℈ii. *camphoræ gra.* iiii. *miſce, et in mortario plumbeo ducantur per tres horas, conflatum inde unguentum, ſervetur in pyxide plumbea.* Some commend and uſe certaine waters fit to cleanſe, dry, binde, ſtrengthen, and abſolutely free the eye-lids from itching and redneſſe; of which this is one.

A detergent *collyrium.*

℞. *aquæ euphrag. fæniculi, chelidon. an* ℥ß. *ſarcocal. nutritæ* ℈ii. *vitriol. rom.* ʒi. *miſceantur ſimul & bulliant unica ebullitione; poſtea coletur liquor, & ſervetur ad uſum dictum.* Or elſe. ℞. *aquæ roſ. & vini alb. boni an.* ℥iiii. *tuth. præpar. aloës an.* ʒi. *flor. æris* ℈ii. *camphor. gra.* ii. Let them bee boyled according to art, and kept in a glaſſe to waſh the eye-lids. Or elſe, ℞. *vini albi* ℔ß. *ſalis com.* ʒi. let them be put into a cleane barbars baſon and covered, and kept there five or ſix dayes, and bee ſtirred once a day, and let the eye-lids bee touched with this liquor. Some wiſh that the patients urine be kept all night in a barbers baſon, and ſo the patients eie-lids be waſhed therwith. Verily in this affect we muſt not feare the uſe of acride medicines, for I once ſaw a woman of fifty yeares of age, who waſhed her eye-lids when they itched with the ſharpeſt vinegar ſhe could get, and affirmed that ſhe found better ſucceſſe of this than of any other medicine. *Vigo* preſcribes a water whoſe efficacy above other medicines in this affect, hee ſaith, hath bin proved; and that it is to bee eſteemed more worth than gold, the deſcription thereof is thus. ℞. *aq. roſ. vini albi odoriferi mediocris vinoſitatis an.* ℥iiii. *myrobalan. citrini trit.* ʒiß. *thuris* ʒii. *bulliant omnia ſimul uſque ad conſumptionem tertiæ partis; deinde immediatè addantur floris æris* ℈ii. *camph. gr.* ii. Let the liquor be kept in a glaſſe well ſtopped for the foreſaid uſe.

You need not feare to uſe acride medicines in the itching of the eye-lids.

Lib. 2. cap. 4. tract. 3.

Chap. XI.

Of Lippitudo, *or Bleare-eyes.*

THere are many whoſe eyes are never dry, but alwaies flow with a thinne, acrid and hot humour, which cauſeth roughneſſe, and upon ſmall occaſions inflammations, blear or blood-ſhot eies, and at length alſo *Strabiſmus* or ſqinting. *Lippitudo* is nothing elſe but a certaine white filth flowing from the eyes, which oft times agglutinates or joynes together the eye-lids. This diſeaſe often troubles all the life time, and is to be cured by no remedy: in ſome it

What *lippitudo* is.

is cureable. Such as have this diſeaſe from their infancy, are not to be cured, for it remaines with them till their dying day. For large heads, and ſuch as are repleate with acride or much excrementitious phlegme, ſcarce yeeld to medicines. There is much difference whether the phlegme flow downe by the internall veſſels under the ſcull, or by the externall which are betweene the skull and the skin, or by both. For if the internall veines caſt forth this matter, it will be difficultly cured if it bee cured at all. But if the externall veſſels caſt it forth, that cure is not unprofitable, which having uſed medicines reſpecting the whole body, applyes aſtringent medicines to the ſhaved crown, as *Empl. contra rupturam*, which may ſtreighten the veines, and as it were ſuſpend the phlegme, uſeth cupping, and commands frictions to bee made towards the hinde part of the head, and laſtly, maketh a Seton in the necke. There are ſome who cauterize the toppe of the crowne with a hot iron, even to the bone, ſo that it may caſt a ſcaile, thus to divert and ſtay the defluxion. For locall medicines, a *Collyrium* made with a good quantity of roſewater, with a little vitrioll diſſolved therein, may ſerve for all.

A *Collyrium* of vitrioll to ſtay the defluxions of the eyes.

CHAP. XII.

Of the Ophthalmia, *or inflammation of the Eyes.*

What *Ophthalmia* is, and the cauſes thereof.

AN *Ophthalmia* is an inflammation of the coate *Adnata* and conſequently of the whole eye, being troubleſome by the heate, redneſſe, beating, renitency, and laſtly paine. It hath its originall either by ſome primitive cauſe or occaſion, as a fall, ſtroake, duſt, or ſmall ſand flying into the eyes. For the eye is a ſmooth part, ſo that it is eaſily offended by rough things, as ſaith *Hippocrates, lib. de carnibus*. Or by an antecedent cauſe, as a defluxion falling upon the eyes. The ſignes follow the nature of the materiall cauſe, for from blood eſpecially cholerike and thin, it is full of heat, redneſſe and paine; from the ſame allayed with phlegme all of them are more remiſſe. But if a heavineſſe poſſeſs the whole head, the original of the diſeaſe proceeds therfrom. But if a hot pain trouble the forehead, the diſeaſe may be thought to proceed from ſome hot diſtemper of the *Dura mater*, or the *pericranium*; but if in the very time of the raging of the diſeaſe the patient vomit, the matter of the diſeaſe proceeds from the ſtomacke. But from whence ſoever it commeth there is ſcarce that paine of any part of the body, which may be compared to the paine of the inflamed eyes. Verily the greatneſſe of the inflammation hath forced the eyes out of their orbe, and broken them aſunder in divers. Therefore there is no part of Phyſicke more blazed abroad than for ſore eyes. For the cure, the Surgeon ſhall conſider and intend three things, diet, the evacuation of the antecedent and conjunct cauſe, and the overcomming it by topicke remedies. The diet ſhall bee moderate, eſchewing all things that may fill the head with vapours; and thoſe things uſed that by aſtriction may ſtrengthen the orifice of the ventricle, and prohibite the vapours from flying up to the head; the patient ſhall bee forbidden the uſe of wine, unleſſe peradventure the diſeaſe may proceed from a groſſe and viſcide humour, as *Galen* delivers it. The evacuation of the matter flowing into the eye, ſhall bee performed by purging medicines, phlebotomy in the arm, cupping the ſhoulders and neck with ſcarification, and without: and laſtly, by frictions, as the Phyſitian that hath undertaken the cure ſhall thinke it fit. *Galen* after univerſall remedies for old inflammations of the eyes, commends the opening of the veines and arteryes in the forehead and temples, becauſe for the moſt part the veſſels therabouts diſtended with acride, hot and vaporous blood, cauſe great & vehement paines in the eye.

Signes.

The cure.

Com. ad aphor. 31. ſect. 6.

Lib. 13. meth. cap. ult.

For the impugning of the conjunct cauſe, divers topick medicines ſhall be applyed, according to the four ſundry times or ſeaſons that every phlegmon uſually hath. For in the beginning, when as the acride matter flowes downe with much violence, repercuſſives doe much conduce: and tempred with reſolving medicines, are good alſo in the encreaſe. ℞. *aq. roſ. et plantag. an.* ʒß. *mucagin. gum. Tragacanth.* ʒii. *al-*

bum

A repercuſſive medicine.

Aſtringent emplaſters.

An anodine cataplaſme.

The efficacy of Bathes in pains of the eyes. *Ad aphor. ſect. 7.*

Detergent *Collyria.*

bum.ovi quod ſufficit, fiat collyrium, let it bee dropped warme into the eye, and let a double cloth dipped in the ſame *collyrium* bee put upon it. Or, ℞.*mucag. ſem. pſil. & cydon. extractæ in aq. plant. an.* ℥ß.*aq. ſolan. & lactis muliebris, an.* ℥i.*trochiſc. alb. rha.*℈i. *fiat collyrium*, uſe this like the former. The veins of the temples may be ſtreightened by the following medicine. ℞.*bol. arm. ſang. drac. & maſt. an.* ʒi.ß.*alb. ovi, aquæ roſ. & acet. an.* ℥i. *tereb. lot. & ol. cidon. an.* ℥i.ß.*fiat defenſivum.* You may alſo uſe *Ung. de Bolo, empl. diacal.* or *contra rupturam* diſſolved in oyle of myrtles, and a little vinegar. But if the bitterneſſe of the paine be intolerable, the following cataplaſme ſhall be applyed. ℞.*medul. pomor. ſub. ciner. coctorum.* ℥iii.*lactis muliebris* ℥ß. let it be applyed to the eye, the formerly preſcribed *collyrium* being firſt dropped in. Or, ℞.*mucag. ſem. pſil. & cidon. an.* ℥ß.*micæ panis albi in lacte infuſi,* ℥ii.*aquæ roſ.* ℥ß.*fiat cataplaſma.* The bloud of a turtle Dove, Pigeon or Hen drawne by opening a veine under the wings, dropped into the eye, aſſwageth paine. Baths are not onely anodine, but alſo ſtay the defluxion by diverting the matter thereof by ſweats; therefore *Galen* much commends them in ſuch defluxions of the eyes as come by fits. In the ſtate when as the paine is either quite taken away or aſſwaged, you may uſe the following medicines. ℞.*ſarcocol. in lacte muliebri nutritæ,* ʒi. *aloës lotæ in aq. roſar.* ℈ii. *trochiſ. alb. rha.* ʒß.*ſacchar cand.* ʒii.*aquæ roſ.* ℥iii. *fiat collyrium.* Or, ℞.*ſem. fæniculi, & fænug. an.* ʒii.*flo. chamæ. & melil. an.* m. ß. *coquantur in aq. com. ad* ℥iii. *colatura adde tuthiæ præp. & ſarcoc. nutritæ in lacte muliebri. an.* ʒi. ß.*ſacchari cand.* ℥ß. *fiat collyrium ut artis eſt.* In the declination the eye ſhall be fomented with a carminative decoction, and then this *collyrium* dropped thereinto. ℞.*ſarcoc. nutritæ* ʒii.*aloës & myrrh. an.* ʒi.*aq. roſ. & euphrag. an.* ℥ii.*fiat collyrium, ut artis eſt.*

Chap. XIII.

Of the Proptoſis, *that is, the falling or ſtarting forth of the eye, and of the* Phthiſis, *and* Chemoſis *of the ſame.*

The cauſe.

The cure.

THe Greekes call that affect *Proptoſis,* the Latines *procidentia* or *Exitus oculi,* when as the eye ſtands, and is caſt out of the orbe by the occaſion of a matter filling and lifting up the eye into a greater bigneſſe, and largeneſſe of ſubſtance. The cauſe of this diſeaſe is ſometimes externall, as by too violent ſtrayning to vomit, by hard labour in child-birth, by exceſſive and wondrous violent ſhouting, or crying out. It ſometimes happeneth that a great and cruell paine of the head, or the too ſtrait binding of the forehead and temples for the eaſing thereof, or the palſie of the muſcles of the eye, give beginning to this diſeaſe. Certainely ſometimes the eye is ſo much diſtended by the defluxion of humors, that it breakes inſunder, and the humours thereof are ſhed, and blindeneſſe enſues thereof, as I remember befell the ſiſter of *Lewis de Billy* merchant, dwelling at Paris near S. *Michael*'s bridg. The cure ſhall be diverſified according to the cauſes. Therefore univerſall medicines being premiſed, cupping glaſſes ſhalbe applyed to the originall of the ſpinall marrow, and the ſhoulders; as alſo cauteries, or Setons: the eye ſhall be preſſed or held downe with clothes doubled and ſteeped in an aſtringent decoction made of the juice of *Acacia,* red roſes, the leaves of poppy, henbane, roſes and pomegranate pills: of which things poultiſſes may bee made by addition of barly meale and the like.

The *Atrophia* of the eye.

The *Phthiſis* thereof. *Lib. 3. cap. 22.*

There is ſometimes to bee ſeene in the eye an affect contrary to this, and it is termed *Atrophia.* By this the whole ſubſtance of the eye growes lanke and decayes, and the apple it ſelfe becomes much leſſe. But if the conſumption and emaciation take hold of the pupill onely, the Greekes, by a peculiar name and different from the generall, terme it a *Phthiſis,* as *Paulus* teacheth. Contrary cauſes ſhall bee oppoſed to each affect; hot and attractive fomentations ſhall be applyed; frictions ſhall be uſed in the neighbouring parts, and laſtly all things ſhall be applyed which may without danger be uſed to attract the bloud and ſpirits into the parts.

There is another affect of the eye, of affinity to the *Proptoſis,* which by the Greeks

is

The *Chemoſis.* *Paulus li.3.cap.2.*

is termed *Chemoſis*. Now this is nothing elſe than when both the eye-lids are turned up by a great inflammation, ſo that they can ſcarce cover the eyes, and the white of the eye is lifted much higher up than the blacke. Sometimes the *Adnata* changing his wont, looketh red; beſides alſo, this affect may take its originall from externall cauſes, as a wound, contuſion and the like. But according to the variety of the cauſes, and the condition of the preſent affect fixed and remaining in the part, divers remedies ſhall be appointed.

CHAP. XIV.

Of the Ungula, or Web.

THE *Ungula, Pterygion* or Web is the growth of a certaine fibrous and membranous fleſh upon the upper coate of the eye called *Adnata*, ariſing more frequently in the bigger, but ſometimes in the leſſer corner towards the temples. When it is neglected, it covers not onely the *Adnata*, but alſo ſome portion of the *Cornea*, and comming to the pupill it ſelfe hurts the ſight thereof. Such a Web ſometimes adheres not at all to the *Adnata*, but is onely ſtretched over it from the corners of the eye, ſo that you may thruſt a probe betweene it and the *Adnata*: it is of ſeverall colours, ſomewhiles red, ſomewhiles yellow, ſomewhiles duskiſh, & otherwhiles white. It hath its originall either from externall cauſes, as a blow, fall, and the like; or from internall, as the defluxion of humours into the eyes. The *Ungula* which is inveterate, and that hath acquired much thickneſſe and breadth, and beſides doth difficultly adhere to the *Adnata*, is difficultly taken away, neither may it bee helped by medicines whereby ſcars in the eyes are extenuated. But that which covereth the whole pupill muſt not bee touched by the Surgeon, for being cut away, the ſcar which is left by its denſity hindereth the entrance of objects to the criſtalline humour, and the egreſſe of the animall ſpirit to them. But oftentimes it is accompanied with an inflammation of the eyes, a burning itching, weeping defluxion, and ſwelling of the eye-lids. That the cure may rightly and happily proceed, hee muſt firſt uſe a ſpare diet, purging medicines ſhall be given, and bloud taken away by opening a veine, eſpecially, if there be great inflammation. For particular remedies, this excreſcence ſhall be eaten away, or at leaſt kept from growth by dropping into the eye *collyrium* of vitrioll deſcribed in wounds of the eyes. But if that wee profit nothing by this meanes, it remaineth, that wee take it away with the hand after the following manner.

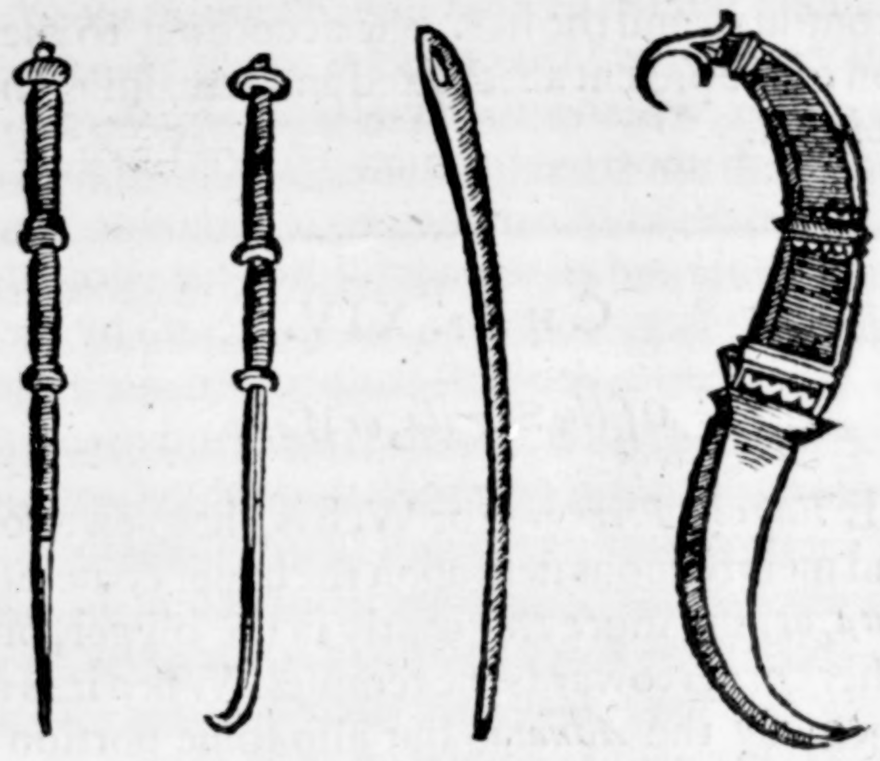
What Web curable, and what uncurable.

The cure.

The cutting of the Web.

You ſhall ſet the patient upon a forme or ſtoole, and make him leane much backe, and be ſo held firmely, that he may not fall nor ſtirre; then muſt you open his ſore eye, putting therein the *ſpeculum oculi* formerly deſcribed in treating of the wounds of this part, and then muſt you lift up the Web it ſelfe with a ſharpe little hook, with the point turned a little in, and put under the midſt of the Web; when you have lifted it a little up, thruſt a needle threaded with a ſmoth threed between it & the *Adnata*, then taking hold of the hooke, and the two ends of the threed drawne through with the needle, and lifting up the Web by them, you ſhall gently begin to ſeparate it from the ſubſtance of the eye lying there-under, beginning at the originall thereof with a crooked inciſion knife, and ſo proſecute it even to the end, yet ſo as you hurt no part of the *Adnata*, nor *Cornea*.

The figures of little hookes, a needle, and crooked inciſion knife.



Little Hookes. *A needle.* *A crooked inciſion knife.*

Then muſt it bee cut off with a paire ſiſſers, and the white of an egge beaten with ſome Roſe-water laid thereon, and often renewed. Afterwards the eye muſt every day be opened, leſt comming to cicatrization, the eye-lids ſhall be glewed together in that part whereas the Web is taken away, which alſo ſhall bee hindred by putting of common ſalte, ſage and cummin ſeeds into the eye, being firſt champed and chawed in the mouth. There are ſome who in ſtead of the crooked knife ſeparate the Web from the *Adnata* with a horſes haire, others do it with a gooſe quill made ready for the ſame purpoſe, taking heed that they hurt not the caruncle at the corner by the noſe, for it will follow if that you draw the Web away too violently; and if it be cut, there wil remain a hole, through which during the reſt of the life a weeping humour will continually flow, a diſeaſe by the Greekes termed *Rhyas*. If after the cutting, there be fear of inflammation, linnen rags moyſtned in repelling medicines, formerly preſcribed in wounds of the eye, ſhall bee layd thereupon.

CHAP. XV.

Of the Ægilops, fiſtula lachrimoſa, *or weeping Fiſtula of the eye.*

The uſe of the glandule at the greater corner of the eye.

The differences.

AT the greater corner of the eye there is a glandule, made for the receiving and contayning the moyſture which ſerveth for the lubricating and humecting the eye, leaſt it ſhould dry by continuall motion. This Glandule ſometimes by a ſanguine or pituitous defluxion falling violently from the brain, ſwels, impoſtumates & ulcerates with an ulcer, not ſeldome degenerating into a fiſtula, ſo that in ſucceſſe of time it rotteth the bone that lyeth under it: of ſuch fiſtulaes, ſome are open outwardly, and theſe uſually have their originall from a phlegmon; other ſome are inwardly, and thoſe are ſuch as at firſt ſwelled by the defluxion or congeſtion of a phlegmaticke matter, ſo that there appeareth no hole outwardly, but onely a tumor of the bigneſſe of a peaſe; this tumor being preſſed, floweth with a ſanious, ſerous and red, or otherwiſe with a white and viſcide matter, and that either by the corner of the eye, or by the inſide of the noſe. Some have this matter flowing continually, others have it onely monethly, which is proper alſo to ſome fiſtulaes. Such weeping fiſtulaes if they become old, cauſe an *Atrophia* of the eye, & ſometimes blindneſſe, & a ſtinking breath. Therefore wee muſt diligently and ſpeedily by phiſicall and chirurgicall meanes reſiſt the breeding diſeaſe. Wherefore, having uſed generall medicines, we muſt come to particulars. Therefore if the ulcer be not ſufficiently wide, it ſhall bee inlarged by putting tents of ſpunge

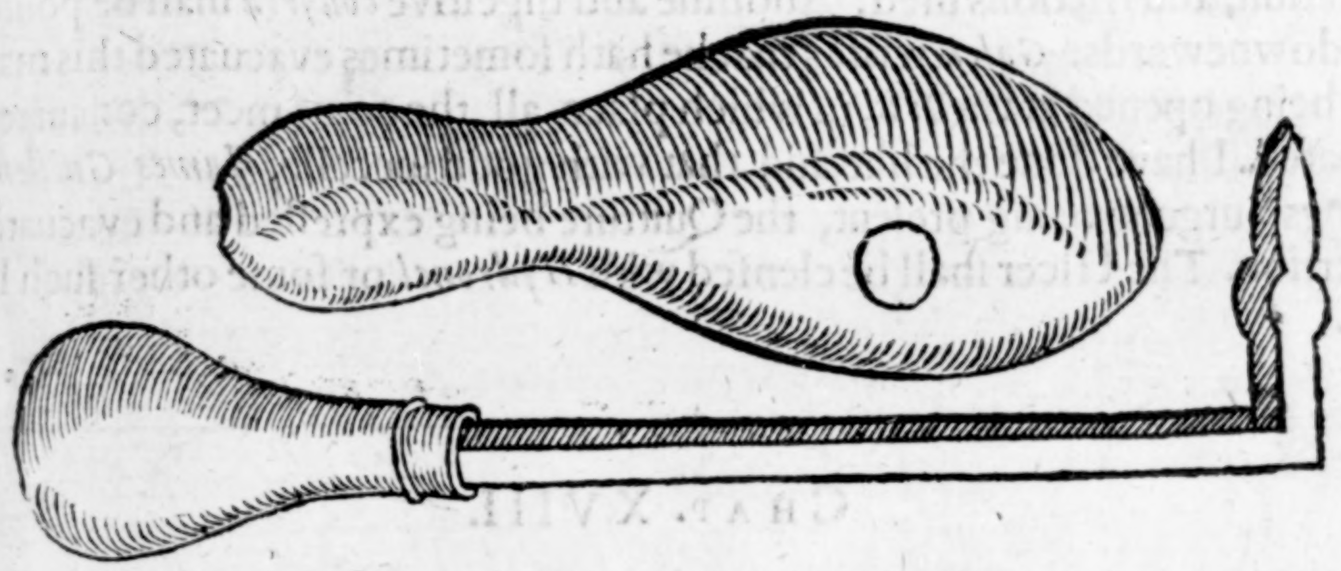
Periodicall and Typicall Fiſtulaes.

therein. The fleſh of the Glandule encreaſing more than is fit, ſhall be corrected by putting therein the cathæreticke pouders of Mercury, calcined vitrioll, or ſome *aqua fortis*, or oyle of vitrioll, and laſtly, by a potentiall cautery. If you cannot prevaile by theſe meanes, and that the bone begins to rot, and the patient bee ſtout hearted, then uſe an actuall cautery whoſe uſe is far more effectuall, ready, certaine and excellent than a potentiall cautery, as I have tryed in many with happy ſucceſſe. In my opinion it makes no matter, whether the cautery be of gold, ſilver or iron; for the efficacy it hath, proceedeth not from the matter, but from the fire. Yet if wee muſt religiouſly obſerve and make choiſe of mettals, I had rather have it of Iron, as that which hath a far more drying and aſtringent faculty than gold, for that the element of earth beareth the chiefe ſway thererein, as appeareth by the waters which flow through iron mines. Wherefore you ſhall cauſe to be made a triangular Iron, ſharpe at the end, that it may the more ſpeedily penetrate. And then the ſound eye and adjacent parts being well covered and defended, and the patients head firmely holden in ones hands, leſt the patient being frighted, ſtirre himſelfe in the very inſtant of the operation. But a plate of iron ſomewhat depreſſed in the midſt, for the cavity of the greater corner, ſhall be applyed and fitted to the pained eye. This plate ſhall be perforated that the hot Iron may paſſe thereby to the fiſtula lying thereunder, and ſo may onely touch that which is to be cauterized.

The cure.

The efficacy of an actuall cautery.

The figure of a cautery, and a plate with a hole therein.



After the bone is burnt with the cautery, a *collyrium* made of the whites of egges beaten in plantaine and nightſhade waters muſt be poured into the hole it ſelfe, the eye and all the neighbouring parts; but the patient ſhall bee layd in bed, with his head ſomewhat high, and the *collyrium* ſhall be renued as often and as ſoone as you ſhall perceive it to grow dry. Then the fall of the Eſchar ſhall be procured by annointing it with freſh butter; when it is fallen away, the ulcer ſhall be cleanſed, filled with fleſh, and laſtly cicatrized.

Things to be done after the cauterizing.

Chap. XVI.

Of the Staphiloma, *or grape-like ſwelling.*

STaphiloma is the ſwelling of the horney and grape-like coat, bred through the occaſion of an humor flowing downe upon the eye, or by an ulcer, the horney coat being relaxed, or thruſt forth by the violence of the puſtule generated beneath. It in ſhape reſembleth a grape, whence the Greekes ſtile it *Staphyloma*. This tumor is ſometimes blackiſh, otherwhiles whitiſh. For if the horney coat bee ulcerated and fretted in ſunder, ſo that the grapie coat ſhew it ſelfe, and fall through the ulcer, then the *Staphyloma* will looke blacke like a ripe grape, for the utter part of the *Uvea* is blackiſh. But if the *Cornea* bee onely relaxed and not broken, then the ſwelling appeares of a whitiſh colour like an unripe grape. The Ancients have made many kindes or differences thereof. For if it bee but a ſmall hole of the broken

What a *Staphiloma* is, and the cauſes thereof.

Paulus and *Aetius*.

broken *Cornea* by which the *Uvea* ſheweth or thruſteth forth its ſelfe, they then termed it *Myocephalon*, that is, like the head of a fly. But if the hole were large, and alſo callous, they called it *Clavus*, or a naile; If it were yet larger, then they termed it *Acinus*, or a grape. But in what ſhape or figure ſoever this diſeaſe ſhall happen, it bringeth two diſcommodities, the one of blindneſſe, the other of deformity. Wherefore here is no place for ſurgery to reſtore the ſight, which is already loſt, but onely to amend the deformity of the eie; which is by cutting off that which is prominent. But you muſt take heed that you cut away no more than is fit, for ſo there would be danger of pouring out the humors of the eye.

Every *Staphiloma* infers incurable blindneſs.

Chap. XVII.

Of the Hypopyon, *that is, the ſuppurate or putrefied eye.*

The cauſe.

Pus, or Quitture is ſometimes gathered between the horny and grapy coate from an internall, or externall cauſe; From an internall, as by a great defluxion, and oft times after an inflammation, but externally, by a ſtroake, through which occaſion a veine being opened hath poured forth blood thither, which may preſently be turned into Quitture. For the cure, univerſall remedies being premiſed, cupping-glaſſes ſhall bee applied, with ſcarification, and frictions uſed. Anodine and digeſtive *collyria* ſhall be poured from above downewards. *Galen* writes that he hath ſometimes evacuated this matter, the *Cornea* being opened at the *Iris*, in which place all the coats meet, concurre and are terminated. I have done the like, and that with good ſucceſſe, *James Guillemeau* the the Kings Surgeon being preſent, the Quitture being expreſſed and evacuated after the apertion. The Ulcer ſhall be clenſed with *Hydromel*, or ſome other ſuch like medicine.

Lib. 14. method. cap. ult.

Chap. XVIII.

Of the Mydriaſis, *or dilatation of the pupill of the eye.*

The cauſe.

M*ydriaſis* is the dilatation of the pupill of the eye; and this happeneth either by nature or chance: the former proceedeth from the default of the firſt conformation, neither is it curable; but the other is of two ſorts; for it is either from an internall cauſe, the off-ſpring of an humour flowing downe from the braine, wherefore Phiſicall meanes muſt bee uſed for the cure thereof. Now that which commeth by any externall occaſion, as a blow, fall or contuſion upon the eye, muſt bee cured by preſently applying repercuſſive and anodyne medicines; the defluxion muſt be hindred by diet skilfully appointed, phlebotomie, cupping, ſcarification, frictions, and other remedies which may ſeeme convenient. Then muſt you come to reſolving medicines; as the bloud of a Turtle Dove, Pigeon, or Chicken reeking hot out of the veine, being poured upon the eye and the neighbouring parts. Then this following cataplaſme ſhall be applyed thereto. ℞. *farinæ fabar. & hordei an.* ℥iiii. *ol. roſar. & myrtillor. an.* ℥i. ß. *pul. ireos flor.* ʒii. *cum ſapa fiat cataplaſma.* You may alſo uſe the following fomentation. ℞. *roſar. rub. & myrtill. an.* m. i. *florum melil. & chamæm. an.* p. i. *nucum cupreſſ.* ℥i. *vini auſteri* ℔. ß. *aq. roſar. & plantag. an.* ℥iii. make a decoction of them all for a fomentation to be uſed with a ſponge.

The cure.

A digeſting Cataplaſme.

Chap.

CHAP. XIX.

Of a Cataract.

A Cataract.

A Cataract is called alſo by the Greeks *Hypochyma*, by the Latines, *ſuffuſio*. Howſoever you terme it, it is nothing elſe but the concretion of an humour into a certaine thin skin under the horny coat, juſt againſt the apple or pupill, and as it were ſwimming upon the watery humour; and whereas the place ought to bee empty, oppoſing it ſelfe to the internall faculty of ſeeing, whereby it differeth from ſpots and ſcars growing upon the horny coate and *Adnata*. It ſometimes covereth the whole pupill, otherwhiles but the one halfe thereof, and ſomwhiles but a ſmall portion thereof. According to this variety the ſight is either quite loſt, weake, or ſomewhat depraved; becauſe the animall viſive ſpirit cannot in its entire ſubſtance paſſe through the denſity thereof. The defluxion of the humour whence it proceeds, is either cauſed by an external occaſion, as a ſtroake, fall, or by the heat or coldneſſe of the encompaſſing ayre, troubleſome to the head and eyes; or elſe it is by an internall meanes, as the multitude, or elſe the acride hot and thin quality of the humours. This diſeaſe alſo ſometimes taketh its originall from groſſe and fumid vapours ſent from a crude ſtomacke, or from vaporous meats or drinks, up to the braine, and ſo it falleth into the eyes, where by the coldneſſe, ſtraitneſſe and tarrying in the place, they turn into moyſture, and at length into that concretion or filme which wee ſee: The ſigns may be eaſily drawne, from that we have already delivered. For when the cataract is formed and ripe, it reſembleth a certain thin membrane ſpred over the pupill, and appeareth of a different colour, according to the variety of the humour whereof it conſiſteth, one while white, another while blacke, blew, aſh-coloured, livid, citrine, greene. It ſometimes reſembleth quickſilver, which is very trembling and fugitive, more than the reſt. At the firſt when it beginneth to breed they ſeeme to ſee many things, as flyes flying up and downe, haires, nets, and the like, as if they were careleſly toſſed up and down before their eyes: ſometimes every thing appeareth two, and ſomewhiles leſſe than they are; becauſe the viſive ſpirit is hindered from paſſing to the objects by the denſity of the skin, like as a cloud ſhadowing the light of the Sun. Whence it is that the Patients are duller ſighted about noone, and ſurer and quicker ſighted in the morning and evening, for that the little viſive ſpirit diffuſed through the aire, is diſperſed by the greater light, but contracted by the leſſe. Now if this filme cover halfe the pupill, then all things ſhew but by halfes; but if the midſt thereof bee covered and as it were the center of the Chriſtalline humour, then they ſeeme as if they had holes or windowes: but if it cover it all, then can hee ſee nothing at all, but onely the ſhadowes of viſible bodies, and of the Sun, Moone, Stars, lighted candles, and the like luminous things, and that but confuſedly and as by conjecture.

The differences.

CHAP. XX.

The phyſicall cure of a beginning Cataract.

Diet for ſuch as are troubled with a Cataract.

A Beginning Cataract is hindred from growing and concretion by diet conveniently and artificially preſcribed, by the abſtinence from wine, eſpecially more ſtrong and vaporous, and forbearing the uſe of meates, which yeeld a flegmaticke juice and vaporous, as peaſe, beanes, turneps, cheſnuts, and laſtly all ſuch things as have the faculty of ſtirring up the humours, and cauſing defluxion in the body, ſuch as are all ſalt & ſpiced meats, as alſo garlike, onions, muſtard. The immoderate uſe of venery hurts more than all the reſt, for that it more violently exagitates the whole body, weakens the braine and head, and begets crude humours.

Bread ſeaſoned with fennell ſeeds.

Let his bread be ſeaſoned with ſome fennell ſeeds, for it is thought to have a faculty of helping the ſight, and clearing the eyes, and diſſipating the miſty vapours in the ſtomacke before they can aſcend to the braine. Wherefore by the ſame reaſon it is good to uſe marmelade of quinces, conſerve of roſes, and common drige powder, or any ſuch like compoſed of things good to break wind, or corroborate the ventricle. Phlebotomie and purging, if they be requiſite, ſhall be fitly appointed: Ventoſes ſhall be applyed to the ſhoulders and necke; the phlegmaticke matter ſhall be diverted and evacuated by the mouth with uſing maſticatories in the morning. There be ſome which believe that a beginning cataract may be diſſipated and diſcuſſed by often rubbing the eye-lids with the fingers, and in like ſort by the often and earneſt beholding of the Starres, and the Moone when it is at the full, looking-glaſſes, diamonds, and all other ſuch like bright ſhining things. I beleeve that by beames plentifully and ſuddenly brought and diffuſed over the eye, directly oppoſite againſt ſome bright ſhining thing, it may ſeeme to have a penetrating, dividing, diſſolving, as alſo a conſuming and drying faculty. Beſides, alſo the hot breath of him who holdeth in his mouth, and chaweth fennell-ſeeds, aniſeeds, coriander-ſeeds, nutmeg, cinamon, cloves, and the like, hath a great faculty, the eyes being firſt gently rubbed with the finger, it being breathed in, neare at hand and often received, to heat, attenuate, reſolve, digeſt, and diffuſe the humour which is ready to concrete. Moreover, this *collyrium* of *John Vigo* is thought very powerfull to cleare the eyes, ſtrengthen the ſight, hinder ſuffuſions, and diſcuſſe them if at any time they concrete and beginne to gather. ℞. *hepatis hircini ſani & recentis lib.* ii. *calami aromatici & mellis an.* ℥ß. *ſucci rutæ*, ʒiii. *aquæ chelidoniæ, fæniculi, verbeniæ euphoſiæ, an.* ʒiii. *piperis longi, nucis moſchatæ, caryophyllorum an.* ʒii. *croci* ℈i. *floris roriſmarini aliquantum contriti*, m. ß. *ſarcocollæ, aloës hepaticæ, an.* ʒiii. *fellis raiæ, leporis & perdicis, an.* ℥i. *terantur omnia, tritiſque adde ſacchari albi* ℥ii. *mellis roſati* ʒvi. *conjiciantur in alembicum vitreum & diſtillentur in balneo Mariæ*; Let this diſtilled liquor bee often dropped into the eyes. But if you prevaile nothing by all theſe medicines, and that the cloudy and heaped up humour doth daily encreaſe and thicken, then muſt you abſtaine from remedies, and expect untill it bee no more heaped up, but thickned, yea untill it ſeeme to be growne ſomewhat hard. For ſo at length it may bee couched with a needle; otherwiſe if this ſame skin ſhall not be ripe, but more tender than is fitting, when you ſhall come to the operation, it will be broken and thruſt through with the needle, and not couched. On the contrary, if it bee too hard, it will reſiſt the needle; neither will it ſuffer it ſelfe to bee eaſily couched. Wherefore it is requiſite that the Surgeon know when it is ripe, and he muſt diligently obſerve the ſignes whereby he may diſcerne a ripe Cataract from an unripe; and that which is cureable, from that which is uncurable. For that only which is ripe and curable is to be couched; that which is unripe, that is, ſuch an one as is more tender, and as it were crude, and that which is more hard and denſe, and laſtly, that which is uncureable muſt not bee attempted at all.

How bright ſhining things may diſſipate a beginning Cataract.

A *Collyrium* diſſipating a beginning Cataract.

A Cataract muſt not be couched unleſs it be ripe.

Chap. XXI.

By what ſignes ripe and curable cataracts may bee diſcerned from unripe and uncurable ones.

If the ſound eye being ſhut, the pupill of the ſore or ſuffuſed eye, after it ſhall be rubbed with your thumbe, bee preſently dilated and diffuſed, and with the like celerity returne into the place, figure, colour and ſtate, it is thought by ſome to ſhew a ripe and confirmed cataract. But an unripe and not to bee couched, if the pupill remaine dilated and diffuſed for a long while after. But it is a common ſigne of a ripe, as alſo more denſe and conſequently uncurable ſuffuſion, to bee able to ſee nor diſtinguiſh no viſible thing beſide light and brightneſſe; for to diſcerne other objects ſheweth that it is not yet ripe. Therefore the ſound eye being ſhut and preſſed, the pupill of the other rubbed with your thumbe, is dilated, enlarged, ſwelleth and is more diffuſed; the viſive ſpirits by this compreſſion being as it were forced from the ſound into the ſore eye. But theſe following cataracts are judged uncurable, that is, ſuch as are great, ſuch as when the eye-lid is rubbed are nothing dilated or diffuſed, whoſe pupill becommeth no broader by this rubbing: for hence you may gather that the ſtopping or obſtruction is in the opticke nerve, ſo that how cunningly and well ſoever the cataract bee couched, yet will the Patient continue blind; you ſhall do no more good in couching a cataract, which is in an eye conſumed and waſted with a *Phthiſis*. Alſo that cataract is uncurable which is occaſioned by a moſt grievous diſeaſe, to wit, by moſt bitter and cruell paines of the head, or by a violent blow. Such as are of a plaiſter-like, green, blacke, livid, citrine and quickſilver-like colour, are uſually uncurable. On the contrary, ſuch as are of a Cheſnut colour, or of a skye or ſea-water colour, with ſome little whitneſſe, yeeld great hope of a happy and ſucceſſefull cure.

Uncurable Cataracts.

Curable Cataracts.

Chap. XXII.

Of the couching a Cataract.

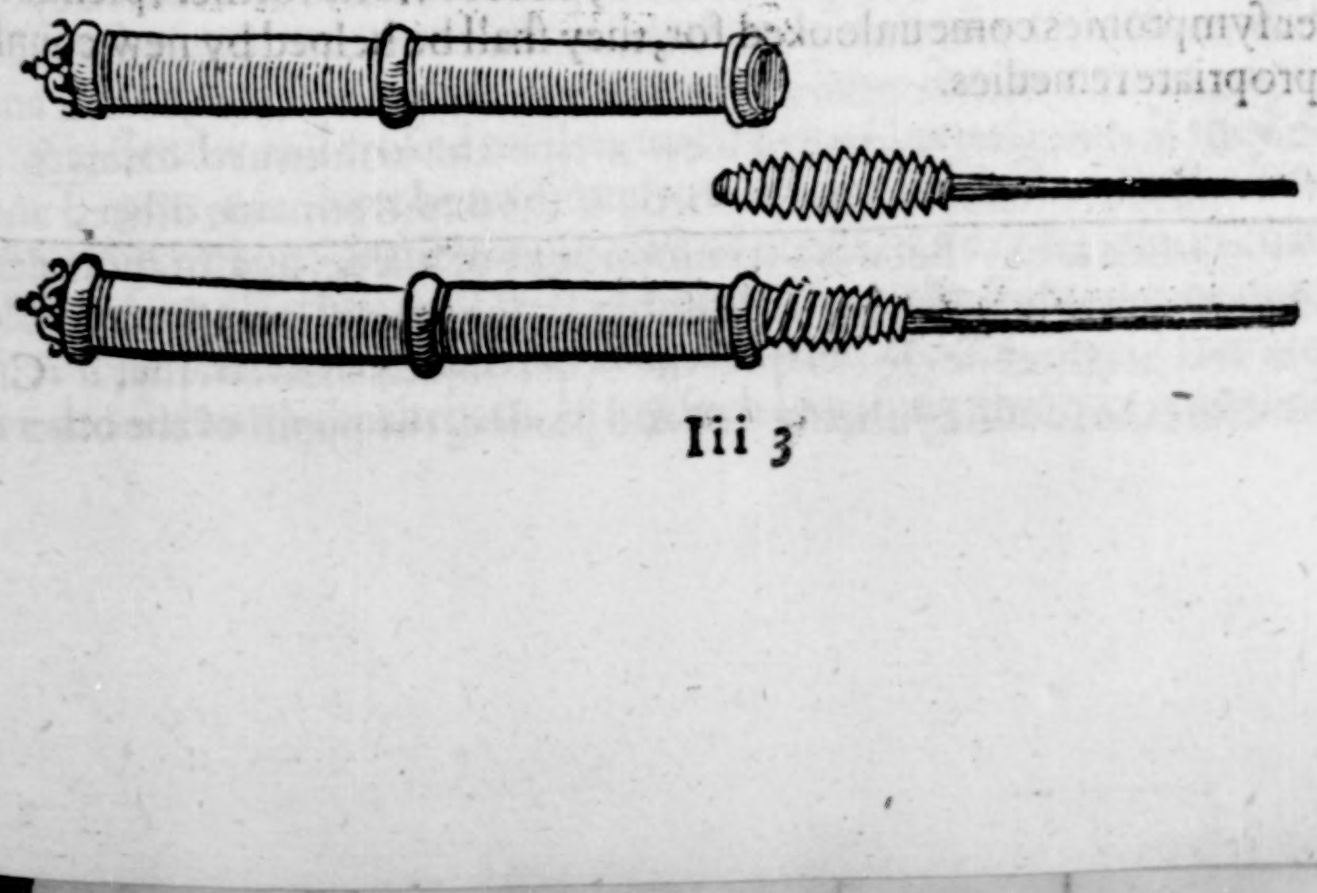
After you ſhal know by the forementioned ſignes, that the Cataract is curable, it remains that you attempt the couching thereof, but ſo, that there be nothing which may hinder. For if the paine of the head, cough, nauſeouſnes or vomiting at that time trouble the patient, you ſhal then beſtow your labour in vaine: Wherefore you muſt expect untill theſe ſymptomes be gone. Then make choice of a ſeaſon fitting for that purpoſe, that is, in the decreaſe of the moon, when the aire is not troubled with thunder nor lightening, and when as the Sunne is not in Aries, becauſe that ſigne hath dominion over the head. Then let the Surgeon conſult a Phyſitian whether purging or bloud-letting be convenient for the Patient, ſo to reſiſt plethoricke ſymptomes, otherwaies ready to yeeld matter for relapſe. Two dayes after you muſt make choice of a place furniſhed with indifferent or competent light, and the Patient being faſting ſhall be placed in a ſtrait chaire, ſo that the light may not fall with the beames directly upon him, but ſidewiſe. The eye which ſhall bee cured muſt bee made more ſteddy, by laying and binding wooll upon the other: Then the Surgeon ſhall ſeate and place himſelfe directly againſt the Patient upon a ſeat ſomewhat higher, and bidding the Patient put his hands downe to his girdle, he ſhall hold the patients legges betweene his knees. One ſhall ſtand at the Patients backe who ſhall hold his head and keepe it from ſtirring; for by a little ſtirring hee may loſe his ſight for ever. Then muſt you prepare and make ready your needle, and thruſt it often into ſome ſtrong thicke cloth, that it may bee as it were ſmoothe by this motion, and for the performance of the worke in hand with the leſſe paine ſomewhat warmed. It muſt bee made of iron or ſteele, and not of gold or ſilver, it muſt be alſo flatted on the ſides, and ſharpe pointed, that ſo it may the better pierce into the eye, and wholly couch the Cataract once taken hold of; and leſt it ſhould ſlip in the Surgeons hand, and be leſſe ſteddy, it ſhall bee put into a handle, as you may ſee by the following figure.

When to couch a Cataract.

The place.

The needle.

A needle inſerted in a handle for the couching of Cataracts.



All things being thus in a readineſſe, you muſt bid the patient to turne the ſight of his eye towards his noſe, and the needle muſt be boldly thruſt (for it is received in a place that is voyde, and onely filled with ſpirits) directly by the coat *Adnata*, in the middle ſpace between the leſſer corner & the horny coat, juſt againſt the midſt of the Cataract, yet ſo, as that you hurt no vein of the *Adnata*, & then by ſtirring it as it were diverſly untill it come to the midſt of the pupill and ſuffuſion. When it is come thither, the needle muſt bee inclined from above downewards to the ſuffuſion, and there to be ſtirred gently untill by little and little it couch or bring downe the Cataract as whole as may be beneath the compaſſe of the pupill; let him ſtill follow it though couched with his needle, and ſomewhat violently depreſſe, and keep it down for ſome ſhort ſpace, that ſo it may reſt and ſtay in that lower place whether it is depreſſed. The Surgeon ſhall try whether it firmely remaine there or no, bidding the patient preſently to move his eye; For if it remaine conſtantly ſo, and doe not returne againe, the cure is perfect. Then muſt the needle be lifted up by little and little, neither muſt it preſently be taken forth, that if the Cataract ſhould beare up, or riſe againe, that it might againe, and ſo often (whilſt the worke is yet hot, and all things in a readineſſe) be couched towards the leſſer corner, untill it be fully and ſurely hid. Then muſt you draw backe the needle gently, and after the ſame manner as you put it in; leſt if you uſe not moderation, you bring backe the Cataract, from whence you couched it, or grievouſly offend the cryſtalline humour, the prime inſtrument of ſight, or the pupill with danger of dilating thereof. Some as ſoone as the worke is done, give the patient ſomething in his hand to looke upon: but *Paulus* approves not thereof, for hee feares leſt his endeavouring or ſtriving to ſee, may draw backe the Cataract. Wherefore it is more wiſedome and better, preſently after the drawing forth of the needle, to put on a ſoft ragge the white of an egge beaten in roſe-water with a little choice alume, and ſo apply it to the eye and neighbouring parts for to binde and hinder the inflammation; then alſo you muſt together therewith bind up the ſound eye, leſt by ſtirring to ſee, it might together therewith draw and move the ſore eye, by reaſon of the ſympathy and conſent they mutually have by the opticke nerves. After all things are thus performed, the patient ſhall bee laid in a ſoft bed, & ſo placed, that his head may lye ſomwhat high; let him be laid far from noiſe, let him not ſpeake, nor eate any hard thing that may trouble his jawes, wherefore let him feed upon liquid meats, as ponado barly cream, culliſſes, gellyes, reare egs, and other meates of the like nature. At the end of eight dayes the ligature that binds up his eyes ſhall be looſed, and his eyes waſhed with roſe water, and putting on ſpectacles, or ſome taffaty, the patient ſhall by little and little accuſtome himſelfe to the light, leſt hee ſhould bee offended by the ſudden meeting with light. But if the ſuffuſion, after ſome ſhort while after, lift it ſelfe up againe, it muſt bee couched againe, but through a new hole, for the eye is pained and tender in the former place. It ſometimes happens by the touch of the needle that the Cataract is not couched whole, but is broken into many peeces; then therefore each of them muſt be followed, and couched ſeverally: if there be any very ſmall particle which ſcapes the needle, it muſt bee let alone, for there is no doubt but that in proceſſe of time it may be diſſolved by the force of the native heat. There are alſo ſome Cataracts which at the firſt touch of the needle are diffuſed & turne into a ſubſtance like to milke or troubled water, for that they are not throughly ripe, yet theſe put us in good hope of recovery, and it bee but for this, that they can never afterwards concrete into one body as before. Wherefore at the length they are alſo diſcuſſed by the ſtrength of the native heat, and then the eye recovers its former ſplendor. If that any other ſymptomes come unlooked for, they ſhall be helped by new counſels and their appropriate remedies.

CHAP.

CHAP. XXIII.

Of the ſtopping of the paſſage of the eares, and the falling of things thereinto.

The cauſe.

IT ſometimes happeneth that children are born without any holes in their eares, a certaine fleſhy or membranous ſubſtance growing in their bottome or firſt entrance. The ſame may alſo happen afterwards by accident, they being ulcerated by ſome impoſtume or wound, and the eare ſhut up by ſome fleſhy excreſcence or ſcar. When as the ſtopping is in the bottome of the cavity, the cure is more difficult than if it were in the firſt entrance. But there is a double way of cure; for this ſubſtance, whatſoever it be, muſt either be cut out, or elſe eaten away and conſumed by acrid and catheriticke medicines; in performance of which there is need of great moderation of the mind and hand. For it is a part endued with moſt exquiſite ſence and neare the braine, wherefore by handling it too roughly, there is feare of diſtenſion of the nerves, and conſequently of death.

The cure.

Sometimes alſo the preternaturall falling of ſtrange bodies into this paſſage, maketh a ſtopping of the eares, ſuch as are fragments of ſtones, gold, ſilver, iron and the like mettals, pearles, cherry-ſtones, or kernels, peaſe and other ſuch like pulſe. Now ſolid and bonie bodies ſtill retaine the ſame magnitude; but peaſe, ſeeds and kernels, by drawing the moiſture there implanted into them, ſwell up, and cauſe vehement pain by the diſtenſion of the neighbouring parts, wherefore the ſooner they are drawne forth, the better it is for the patient. This ſhall be done with ſmall pincers and inſtruments made in the ſhape of earepicks. But if you profit nothing thus, then muſt you uſe ſuch gymblets as are made for the drawing forth of bullets ſhot deep into the body. Little ſtones and bodies of the like ſtony hardneſſe ſhall bee forced forth by the brain, provoked to concuſſion by ſneeſing, & by dropping ſome oyle of almonds firſt into the paſſage of the eare, that the way may be the more ſlippery; for it will come to paſſe by this ſneeſing, or violence of the internall aire forcibly ſeeking paſſage out, that at length they may bee caſt forth, the mouth and noſtrils being ſtopped with the hand. But it wee cannot thus prevaile, it remaines, that we cut open the paſſage with an inciſion knife, ſo much as ſhall be ſufficient for the putting in and uſing of an inſtrument for to extract them. If any creeping things of little creatures, as fleas, ticks, piſmires, gnats and the like, which ſometimes happeneth, ſhall get therein, you may kill them by dropping in a little oyle and vineger. There is a certaine little creeping thing, which for piercing and getting into the eares, the French call *Perſe-oreille* (wee an Eare-wigge). This, if it chance to get into the eare, may be killed by the foreſaid meanes, you may alſo catch it, or draw it forth by laying halfe an apple to your eare, as a bait for it.

The concuſſive force of ſneeſing.

CHAP. XXIV.

Of getting of little bones and ſuch like things out of the jawes and throate.

The cure different according to the places where they ſticke.

SOmetimes little bones and ſuch like things in eating greedily uſe to ſticke, or as it were faſten themſelves in the jawes or throate. Such bodies if you can come to the ſight of them ſhall bee taken out with long, ſlender and croked mallets made like a Cranes beake. If they do not appear, nor there be no means to take them forth, they ſhalbe caſt forth by cauſing vomit, or with ſwallowing a cruſt of bread, or a dry fig gently chawed, and ſo ſwallowed; or elſe they ſhall be thruſt downe into the ſtomacke, or plucked back with a leeke, or ſome other ſuch like long and ſtiffe crooked body annoynted with oile and thruſt downe the throate. If any ſuch like thing ſhall get into the Weazon you muſt cauſe coughing by taking ſharpe things, or elſe ſneeſing, ſo to caſt forth whatſoever is there troubleſome.

CHAP. XXV.

Of the Tooth-ache.

The Tooth ach a moſt cruell paine.

The cauſe thereof.

Signes of this or that defluxion.

Three ſcopes of curing.

A cold & repercuſſive lotion for the mouth.

Trochiſces for a hot defluxion.

Narcoticks.

OF all paines, there is none which more cruelly tormenteth the patients than the Tooth-ache. For wee ſee them oft-times after the manner of other bones to ſuffer inflammation, which will quickly ſuppurate, and they become rotten, and at length fall away piecemeale; for wee ſee them by daily experience to be eaten and hollowed, and to breed wormes, ſome portion of them putrefying. The cauſe of ſuch paine is either internall, or externall and primitive. The internall is a hot or cold defluxion of humours upon them, filling their ſockets, & thence conſequently driving out the teeth; which is the reaſon that they ſtand ſometimes ſo farre forth, that the patient neither dares nor can make uſe of them to chaw for feare of paine; for that they are looſe in their ſockets by the relaxation of the gums, cauſed by the falling downe of the defluxion. When as they are rotten and perforated even to the roots, if any portion of the liquor in drinking, fall into them, they are pained as if you thruſt in a pin or bodkin, the bitterneſſe of the paine is ſuch. The ſignes of a hot defluxion are ſharpe and pricking paine, as if needles were thruſt into them, a great pulſation in the roote of the pained tooth and the temples, and ſome eaſe by the uſe of cold things. Now the ſignes of a cold defluxion are a great heavineſſe of the head, much and frequent ſpitting, ſome mitigation by the uſe of hot remedies. In the bitterneſſe of paine we muſt not preſently run to Tooth-drawers, or cauſe them preſently to goe in hand to plucke them out. Firſt conſult a Phyſician, who may preſcribe remedies according to the variety of the cauſes. Now here are three intenſions of cureing. The firſt is concerning diet; the other for the evacuation of the defluxion or antecedent cauſe; the third for the application of proper remedies for the aſſwaging of paine. The two former ſcopes, to wit, of diet, and diverting the defluxion by purging, phlebotomie, application of cupping glaſſes to the necke and ſhoulders, and ſcarification, doe abſolutely belong to the Phiſitian. Now for proper and topicke medicines they ſhall be choſen contrary to the cauſe. Wherefore in a hot cauſe, it is good waſhing the mouth with the juice of Pomgranats, plantaine water, a little vinegor wherein roſes, *balauſtiæ* and *ſumach* have beene boyled. But ſuch things as ſhall be applyed for the mitigating of the paine of the teeth, ought to bee things of very ſubtle parts, for that the teeth are parts of denſe conſiſtence. Therefore the ancients have alwaies mixed vineger in ſuch kind of remedies. ℞. *roſar. rub. ſumach. hordei, an.* m. ß *ſeminis hyoſcyami conquaſſati* ʒii. *ſantalorum an.* ʒi. *lactucæ ſummitatum rubi, ſolani, plantaginis, an.* m. ß. *bulliant omnia in aqua lib.* iiii. *& pauco aceto ad hordei crepaturam.* Waſh the mouth with ſuch a decoction being warme. You may alſo make Trochiſces for the ſame purpoſe after this manner. ℞. *ſem. hyoſcyami, ſandarachæ, coriandri, opii an.* ʒß. *terantur & cum aceto incorporentur, formenturque trochiſci apponendi dentibus dolentibus.* Or elſe, ℞. *ſeminis portulacæ, hyoſcyami, coriandri, lentium, corticis ſantali citrini, roſar. rub. pyrethri, camphoræ, an.* ʒß. Let them all bee beaten together with ſtrong vineger, and made into trochiſces, with which being diſſolved in roſe water, let the gums and whole mouth bee waſhed when need requireth. But if the paine bee not aſſwaged with theſe, you ſhall come to narcoticks, which may ſtupefie the nerve; as, ℞. *ſeminis hyoſcyami albi, opii, camphoræ, papaveris albi, an. quantum ſufficit, coquantur cum ſapa, et denti applicentur.* Beſides, you muſt alſo put this following medicine into the eare of the pained ſide. ℞. *opii & caſtorei, an.* ℈i. *miſceantur cum oleo roſato*: It hath ſometimes availed in ſwolne and diſtended gums, being firſt lightly ſcarified, to have applied leaches, for the evacuation of the conjunct matter, as alſo to have opened the veines under the tongue, or theſe which are behind the eares. For I remember that I, by theſe three kindes of remedies, aſſwaged great paines of the teeth. Yet there bee ſome who in this affect open not theſe veines which are behind the eares, but thoſe which are conſpicuous in the hole of the eare in the upper part thereof.

Paine of the teeth ariſing from a cold cauſe and defluxion, may be helped by theſe remedies; boyle roſemary, ſage, and pellitory of Spaine in wine and vinegar, and adde therto a little *aqua vitæ*, in this liquor diſſolve a little treacle, and waſh your teeth therewith. Others mingle Gum *ammoniacum* diſſolved in *aqua vitæ* with a little *ſandaracha* and myrrhe, and lay it to the pained tooth, after *Vigoes* counſaile. *Meſue* thinkes that beaten garlicke carryed in the right or left hand, aſſwages the paine, as the teeth ake upon the right or left ſide. But I being once troubled with grievous paine in this kinde, followed the counſaile of a certaine old woman, and laid garlicke roſted under the embers to my pained tooth, and the paine forthwith ceaſed. The ſame remedy uſed to others troubled with the like affect, had like ſucceſſe. Moreover, ſome thinke it availeable if it bee put into the auditory paſſage. Others drop into the eares oile of *caſtoreum*, or of cloves, or ſome ſuch other chymicall oile. It is good alſo to waſh the teeth with the following decoction. ℞. *rad. pyrethri* ʒß. *menthæ et rutæ an. p.*i. *bulliant in aceto*, and with this decoction being warme, waſh the teeth. Some like fumes better, & they make them of the ſeeds of *Coloquintida* and muſtard, and other like; they take the ſmoake by holding their mouths over a funnell. Other ſome boile pellitory of Spaine, ginger, cinamon, alume, common ſalt, nut megs, cipreſſe nuts, aniſe and muſtard ſeeds, and *euphorbium* in oxycrate, and in the end of the decoction adde a little *aqua vitæ*, and receive the vapour thereof through a funnell: as alſo they waſh their teeth with the decoction, and put cotton dipped therein into the eare, firſt dropping in a little thereof. Some there are which affirm that to waſh the teeth with a decoction of Spurge is a very good and anodyne medicine in the tooth-ach. I have oft times aſſwaged intolerable paines of the teeth, by applying veſicatories under the eare, to wit, in that cavity whereas the lower jaw is articulated with the upper: for the veine, artery and ſinew which are diſtributed to the roots of the teeth, lye thereunder. Wherfore the bliſters being opened, a thinne liquor runnes out, which doth not onely cauſe, but alſo nouriſh or feed the diſeaſe. But if the tooth be hollowed, and that the patient will not have it puld out, there is no ſpeedier remedy, than to put in cauſtick medicines, as oile of vitrioll, *aqua fortis*, and alſo a hot iron; for thus the nerve is burnt inſunder, and loſeth its ſenſe. Yet ſome affirm that the milky juice that flowes from Spurge made into a paſte with *Olibanum* and *amylum*, and put into the hollowed tooth, will make it preſently to fall away in peeces. When the Gums and Cheekes are ſwollen with a manifeſt tumour, then the patient begins to be ſomewhat better and more at eaſe. For ſo by the ſtrength of nature, the tumor cauſing the paine is carryed from within outwards. But of what nature ſoever the matter which cauſeth the paine be, it is convenient to intercept the courſe thereof with *Empl. contra rupturam*, made with pitch and maſtick, and applyed to the temple on that ſide where the tooth aketh.

Hot fumes.

Veſicatories.

Cauſticks.

CHAP. XXVI.

Of other affects of the teeth.

THe teeth are alſo troubled with other preternaturall affects. For ſometimes they ſhake by relaxation of the gums, or elſe become corrupt and rotten, or have wormes in them, or elſe are ſet on edge. For the firſt, the gummes are relaxed either by an externall or primitive cauſe, as a fall or blow: or elſe by an internall or antecedent, as by the defluxion of acrid or wateriſh humours from the braine, or through want of nouriſhment in old bodies. If the teeth grow looſe by the meanes of the decaying gums, the diſeaſe is then incurable: but you may withſtand the other cauſes by the uſe of ſuch things as faſten the teeth, ſhunning on the contrary ſuch as may looſen them. Therefore the patient muſt not ſpeake too earneſtly, neither chaw hard things. If they become looſe by a fall or blow

Cauſes of looſeneſſe of the teeth.

blow, they muſt not bee taken forth, but reſtored and faſtened to the next that remaine firme, for in time they will be confirmed in their ſockets, as I tryed in *Anthony de la Rue* a tailour, who had his jaw broken with the pommell of a dagger, and three of his teeth looſened and almoſt ſhaken out of their ſockets; the jaw being reſtored, the teeth were alſo put in their places, and bound to the reſt with a double waxed thread; for the reſt, I fed the patient with broths, gellyes, and the like, and I made aſtringent gargariſmes of cypreſſe nuts, myrtle berries, and a little alum boyld in oxycrate, and I wiſhed him to hold it a good while in his mouth: by theſe means I brought it ſo to paſſe, that hee within a while after could chaw as eaſily upon thoſe teeth, as upon the other. I heard it reported by a credible perſon, that he ſaw a Lady of the prime nobility, who inſtead of a rotten tooth ſhe drew, made a ſound tooth, drawne from one of her waiting maids at the ſame time, to be ſubſtituted and inſerted, which tooth in proceſſe of time, as it were taking roote, grew ſo firme, as that ſhe could chaw upon it as well as upon any of the reſt. But as I formerly ſaid, I have this but by heare-ſay.

A Hiſtory.

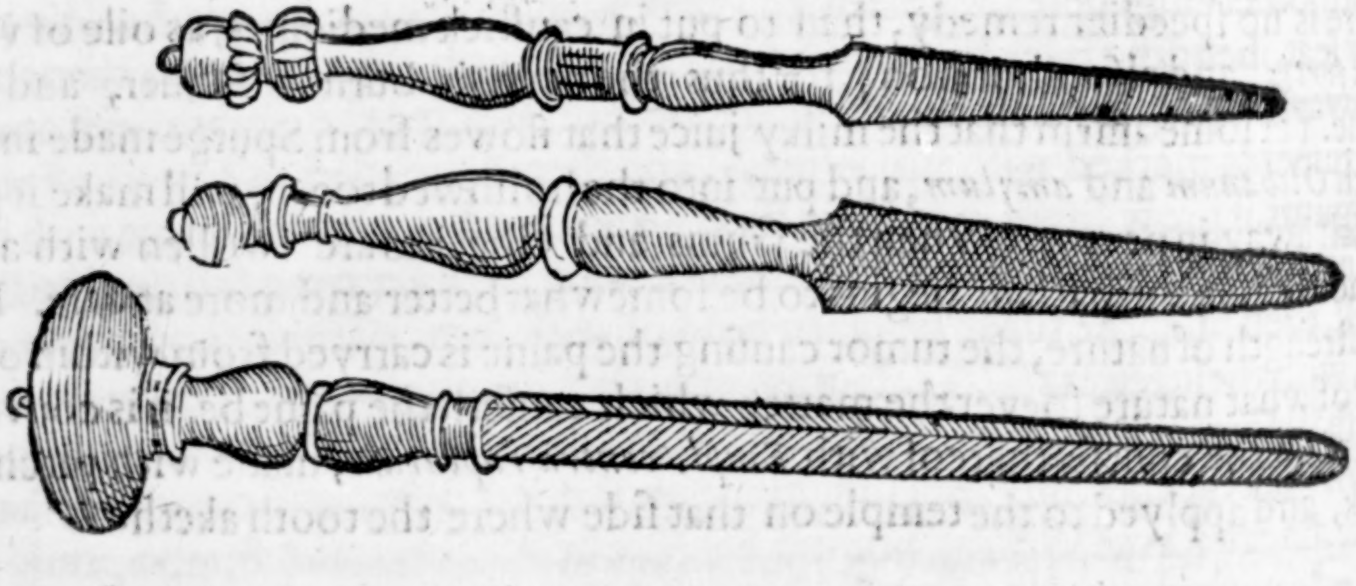
The cauſes of hollow teeth.

Now the teeth are corroded or eaten in by an acride and thinne humour penetrating by a plenteous and frequent defluxion even to their roots, and being there conteined, it putrefies, and becomming more acride, it doth not only draw the teeth into the contagion of its putrefaction, but alſo perforats and corrodes them.

The cure.

The putrefaction may bee corrected, if after generall medicines, you put oile of vitrioll or *aqua fortis* into the hole of the eaten tooth: or elſe, if you burne the tooth it ſelfe to the roote with a ſmall iron wyar being red hot: you ſhall thruſt this hot iron through a pipe or cane made for the ſame purpoſe, leſt it ſhould harm any ſound part by the touch therof, and thus the putrefaction, the cauſe of the arroſion, may be ſtayed. But if the hole bee on the one ſide between two teeth, then ſhall you file away ſo much of the ſound tooth as that you may have ſufficient liberty to thruſt in your wiar without doing any harme.

The formes of Files made for filing the teeth.



Cauſes of wormes in the teeth.

Wormes breeding by putrefaction in the roots of the teeth, ſhall be killed by the uſe of cauſticks, by gargles or lotions made of vinegar wherein, either pellitory of Spain hath bin ſteeped, or Treacle diſſolved alſo; Aloes and Garlike are good to be uſed for this purpoſe.

Cauſes of ſetting the teeth on edge.

Setting the teeth on edge happens to them by the immoderate eating of acride or tart things, or by the continuall aſcent of vapours endued with the ſame quality, from the orifice of the ventricle to the mouth, or by a cold defluxion, eſpecially of acride phlegme, falling from the braine upon the teeth, or elſe by the too exceſſive uſe of cold or ſtupifing liquors. This affect is taken away, if after generall medicines and ſhunning thoſe things that cheriſh the diſeaſe, the teeth bee often waſhed with *aqua vitæ*, or good wine wherein ſage, roſemary, cloves, nutmegs and other things of the like nature have bin boyled.

CHAP.

CHAP. XXVII.

Of drawing of teeth.

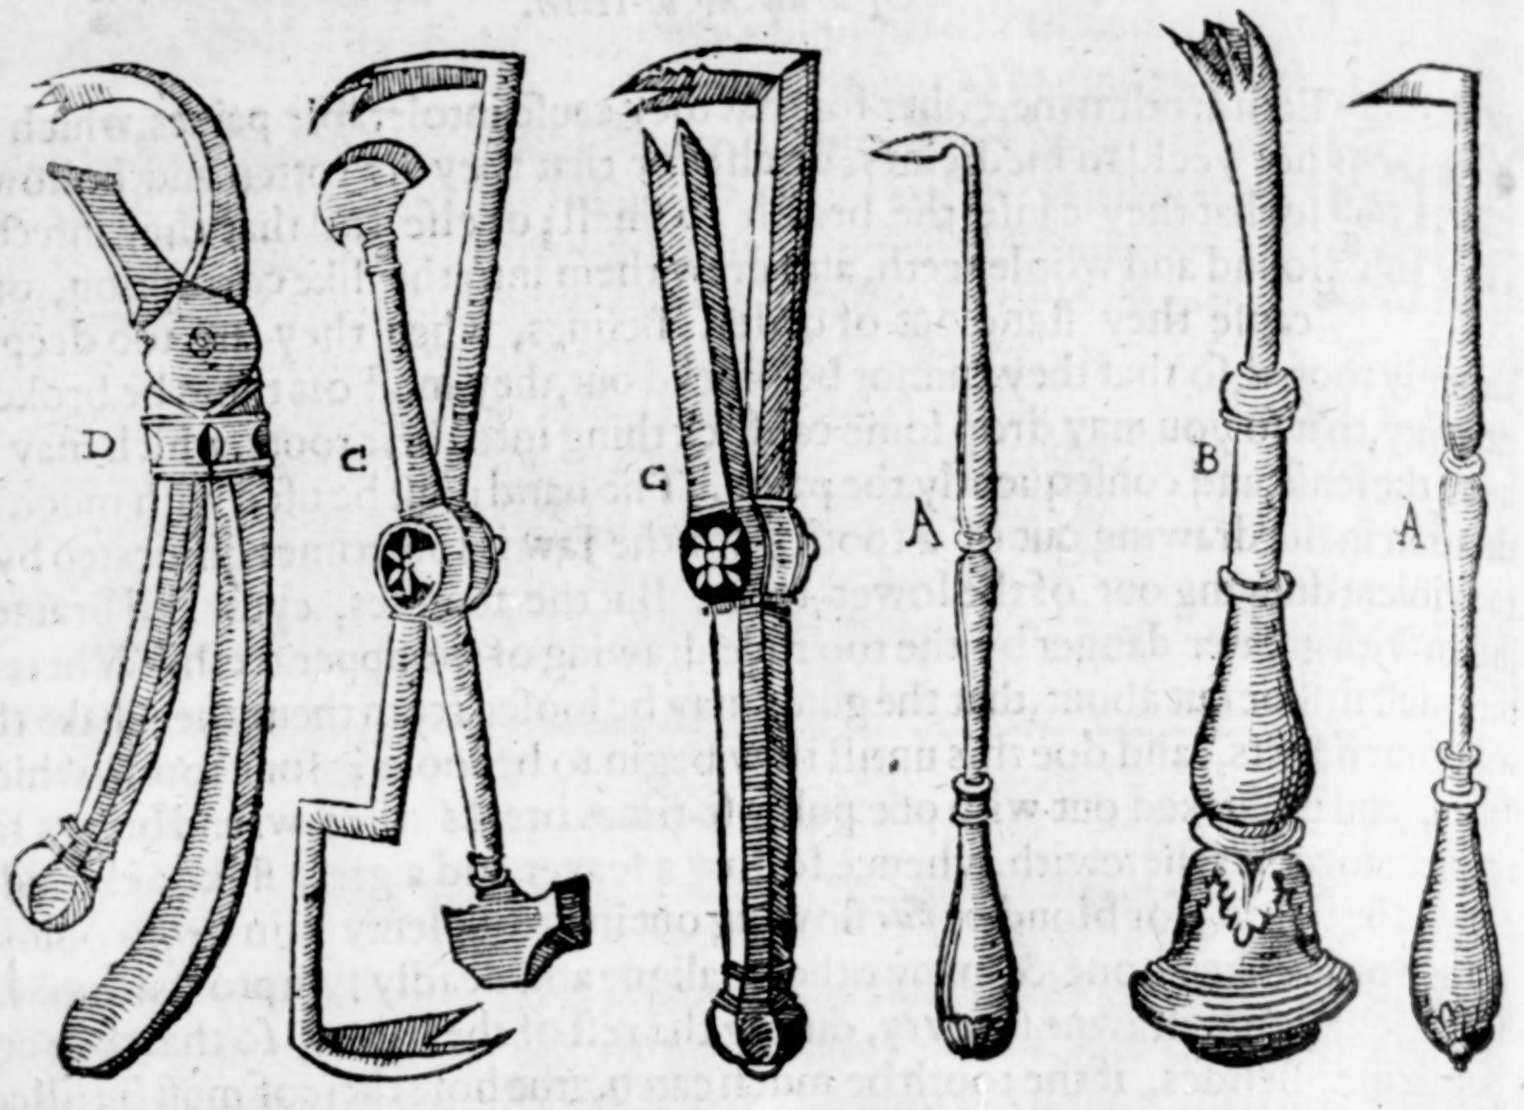
TEeth are drawne, either for that they cauſe intolerable paines, which will not yeeld to medicines, or elſe for that they are rotten and hollowed, ſo that they cauſe the breath to ſmell; or elſe for that they infect the ſound and whole teeth, and draw them into the like corruption, or becauſe they ſtand out of order. Beſides, when they are too deep and ſtrongly rooted, ſo that they cannot be pluckd out, they muſt oft times be broken of neceſſity, that ſo you may drop ſome cauſtick thing into their roots, which may take away the ſenſe, and conſequently the paine. The hand muſt be uſed with much moderation in the drawing out of a tooth; for the Jaw is ſometimes diſlocated by the too violent drawing out of the lower teeth. But the temples, eyes and braine are ſhaken with greater danger by the too rude drawing of the upper teeth. Wherefore they muſt firſt be cut about, that the gums may be looſed from them, then ſhake them with your fingers, and doe this untill they begin to be looſe; for a tooth which is faſt in, and is plucked out with one pull, oft-times breaks the jaw, and brings forth the piece together therewith, whence follow a feaver and a great fluxe of bloud not eaſily to be ſtayed (for bloud or *pus* flowing out in great plenty is, in *Celſus* opinion, the ſign of a broken bone) & many other maligne and deadly ſymptoms: ſome have had their mouthes drawne ſo awry, during the reſt of their lives, ſo that they could ſcarce gape. Beſides, if the tooth be much eaten, the hole thereof muſt be filled either with Lint, or a corke, or a piece of lead well fitted thereto, leſt it be broken under your *forceps*, when it is twitched more ſtraightly to be plucked out, and the root remain, ready in a ſhort time to cauſe more grievous paine. But judgement muſt be uſed, and you muſt take ſpeciall care leſt you take a ſound tooth for a pained one; for oft-times the patient cannot tell, for that the bitterneſſe of paine by neighbourhood is equally diffuſed over all the jaw. Therefore for the better plucking out a tooth, obſerving theſe things which I have mentioned, the patient ſhall be placed in a low ſeat, bending back his head between the Tooth-drawers legs; then the Tooth-drawer ſhall deeply ſcarifie about the tooth, ſeparating the gums therfrom with the inſtruments marked with this letter A. and then if ſpoyled as it were of the wall of the gums, it grow looſe, it muſt be ſhaken and thruſt out by forcing it with the three-pointed levatory noted with this letter B. but if it ſticke in too faſt, and will not ſtirre at all, then muſt the tooth be taken hold of with ſome of theſe toothed *forcipes* marked with theſe letters C. D. E. now one, then another, as the greatneſſe, figure, and ſite ſhall ſeeme to require. I would have a tooth-drawer expert and diligent in the uſe of ſuch toothed mullets; for unleſſe one know readily and cunningly how to uſe them, he can ſcarce ſo carry himſelf, but that he will force out three teeth at once, oft-times leaving that untoucht which cauſed the paine.

A caveat in drawing of teeth.

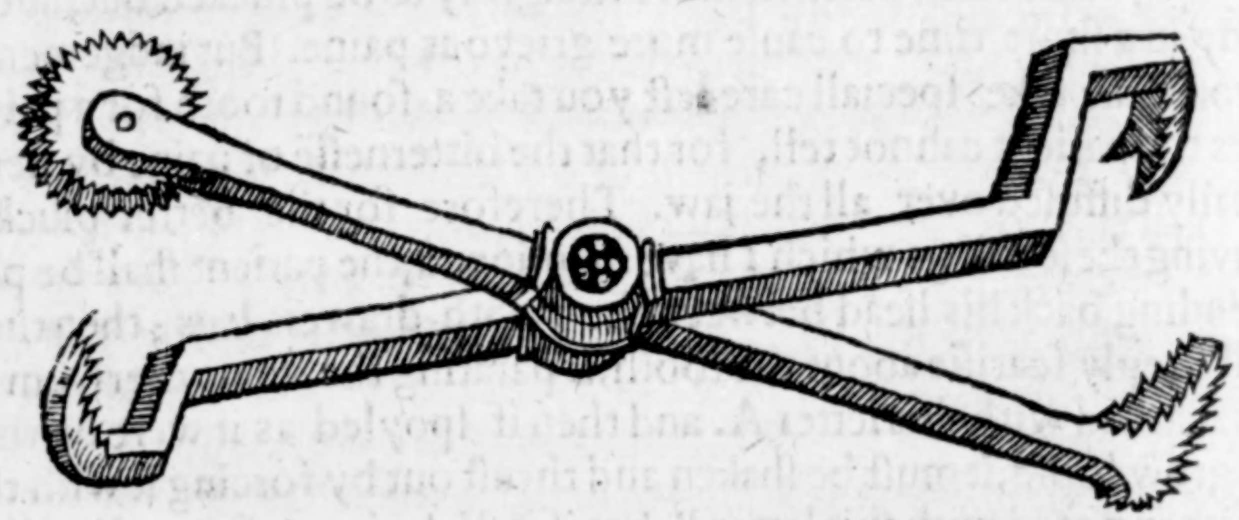
Lib.7.cap.18.

The maner of drawing teeth.

The effigies of Forcipes *or mullets for the drawing of teeth.* *Instruments for ſcraping the teeth, and a three-pointed levatory.*



The forme of another Inſtrument for drawing of teeth.



What to be done when the tooth is pluckt out.

After the tooth is drawn, let the blood flow freely, that ſo the part may be freed from pain, and the matter of the tumor diſcharged. Then let the tooth-drawer preſſe the fleſh of the gums on both ſides with his fingers whereas hee tooke out the tooth, that ſo the ſocket that was too much dilated and oft times torne by the violence of the plucke, may be cloſed again. Laſtly, the mouth ſhall be waſhed with oxycrate; and if the weather bee cold, the patient ſhall take heed of going much in the open aire, leſt it cauſe a new defluxion upon his teeth.

Chap. XXVIII.

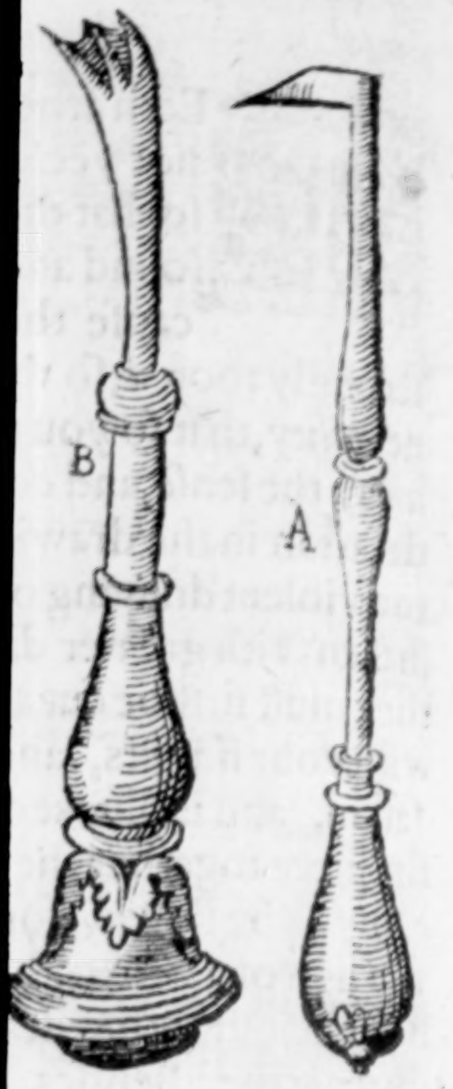
Of cleanſing the Teeth.

Cauſes of foule or ruſty teeth.

PEices of meat in eating ſometimes ſticke between the teeth, and becomming corrupt by long ſtaying there, doe alſo hurt the teeth themſelves, and ſpoile the ſweetneſſe of the breath. Hee that would eſchew this, ought preſently after meate to waſh his mouth with wine mixed with water, or oxycrate, and well to clenſe his teeth that no ſlimy matter adhere to them. Many folkes teeth by their owne default gather an earthy filth of a yellowiſh collour, which eates into them by little and little, as ruſt eates into iron. This ruſty filthineſſe, or as it were mouldineſs of the teeth, doth alſo oft times grow

by

raping the teeth,
intea levatory.



f teeth.

gather an earthy filth of a
e, as ruſt eates into iron.
doth alſo oft times grow
by

---

by the omitting of their proper duty, that is, of chawing. Whenceſoever this ſlimy filth proceeds, wee muſt get *Dentifrices* to fetch it off withall, and then the teeth muſt be preſently rubbed with *aqua fortis* and *aqua vitæ* mixed together, that if there be any thing that hath ſcaped the *Dentifrices*, it may bee all fetched off; yet ſuch acride waſhings are hurtfull to the ſound teeth, for that they by little and little conſume and waſte the fleſh of the gums.

The cure.

A caution in the uſe of acride things.

Dentifrices ſhall be made of the roote of marſh mallowes boiled in white wine & Alume; and as when the teeth are looſe wee muſt abſtaine from ſuch things as are hard to be eaten and chawed, but much more from breaking of ſuch things as are of a bony conſiſtence, alſo here we muſt ſhunne all things that by their toughneſſe ſtick to the teeth. Many for the cleanſing of the teeth, commend a powder made of ſcuttle bones, purple ſhells, pumice ſtone, burnt alume, and harts horne, and a little cinamon, which is a ſingular remedy for the teeth howſoever affected. Many other are content with bread only toſted & beaten; but this following water is very effectuall to whiten the teeth. ℞. *ſal. ammon. & gemmei, an.* ℥i. *alum. roch.* ℥ß. *aquæ roſ. quod ſufficit, deſtillentur.* And let the teeth be cleanſed with this diſtilled liquor.

A water to whiten the teeth.

CHAP. XXIX.

Of the impediment and contraction of the Tongue.

THe tongue is ſometimes tyed and ſhort from the nativity; as when the liberty of the tongue is reſtrained by the ſubject and neighbouring as well membraines as muſcles, being either too ſhort or too hard. Sometimes this diſeaſe happens after they are borne by ſome accident or preternaturall affect, as by too hard a ſcarre left by the healing of an ulcer under the tongue. The patient at his beginning to ſpeake, is too ſlow in ſpeaking, but preſently leaving his ſlowneſſe hee becomes too quicke, ſo that he ſtammers. If the diſeaſe proceed from the aſtriction and ſhortneſſe of the ligamentall membrane lying under the tongue, then the in inciſion ſhall bee made broadwiſe, having great care that the veines and arteries which are there, be not violated, for feare leſt they ſhould cauſe a *hæmorrhagy* not eaſily to be ſtayed: Then the mouth ſhall be preſently waſhed with oxycrate, and ſome lint dipped in ſyrupe of dryed roſes, or honey of roſes put into the midſt of the inciſion, leſt the part of the ligament, eſpecially on the night time when the tongue is ſilent and at reſt, ſhould grow to the reſt of the ligament. For the ſame purpoſe the finger ſhall be often thruſt this way, and the tongue more violently rowld up and down, & thruſt out of the mouth. Yet ſomtimes this ligament is ſo thick & ſhort, and therfore holds down the tongue ſo cloſe, that you cannot come to cut it with a knife or lancet without great and manifeſt danger of death by bleeding. Therefore in ſuch a caſe a needle and thread ſhall bee thruſt through it, and ſo the thread ſhall bee tyed ſtraiter and ſtraiter every day, untill by little and little this ligamentall tye of the tongue, which by its immoderate ſhortneſſe intercepts the liberty of the motion ſhall be conſumed and broken.

The cauſe of being tonguetied.

The cure.

Another way to cut it.

CHAP. XXX.

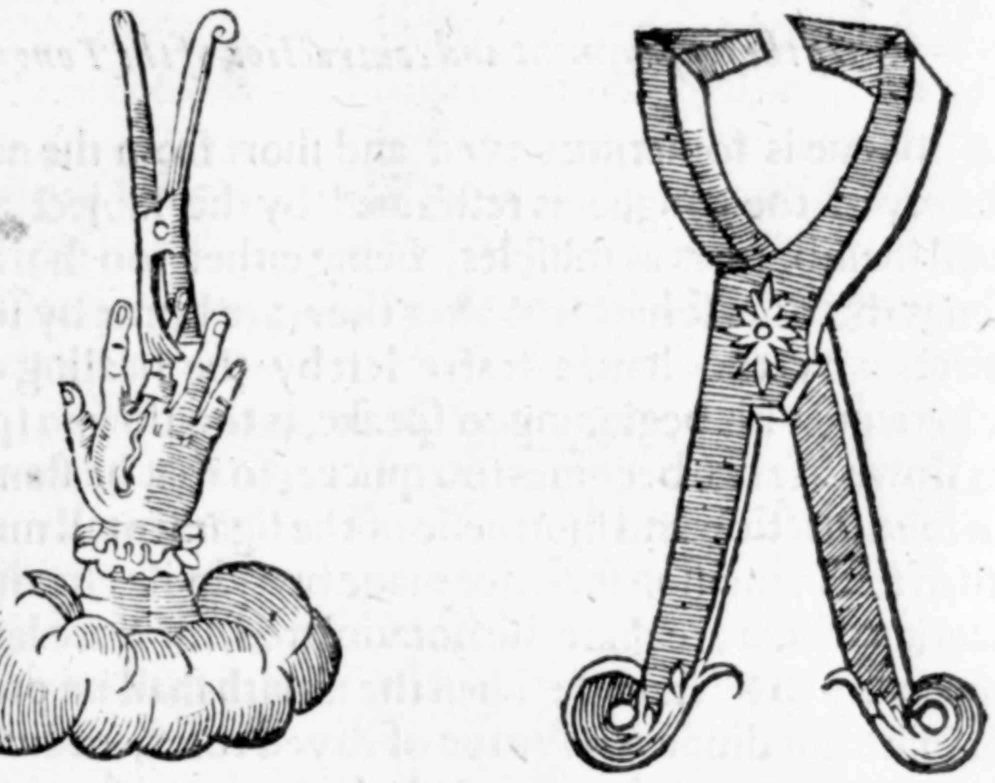
Of ſuperfluous Fingers, and ſuch as ſticke together.

EAch hand hath naturally five fingers onely; whatſoever is more or leſſe is againſt nature: and if there be fewer, it is a fault not to be helped by art. But if there be more, that for the moſt part may be helped by art: ſuperfluous fingers uſually grow by the thumbe, or the little finger, but ſeldome otherwiſe, Theſe are either wholly fleſhy, or have bones of their kind and nailes upon them. Thoſe which are of a bony nature doe either ariſe from the joints of the naturall fingers, and are joynted like them, and ſo are oft times move-

The differences.

moveable, or elſe from ſome middle ſpace of a joint, and theſe have not power to ſtirre or move. Now they are ſometimes equall in magnitude to the naturall fingers to which they grow, yet more frequently they are ſhorter. Thoſe which are onely fleſhy, are eaſily amputated and made even with a razour; but ſuch as are alſo bony cannot be cut off, unleſſe with the cutting mullets hereafter deſcribed, and this is a diſeaſe of the fingers in number. There is alſo another diſeaſe in figure, for they ſomtimes ſticke together, and otherwhiles they are very little ſeparated. This fault happens either from the firſt originall by the error of the formative faculty; or elſe it happens afterwards by accident, as by a wound or burne ill cured. For neighbouring fingers being ulcerated do eaſily grow together, unleſſe they be kept aſunder by a linnen ragge. And if they by chance ſhall grow together by a little and thin ſkinne and fleſh, they ſhall forthwith be divided with a ſharp razour; but if they be joyned by the interpoſition of a more groſſe and denſe ſubſtance, to wit, the nerves, tendons, and veſſels, being knit together on each ſide, it will be beſt not to meddle at all with the dividing them.

Cutting Mullets neatly made for the cutting off ſuperfluous Fingers.



The cure of nailes running into the fleſh of the fingers.

Neither muſt wee omit, that many have their nailes run with ſuch bony ſharpeneſſe into the fleſh of their fingers lying under them, that they cauſe moſt cruell pain; neither commonly do you availe any thing by paring them; for growing up within a while after, they preſſe downewards againe with the more violence. Therefore the Surgeon is often forced to cut away all the fleſh whereinto the ſharpeneſſe of the naile runs. Which I have done in many with happy ſucceſs. Many have corns growing upon their fingers in divers faſhions: They are taken off by paring away by little and little the callous hardneſſe, and then laying a head of garlicke beaten thereon. Yet the cure is more quick and certaine which is performed by cauſtickes, as *aqua fortis*, or oile of vitrioll.

How to take off the cornes of the fingers.

CHAP. XXXI.

Of the too ſhort a Præpuce, and of ſuch as have bin circumciſed.

The cauſe.

WHen as the Præpuce or foreskin is too ſhort, it cannot cover the *glans*. This happens either by nature, to wit, by the firſt conformation, or afterwards by ſome accident, as to thoſe whom religion and the cuſtome of their nation bids to be circumciſed. The cure is thus. The Præpuce is turned up, and then the inner membrane thereof is cut round, and great care is had, that the veine and artery which are there betweene the two membranes

The cure.

of the Præpuce, be not cut inſunder. Hence it is drawn downward by extenſion, untill it cover the *glans*, a deſiccative emplaſter being firſt put betweeen it and the *glans*, leſt they ſhould grow together. Then a pipe being firſt put into the urinary paſſage, the præpuce ſhall be there bound untill the inciſion be cicatrized. This cure is uſed to the Jewes, when having abjured their religion full of ſuperſtitions, for handſomneſſe ſake, they would cover the nut of their yard with a præpuce, and ſo recover their cut off skinne.

CHAP. XXXII.

Of Phymoſis *and* Paraphymoſis, *that is, ſo great a conſtriction of the præpuce about the* Glans *or Nut, that it cannot be bared or uncovered at Pleaſure.*

THe prepuce is ſtraitened about the *Glans* two waies; for it either covers the whole nut, & ſo ſtraitly encompaſſes the end therof, that it cannot be drawne upwards, and conſequently the nut cannot be uncovered; or elſe it leaves the *Glans* bare under it, being faſtened ſo ſtiffely to the roots thereof, that it cannot bee turned up, nor drawn down, or over the *Glans*. The firſt manner of conſtriction is termed *Phymoſis*, the latter *Paraphymoſis*. The causes. The *Phymoſis* happens either by the fault of the firſt conformation, or elſe by a ſcarre, through which occaſion the præpuce hath growne leſſer, as by the growing of warts. Now *Paraphymoſis* is often occaſioned by the inflammation of the yard, by impure copulation; for hence ulcers breed betweene the præpuce and *Glans*, with ſwelling, and ſo great inflammation, that the præpuce cannot bee turned backe. Whence it is that they cannot bee handled and cured as you would, and a gangrene of the part may follow, which may by the contagion bring death to all the body, unleſs it be hindred & prevented by amputation: The cure. but if a ſcar be the cauſe of the conſtriction of the præpuce, the patient being plac'd in a convenient ſite, let the præpuce be drawne forth and extended, and as much as may be ſtretched and enlarged, then let the ſcarre be gently cut in three or foure places on the inner ſide with a crooked knife, but ſo, that the gaſhes come not to the outſide, and let them be an equall diſtance each from other. But if a fleſhy excreſcence or a wart ſhall be the occaſion of this ſtraitneſſe and conſtriction, it ſhall be conſumed by the ſame remedies, by which the warts of the wombe and yard are conſumed or taken off. But when as the præpuce doth cloſely adhere to the *Glans* on every ſide, the cure is not to be hoped for, much leſſe to be attempted.

CHAP. XXXIII.

Of thoſe whoſe Glans *is not rightly perforated, and of the too ſhort or ſtrait ligament, bridle, or Cord of the yard.*

SOme at their birth, by evill conformation, have not their *Glans* perforated in the middle, but have only a ſmall hole underneath, toward the bridle & ligament of the yard, called the cord. The cauſe. Which is the cauſe, that they do not make water in a ſtrait line, unleſſe they turn up their yard toward their belly, neither by the ſame reaſon can they beget children, becauſe through this fault of conformation, the ſeed is hindred from being caſt directly into the wombe. The cure. The cure is wholly chirurgicall, and is thus performed. The præpuce is taken hold of and extended with the left hand, but with the right hand, the extremity thereof, with the end of the *Glans*, is cut even to that hole which is underneath. But ſuch as have the bridle or ligament of the yard too ſhort, ſo that the yard cannot ſtand ſtraight, but crooked, and as it were turned downewards; in theſe alſo the generation of children is hindred, becauſe the ſeed cannot be caſt directly and plentifully into the wombe. Therefore this ligament muſt be cut with much dexterity, and the wound cured after the manner of other wounds, having regard to the part.

Such as are borne without a hole in their fundament are not long lived.

Children alſo are ſometimes borne into the world with their fundaments unperforated, for a skinne preternaturally covering the part, hinders the paſſage forth of the excrements; thoſe muſt have a paſſage made by art with an inſtrument, for ſo at length the excrements will come forth: yet I have found by experience, that ſuch children are not naturally long lived, neither to live many dayes after ſuch ſection.

Chap. XXXIV.

Of the cauſes of the ſtone.

Why children are ſubject to the ſtone in the bladder.

The cauſe.

THE ſtones which are in the bladder have for the moſt part had their firſt originall in the reines or kidneys, to wit, falling down from thence by the ureters into the bladder. The cauſe of theſe is twofold, that is, materiall and efficient. Groſſe, tough, and viſcide humours, which crudities produce by the diſtempers of the bowels and immoderate exerciſes, chiefly immediately after meat, yeeld matter for the ſtone; whence it is that children are more ſubject to this diſeaſe than thoſe of other ages. But the efficient cauſe is either the immoderate heate of the kidneys, by meanes whereof the ſubtler part of the humors is reſolved, but the groſſer and more earthy ſubſides, and is hardened as we ſee bricks hardened by the ſun and fire; or the more remiſſe heat of the bladder, ſufficient to bake into a ſtone the *fæces* or dregges of the urine gathered in great plenty in the capacity of the bladder. The ſtraightneſſe of the ureters and urenary paſſage may be accounted as an aſſiſtant cauſe. For by this meanes the thinner portion of the urine floweth forth, but that which is more feculent and muddy being ſtayed behind, groweth as by ſcaile upon ſcaile, by addition and collection of new matter into a ſtony maſſe. And as a weeke often-times dipped by the Chandler into melted tallow, by the copious adheſion of the tallowy ſubſtance preſently becomes a large candle; thus the more groſſe and viſcide fæces of the urine ſtay as it were at the barres of the gathered gravell, and by their continuall appulſe are at length wrought and faſhioned into a true ſtone.

Chap. XXXV.

Of the ſignes of the ſtone of the Kidneys and bladder.

Why the thigh is numme in the ſtone of the reines.

Signes of the ſtone in the bladder.

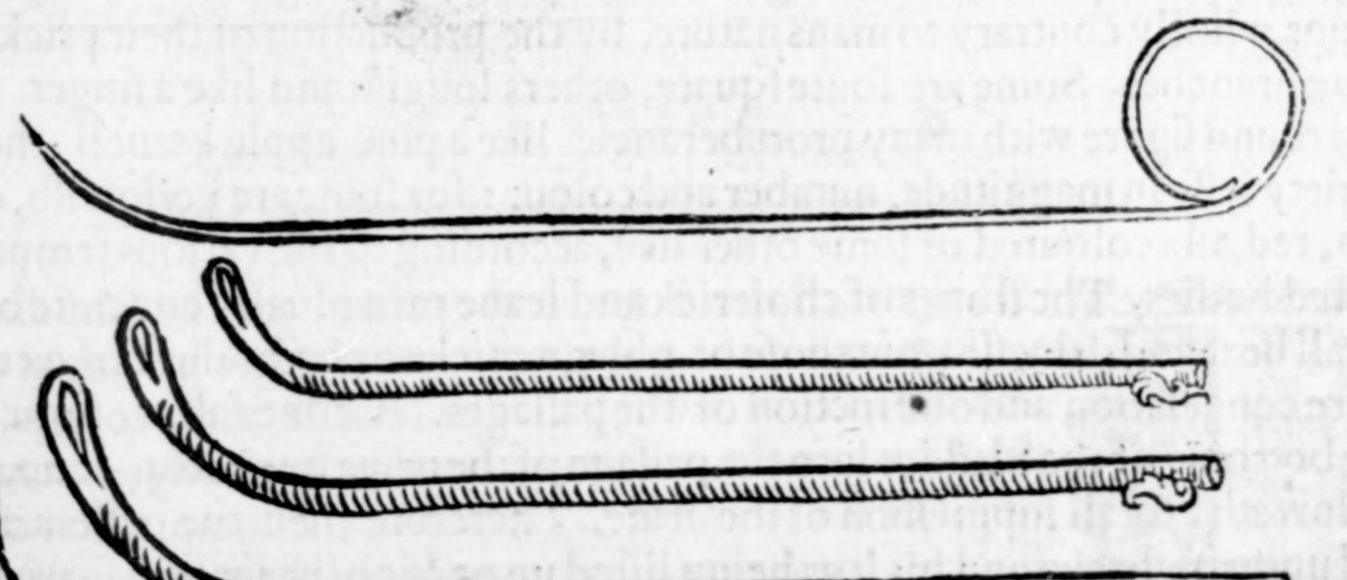
Why ſuch as have a ſtone in the bladder are troubled with the falling of the fundament.

THE ſignes of the ſtone in the reines, are the ſubſiding of red or yellow ſand in the urine, a certaine obſcure itching at the kidneys, and the ſenſe of a weight or heavineſſe at the loynes, a ſharp and pricking paine in moving or bending the body, a numneſſe of the thigh of the ſame ſide, by reaſon of the compreſſion cauſed by the ſtone, of the nerves diſcending out of the *vertebræ* of the loynes of the thigh. But when the ſtone is in the bladder, the fundament and whole *perinæum* is preſſed as it were with a heavie weight, eſpecially if the ſtone be of any bigneſſe, a troubleſome & pricking pain runs to the very end of the yard, and there is a continuall itching of that part, with a deſire to ſcratch it: hence alſo by the paine and heat there is a tenſion of the yarde, and a frequent and needleſſe deſire to make water, and ſometimes their urine commeth from them drop by drop. A moſt grievous paine torments the patient in making water, which he is forced to ſhew by ſtamping with his feet, bending of his whole body, and the grating of his teeth. He is oft times ſo tormented with exceſſe of paine, that the *Sphincter* being relaxed, the right gut falleth downe, accompanied with the ſwelling heate and paine of the *Hæmorrhoid* veines of that place. The cauſe of ſuch torment is, the frequent ſtriving of the bladder to expell the ſtone wholly contrary to the nature thereof, whereto by ſympathy the expulſive faculty of the guts and all their parts of the belly come as it were for ſupply. The ſediment of the urine is groſſe & viſcid, and oft-times like the whites of egs, which argueth the weakneſſe of the native heate not attenuating the juices. The patient looketh of a pale and yellowiſh complexion and hollow eyed, by reaſon of the almoſt continuall watching which is cauſed by the bitterneſſe of paine; yet may it more certainely be knowne by putting in, or ſearching with a *Cathater*. Which to doe, the patient ſhall bee wiſhed to ſtand with his body ſomewhat ſtooping, leaning againſt ſomewhat with his backe, and holding his knees ſome foot aſunder. Then the *Cathater* being bigger or leſſer as the body ſhall require, and anointed with oyle or butter, ſhall bee thruſt with a skilfull hand into the paſſage of the urine, and ſo into the capacity of the bladder. But if the *Cathater* cannot come to that capacity, the patient ſhall be placed in ſuch a poſture; then ſhall he be layd upon his backe on a bench, or the feet of a bed, with his knees bended, and his heeles drawn to his buttocks, after which manner he muſt almoſt lie when he is to be cut for the ſtone, as ſhall be ſhewen hereafter. For thus the *Cathater* is more eaſily thruſt into the bladder, and ſhewes there is a ſtone by the meeting and obſcure ſound of the obvious, hard and reſiſting body. You muſt have ſundry *Cathaters*, that they may ſerve for every body bigger and leſſer, and theſe muſt be crooked, ſmooth and hollow. When being thruſt into the urenary paſſage (which before unawares I omitted) they come to the necke of the bladder, they muſt not be thruſt ſtreight into the bladder, but taking hold of the yard with the left hand, they muſt bee gently thruſt with the right directly into the bladder, eſpecially in men, by reaſon of the length and crookedneſſe of the way, which trends in the forme of this letter S. It is not ſo in women by reaſon of the ſhortneſſe and ſtraitneſſe of the necke of the bladder. It is fit your *Cathaters* bee hollow or fiſtulous in manner of a pipe, that they may receive a ſilver wiar or ſtring, that may hinder the groſſe and viſcide humour, clotted blood, or the like, from ſtopping the further end of the *Cathater*, through which the ſuppreſſed urine ought to paſſe & be made. But now aſſoon as we perceive that the *Cathater* is come into the capacity of the bladder, the wiar muſt be drawn forth, that ſo the urine may the freelier flow out by the hollowneſſe of the *Cathater*. You may perceive the ſhapes of theſe inſtruments by this following figure.

How to ſe[illegible] for the ſtone in the bladder with a *Cathater*.

The figure of the necke of the bladder is different in men and women.

The ſigure of Cathæters, *and of a ſilver ſtring or wiar.*



Chap. XXXVI.

Prognoſtickes in the ſtone.

When the ſtone is caſt forth of the kidney (whereas it bred by little and little) and is ſo driven into one of the ureters, that it wholly ſtop it, yet thereupon there followeth no ſuppreſſion of the urine; for ſeeing nature hath made divers parts of our body double, all the urine floweth into the other ureter. But if they ſhall bee both ſtopped with ſtones, there is no doubt but the urine will bee wholly ſuppreſt, and death enſue by the ſuffocation and extinction of the native heat, by the urine flowing back by the rivelits of the veines over all the whole body. Such as have a ſmall ſtone caſt forth of their reines into the cavity of the ureters, theſe, untill this ſtone be fallen into the bladder, have cruell paine with gripings, with often deſire to go to ſtoole and make water, but oft-times do neither. For ſuch oft-times have their bellies diſtended with flatulencies: an argument hereof is their continuall belching, or breaking of wind. But by ſneeſing & coughing, or any other concuſſion of the whole body, a pricking paine is forthwith felt, whereas the ſtone ſtops, eſpecially if it be either rough, or have ſharpe points like hornes. This paine is communicated to the hip and thigh by ſympathie, and ſome have the ſtones drawne up as it were with great violence. To theſe may bee added the Colicke, cholericke vomiting, and almoſt a generall ſweat. The ſtone in the kidnies is moſt commonly bred in ſuch as are ancient, by reaſon of the weakneſſe of the expulſive faculty. But the ſtone in the bladder happeneth to ſuch as are more young, becauſe the native heat is more vigorous in ſuch, and ſtrong and inordinate motions increaſe the ſtrength of the expulſive facultie. When the ſtone is in the bladder, and the urine appeareth bloody, it is the ſigne of a ſmall, as alſo a prickly and rough ſtone, for thus it more eaſily entreth into the neck of the bladder, and exulcerateth it being fleſhy, whence the blood commeth away with the urine, and moſt cruell paine as of needles thruſt into the fleſh, eſpecially after labour and much exerciſe: on the contrary, a larger and more ſmooth ſtone will not cauſe ſuch tormenting paine, and it cauſeth a milkie water. The ſhapes of ſtones bred in the kidnies are various, according to the variety of the ſtrainers through which they paſſe whilſt they are bred. Verily I have ſeen ſtones which repreſented the figure of grayhounds, hogs and other creatures, and things wholly contrary to mans nature, by the production of their prickles and as it were branches. Some are foure ſquare, others longiſh and like a finger, other ſome of a round figure with many protuberancies like a pine-apple kernell; neither is the variety leſſe in magnitude, number and colour: for ſome are yellowiſh, others whitiſh, red, aſh-coloured or ſome other like, according to the various temper of the affected bodies. The ſtones of cholerick and leane men uſually concrete by preternaturall heat and drineſſe; but thoſe of phlegmaticke or fat bodies, of a certaine as it were congelation and obſtruction of the paſſages. A ſtone falling ſometimes from the bottome of the bladder into the paſſage of the urine quite ſtops it up, and thence followeth a totall ſuppreſſion of the urine. Therefore then the patient ſhall be placed upon his backe and his legs being liſted up on high, he ſhall be ſhaken and toſſed up and downe, juſt as one would ſhake up a ſacke to fill it; for thus it is forced back into the bladder from whence it came, from the paſſage of the urine whereinto it was got; yet it may alſo bee forced backe by thruſting in a Cathæter. The paine which afflicteth ſuch as have the ſtone is ſome whiles continuall, yet more frequently it commeth by fits and returnes, ſometimes monethly, otherwhiles yearely. Such as have the ſtone in the kidnies make for the moſt part wateriſh urine. Women are not ſo ſubject to the ſtone as men, for they have the neck of their bladder more ſhort and broad, as alſo more ſtraight; wherefore the matter of the ſtone by reaſon of the ſhortneſſe of the paſſage is evacuated in gravell, before it can be gathered and grow into a ſtone of a juſt magnitude; yet ſtones breed in ſome women and thoſe equally as big as in men, and therefore they are to be cured by ſection and the like remedies.

How death may enſue by the ſuppreſſion of the urine.

Why ſtones of the kidneys have ſundry ſhapes.

Why men are more ſubject to the ſtone than women.

When the ſtone exceedeth the bigneſſe of an egge, it can ſcarce be taken away without the tearing of the bladder, whence happeneth an unvoluntary ſhedding of the water, curable by no art, becauſe the bladder, ſeeing it is nervous and without bloud, being once torne admitteth no conſolidation, adde hereto that inflammation and a gangrene often following the rending of the bladder bring inevitable death. The patient runs the ſame hazzard, if a long ſtone be pulled out ſidewiſe with your inſtrument, or if it be incloſed in a membrain (which kind of ſtone can ſcace be found with a Cathæter) and ſo bee faſtened to the bladder, or otherwiſe if the ſtone it ſelfe bee faſtened into the ſubſtance of the bladder, or laſtly if by any chance the Surgeon being about to plucke out the ſtone ſhall hurt the body of the bladder with his inſtruments. Yet ſtones of an indifferent bigneſs are more ſafly extracted out of the bladder than thoſe which are leſſe, and the patient more frequently and happily recovereth. For they doe not ſcape from the inſtrument, and the patient being uſed a long while to endure pain, as that which hath been a long time a growing, doth more eaſily and conſtantly away with the inflammation, paine and other ſymptomes, which happen after cutting, yea in cutting. Having thus ſpoken of the cauſes, ſigns, places, ſymptomes and prognoſticks, we muſt come to the cure, beginning with that part which is termed *Prophylactice*, that is, the preventing part.

What ſtones cannot be taken out of the bladder without killing the patient.

CHAP. XXXVII.

What cure is to be uſed when we feare the ſtone.

Diet muſt firſt bee appointed, which by the convenient uſe of the ſixe things not naturall (as they terme them) may heape up ſmall ſtore of groſſe, tough and viſcide humours in our bodies. Therefore cold and cloudy aire is to be ſhunned. They muſt abſtaine from fiſh, beefe, porke, water-foule, pulſe, cheeſe, milke meates, fryed and hard egges, rice, cakes and all paſtry, unleavened bread, and laſtly all manner of obſtructing meats. Alſo garlike, onions, leeks, muſtard, ſpices, & laſtly all things which overheat the bloud and humors muſt be ſhunned, eſpecially if you feare that the ſtone is concrete by the heat of the reines. Standing and muddy waters, thicke and troubled wines, beare, and ſuch kind of liquors muſt be eſchewed. Saciety in meats and drinks is to be ſhunned, as that which breeds crudities. Alſo long watching and continuall labour becauſe they inflame the bloud, cauſe crudities, and preternaturall heat muſt carefully be eſchewed, as alſo all more vehement paſſions of the minde. If the body be plethoricke, then it muſt bee evacuated by phlebotomie, purging and vomiting, which is accounted for a ſingular remedy for the prevention of this diſeaſe. For the performance of all which things a Phyſician ſhall be conſulted. But becauſe Phyſicians are not in every place and alwaies at hand, I have thought good to ſet downe theſe following medicines; yet we muſt firſt remember this counſell of *Galen*; The uſe of diureticks, and ſtrong purging medicines is hurtfull, as often as there is inflammation in the reines and bladder, for ſo the confluxe of the humors to the affected parts is the greater, whence the inflammation and paine are increaſed.

What diet ſuch muſt uſe as fear the ſtone.

Lib.13.method.

Wherefore firſt uſing relaxing medicines, as ſixe drams of *Caſſia* newly drawne, with ℈iv. of *Rubarbe* in powder mixed therewith; then lenitive and refrigerating medicines ſhall bee inwardly and outwardly uſed, ſuch as is this following ſyrupe. ℞. *ſummitatum malv. biſmal. & violar. an.* m. ß. *rad. alth.* ℥i. *glycyr.* ℥ß.4. *ſem. frigid. major. an.* ʒi. *fiat decoctio.* ℞. *prædict. decoctionis* ℔.ß. *in colatura diſſolve ſacch. albiſſ.* ℥ii. *mellis albi* ℥iß. *fiat ſyrupus ſecund. artem*; let the patient uſe this often. This following apozeme is alſo very effectual for the ſame purpoſe. ℞. *rad. aſpar. gramin. polyp. querceni, paſſul. mund. an.* ℥ß. *betonic. herniar. agrimon. omnium capill. & pimpinell an.* m. ß.4. *ſem. frigid. major. & ſem. fænic. an.* ʒi. *folior. ſen.* ʒvi. *fiat decoct. ad* ℔.ß. *in colatura diſſolve ſyrupi de Althæa & de herniar. an.* ℥iß. Make a cleare apozeme and let it be aromatized with a little cinamon, for two doſes; let him take the firſt doſis in the morning two houres before meat, and the other at foure of the clock in the afternoone. Moreover

A lenitive and lubricating ſyrupe.

A diuretick Apozeme.

A diuretick and lenitive broth.

A diuretick powder.

The lye made of the aſhes of beane ſtalkes a diuretick.

Anodine gliſters in the ſtone.

Remedies againſt the ſtone of the kidnies comming from a cold cauſe.

Carminative gliſters.

over this following broth hath an excellent and certain power to prevent the ſtone. ℞. *hordei integr.* p.i. *radic. petroſelini, acetoſ. fœnicul. cichor. bruſci an.* ℥i. 4. *ſem. frigidorum conquaſſatorum. an.* ʒß. *fol. acetoſ. portul. lactucæ, ſummitatum malvæ, & violar. an.* m.ß. *bulliant in aqua fluviatili cum gallo gallinaceo & crure vitulino*; let the broth bee kept, and let the Patient take thereof ſixe ounces for foure daies; in the morning two houres before meat, with an ounce of the juice of Citrons gently warmed with the ſame broth at the time of the taking thereof; for thus, much urine will be made in a ſhort while after, full of a ſandy ſediment and a groſſe viſcide humour. Whereby you may certainly gather that this kind of broth is very effectuall to cleanſe the paſſages of the urine, neither in the interim, doth it any harme to the ſtomacke and other parts by which it paſſeth: ſo that it may be rightly eſteemed a medicinall nouriſhment. You may alſo profitably uſe this following powder. ℞. *nucleorum meſpilorum* ℥i. *pul. elect. diamarg. frig.* ʒii. 4. *ſem. frigid. majorum mund. glycyrhizæ raſæ,* ʒi. *ſem. ſaxifrag.* ʒii. *ſem. milii ſolis, geniſt. pimpinel. bruſci & aſparag. an.* ℈i. *ſem. althea,* ʒiß, *ſacch. albiſſ.* ℥vi. *fiat pulvis*; let him take a ſpoon full in the morning three houres before meat. Alſo ſome thinke that lye made of the ſtalkes and huskes of beanes is a good preſervative againſt this diſeaſe. Beſides the uſe of this following glyſter hath done good to many. ℞. *fol. lactuc. ſcariol. portul. an.* m.i. *flor. viol. & nenuph. an.* p.i. *fiat decoctio. ad lib.* i. *in colatura diſſolve caſsiæ fiſtulæ* ℥i. *mellis viol. & ſacch. rub. an.* ℥iß. *olei viol.* ℥iiii. *fiat clyſter.* This which followeth is the fitter to aſſwage the paine. ℞. *flo. cham. melil. ſummitat. aneth. berul. an.* p. ii. *fiat decoctio in lacte vaccino*; *in colatura diſſolve caſsiæ fiſtul. & ſacchar. alb. an.* ℥i. *vitellos ovorum num.* ii. *olei anethini, & chamæm. an* ℥ii. *fiat clyſter.* In the interim let the kidneys bee annointed on the outſide with *unguentum roſatum, refrigerans Galen.* and *populeon* uſed ſeverally, or mixed together, laying thereupon a double linnen cloth dipped in oxycrate. But if the concretion of the ſtone be of a cold cauſe, the remedies muſt bee varied, as follows; ℞. *terebinth. venet.* ʒi. *cort. citri* ʒii. *aquæ coct.* ʒii. *fiat potio.* Or elſe, ℞. *caſsiæ recent. extract.* ʒvi. *benedict. lax.* ʒiii. *aq. fœnicul.* ℥ii. *aq. aſparag.* ℥i. *fiat potio*; let him take it three houres before dinner: this following apozeme is alſo good. ℞. *rad. cyper. bardan. & gram. an* ʒiii. *biſmal. cum toto, beton. an.* m.ß. *ſem. milii ſolis, bardan. urtic. an* ʒii. *ſem. melon. glycyrhiz. raſ. an.* ʒiiß. *ficus num.* 4. *fiat. decoct. ad quart.* iii. *in expreſſa colatura, diſſolve ſyrup. de caphan. & oxymilitis ſcillitici an.* ℥i. ß. *ſacchar. albiſ.* ʒiii. *fiat apozema pro tribus doſibus, clarificetur & aromatiz. cum.* ʒi. *cinam. &* ʒß. *ſant. citrin.* let him take foure ounces three houres before dinner. Or elſe, ℞. *rad petroſel. fœnicul. an.* ʒi. *ſaxifrag. pimp. gram. & bardan. an.* m. ß. *quatuor ſeminum frig. major. mundat. & milii ſolis an.* ʒii. *fiat decoctio, cape de colatura* ℔. ß. *in qua diſſolve ſacch. rub. & ſyrup. capill. ven. an.* ℥i. ß. Let it be taken at three doſes, two houres before meat. The following powder is very effectuall to diſſolve the matter of the ſtone. ℞. *ſem. petroſel. & rad. ejuſdem mundat. an* ℥ß. *ſem. cardui, quem colcitrapam vocant,* ℥i. let them be dryed in an oven or ſtone with a gentle fire, afterwards let them be beaten ſeverally and make a powder, whereof let the patient take ℈i. ß. or two ſcruples with white wine, or chicken broth faſting in the morning by the ſpace of three daies. Or, ℞. *coriand. præp.* ℈iv. *aniſ. marathri, ganor. alkakengi, milii ſolis, an* ʒii. *zinzib. & cinam. an.* ℈ii. *turbith. electi* ʒi. *cari* ℈ii. *galang. nucis moſchat. & lapid. judiaci an.* ℈i. *fol. ſennæ mund. ad duplum omnium, diacrydii* ʒii. ß. *miſce, fiat pulvis*: the doſis is about ʒi. with white wine three houres before meate. Againſt the flatulencies which much diſtend the guts in this kind of diſeaſe, gliſters ſhall be thus made; ℞. *malv. biſmal. pariet. origani, calament. flo. chamæm. ſumitat. anethi, an.* m. ß. *aniſi, carvi. cumini, fœnic. an.* ℥ß. *baccar. laur.* ʒiii. *ſemin. rutæ* ʒii. *fiat decoctio, in colatura, diſſolve bened. lax. vel diaphænic.* ℥ß. *confect. bac. lauri* ʒiii. *ſacchar. rub.* ℥i. *olei aneth. chamæm. & rutar. an.* ℥i. *fiat clyſter.* Or, ℞. *olei nucum & vini mal. an.* ℔. ß. *aq. vitæ.* ℥ß. *fiat clyſter*; let it be kept long, that ſo it may have the more power to diſcuſſe the winde.

CHAP. XXXVIII.

What is to be done, when the ſtone falleth out of the Kidney into the Ureter.

Oft-times it falleth out that the reines uſing their expulſive faculty force downe the ſtone (whoſe concretion and generation the Phyſicians by the formerly preſcribed meanes could not hinder) from themſelves into the ureters ; but it ſtayeth there either by reaſon of the ſtraightneſſe of the place, or the debility of the expulſive faculty. Therefore then cruell paine tormenteth the patient in that place whereas the ſtone ſticketh, which alſo by conſent may be communicated to the hippe, bladder, teſticles and yard, with a continuall deſire to make water and goe to ſtoole. In this caſe it behooveth the Phyſician that he ſupply the defect of nature, and aſſiſt the weake indeavours.

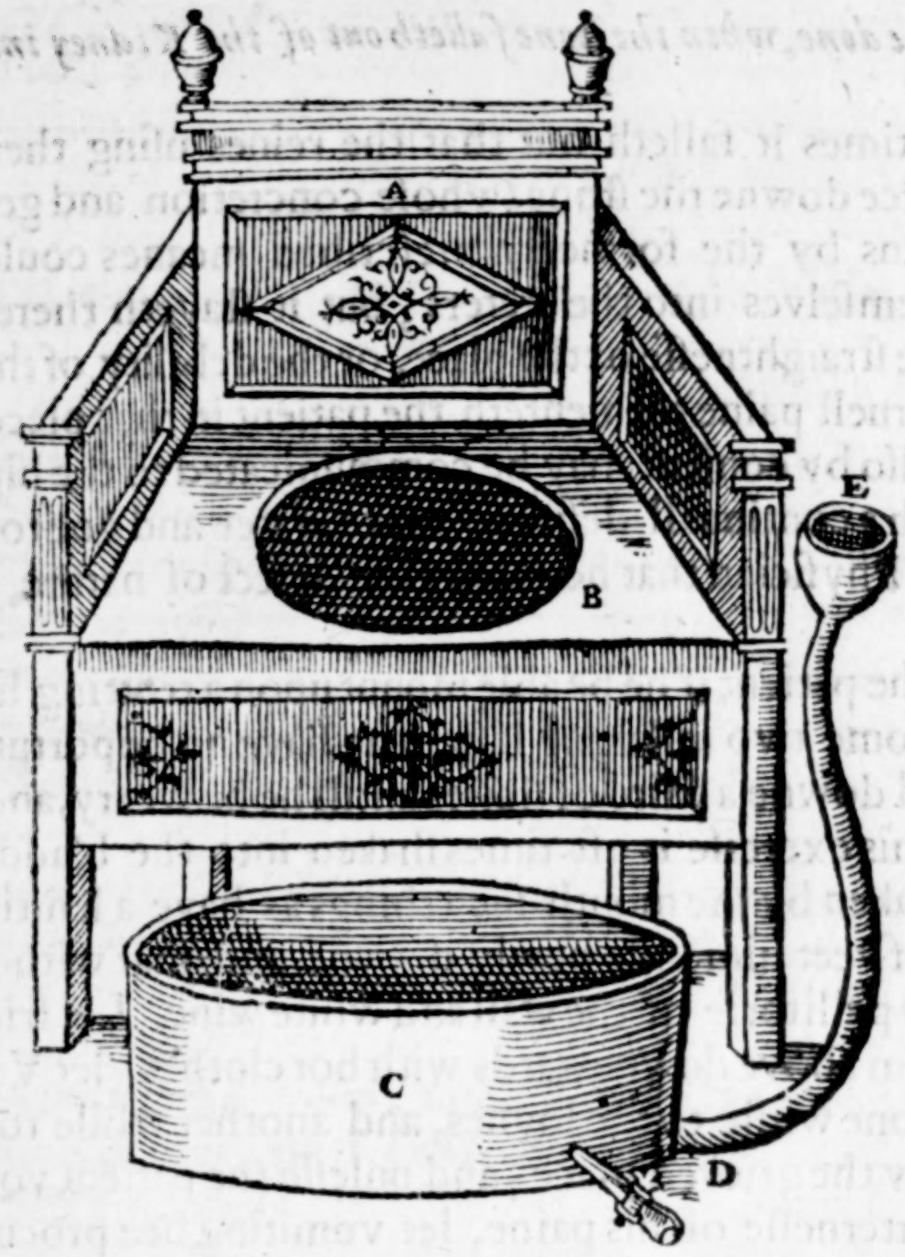
Signes of the ſtone ſtopping in the *ureter*.

Therefore let the patient if he be able mount upon a trotting horſe, and ride upon him the ſpace of ſome two miles, or if hee can have no opportunity to doe ſo, then let him run up and downe a paire of ſtaires untill he be weary, and even ſweat again ; for the ſtone by this exerciſe is oft-times ſhaken into the bladder ; then preſently ſhall be given or taken by the mouth ſuch things as have a lenitive and relaxing facultie, as oyle of ſweet almonds newly drawne and that without fire, and mixed with the water of pellitorie of the wall and white wine. Let frictions of the whole body be made from above downewards with hot clothes ; let Ventoſes with a great flame be applyed one while to the loynes, and another while to the bottome of the belly, a little below the grieved place ; and unleſſe the patient vomit of his owne accord, or by the bitterneſſe of his paine, let vomiting bee procured with a draught of water and oile luke warme ; for vomiting hath much force to drive downe the ſtone, by reaſon of the compreſſion of the parts, which is cauſed by ſuch an endeavour : laſtly, if the ſtone deſcend not by the power of theſe remedies, then the patient muſt bee put into a *Semicupium*, that is, a Halfe-bath, made of the following decoction. ℞. *malvæ, biſmal. cum toto an.* m.ii. *beton. naſturt. ſaxifrag. berul. parietar. violar. an.* m.iii. *ſemin. melonum, milii ſolis, alkekengi an.* ʒvi. *cicer. rub* ℔.i. *rad. appii, gram. fœniculi, & eryngii, an.* ℥iiii. *in ſufficienti quantitate aquæ pro inceſſu ; coquantur iſta omnia incluſa ſacco* ; herein let the patient ſit up to the navell : neither is is fit that the patient tarry longer in ſuch a bath than is requiſite, for the ſpirits are diſſipated, and the powers reſolved by too long ſtay therein. But on the contrary, if the patient remaine as long as is ſufficient in theſe rightly made, the paine is mitigated, the extended parts relaxed, and the paſſages of urine opened and dilated, and thus the ſtone deſcendeth into the bladder. But if it be not moved by this meanes any thing at all out of the place, and that the ſame totall ſuppreſſion of urine do as yet remaine, neither before the patient entred into the bath the putting of a *Cathæter* into the bladder did any thing availe, yet notwithſtanding he ſhall try the ſame againe after the patient is come out of the bath, that hee may bee throughly ſatisfied whether peradventure there may bee any other thing in theſe firſt paſſages of the yard and neck of the bladder, which may with-hold the urine ; for the *Cathæter* will enter farre more eaſily, the parts being relaxed by the warmeneſſe of the bath : then inject ſome oyle of ſweet almonds with a ſyringe into the *Urethra* or paſſage of the yarde ; whilſt all theſe things are in doing, let not the patient come into the cold aire. But here I have thought good to deſcribe a chaire for a bath, wherein the patient may fitly ſit.

Remedies to force down the ſtone ſticking in the *ureter*.

A decoction for a bath.

The figure of a chaire for a Semicupium.



A. *Sheweth the whole frame of the Chaire.*
B. *The hole wherein the patient muſt ſit.*
C. *The Ciſterne that holds the water.*
D. *A Cocke to empty the water when it groweth cold.*
E. *A Funnell whereby to poure in warme water.*

An Anodine Cataplaſme.

Signes of the ſtone fallen out of the *ureter* into the bladder.

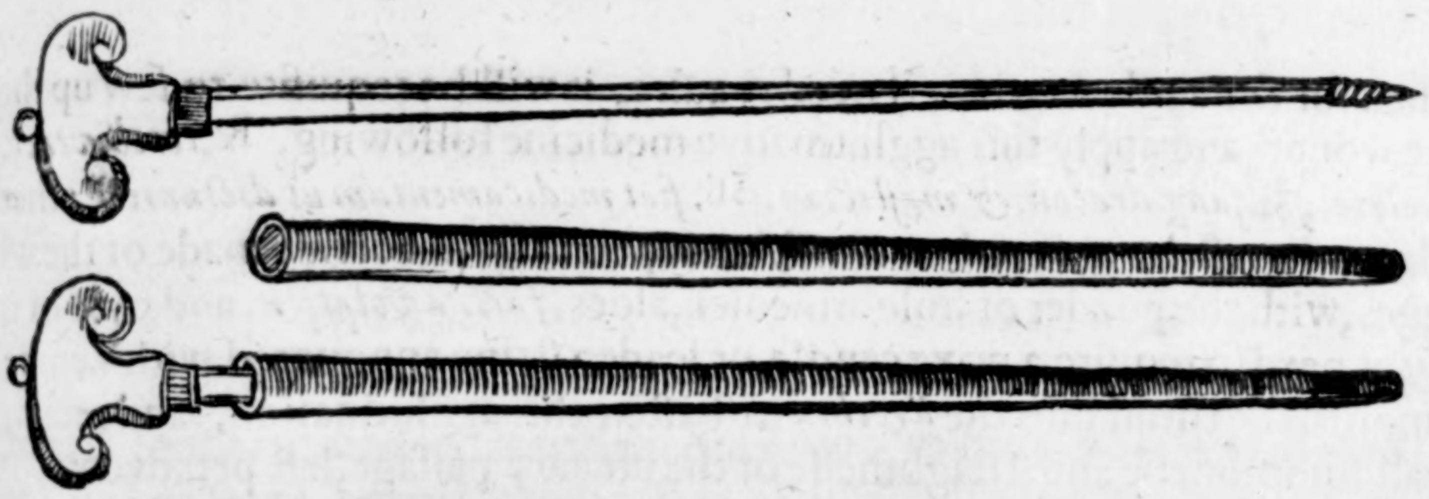
There may alſo be another decoction made for the bath, as thus: ℞. *rad. raph. alth. an.* ℔.ii. *rad. ruſc. petroſel. & aſparag. an.* ℔.i. *cumin. fœnicul. ameos an.* ℥iiii. *ſem. lini, fænug. an.* ʒvi. *fol. marub. parietar. florum chamæm. melil. anethi, an.* m.ii. *bulliant omnia ſecundum artem in aquæ ſufficienti, & vini albi odoriferi exigua quantitate ad conſumptionem tertiæ partis pro Semicupio.* Alſo the ſame decoction may bee uſed for gliſters, adding thereto two yolkes of egges, and foure ounces of oyle of lillies, with ʒi. of oile of Juniper, which hath a certaine force to aſſwage the paine of the ſtone and colick. But a farre leſſe quantity of the decoction in a gliſter muſt be uſed in theſe diſeaſes, than uſually is appointed in other diſeaſes; otherwiſe there will be danger leſt the guts being diſtended ſhould more preſſe upon the kidneys and ureters, troubled in ſome ſort with inflammation, and ſo increaſe the paine and other ſymptomes. This following cataplaſme ſhall be profitably applyed to the grieved place, to wit, the loynes or flankes and bottome of the belly, for it is very powerfull to aſſwage paine, and help forwards the falling downe of the ſtone. ℞. *rad. alth. & raphani, an.* ℥iiii. *pariet. fœnic. ſenecionis, naſturt. berul. an.* m. i. *herniariæ* m. ß. *omnibus in aqua ſufficienti decoctis, & deinde contritis, adde olei aneth. chamæm. & pingued. cuniculi, an.* ℥ii. *farin. cicer. quantum ſufficit, fiat cataplaſma ad uſum prædictum.* After by theſe means the ſtone forced out of the *ureter* is fallen into the bladder, the paine preſently (if there be but one ſtone, for ſometimes more with much gravell do againe fall into the *ureter)* is mitigated, and then the patient is troubled with an itching and pricking at the end of his yard and fundament. Therefore then unleſſe he bee very weake, it is fit that he ride and walk a foote, and take ʒiv. of *ſpecies Lithontribon* in foure doſes with white wine, or the broth of red Cicers three houres before dinner and ſupper. Beſides, let him plentifully drink good wine, and after he hath drunke, let him hold in his urine as long as he can; that ſo it being gathered in greater plenty, it may preſently thruſt the ſtone out of the bladder with the more force: for which purpoſe you may alſo inject the following liquor into the bladder. ℞. *ſyrupi capill. ven.* ℥i. *aquæ alkekengi* ℥iii. *olei ſcorpionum.* ℥ß. Let it bee injected into the bladder with a ſyringe.

Chap. XXXIX.

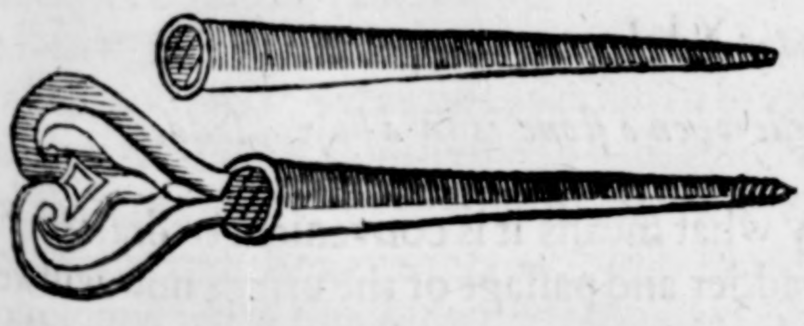
What muſt be done the ſtone being fallen into the necke of the bladder, or paſſage of the yard.

After the ſtone is fallen out of the capacity of the bladder, and ſtops in the necke thereof, or paſſage of the yard, the Surgeon ſhall have a ſpeciall care that he do not force or thruſt backe the ſtone from whence it came, but rather that he preſs it gently with his fingers to the end of the yard, the paſſage being firſt made ſlippery by injecting ſome oyle of ſweet almonds. But if it ſtop in the end of the *Glans*, it muſt bee plucked out with ſome crooked inſtrument; to which if it will not yeeld, a Gimblet with a pipe or caſe thereto, ſhall be put into the paſſage of the yard, and ſo it ſhall be gotten out, or elſe broken to pieces by the turning or twining about of the Gimblet, which I remember I have divers times attempted and done; for ſuch Gimblets are made with ſharpe ſcrewes, like ordinary Gimblets.

The delineation of a Gimblet made to breake the ſtones in the paſſage of the yard, together with its pipe, or caſe.



The effigies of another leſſer Gimblet.



Verily what Gimblets ſoever are made for this buſineſſe, their body nor point muſt bee no thicker than a ſmall probe; leſt whilſt they are forced or thruſt into the *urethra*, or urinary paſſage, they might hurt the bodies next unto them by their violent entrance.

Chap. XL.

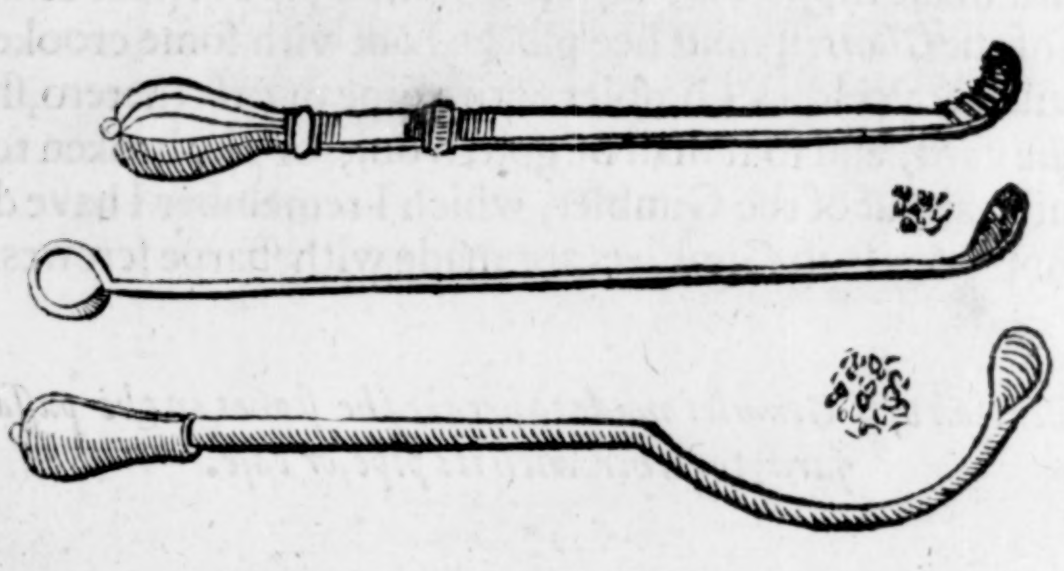
What courſe muſt be taken, if the ſtone ſticking in the Urethra *or urinary paſſage, cannot be gotten out by the fore-mentioned arts.*

But if the ſtone be more thicke, hard, rough and remote from the end of the yard, than that it may be gotten out by the meanes formerly mentioned in the precedent chapter, and if that the urine be wholly ſuppreſt therewith, then muſt you cut the yard upon the ſide with a ſtreight wound: for you muſt not make inciſion on the upper part for feare of a fluxe of blood, for a large veine and artery lyeth thereunder; nor in the lower part, for

When the yard may be ſafely cut.

for ſo it would ſcarce ever heale againe, for that it is a bloodleſſe part, and beſides, the continuall and acride falling of the urine would hinder the agglutination: wherefore the inciſion muſt be made on the ſide, on that part whereas the ſtone moſt reſiſts and ſwels out. For that part is the more fleſhie; yet firſt the end of the skin of the prepuce muſt be much drawn up ſo to cover the *Glans*, which being done, the *Urethra* ſhall be tyed with a threed a little above the ſtone, that ſo the ſtone may be ſtayed there, and may not fall back againe. Therefore then, inciſion being made, the ſtone muſt be taken forth, and the skin which was drawne more violently to cover the *Glans* is to be let goe backe againe; for ſo it will come to paſſe that a whole part of the skin may cover the cut yard, and ſo it may be the more ſpeedily united and the urine may naturally flow out. I have by this meanes oft-times taken forth the ſtone with the inſtruments here delineated.

Inſtruments fit to take the ſtone forth of the opened Urethra, *or urenary paſſage of the yard.*



An agglutinative medicine.

Then for the agglutination, if need require, it will be requiſite to ſew up the lips of the wound, and apply this agglutinative medicine following. ℞. *tereb. venet.* ℥iiii. *gum. elemi*, ℥i. *ſang. dracon. & maſtic. an.* ʒß. *fiat medicamentum ut dictum eſt*: then the whole yard muſt be covered over with a repercuſſive medicine made of the whites of egges, with the pouder of bole armenick, aloes, *farina volatilis*, and oyle of roſes. Laſtly, if need ſo require, a waxe candle, or leaden ſtring annoynted with Venice turpentine ſhall be thruſt into the *Urethra* to haſten the agglutination, and retaine the naturall ſmoothneſſe and ſtreightneſſe of the urenary paſſage, leſt peradventure a caruncle grow therein.

How to haſten the agglutination.

Chap. XLI.

What manner of ſection is to be made when a ſtone is in a boyes bladder.

Why the boy muſt be ſhaken before cutting.

How to place the child before diſſection.

Hitherto we have ſhewed, by what means it is convenient to draw ſmall ſtones out of the ureter, bladder and paſſage of the urine; now will we briefly ſhew the manner of taking of greater ſtones out of the bladder, which is performed by inciſion and iron inſtruments, and I will deliver the practice thereof firſt in children, then in men, and laſtly in women. Firſt therefore let the Surgeon take the boy (upon whom it is determined the worke ſhall be performed) under the arme holes, and ſo give him five or ſixe ſhakes, that ſo the ſtone may deſcend the more downewards to the neck of the bladder. Then muſt you cauſe a ſtrong man ſitting upon a high ſeat to lay the child upon his backe with his face from himward, having his hips lying upon his knees. The child muſt lye ſomewhat high that he may breathe the freelier, & let not the nervous parts be too much ſtretched, but let all parts be looſe and free for the drawing forth of the ſtone. Furthermore, it is fit that this ſtrong man, the childs legges being bended backe, wiſh the child, that putting his legs to his hams, that he draw them up as much as he can, & let the other be ſure he keep them ſo; for this ſite of the child much

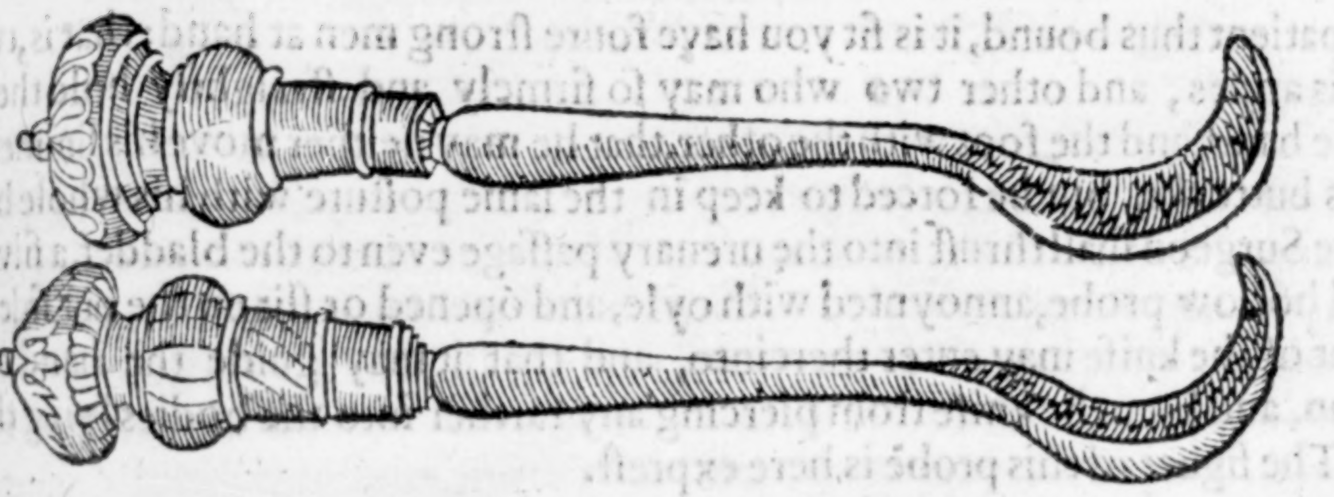
conduceth to well performing of the worke. Then let the Surgeon thruſt two of the fingers of his left hand as farre into the childs fundament as hee is able; but let him with his other hand preſſe the lower belly, firſt wrapping a cloth about his hand, that ſo the compreſſion may be the leſſe troubleſome, and leſt inflammation ſhould happen rather by this meanes than by the inciſion. Now the compreſſion hath this uſe, to cauſe the ſtone deſcend out of the bottome of the bladder into the neck thereof under the *os pubis*, whither after it is arrived, it muſt be there kept, & as it were governed by the command of your hand, leſt it ſhould ſlide from that place whereto you have brought it. Theſe things thus done, nothing now remaineth, but that the Surgeon, with a wound ſome two fingers breadth diſtant from the fundament, cut through all the fleſh even to the ſtone on the left ſide of the *perinæum*. But in the interim, let him beware that he hurt not the *inteſtinum rectum*; for it may, and uſually doth happen, that whileſt the ſtone is brought out of the bottome of the bladder to the neck thereof, this gut is doubled in: now if it bee cut with your inciſion knife, it commeth to paſſe that the excrements may ſometimes come out at the wound, and the urine by the fundament, which thing hath in many hindred the agglutination and conſolidation of the wound; yet in ſome others it hath done little harme, becauſe in this tender age many things happen, which may ſeeme to exceed nature: the inciſion being made, the ſtone muſt bee plucked forth with the inſtrument here expreſſed.

Where to divide the *perinæum*.

Nature very powerfull in children.

Hookes to pull ſtones forth of childrens bladders.



The ſtone being drawne out, a ſmall pipe ſhall be put into the wound, and there kept for ſome ſpace after, for reaſons hereafter to bee delivered; then his knees ſhall bee bound together, for thus the wound will the ſooner cloſe and bee agglutinated. The reſidue of the cure ſhall be performed by reducing the generall cure of wounds, to the particular temper of the childs age, and the peculiar nature of the child in cure.

Generall rules muſt be reduced to particular bodies.

Chap. XLII.

How to cut men, for the taking out of the ſtone in the bladder.

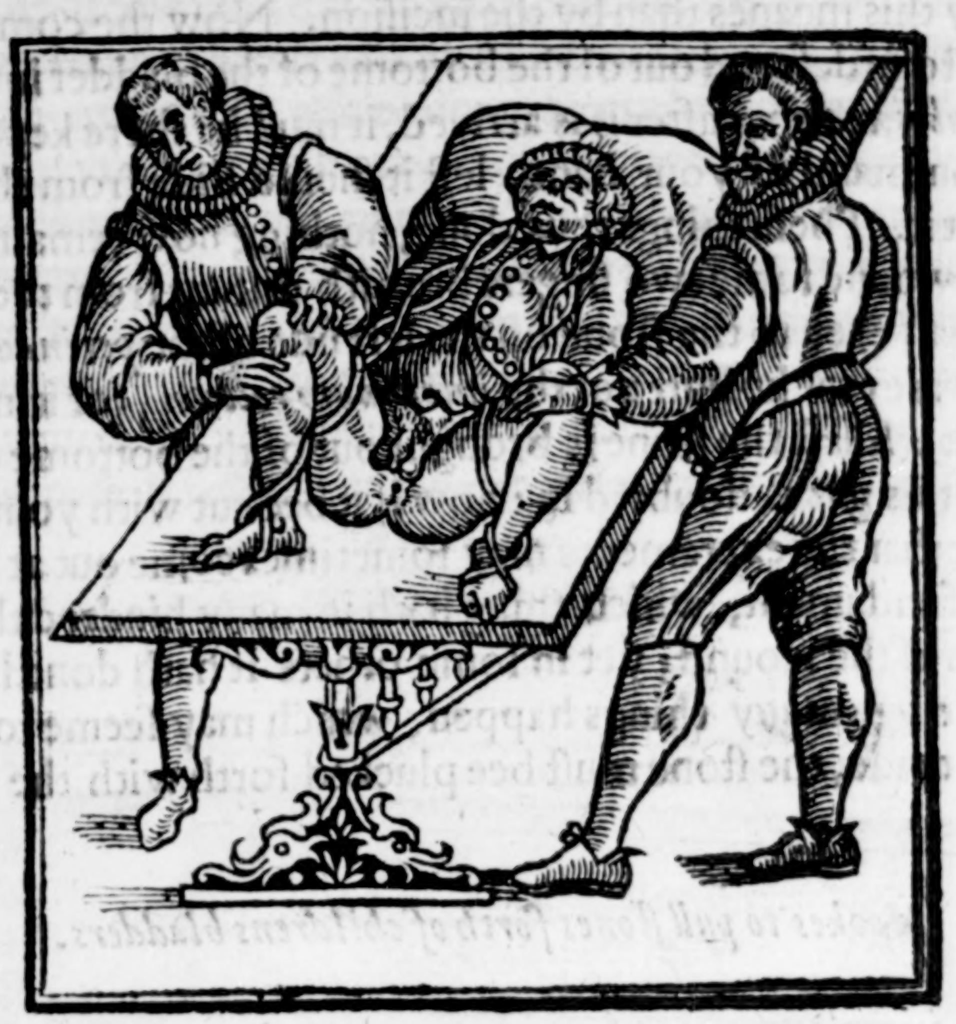
SEing wee cannot otherwiſe helpe ſuch men as have ſtones in their bladders, we muſt come to the extreme remedy, to wit, cutting. But the patient muſt firſt be purged, and if the caſe require, draw ſome bloud; yet muſt you not immediately after this, or the day following haſten to the work, for the patient cannot but be weakened by purging & bleeding. Alſo it is expedient for ſome daies before to foment the privities with ſuch things as relaxe and ſoften, that by their yeelding, the ſtone may the more eaſily be extracted. Now the cure is thus to be performed; The patient ſhall be placed upon a firm table or bench with a cloth many times doubled under his buttocks, and a pillow under his loynes & back, ſo that he may lie halfe upright with his thighs lifted up, and his legs and heels drawn back to his buttocks. Then ſhall his feet be bound with a ligature of three fingers breadth caſt about his ankles, and with the heads thereof being drawn upwards to his neck, and caſt a-

What to bee done before diſſection.

How to lay the patient.

bout it, and ſo brought downewards, both his hands ſhall bee bound to his knees, as the following figure ſheweth.

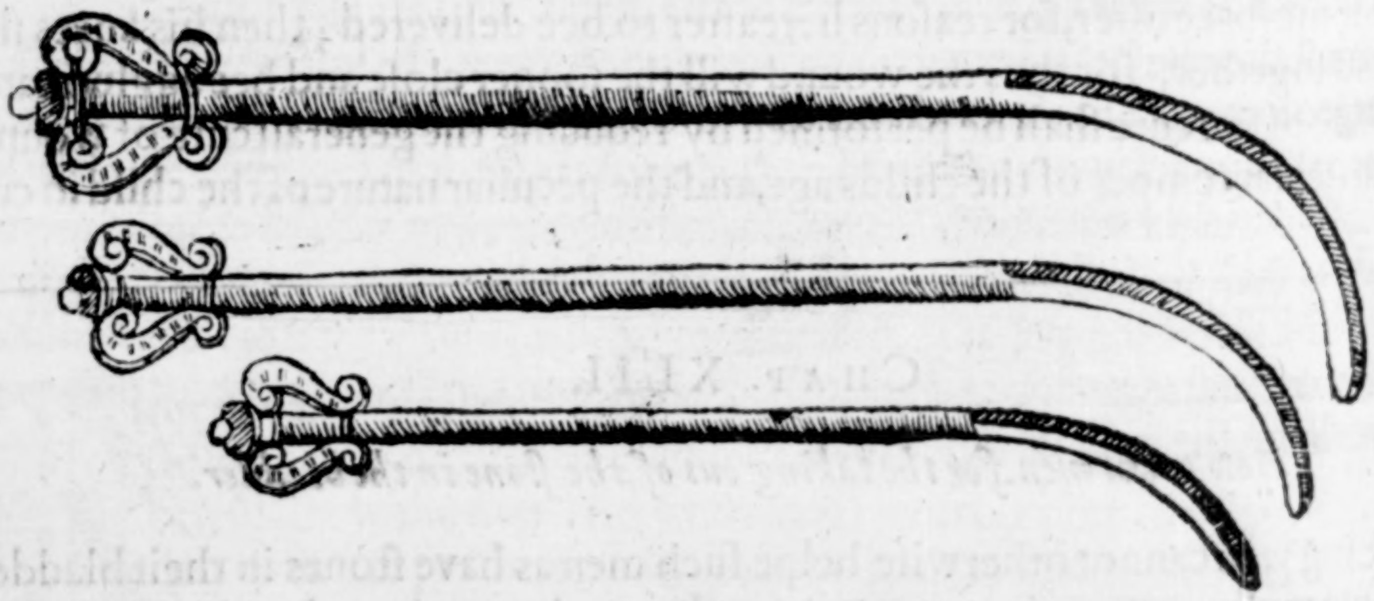
The figure of a man lying ready to be cut for the ſtone.



The patient thus bound, it is fit you have foure ſtrong men at hand; that is, two to hold his armes, and other two who may ſo firmely and ſtraightly hold the knee with one hand, and the foot with the other, that he may neither move his limmes, nor ſtirre his buttocks, but be forced to keep in the ſame poſture with his whole body. Then the Surgeon ſhall thruſt into the urenary paſſage even to the bladder, a ſilver or iron and hollow probe, annoynted with oyle, and opened or ſlit on the out ſide, that the point of the knife may enter thereinto, and that it may guide the hand of the workman, and keep the knife from piercing any farther into the bodies lying thereunder. The figure of this probe is here expreſt.

Why the probe muſt be ſlit on the out-ſide.

Probes with ſlits in their ends.



Why the ſeame of the *perinæum* muſt not be cut.

He ſhall gently wreſt the probe, being ſo thruſt in, towards the left ſide, and alſo he who ſtandeth on the patients right hand, ſhall with his left hand gently lift up his Cods, that ſo in the free and open ſpace of the left ſide of the *perinæum*, the Surgeon may have the more liberty to make the inciſion upon the probe which is thruſt in and turned that way. But in making this inciſion, the Surgeon muſt be carefull that he hurt not the ſeame of the *perinæum* and fundament. For if that ſeame bee cut, it will not be eaſily conſolidated, for that it is callous and bloudleſſe, therefore the urine would continually drop forth this way. But if the wound be made too neare the fundament, there is danger, leſt by forcible plucking forth of the ſtone he may break ſome of the hæmorrhoide veins, whence a bleeding may enſue, which is ſcarce to be ſtopped e bound to his knees, as

e ſtone.

n at hand; that is, two to
ſtraightly hold the knee

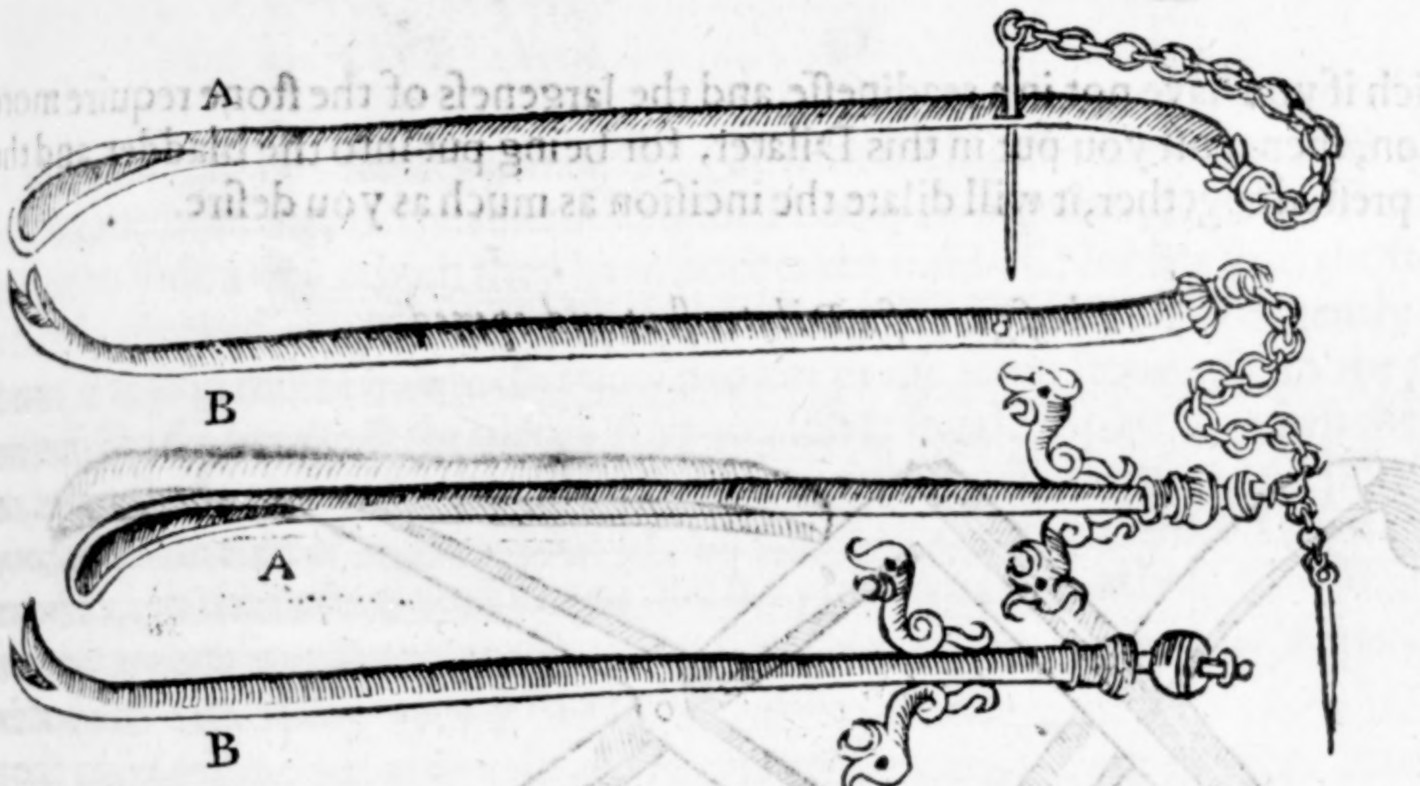
nd be made too neare the
of the ſtone he may break
nſue, which is ſcarce to be
ſtopped

ſtopped by any meanes, or that hee may rend the *ſphincter* muſcle, or body of the bladder, ſo that it can never be repaired. Therefore it muſt be made the ſpace of two fingers from the fundament, according to the ſtraightneſſe of the fibres, that ſo it may be the more eaſily reſtored afterwards. Neither muſt the inciſion thus made, exceed the bigneſſe of ones thumbe, for that it is afterwards enlarged by putting in the Crowes beake and the dilater, but more by the ſtone as it is plucked forth. But that which is cut, is neither ſo ſpeedily nor eaſily healed up, as that which is torne. Then preſently put into the wound ſome one of theſe ſilver inſtruments delineated here below, and called by the name of Guiders, for that they ſerve as guides to the other inſtruments which are to be put into the bladder; theſe are made with a round & prominent head, whereby it may bee put into the deſcribed cavity of the probe, and they are noted by theſe letters A. A. then there are others marked with the letters B. B. and called by the like name, and are to be put under the former, being made forked at the end, that ſo it may, as it were, embrace the end of the former.

Where to make the wound to take forth the ſtone.

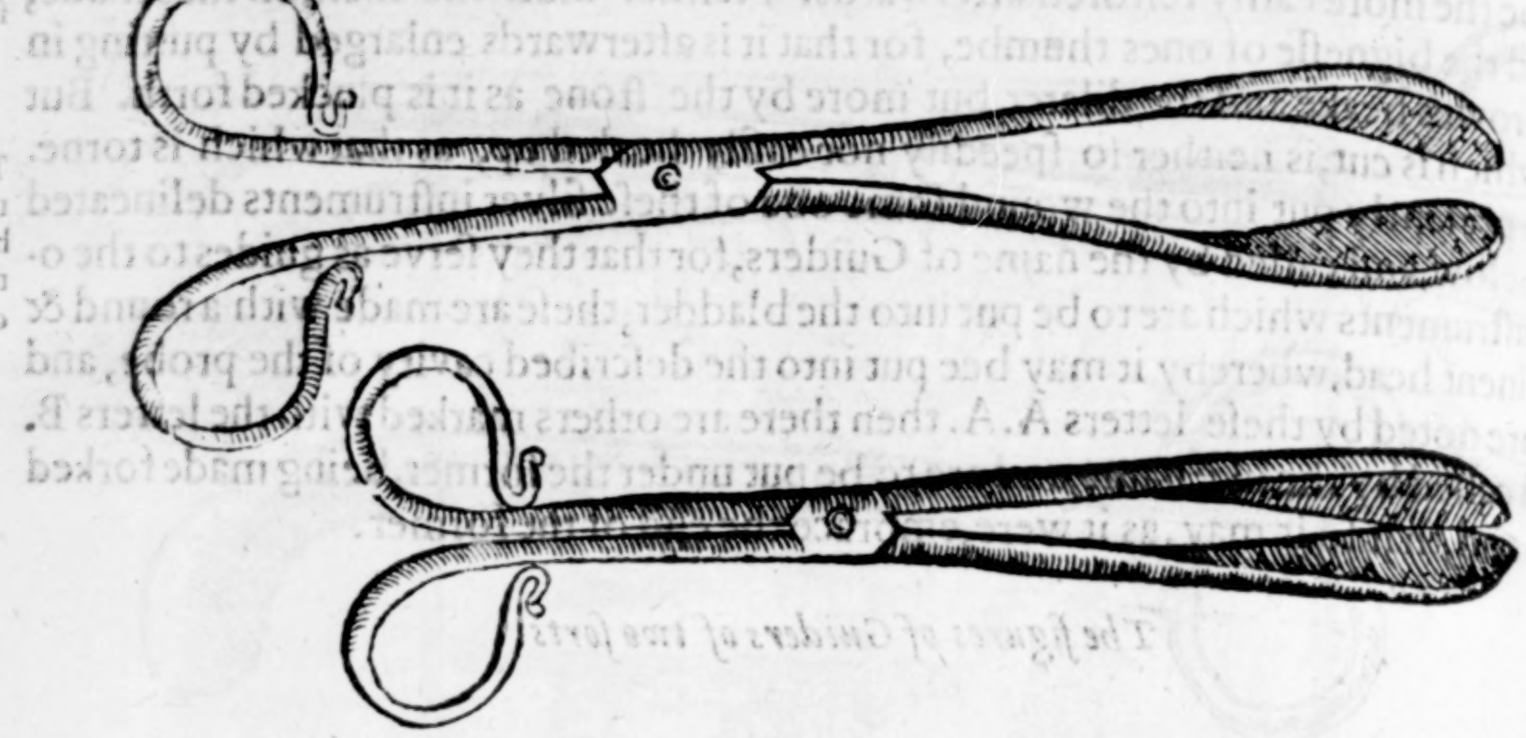
That which is torne is ſooner healed than that which is cut.

The figures of Guiders of two ſorts.



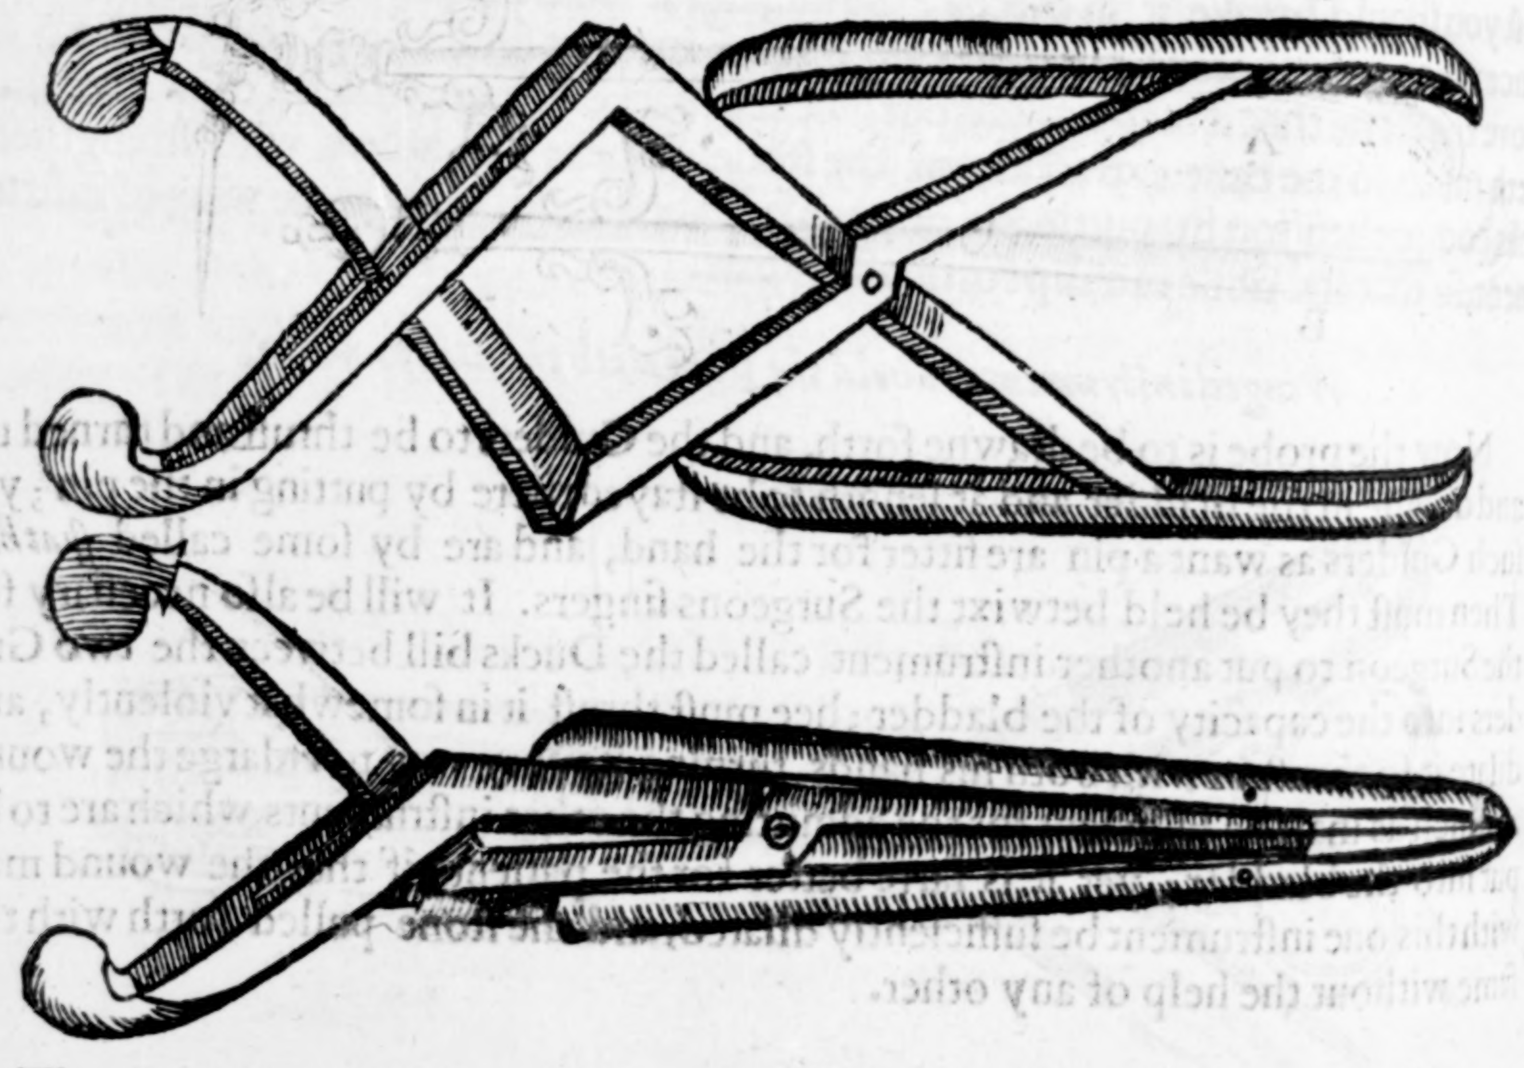
Now the probe is to be drawne forth, and the Guiders to be thruſt and turned up and downe in the bladder, and at length to be ſtayed there by putting in the pin; yet ſuch Guiders as want a pin are fitter for the hand, and are by ſome called *ſpathæ*. Then muſt they be held betwixt the Surgeons fingers. It will be alſo neceſſary for the Surgeon to put another inſtrument called the Ducks bill between the two Guiders into the capacity of the bladder; hee muſt thruſt it in ſomewhat violently, and dilate it ſo thruſt in with both his hands, turning it every way to enlarge the wound as much as ſhall be ſufficient for the admitting the other inſtruments which are to be put into the bladder; yet it is farre better for the patient, if that the wound may with this one inſtrument be ſufficiently dilated, and the ſtone pulled forth with the ſame without the help of any other.

The effigies of an inſtrument called a Ducks bill.



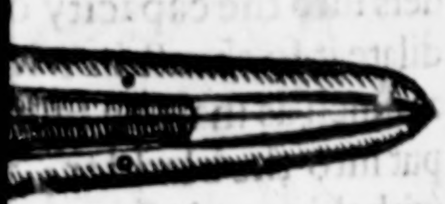
Which if you have not in a readineſſe, and the largeneſs of the ſtone require more dilatation, then muſt you put in this Dilater, for being put into the bladder, and the handle preſſed together, it will dilate the inciſion as much as you deſire.

The figure of a Dilater ſhut and opened.



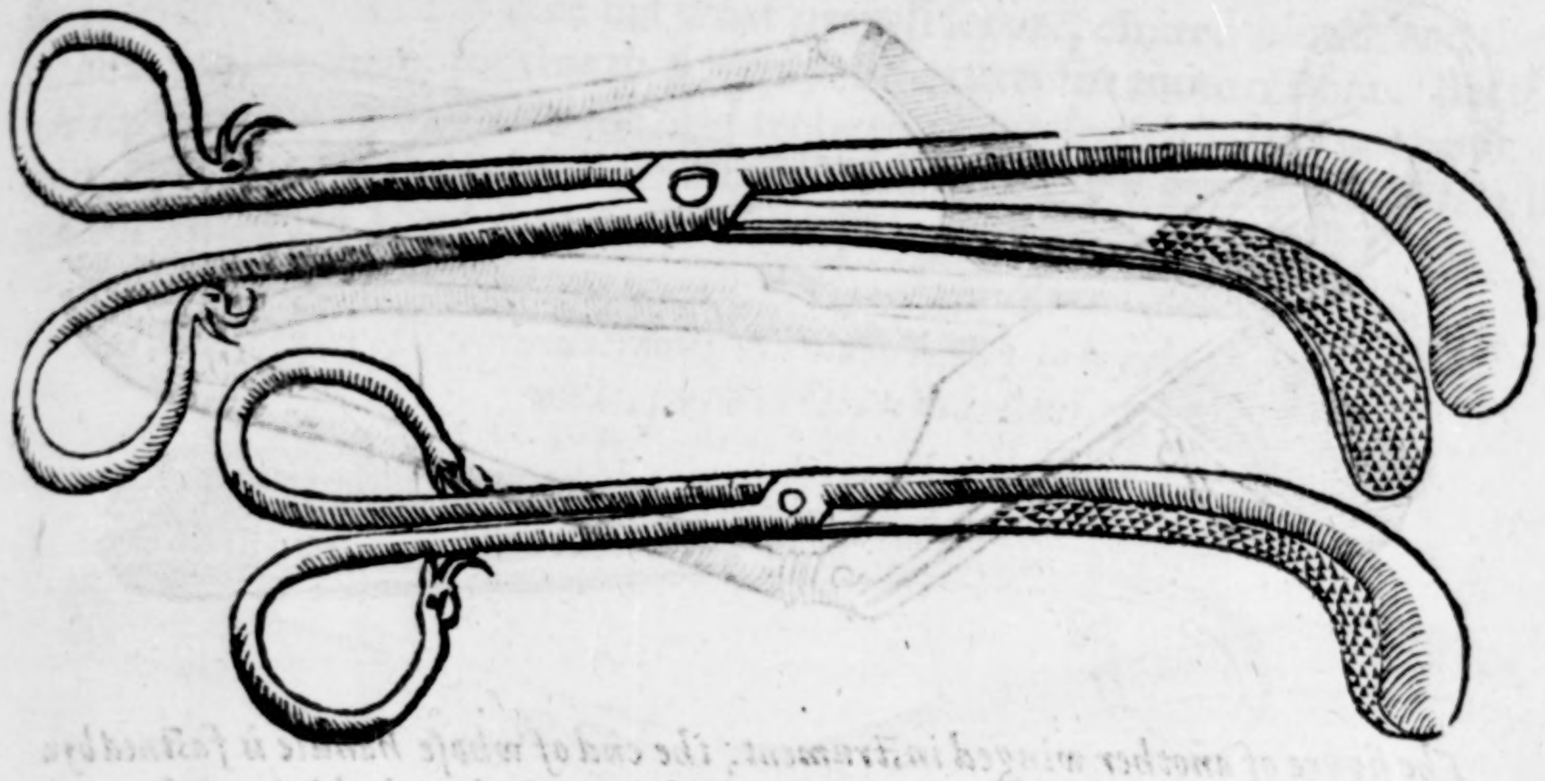
The wound by the helpe of this inſtrument being dilated as much as is ſufficient, then put in the ſtreight Ducks-bill before deſcribed, or the crooked here expreſt.

the ſtone require more
to the bladder, and the
you deſire.



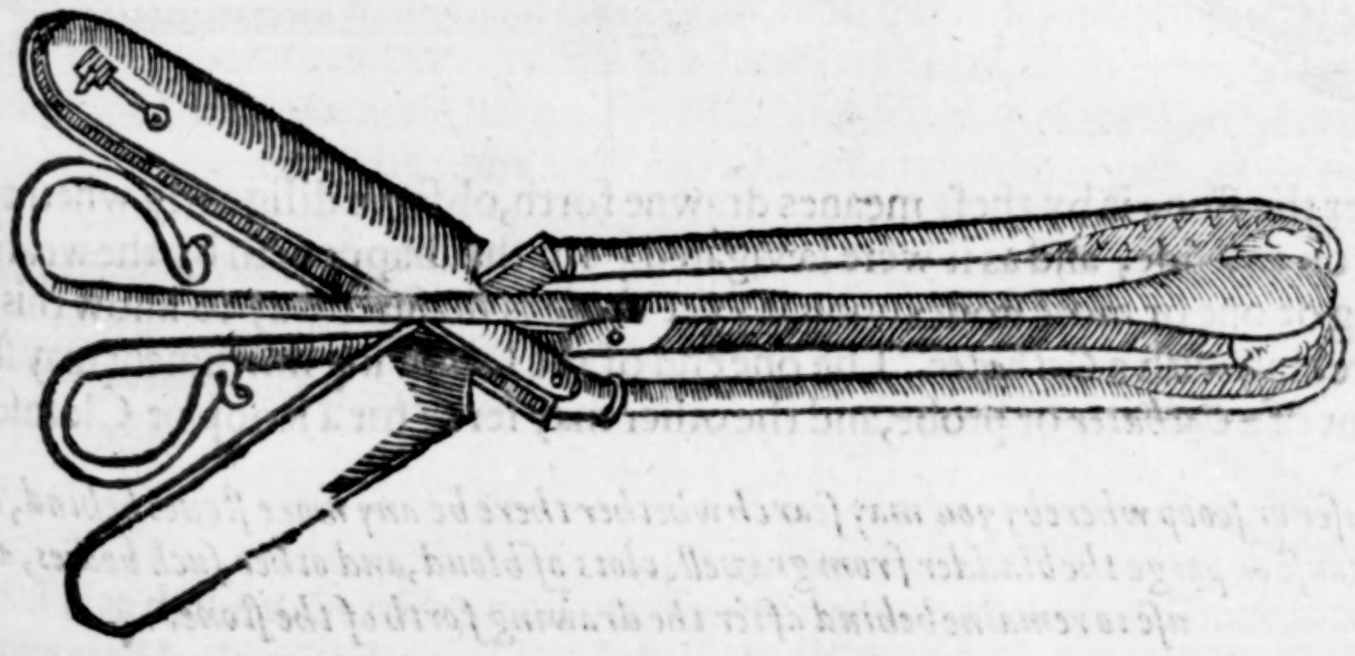
d as much as is ſufficient
crooked here expreſt.

Crooked Forcipes *like a Ducks-bill.*

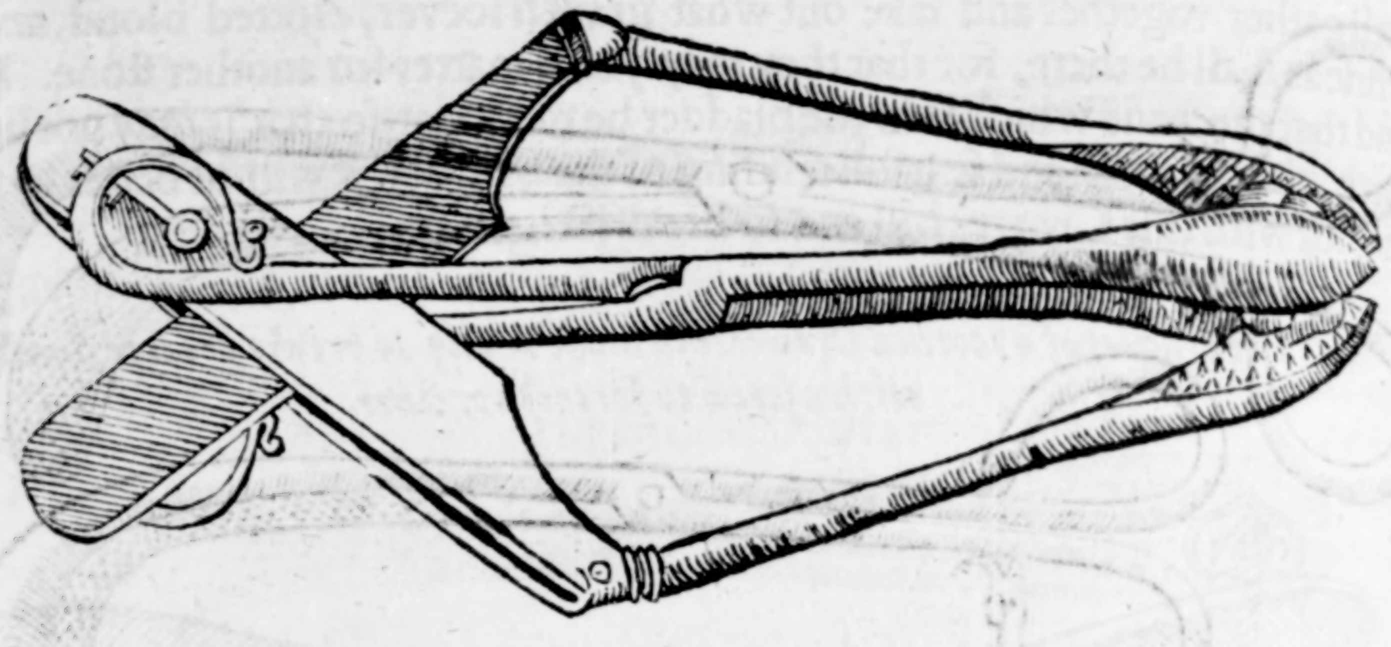


The ſtone may be ſought & taken hold of with theſe inſtruments, and being taken hold on, the branches of the inſtrument ſhall bee tyed together, leſt they ſhould ſuffer that to ſlide away which they have once taken hold of. Neither ſhall the ſtone be ſuddenly plucked out, but eaſily ſhaken too & again, and at the length gently drawn forth. Yet you muſt beware that you doe not preſſe it too ſtraightly in the *forceps*, leſt you ſhould breake it in pieces: Some, leſt it ſhould ſlip away, when they have once taken hold thereof, put their two fingers into the fundament, and put them above the ſtone that it may not fall out, nor ſlip backe againe, which I thinke conduceth much to the eaſie extraction of the ſtone. There are others who ſtrengthen this comprehenſion by putting in on each ſide above and below theſe winged inſtrument, ſo that the ſtone can ſlip forth on no ſide.

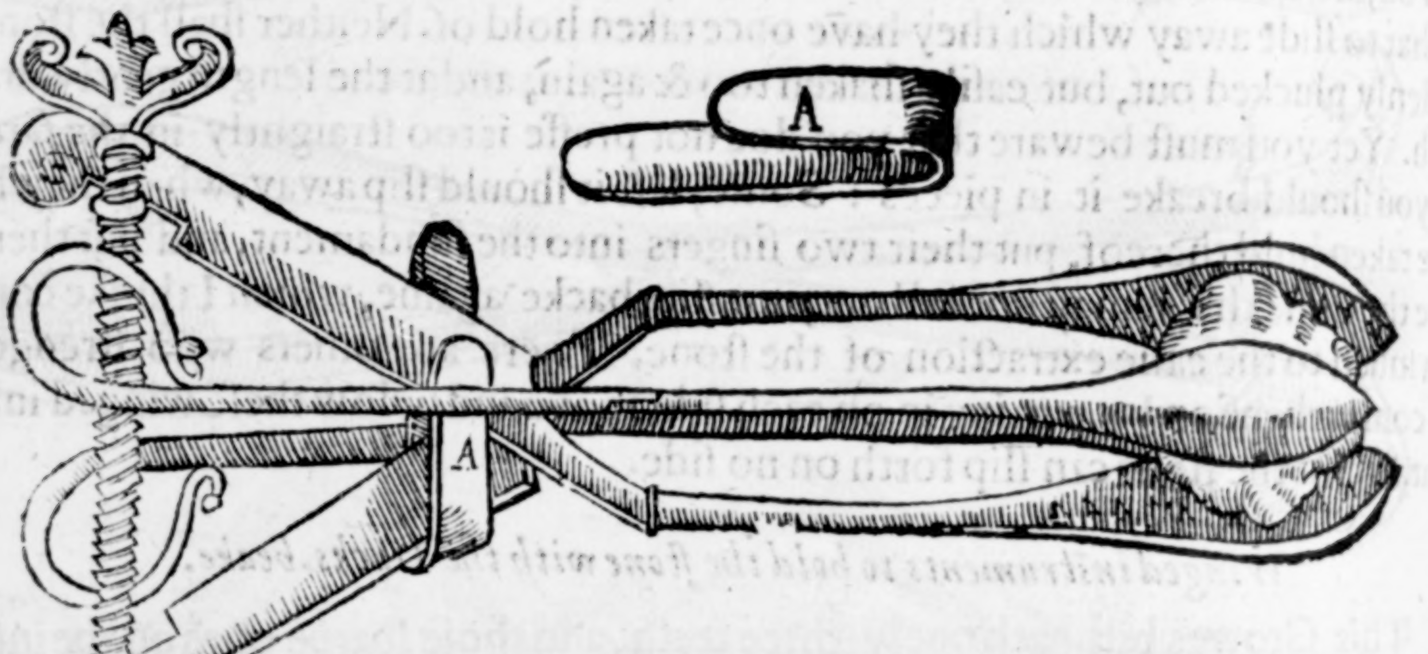
Winged inſtruments to hold the ſtone with the Ducks-beake.



The figure of another.



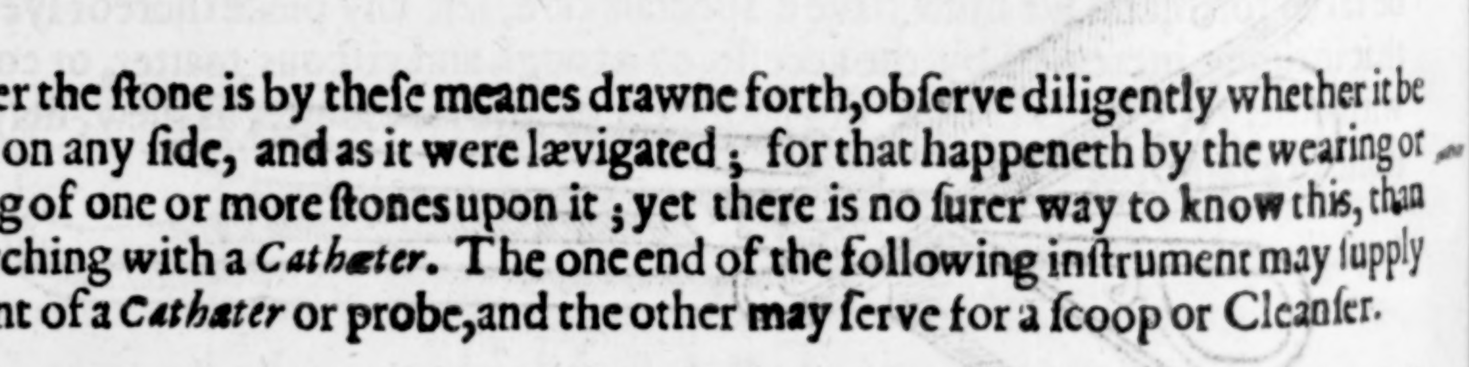
The figure of another winged instrument, the end of whoſe handle is faſtned by a ſcrew, as alſo a bended iron plate which is marked with this letter A. *for the firmer holding thereof.*



After the ſtone is by theſe meanes drawne forth, obſerve diligently whether it be worne on any ſide, and as it were lævigated; for that happeneth by the wearing or rubbing of one or more ſtones upon it; yet there is no ſurer way to know this, than by ſearching with a *Cathæter*. The one end of the following inſtrument may ſupply the want of a *Cathater* or probe, and the other may ſerve for a ſcoop or Cleanſer.

A note of more ſtones than one.

A cleanſer or ſcoop whereby you may ſearch whether there be any more ſtones behind, as alſo cleanſe or purge the bladder from gravell, clots of bloud, and other ſuch bodies, as uſe to remaine behind after the drawing forth of the ſtone.

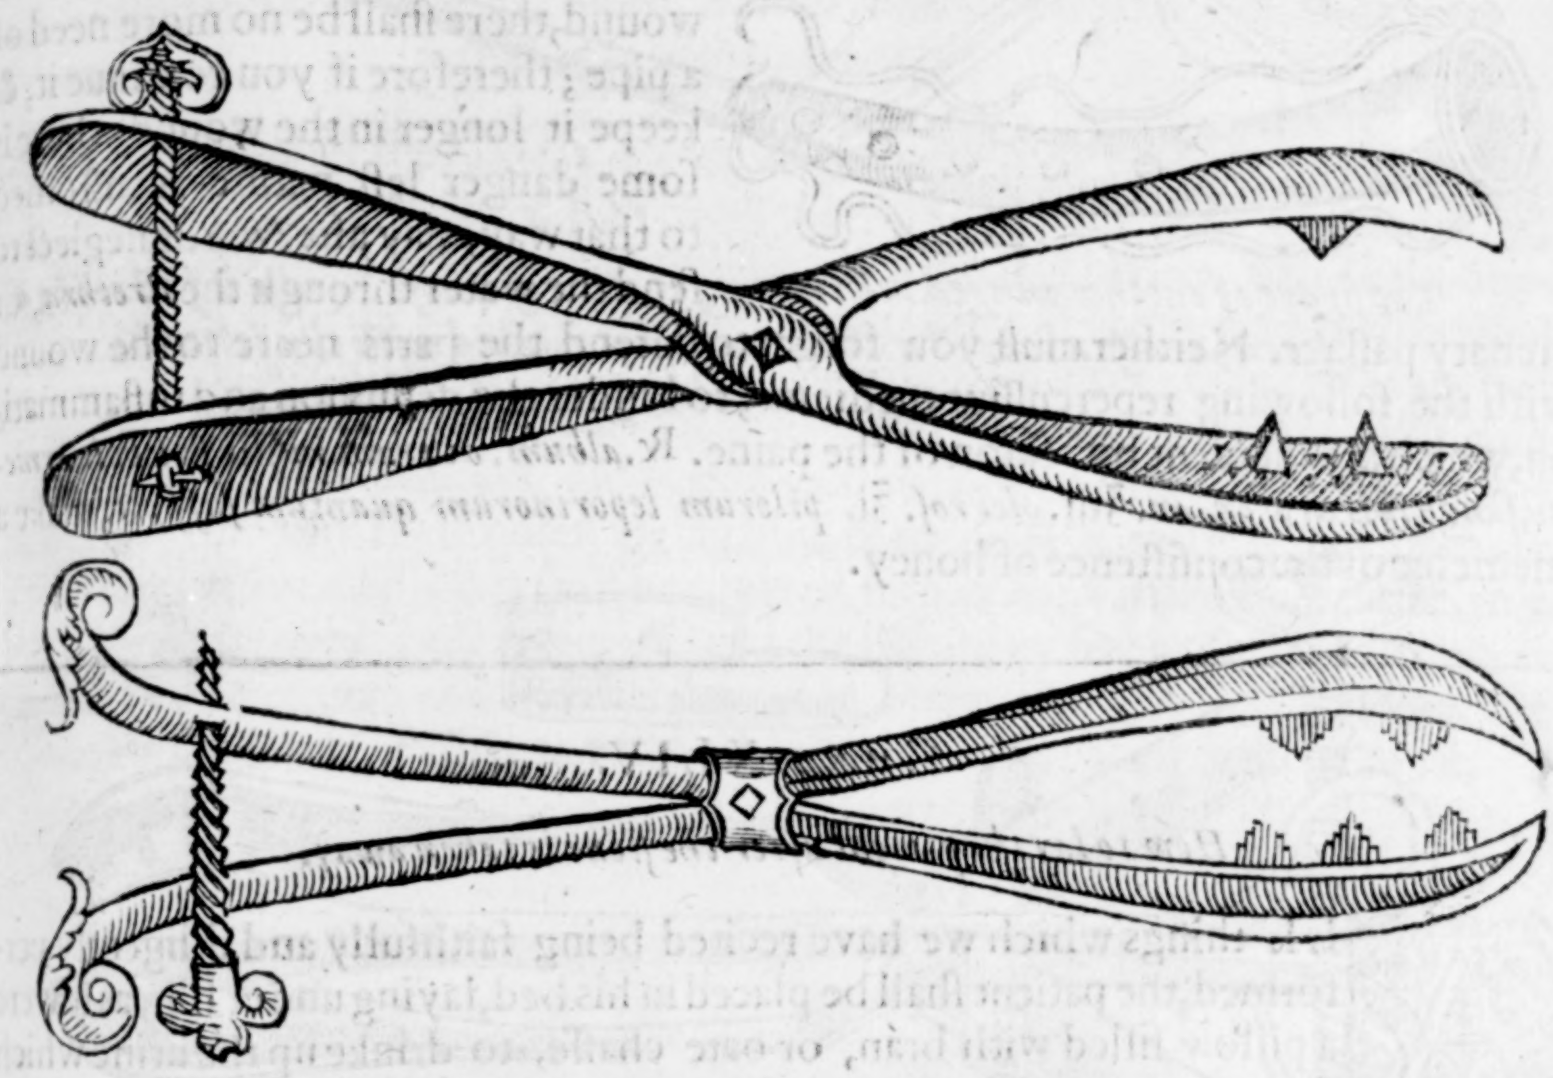


How to cleanſe the bladder.

For if other ſtones remaine behinde, they ſhall bee drawne forth as the former, which being done, the end of the inſtrument, which is crooked and hollowed like a ſcoop or ſpoone, ſhall bee thruſt by the wound into the bladder, and therewith you ſhall gather together and take out what gravell ſoever, clotted bloud, and the like refuſe as ſhall be there, for that they may yeeld matter for another ſtone. But if you find that the ſtone which is in the bladder be too great, ſo that it may not be plucked forth without great and fearfull rending of the bladder, it will be better to take hold thereof with this Crowes bill and ſo break it to peeces.

How to breake a ſtone that cannot be taken out whole and at once.

The effigies of a toothed Crowes-bill made neatly to breake greater ſtones, with a ſcrew to force it together.



This Crowes bill hath onely three teeth, and thoſe ſharpe ones on the inſide, of which two are placed above, and one below, which is the middle-moſt, ſo that it falleth between the two upper. When the ſtone is broken, all the peeces thereof muſt be taken forth, and we muſt have a ſpeciall care, leſt any piece thereof lye hid; for that in time, increaſed by the acceſſe of a tough and viſcous matter, or conjoyned with other fragments by the interpoſition of the like matter as glew, may riſe to a ſtone of a large bigneſſe.

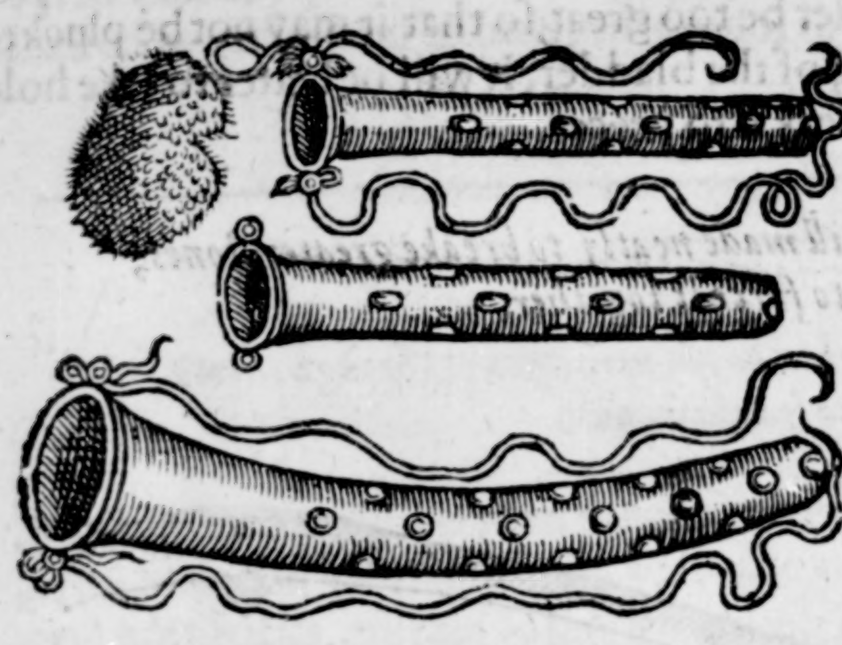
CHAP. XLIII.

What cure muſt be uſed to the wound, when the ſtone is taken forth.

Of ſewing the wound when the ſtone is taken forth.

THE ſtone being drawne out, if the greatneſſe of the wound ſo require, it ſhall have one or two ſtitches with a needle and threed, leaving onely ſo much ſpace as ſhall be ſufficient to put in a pipe for the uſe we ſhall hereafter ſhew; your threed muſt be of crimſon ſilke waxed, and let it not be too ſmall, leſt it by binding ſhould cut aſunder the fleſhy lips of the wound, or rot in a ſhort time, either by the moyſture of the urine, or matter flowing from the ulcer. Therefore you ſhall take up much fleſh with the skin in ſewing it, leſt the lips of the wound being torne, your labour prove in vaine, and ſo you are forced to trouble the patient with making a new one. Things being thus performed, a ſilver pipe ſhall be put through the wound into the bladder, whereof I have here given you divers forms, that you may take your choice, and ſo fit them to the wounds, and not the wounds to them, which oft-times in want of inſtruments the Surgeons are forced to doe, to the great harme of the patient.

Silver pipes to be put into the bladder when the ſtone is drawne out.



Theſe muſt have no holes in their ſides (as thoſe here expreſſed) but onely in their ends, that all the matter of the wound, and the filth gathered and concrete in the bladder may flow and bee carryed forth this way. When cleere urine ſhall beginne to flow out of the wound, there ſhall be no more need of a pipe; therefore if you continue it, & keepe it longer in the wound, there is ſome danger leſt nature accuſtomed to that way, may afterwards neglect to ſend the water through the *Urethra*, or urenary paſſage. Neither muſt you forget to defend the parts neare to the wound with the following repercuſſive medicine, to hinder the defluxion and inflammation, which are incident by reaſon of the paine. ℞.*album. ovorum.nu.*iii.*pul.boli armeni, ſanguinis dracon. an.* ℥iii. *olei roſ.* ℥i. *pilorum leporinorum quantum ſufficit*, make a medicine of the conſiſtence of honey.

A repercuſſive medicine.

CHAP. XLIV.

How to lay the patient after the ſtone is taken away.

ALL things which we have recited being faithfully and diligently performed, the patient ſhall be placed in his bed, laying under him as it were a pillow filled with bran, or oate chaffe, to drinke up the urine which floweth from him. You muſt have divers of theſe pillowes, that they may bee changed as neede ſhall require. Sometimes after the drawing forth of the ſtone, the bloud in great quantity falleth into the Cod, which unleſſe you be carefull to provide againſt, with diſcuſſing, drying, and conſuming medicines, it is to be feared, that it may gangrenate. Wherefore if any accidents happen in curing theſe kinde of wounds, you muſt diligently withſtand them. After ſome few daies a warme injection ſhall be caſt into the bladder by the wound, conſiſting of the waters of plantain, night-ſhade & roſes, with a little ſyrupe of dried roſes. It wil help to temper the heat of the bladder cauſed both by the wound and contuſion, as alſo by the violent thruſting in of the inſtruments. Alſo it ſometimes happens, that after the drawing forth of the ſtone, clots of bloud and other impurity may fall into the urenary paſſage, and ſo ſtop the urine that it cannot flow forth. Therefore you muſt in like ſort put a hollow probe for ſome daies into the *urethra*, that keeping the paſſage open, all the groſſer filth may flow out together with the urine.

Remedies for the Cod, leſt it gangrenate.

CHAP. XLV.

How to cure the wound made by the inciſion.

What things haſten the union.

YOu muſt cure this wound after the manner of other bloody wounds, to wit, by agglutination and cicatrization, the filth, or ſuch things as may hinder, being taken away by detergent medicines. The patient ſhall haſten the agglutination if hee lye croſſe-legged, and keep a ſlender diet untill the ſeventh or ninth day be paſt. Hee muſt wholly abſtaine from wine, unleſſe it bee very weak; in ſtead thereof let him uſe a decoction of barly and licoriſh, or mead, or water and ſugar, or boyled water mixed with ſyrups of dryed roſes, maidenhaire, and the like. Let his meat bee ponado, raiſons, ſtewed prunes, chickens boiled, with the cold ſeeds, lettuce, purſlaine, ſorrell, borage, ſpinage, and the like. If he be bound in his belly, a Phyſitian ſhall be called, who may helpe it, by appointing either *Caſsia*, a gliſter, or ſome other kind of medicine, as he ſhall thinke good.

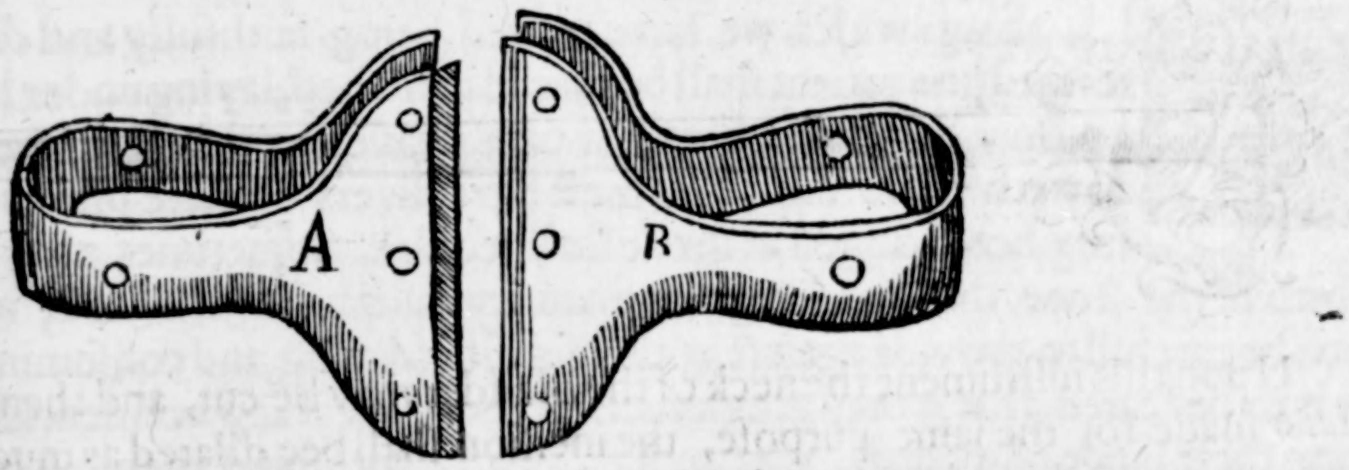
Chap. XLVI.

What cure is to be uſed to Ulcers, when as the urine flowes through them, long after the ſtone is drawne out.

How to make a freſh wound of an old ulcer.

Many after the ſtone is drawne out, cannot have the ulcer conſolidated, therefore the urine flowes out this way continually by little and little, and againſt the patients will during the reſt of his life, unleſſe the Surgeon helpe it. Therefore the callous lippes of the wound muſt be amputated, ſo to make a green wound of an old ulcer; then muſt they bee tyed up, and bound with the inſtrument wee terme a *Retinaculum* or ſtay; this muſt be perforated with three holes, anſwering to three other on the other ſide, needles ſhall be thruſt through theſe holes, taking hold of much fleſh, and ſhall be knit about it: then glutinative medicines ſhall be applyed, ſuch as are Venice Turpentine, gum *Elemi*, *ſanguis Draconis*, bole armenick, and the like; after five or ſixe dayes the needles ſhall bee taken out, and alſo the ſtay taken away. For then you ſhall finde the wound almoſt glewed, and there will nothing remaine but onely to cicatrize it.

The figure of a Retinaculum *or Stay.*



A. ſhewes the greater. B. the leſſer, that you may know that you muſt uſe divers according to the different bigneſſe of the wound.

What to doe in want of a ſtay.

If a *Retinaculum* or ſtay be wanting, you may conjoyne the lippes of the wound after this following manner. Put two quilles ſomwhat longer than the wound, on each ſide one, and then preſently thruſt them through with needles having thread in them, taking hold of the fleſh between, as often as need ſhall require, then tying the thread upon them. For thus the wound ſhall be agglutinated, and the fleſhy lips of the wound kept from being torne, which would be in danger if the needle & thread were onely uſed.

Chap.

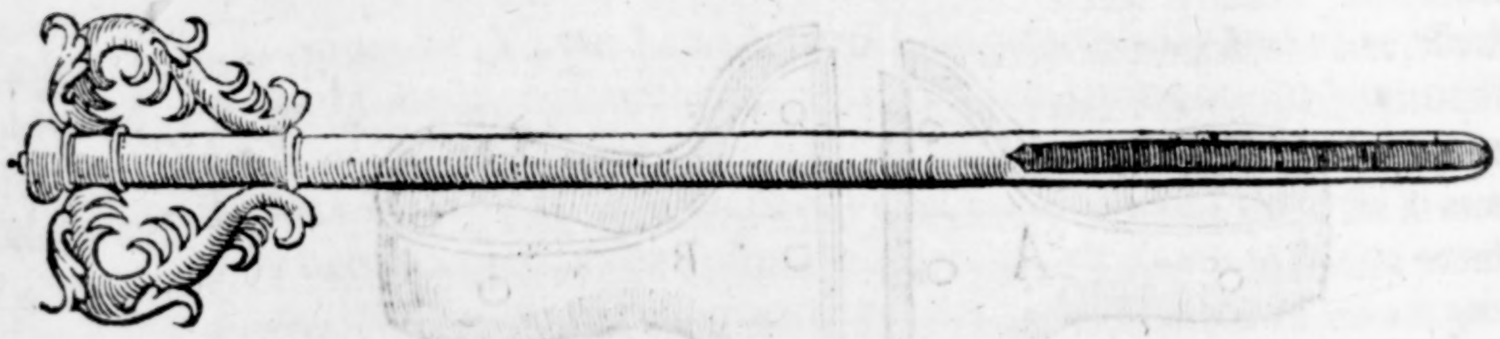
CHAP. XLVII.

How to take ſtones out of womens bladders.

How to ſearch for the ſtone in women.

WEe know by the ſame ſignes that the ſtone is in a womans bladder as we do in a mans, yet it is far more eaſily ſearched by a *Cathater*, for that the necke of the bladder in the ſhorter, broader, and the more ſtreight. Wherfore it may not onely be found by a *Cathater* put into the bladder, but alſo by the fingers thruſt into the necke of the womb, turning them up towards the inner ſide of the *Os pubis*, and placing the ſicke woman in the ſame poſture as we mentioned in the cure of men. Yet you muſt obſerve that maides yonger than ſeven yeares old, that are troubled with the ſtone, cannot bee ſearched by the neck of the wombe, without great violence. Therefore the ſtone muſt be drawne from them by the ſame meanes as from boyes, to wit, by thruſting the fingers into the fundament; for thus the ſtone being found out, and the lower belly alſo preſſed with the other hand, it muſt be brought to the necke of the bladder, and then drawn forth by the forementioned meanes. Yet if the riper yeares of the patient permit it to bee done without violence, the whole worke ſhall be more eaſily and happily performed, by putting the fingers into the necke of the wombe, for that the bladder is nearer the neck of the womb, than it is to the right gut. Wherfore the fingers thus thruſt in, a *Cathæter* ſhall bee preſently put into the necke of the bladder. This *Cathæter* muſt bee hollow, or ſlit on the outſide like thoſe before deſcribed, but not crooked, but ſtreight, as you may perceive by the following figure.

A Cathæter *upon which, being put into the Bladder, the necke thereof may be cut, to draw out a ſtone from a woman.*



Upon this inſtrument the neck of the bladder may be cut, and then with the *Dilater* made for the ſame purpoſe, the inciſion ſhall bee dilated as much as need requires; yet with this caution, that ſeeing the necke of a womans bladder is the ſhorter, it admits not ſo great dilatation as a mans, for otherwiſe there is danger that it may come to the body of the bladder, whence an unvoluntary ſhedding of the water may enſue and continue thereafter. The inciſion being dilated, the Surgeon putting one or two of his fingers into the necke of the wombe, ſhall preſſe the bottome of the bladder, and then thruſt his crooked inſtruments or *forcipes* in by the wound, and with theſe he ſhall eaſily pluck out the ſtone, which he ſhall keepe with his fingers from ſlipping backe againe. Yet *Laurence Collo* the Kings Surgeon, and both his ſunnes (than whom I doe not know whether ever there were better cutters for the ſtone) doe otherwiſe performe this operation; for they doe not thruſt their fingers into the fundament or necke of the wombe, but contenting themſelves with putting in onely the Guiders (whereof we formerly made mention) into the paſſage of the urine, they preſently thereupon make a ſtreight inciſion directly at the mouth of the neck of the bladder, and not on the ſide, as is uſually done in men. Then they gently by the ſame way thruſt the *forcipes* hollowed on the outſide formerly delineated, and ſo dilate the wound by tearing it as much as ſhall be ſufficient for the drawing of the ſtone forth of the bladder. The reſidue of the cure is the ſame with that formerly mentioned in men: yet this is to be added, that if an ulcer grow in the neck of the bladder by reaſon of the rending it, you may by putting in the *ſpeculum matricis*, dilate the neck of the womb, that fitting remedies may be applyed with the more eaſe.

Chap. XLVIII.

Of the ſuppreſsion of the Urine by internall cauſes.

BEſides the forementioned cauſes of ſuppreſſed urine, or difficulty of making of water, there are many other, leſt any may thinke that the urine is ſtopt onely by the ſtone or gravell, as Surgeons thinke, who in this caſe preſently uſe diuretickes. Therefore the urine is ſuppreſt by externall and internall cauſes. The internall cauſes are clotted bloud, tough phlegme, warts, caruncles bred in the paſſages of the urine, ſtones, and gravell; the urine is ſometimes ſuppreſt, becauſe the matter thereof, to wit, the ſerous or whayiſh part of the blood, is either conſumed by the feavouriſh heat, or carryed other wayes by ſweats or a ſcouring; ſomtimes alſo the flatulencie there conteined, or inflammation ariſing in the parts made for the urine and the neighbouring members, ſuppreſſes the urine. For the right gut if it be inflamed, intercepts the paſſage of the urine, either by a tumour whereby it preſſeth upon the bladder, or by the communication of the inflammation. Thus by the default of an ill affected liver, the urine is oft times ſuppreſt in ſuch as have the dropſie; or elſe by dulneſſe or decay of the attractive, or ſeparative faculty of the reines by ſome great diſtemper, or by the default of the animall faculty, as in ſuch as are in a phrenſie, lethargy, convulſion, apoplexie. Beſides alſo a tough and viſcide humour falling from the whole body into the paſſages of the urine, obſtructs and ſhuts up the paſſage. Alſo too long holding the water ſomtimes cauſes this affect. For when the bladder is diſtended above meaſure, the paſſage thereof is drawn together and made more ſtrait: hereto may be added that the too great diſtenſion of the bladder is a hinderance that it cannot uſe the expulſive faculty, and ſtraiten it ſelfe about the urine to the excluſion thereof; hereto alſo paine ſucceeds, which preſently dejects all the faculties of the part which it ſeazeth upon. Thus of late a certaine young man, riding on horſebacke before his Miſtreſſe, and therfore not daring to make water, when he had great need ſo to doe, had his urine ſo ſuppreſt that returning from his journy home into the city, he could by no meanes poſſible make water. In the meane time he had grievous paine in the bottom of his belly and the *perinæum*, with gripings and a ſweat all over his body, ſo that he almoſt ſowned. I being called, when I had procured him to make water by putting in a hollow *Cathater*, and preſſing the bottom of his belly, whereof he forthwith made two pints; I told them that it was not occaſioned by the ſtone, which notwithſtanding the ſtanders by imagined to bee the occaſion of that ſuppreſſion of urine. For thence forward there appeared no ſignes of the ſtone in the youth, neither was he afterwards troubled with the ſtopping of his urine.

In ſuppreſſion of the urine we muſt not preſently fly to diureticks.

Why the too long holding the urine cauſeth the ſuppreſſion therof.

A hiſtory.

Chap. XLIX.

A digreſsion concerning the purging of ſuch things as are unprofitable in the whole body by the urine.

I Think it not amiſſe to teſtifie by the following hiſtories, the providence of nature in expelling by urine ſuch things as are unprofitable in the whole body. *Mounſieur Sarret* the Kings ſecretary was wounded in the right arme with a piſtoll bullet; many and maligne ſymptomes happened thereupon, but principally great inflammations, flowing with much *ſanies* and *pus* or quitture: it ſometimes happened that without any reaſon this purulent and ſanious effluxe of matter was ſtayd in the inflammation; wherof while we ſolicitouſly enquired into the cauſe, wee found both his ſtooles and water commixed with much purulent filth, and this through the whole courſe of the diſeaſe, whereof notwithſtanding by gods aſſiſtance he recovered, and remaines whole and ſound; we obſer-

A hiſtory.

ved

A hiſtory.

How the *pus* may flow from the wounded arme, by the urine and excrements.

Lib. de loc. affect. 6 cap. 4.

ved that as long as his arme flowed with this filthy matter, ſo long were his excrements of the belly and bladder free from the ſanious and purulent matter: as long on the contrary as the ulcers of the arme were dry, ſo long were the excrements of the guts and bladder ſanious and purulent. The ſame accident befell a Gentleman called *Mounſieur da la Croix*, who received a deadly wound with a ſword on the left arme, though *German Chavall*, and *Maſter Raſſe* moſt expert Surgeons, and others, who together with me had him in cure, thought it was not ſo for this reaſon, becauſe the *pus* cannot runne ſo long a way in the body, neither if it were ſo, could that bee done without the infection and corruption of the whole maſſe of blood, whileſt it floweth through the veines; therefore to be more probable that this quantity of filth, mixed with excrements and urine, flowed by reaſon of the default of the liver, or of ſome other bowell, rather than from the wounded arme: I was of a contrary opinion for theſe following reaſons. Firſt for that which was apparently ſeen in the patient; for as long as the excrement and urine were free from this purulent matter, ſo long his arme plentifully flowed therewith; this on the contrary being dry, much purulent matter was voided both by ſtoole and urine. Another was, that as our whole body is perſpirable, ſo it is alſo (if I may ſo terme it) confluxible. The third was an example taken from the glaſſes which the French terme Monte-vins (that is, Mount-wines) for if a glaſſe that is full of wine be ſet under another that is fill'd with water, you may ſee the wine raiſe it ſelſe out of the lower veſſell to the upper through the midſt of the water, & ſo the water deſcend through the midſt of the wine, yet ſo, that they do not mixe themſelves, but the one take & poſſeſs the place of the other. If this may be done by art, by things only naturall, & to be diſcernd by our eyes, what may be done in our bodies, in which by reaſon of the preſence of a more noble ſoule, all the works of nature are far more perfect? What is it which we may deſpair to be done in the like caſe? For doth not the laudible blood flow to the guts, kidneyes, ſpleen, bladder of the gall, by the impulſe of nature together with the excrements, which preſently the parts themſelves ſeparate from their nutriment? Doth not milke from the breaſts flow ſometimes forth of the wombes of women lately delivered? Yet that cannot bee carryed downe thither, unleſſe by the paſſages of the mamillary veines and arteryes, which meete with the mouthes of the veſſels of the wombe in the middle of the ſtreit muſcles of the *Epigaſtrium*. Therefore no marvaile if according to *Galen* the *pus* unmixt with the bloud flowing from the whole body by the veines and arteryes into the kidneyes and bladder, bee caſt forth together with the urine. Theſe and the like things are done by nature, not taught by any counſell or reaſon, but onely aſſiſted by the ſtrength of the ſegregating and expulſive faculty; and certainely we preſently diſſecting the dead body, obſerved that it all, as alſo all the bowels thereof, were free from inflammation and ulceration, neither was there any ſigne or impreſſion of any purulent matter in any part thereof.

CHAP. L.

By what externall cauſes the urine is ſuppreſt; and prognoſtickes concerning the ſuppreſſion thereof.

Why the diſlocation of a *vertebra* of the loins may cauſe a ſuppreſſion of urine.

Why the ſuppreſſion of the urine becomes deadly.

THere are alſo many externall cauſes, through whoſe occaſion the urine may be ſuppreſt. Such are bathing and ſwimming in cold water; the too long continued application of Narcoticke medicines upon the Reines, *perinæum* and ſhare; the uſe of cold meats and drinkes, and ſuch other like. Moreover, the diſlocation of ſome *Vertebra* of the loines to the inſide, for that it preſſeth the nerves diſſeminated thence into the bladder; therefore it cauſeth a ſtupidity or numneſſe of the bladder. Whence it is, that it cannot perceive it ſelſe to bee vellicated by the acrimony of the urine, and conſequently it is not ſtirred up to the expulſion thereof. But from whatſoever cauſe the ſuppreſſion of the urine proceeds, if it perſevere for ſome dayes, death is to bee feared, unleſſe either a feaver, which may conſume the matter of the urine, or a ſcouring or fluxe, which may divert it, ſhall happen thereupon. For thus by ſtay it acquireth an acride and venenate

nate quality, which flowing by the veines readily infecteth the maſſe of blood, and carryed to the braine much moleſts it by reaſon of that ſimilitude and ſympathy of condition which the bladder hath with the *Meninges*. But nature, if prevalent, eaſily freeth it ſelfe from this danger by a manifeſt evacuation by ſtoole, otherwiſe it muſt neceſſarily call as it were to its aide, a feavouriſh heat, which may ſend the abounding matter of this ſerous humidity out through the ſkinne, either by a ſenſible evacuation as by ſweat; becauſe ſweate and urine have one common matter: or elſe diſperſe and breath it out by tranſpiration, which is an inſenſible excretion.

A feaver following thereon helps the ſuppreſſion of urine.

CHAP. LI.

Of bloody Urine.

The differences

Cauſes.

SOME piſſe pure blood, others mixt, and that either with urine, & then that which is expelled reſembles the waſhing of fleſh newly killed; or elſe with *pus*, or matter, and that either alone or mixed with the urine. There may be divers cauſes of this ſymptome, as the too great quantity of blood gathered in the body, which by the ſuppreſſion of the accuſtomed & periodicall evacuation, by the courſes or hæmorrhoids, now turns its courſe to the reins & bladder; the fretting aſunder of ſome veſſell by an acride humour, or the breaking thereof by carrying or lifting of ſome heavie burden, by leaping, falling from high, a great blow, the falling of ſome wait upon the loins, riding poſt too violently, the too immoderate uſe of venery, & laſtly, from any kind of painful & more violent exerciſe, by a rough & ſharp ſtone in the kidneys, by the weakneſſe of the retentive faculty of the kidneys, by a wound of ſome of the parts belonging to the urine, by the too frequent uſe of diureticke and hot meats and medicines, or elſe of things in their whole nature contrary to the urenary parts; for by theſe and the like cauſes, the reins are oft times ſo enflamed, that they neceſſarily impoſtumate, and at length the impoſtume being broken it turnes into an ulcer, caſting forth quitture by the urine. In ſo great variety of the cauſes of bloody urine, we may gather whence the cauſes of this ſymptome may ariſe, by the depraved action of this, or that part, by the condition of the flowing blood, to wit, pure or mixt, and that either with the urine alone, or with *pus*. For example, if this bloody matter flow from the lungs, liver, kidneies, diſlocated *Vertebræ*, the ſtreight gut, or other the like part: you may diſcerne it by the ſeat of the paine and ſymptomes, as a feaver; and the propriety of the paine, and other things which have preceded, or are yet preſent. And we may gather the ſame by the plenty and quality, for if, for example, the *pus* flow from an ulcer of the arm, the purulent matter will flow by turnes, one while by the urine, ſo that little is caſt forth by the ulcer; then preſently on the contrary the urine becomes more cleere. That purulent matter which flows from the lungs by reaſon of an *Empyema*, or from the liver, or any other bowell placed above the midriffe, the *pus* which is caſt forth with the urine, is both in greater plenty and more exactly mixed with the urine, than that which flowes from the kidneyes and bladder. It neither belongs to our purpoſe, or a Surgeons office, either to undertake, or deliver the cure of this affect. It ſhall ſuffice onely to note that the cure of this ſymptome is not to bee hoped for ſo long as the cauſe remaines. And if this blood flow by the opening of a veſſell, it ſhall bee ſtayed by aſtringent medicines; if broken, by agglutinative; if corroded or fretted aſunder, by ſarcoticke.

Signes of what cauſes they proceed.

Cure.

Chap. LII.

Of the ſignes of ulcerated Kidneyes.

I Had not determined to follow or particularly handle the cauſes of bloody urines, yet becauſe that which is occaſioned by the ulcerated reines or bladder more frequently happens, therefore I have thought good briefly to ſpeake thereof in this place. The ſignes of an ulcer of the reines are, pain in the loines, matter howſoever mixt with the urine, never evacuated by it ſelfe, but alwaies flowing forth with the urine, and reſiding in the botome of the chamberpot, with a ſanious and redde ſediment, fleſhy and as it were bloody fibres ſwimming up and downe in the urine, the ſmell of the filth is not ſo great as that which flowes from the ulcerated bladder, for that the kidneyes, ſeeing they are of a fleſhy ſubſtance, doe farre better ripen and digeſt the purulent matter than the bladder which is nervous and bloodleſſe.

Why the matter which flows from the kidneyes is leſſe ſtinking than that which flowes from the bladder.

Chap. LIII.

Of the ſignes of the ulcerated Bladder.

Differences.

Ulcers are in the bottome of the bladder and the necke thereof. The ſignes of an ulcer in the bladder are, a deepe paine at the ſharebones; the great ſtinch of the matter flowing therefrom; white and thin skins ſwimming up and downe in the water. But when the ulcer poſſeſſeth the necke of the bladder, the paine is more gentle, neither doth it trouble before the patient come to make water, but in the very making thereof, and a little while after.

But it is common both to the one and the other, that the yard is extended in making of water, to wit, by reaſon of the paine cauſed by the urine fretting of the ulcerated part in the paſſage by: neither is the matter ſeen mixed with the urine, as is uſuall in an ulcer of the upper parts, becauſe it is powred forth not together with the urine, but after it.

Chap. LIV.

Prognoſticks of the ulcerated Reines and Bladder.

Why ulcers of the bladder are cured with more difficulty.

Ulcers of the kidneies are more eaſily and readily healed than thoſe of the bladder; for fleſhy parts more ſpeedily heale and knit, than bloodleſſe and nervous parts. Ulcers which are in the bottom of the bladder, are uncurable, or certainely moſt difficult to heale, for beſides that they are in a bloodleſſe part, they are daily vellicated and exaſperated by the continuall affluxe of the contained urine; for all the urine is never evacuated: now that which remaines after making water, becomes more acride by the diſtemper and heat of the part, for that the bladder is alwaies gathered about it, & dilated & ſtraitned according to the quantity of the conteined urine: therfore in the *Iſchuria*, that is, the ſuppreſſion or difficulty of making water, you may ſomtimes ſee a quart of water made at once. Thoſe which have their legs fall away, having an ulcer in their bladder, are near their deaths. Ulcers ariſing in theſe parts, unleſſe they be conſolidated in a ſhort time, remaine uncureable.

CHAP. LV.

What cure muſt be uſed in the ſuppreſſion of the Urine.

IN curing the ſuppreſſion of the urine, the indication muſt be taken from the nature of the diſeaſe, and cauſe thereof, if it bee yet preſent or not. But the diverſity of the parts, by which being hurt, the *Iſchuria* happens, intimates the variety of medicines, neither muſt we preſently run to diuretickes, and things breaking the ſtone, which many Empericks doe. For hence grievous and maligne ſymptomes often ariſe, eſpecially if this ſuppreſſion proceed from an acride humour, or blood preſſed out by a bruiſe, immoderate venery, and all more vehement exerciſe, a hot and acride potion, as of *Cantharides*, by too long abſtaining from making water, by a *Phlegmon*, or ulcer of the urenary parts. For thus the paine and inflammation are encreaſed, whence followes a gangrene, & at length death. Wherfore attempt nothing in this caſe without the advice of a Phyſitian, no not when you muſt come to Surgery. For diureticks can ſcarce have place in another caſe, than when the urenary paſſages are obſtructed by gravell, or a groſſe and viſcide humour, or elſe in ſome cold countrey, or in the application of Narcoticks to the loines, although we muſt not here uſe theſe before we have firſt made uſe of generall medicines: now Diuretickes may be adminiſtred ſundry waies, as hereafter ſhall appeare.

Scopes of curing.

To what ſuppreſſion of the urine diureticks muſt not be uſed.

To which and when to be uſed.

℞. *agrimon. urtic. parietar. ſurculos rubros habentis, an.* m. i. *rad. aſparag. mundat.* ℥iiii. *gran. alkekengi, nu.* xx. *ſem. malvæ* ʒß. *rad. acor.* ʒi. *bulliant omnia ſimul in ſex libris aquæ dulcis ad tertias, deinde coletur.* Let the patient take ℥ iiii. hereof with ℥i. of ſugar candy, and drinke it warme faſting in a morning, three houres before meat. Thirty or forty Ivie berries beaten in white wine, and given the patient to drink ſome two houres before meate, are good for the ſame purpoſe. Alſo ʒ i. of nettle ſeeds made into fine pouder and drunke in chicken broth, is good for the ſame purpoſe. A decoction alſo of Grummell, Goats ſaxifrage, pellitory of the wall, white ſaxifrage, the rootes of parſley, *aſparagus, acorus, bruſcus*, and orris drunke in the quantity of ſome three or foure ounces, is profitable alſo for the ſame purpoſe. Yet this following water is commended above the reſt to provoke urine, & open the paſſages thereof, from what cauſe ſoever the ſtoppage therof proceed. ℞. *radic. oſmund. regal. cyp. biſmal. gram. petroſel. fœnic. an.* ʒii. *raph. craſſior. in taleol* ℥iiii. *macerentur per noctem in aceto albo acerrimo, bulliant poſtea in aquæ fluvialis* ℔. x. *ſaxifrag. criſt. marin. rub. tinct. milii ſolis, ſummitat. malvæ, biſmal. an.* p. ii. *berul. cicer. rub. an.* p. i. *ſem. melon. citrul. an.* ʒ ii. ß. *alkekengi, gra.* xx. *glycyrhiz.* ℥ i. *bulliant omnia ſimul ad tertias: in colatura infunde per noctem fol. ſen. oriental.* ℔. ß. *fiat iterum parva ebullitio, in expreſſione colata infunde cinam. elect.* ʒ vi. *colentur; iterum colatura injiciatur in alembicum vitreum, poſtea tereb. venet. lucid.* ℔ ii. *aq. vitæ* ℥ vi. *agitentur omnia ſimul diligentiſſime. Lutetur alembicum luto ſapientiæ, fiat deſtillatio lento igne in balneo mariæ.* Uſe it after the following manner. ℞. *aq. ſtillatitiæ preſcriptæ* ℥ii. *aut* iii. According to the operation which it ſhall performe, let the patient take it foure houres before meat. Alſo raddiſh water deſtilled in *balneo mariæ* is given in the quantity of ℥iiii. with ſugar, and that with good ſucceſſe. Bathes and *ſemicupia*, or halfe bathes artificially made, relaxe, ſoften, dilate, and open all the body; therefore the preſcribed diuretickes mixed with halfe a dram of Treacle may be fitly given at the going forth of the bath. Theſe medicines following are judged fit to cleanſe the ulcers of the kidneyes and bladder. Syrupe of maiden-haire, of roſes, taken in the quantity of ℥i. with *hydromel*, or barly water: Aſſes or Goats milke are alſo much commended in this affect, becauſe they cleanſe the ulcers by their ſerous or whayiſh portion, and agglutinate by their cheeſelike. They muſt bee taken warme from the dugge, with honey of roſes or a little ſalt, leſt they corrupt in the ſtomacke; and that to the quantity of foure ounces, drinking or eating nothing preſently upon it. The following Trochiſces are alſo good for the ſame purpoſe. ℞. *quatuor ſem. frigid. major. ſeminis papaveris albi, portulac. plantag. cydon, myrtil, gum. tragacanth. et arub. pinear.*

A diureticke water.

Why the uſe of diuretickes is better after bathing.

To cleanſe the ulcers of the kidneyes and bladder.

Trochiſces to heale the ulcers of the kidneies.

glycyrrhi. mund. hordei mund. mucag. pſilii, amygdal. dulcium, an. ℥ i. *boli armen. ſanguin. dracon. ſpodii, roſar. maſtich. terræ, ſigil. myrrhæ, an.* ℥ ii. *cum oxymelite, conficiantur ſecundum artem trochiſci.* Let the patient take ʒ ß. diſſolved in whay, ptiſan, barly water, and the like; they may alſo be profitably diſſolved in plantaine water, and injected into the bladder. Let the patient abſtaine from wine, and inſtead thereof let him uſe barly water, or *hydromel*, or a ptiſan made of an ounce of raiſins of the ſun, ſtoned and boyled in five pints of faire water, in an earthen pipkin well leaded, or in a glaſſe, untill one pinte be conſumed, adding thereto of liquorice ſcraped and beaten ʒ i. of the cold ſeeds likewiſe beaten two drams. Let it, after it hath boyled a little more, be ſtrayned through an hypocras bagge, with a quarterne of ſugar, and two drams of choice cinamon added thereto, and ſo let it be kept for uſuall drinke.

Drinke in ſtead of wine.

CHAP. LVI.

Of the Diabete, *or inabilty to hold the Urine.*

What *Diabete* is.

The cauſes.

THE *Diabete* is a diſeaſe, wherein preſently after one hath drunke, the urine is preſently made in great plenty, by the diſſolution of the retentive faculty of the reines, and the depravation of immoderation of the attractive faculty. The externall cauſes are the unſeaſonable and immoderate uſe of hot and diureticke things, and all more violent and vehement exerciſes. The internall cauſes are the inflammation of the liver, lungs, ſpleen, but eſpecially of the kidneyes and bladder. This affect muſt be diligently diſtinguiſhed from the excretion of morbifick cauſes by urine. The loines in this diſeaſe are moleſted with a pricking and biting pain, and there is a continuall & unquenchable thirſt: and although this diſeaſe proceed from a hot diſtemper, yet the urine is not coloured, red, troubled, or thick, but thin, and white or wateriſh, by reaſon the matter thereof makes very ſmall ſtay in the ſtomacke, liver, and hollow veine, being preſently drawn away by the heat of the kidneyes or bladder. If the affect long endure, the patient for want of nouriſhment falleth away, whence certaine death enſues.

Signes.

Why the urines are watriſh.

The cure.

Narcoticke things to be applyed to the loines.

For the cure of ſo great a diſeaſe, the matter muſt be purged, which cauſes or feedes the inflammation or *phlegmon*, and conſequently blood muſt be let. We muſt abſtain from the foure cold ſeedes, for although they may profit by their firſt quality, yet will they hurt by their diuretick faculty. Refrigerating and aſtringent nouriſhments muſt bee uſed, and ſuch as generate groſſe humours, as Rice, thicke and aſtringent wine mixed with much water. Exceeding cold, yea Narcotick things ſhall be applyed to the loins, for otherwiſe by reaſon of the thickneſs of the muſcles of thoſe parts, the force, unleſs of exceeding refrigerating things, will not be able to arrive at the reins; of this kind are oile of white poppy, henbain, *opium*, purſlain, and lettuce ſeed, mandrage vinegar, and the like: of which, cataplaſmes, plaiſters, and ointments, may be made, fit to corroberate the parts, and correct the heat.

CHAP. LVII.

Of the Strangury.

What the Strangury is.

The cauſes.

THE Strangury is an affect having ſome affinity with the *Diabete*, as that wherin the water is unvoluntarily made, but not together at once, but by drops, continually and with paine. The externall cauſes of a ſtrangury are, the too abundant drinking of cold water, & all too long ſtay in a cold place. The internall cauſes are, the defluxion of cold humours into the urenary parts, for hence they are reſolved by a certain palſie, and the *ſphincter* of the bladder is relaxed, ſo that he cannot hold his water according to his deſire: inflammation alſo & all diſtemper cauſeth this affect, and whatſoever in ſome ſort obſtructs the paſſage of the urine, as clotted blood, thick phlegme, gravell, and the like. And becauſe, according to *Galens* opinion, all ſorts of diſtemper may cauſe this diſeaſe, divers medicines

dicines ſhall be appointed according to the difference of the diſtemper. Therfore againſt a cold diſtemper fomentations ſhall be provided of a decoction of mallows, roſes, *origanum*, calamint, and the like, & ſo applied to the privities: then preſently after let them be anointed with oile of bayes, and of *Caſtoreum*, and the like. Strong and pure wine ſhall be preſcribed for his drinke, and that not onely in this cauſe, but alſo when the Strangury happens by the occaſion of obſtruction, cauſed by a groſſe and cold humor, if ſo be that the body be not plethoricke. But if inflammation together with a *Plethora* or fulneſſe hath cauſed this affect, wee may, according to *Galens* advice, heale it by blood-letting. But if obſtruction bee in fault, that ſhall be taken away by diuretickes either hot or cold, according to the condition of the matter obſtructing. We here omit to ſpeake of the *Dyſuria*, or difficulty of making water, becauſe the remedies are in generall the ſame with thoſe which are uſed in the *Iſchuria*, or ſuppreſſion of urine.

Com. ad aphor. 25. ſect. 3.

Ad aphor. 48. ſect. 7.

CHAP. LVIII.

Of the Cholike.

WHenſoever the Guts being obſtructed, or otherwiſe affected, the excrements are hindred from paſſing forth, & if the fault bee in the ſmall guts, the affect is termed *Volvulus*, *Ileos*, & *miſerere mei*, but if it be in the greater guts, it is called the Cholick, from the part affected, which is the *Colon*, that is, the continuity of the greater guts; but eſpecially that portion of the greater guts, which is properly and eſpecially named *Colon*, or the cholicke Gut. Therefore *Avicen* rightly defines the Cholicke, A paine of the Guts wherein the excrements are difficultly evacuated by the fundament. *Paulus Aegineta* reduceth all the cauſes of the Colicke how various ſoever to foure heads, to wit, to the groſſeneſſe, or toughneſſe of the humours impact in the coates of the guts: flatulencies hindred from paſſage forth: the inflammation of the guts: and laſtly, the collection of acride and biting humors. Now we will treat of each of theſe in particular. Almoſt the ſame cauſes produce the groſſeneſſe of humors, and flatulencies in the guts, to wit, the uſe of flatulent, and phlegmaticke, tough, and viſcide meats, yea alſo of ſuch as are of good nouriſhment, if ſundry thereof, and of ſundry kinds be eaten at the ſame meale, and in greater quantity than is fit. For hence crudity and obſtruction, and at length the collection of flatulencies, whereon a tenſive paine enſues. This kind of Cholick is alſo cauſed by the uſe of crude fruits, and too cold drink, drunken eſpecially when as any is too hot by exerciſe, or any other way: for thus the ſtomacke and the guts continued thereto, are refrigerated, and the humours and excrements therein conteined are congealed, and, as it were, bound up. The Cholicke which is cauſed by the inflammation of the kidneyes, happens by the Sympathy of the reines pained or troubled with the ſtone or gravell conteined in them or the ureters. Therefore then alſo paine troubles the patient at his hips and loynes, becauſe the nerves, which ariſing from the *vertebræ* of the loins, are oppreſſed by the weight of the ſtones and gravell, about the joint of the hippe are diſſeminated into the muſcles of the loines and thigh. Alſo the ureters are pained (for they ſeeme nothing elſe but certaine hollow nerves) and alſo the cremaſter muſcles, ſo that the patients teſticles may ſeeme to be drawne upwards with much violence. Hence great, phlegmaticke, and cholericke vomiting, and ſweat of the whole body, all which doe not ſurceaſe before that the ſtone, or gravell ſhall bee forced downe into the bladder. Now vomiting happens in this affect, for that the ventricle by reaſon of its continuity and neighbourhood which it hath with the guts, ſuffers by conſent or ſympathy. For the ſtomacke is of the ſame kind or matter as the guts are, ſo that the guts ſeeme nothing elſe but a certaine production of the ſtomacke. Therefore if at any time nature endeavour to expell any thing that is troubleſome in the kidneyes, ureters, coats of the guts, meſentery, *pancreas*, and hypochondryes, it cauſeth a Colicke with pain and vomiting. A hot and dry diſtemper alſo cauſeth the Colicke, producing a pricking

ing and biting paine by drying the excrements ſhut up in the guts, as alſo by waſting as it were the radical humours of that place provided for the lubricating of the guts. Acride, viſcide, and tough phlegme cauſeth the ſame. There is alſo another cauſe of the Collicke which is not ſo common, to wit, the twining of the guts, that is, when they are ſo twined, folded, and doubled, that the excrements, as it were, bound in their knots, cannot be expelled, as it manifeſtly happens in the rupture called *Enterocele*, by the falling of the guts into the cod. Likewiſe alſo wormes generated in the Collicke Gut, whileſt that they mutually fold or twine themſelves up, doe alſo twine the *Colon* it ſelfe and fold it with them. Alſo the too long ſtay of the excrements in the guts, whether it ſhall happen by the peculiar default of the too hot and dry body of the patient, or by his diet, that is, the uſe of too dry meats, or exerciſes and paines taken in the heate of the ſunne, or by the greatneſſe of buſineſſe, the minde being carryed away, cauſeth the Collicke, with headache, and plenty of vapours flying upwards.

A hiſtory.

Signs whereby we know that the collick proceeds from this or that cauſe.

Avicen li. 3. Hip. aphor. 10. ſect. 4.

I remember I once diſſected the body of a boy of ſome twelve yeares old, who had his guts folded with many as it were tyes or knots, of the reſtrained, too hard & dry excrements, the which he caſt out by his mouth a little before his death, which brought him to his end, being not helped in time by fitting medicines. Now theſe are the cauſes of the Collick, according to the opinion of the ancient and moderne Phyſicians, of whoſe ſignes I judge it not amiſſe here to treat in particular. You ſhall know the patient is troubled with the ſtone collick by the paine, which is fixed and as it were kept in one place, to wit, of the kidnies; by his former manner of life, as, if the patient hath formerly voyded ſtones or gravell together with his urine; by the paine of the hips and teſticles for the formerly mentioned cauſes, & laſtly, by that the patient caſts forth by ſtoole or urine, for that the great & laborious endeavour of nature to caſt forth the ſtone which is in the kidnies, is propagated by a certaine ſympathy, & like ſtudy of the neighbouring parts ſtirring up the expulſive faculties each to his work. The ſignes of a flatulent collick are, a tenſive pain, ſuch as if the guts were rent or torne in pieces, together with a noiſe or rumbling in the belly. The force of the ſhut up wind is ſometimes ſo great, that it rendeth or teareth the guts in ſunder, no otherwiſe than a ſwines bladder too hard blown up. Which when it happens, the patient dyes with much vomiting, becauſe the ſtomack oppreſt with wind, can conteine nor imbrace no meat. The collick which is occaſioned by the too long keeping in of the excrements, is accompanied with the weight and pain of the belly, the tenſion of the guts, headach, apparent hardneſs of the belly, & the complaint of the patient that he hath not gone to ſtoole in a long time. That which proceeds from a cholerick inflammation, yeelds a ſenſe of great heat & pulſation in the midſt of the belly, by reaſon of the veins and arteries which are in the *pancreas* and coats of the guts, and there are the other ſignes of a *Phlegmon*, although alſo this as it were inflammation may ariſe alſo from ſalt, acride & viſcous phlegme, which nature can neither expel upwards by vomit, nor downewards by ſtool, this ſundry times is aſſociated with a difficulty of making water, for that when as the right gut is inflamed the bladder is preſſed by reaſon of their ſociety or neighbourhood. The collick which proceeds from the contorſion of the guts ſhews it ſelfe by the exceſſive cruelty of the paine, ariſing for that the guts are not in their due ſite and place, and becauſe the excrements by their too long detenſion acquire a preternaturall heat; & this is the cauſe of the death of many ſuch as have Ruptures, for that the gut falling down from the naturall place into the Cod, being a preternatural place, is redoubled & kept there as it were bound, whereby the excrements being baked becomming more acridly hot cauſe inflammation, and by raiſing up flatulencies encreaſe the diſtenſion through all the guts, untill at length a deadly *Ileos* or collick ariſing, they come forth at the mouth. For prognoſticks; it is better to have the paine in the collick to wander up and down, than to be fixed; it is good alſo that the excrements are not wholly ſuppreſt. But the evill ſignes that here appeare pronounce the affect either difficult or deadly. Now theſe ſhew that it is deadly, intolerable tormenting paine, continuall vomiting, cold ſweat, coldneſſe of the extreme parts, hickiting by reaſon of the ſympathy the ſtomack hath with the guts, a Phrenſie by the conſent of the braine with the ſtomacke, and oft-times a

convulſion by drawing the matter into the nerves. But ſuch as have griping and pain about their navil and loines, which can neither be helped by medicine nor otherwiſe, it ends in a Dropſie. The cure muſt be diverſified according to the variety of the cauſes, for the ſtone collick is cured by medicines proper to the ſtone; that which is cauſed by an *Enterocele*, is cured by the onely reſtoring the gut to its place; that which is occaſioned by wormes, requires medicines fit to kill and caſt forth the wormes. But that which proceeds from the weakneſſe and refrigeration of the guts and ſtomack, is cured by heating and ſtrengthening medicines aſwell applyed outwardly as taken in inwardly by the mouth, or otherwaies. The beginning of the cure of that which is occaſioned by tough flegme and flatulencies, is by the mitigation of the paine, ſeeing there is nothing which more dejects the powers than paine. To this purpoſe ſhall you provide bathes, *Semicupia*, fomentations of mallowes, marſh-mallowes, violet leaves, penyroyall, fennell, *Origanum*, the ſeeds of time and fænugreek, flowers of camomill, melilote, and other ſuch like, which have power to heat, dry, attenuate, and rarifie the skin, ſo to diſſipate the wind. But all ſuch muſt be actually hot. Alſo the belly may be anointed with this following ointment. ℞. *olei chamæm. aneth. butyr. recent. an.* ℥i. *ſem. apii, petroſ. & galang. an.* ʒß. *aq. vitæ, ol. ſalviæ aut thymi chimice extract. q. ſ.* The following liniment is much commended by *Hollerius.* ℞. *olei rut. & nardi, an.* ʒvi. *galbani cum aq. vit. diſſoluti* ʒii. *liquefactis ſimul adde Zibetæ gr.* iv. *croci, gr.* vi. *fiat linimentum.* Alſo little bags made with millet, oates and ſalt fryed with a little white wine in a frying pan, ſhall be applyed hot upon the belly & flankes, and renewed before they grow cold. You may, in ſtead of theſe bags, uſe oxe bladders halfe filled with a decoction of reſolving things; as ſalt, roſemary, thime, lavander, bay-berries and the like: then inject a glyſter being thus made. ℞. *quatuor remol. an.* m. i. *orig. puleg. calamenth. an.* m. ß. *aniſi, carui an.* m. ß *flor. aneth. an.* p. i. *bulliant in hydromele ad lib.* i. *in qua diſſolve bened. laxat. mellis anthoſati, ſacc. rub. an.* ℥i. *olei aneth. & chamæm. an.* ℥iß. Let a glyſter be made to bee injected at twice; for the guts being ſtretched out cannot conteine the accuſtomed doſis of a glyſter: alſo this following glyſter is much approved. ℞. *vini malvat. & olei nucum, an.* ℥iii. *aqua vitæ,* ℥i. *olei juniperi, & rut. per quintam eſſent. extract. an.* ʒiii. Let this be injected as hot as the patient can endure. I have oft-times as by miracle helped intolerable paine cauſed by the wind collick and phlegme with this glyſter. *Avicen* preſcribes a carminative glyſter made of hyſope, *origanum, acorus,* aniſeeds and Engliſh galengall. Let the patient feed upon meats of good juice & eaſie digeſtion, as broths made with the yolks of egs, ſaffron, hot herbes and a nutmeg; let him drink good wine, as Muskedine, or Hypocras made with good wine ſo to heat the ſtomack & guts. For in *Galens* opinion, all windineſſe is generated by a remiſſe heat. But if the pain ſhall continue, a large Cupping-glaſſe ſhall bee applyed to the navill to draw and diſſipate the windineſſe; the belly ſhall be bound with ſtrong and broad ligatures, to ſtrengthen the guts, and diſcuſſe the matter of flatulencies. The patients taught by nature, uſe this remedy, whilſt none admoniſhing them, they preſſe the belly with their hands in the bitterneſſe of paine. But if the paine cannot be thus appeaſed, we muſt come to ſuch medicines as worke by an occult propertie, as the dryed gut of a Wolfe, for a dram thereof made into pouder is given in wine with good ſucceſſe. That collick which is cauſed by a cholerick inflammation requires contrary medicines, to wit, bloodletting and a refrigerating diet; potions made of *Diacatholicon* and *Caſsia* diſſolved in barley water, alſo cooling glyſters. *Avicen* preſcribes narcoticks, for that being cold, they are contrary to the morbifick cauſe which is hot and dry; ſuch are pils of *Philonium.* Alſo pils of *Hyera picra* in the quantity of ℈iv. with *opium* and ſaffron, of each one graine, may be uſed. Alſo baths are appointed, made of water wherein mallowes, marſh-mallowes, violet leaves, flowers of white lillies, lettuce, purſlaine, have bin boyled, to correct the acrimonie of the cholericke and hot humours, whence the diſeaſe and ſymptome ariſeth. That collick which is like to this, and proceeds from ſalt, acride, thick and tough phlegme, is cured, the humour being firſt attenuated and diffuſed, and at length evacuated by medicines taken by the mouth and otherwiſe according to the preſcription of the learned Phiſitian. But *Avicen* cures that which is occaſioned by the ſuppreſſion of the hardened excrements, and twining of them by meates which

which have an emollient faculty, ſuch as humecting broths, as that which is made of an old cock tired with running, & threſhed to death, & ſo boyled with dill, polypody and a little ſalt, untill the fleſh fall from the bones; alſo he uſeth detergent glyſters ſuch as this which followes. ℞. *betæ*, m. i. *furfuris*, p. i. *ficus*, nu. x. *alth.* m. i. *fiat decoctio ad* ℔. i. *in qua diſſolve nitri & muriæ an.* ʒii. *ſacch. rub.* ℥i. *ol. ſeſamini*, ʒii. But if the obſtruction be more contumacious, you muſt uſe more powerfull ones made *ex cyclamin. centaurio, & hiera diacolocinth. ad* ʒii. But if the obſtruction do notwithſtanding remaine, ſo that the excrements come forth at the mouth, *Marianus Sanctus* wiſheth (by the counſell of many who have ſo freed themſelves from this deadly ſymptome) to drink three pounds of quickſilver with water onely. For the doubled and as it were twined up gut is unfolded by the weight of the quickſilver, and the excrements are depreſt and thruſt forth, and the wormes are killed which gave occaſion to this affect. *John* of S. *Germaines* that moſt worthy Apothecary hath told me that hee ſaw a Gentleman who when as hee could not bee freed from the paine of the collick by any means preſcribed by learned Phyſitians, at length by the counſell of a certaine Germane his friend, drank three ounces of oile of ſweet almonds drawne without fire, and mixed with ſome white wine and pellitory water, and ſwallowed a leaden bullet beſmeared with quickſilver, and that bullet comming preſently out by his fundament, he was wholly freed from his collick.

The force of quickſilver in the unfolding of the guts.

A hiſtory.

Chap. LIX.

Of Phlebotomie, or Blood-letting.

What Phlebotomie is.

Phlebotomie is the opening of a veine, evacuating the blood with the reſt of the humours; thus Arteriotomie, is the opening of an Artery. The firſt ſcope of Phlebotomie is the evacuation of the bloud offending in quantity, although oft-times, the Phyſicians intention is to draw forth the blood which offends in quality, or either way by opening a veine. Repletion which is cauſed by the quantity is two-fold, the one *ad vires*, that is, to the ſtrength, the veines being otherwiſe not very much ſwelled; this makes men infirme and weake, nature not able to beare this humour, of what kinde ſoever it be. The other is termed *ad vaſa*, that is, to the veſſels, the which is ſo called comparatively to the plenty of bloud, although the ſtrength may very well away therewith. The veſſels are oft-times broke by this kind of repletion, ſo that the patient caſts and ſpits up blood, or elſe evacuats it by the noſe, wombe, hæmorrhoids, or *varices*. The repletion which is *ad vires* is knowne by the heavineſſe and wearisomneſſe of the whole body; but that which is *ad vaſa* is perceived by their diſtenſion and fulneſſe, both of them ſtand in neede of evacuation. But bloud is onely to bee let by opening a veine, for five reſpects: the firſt is to leſſen the abundance of bloud, as in Phlethorick bodies, and thoſe who are troubled with inflammation without any plenitude. The ſecond is for divertion, or revulſion, as when a veine of the right arme is opened to ſtay the bleeding of the left noſthrile. The third is to allure or draw downe, as when the *ſaphena* is opened in the ankle to draw downe the courſes in women. The fourth is for alteration or introduction of another quality, as when in ſharpe feavers we open a veine to breathe out that bloud which is heated in the veſſels, and cooling the reſidue which remaines behind. The fift is to prevent imminent diſeaſes, as when in the Spring and Autumne we draw bloud by opening a veine in ſuch as are ſubject to ſpitting of bloud, the ſquinancie, pleuriſie, falling ſickneſſe, apoplexie, madneſſe, gout, or in ſuch as are wounded, for to prevent the inflammation which is to be feared. Before bloud-letting, if there bee any old excrements in the guts, they ſhall bee evacuated by a gentle glyſter, or ſuppoſitory, leſt the meſaraicke veines ſhould thence draw unto them any impuritie. Blood muſt not be drawne from ancient people unleſſe ſome preſent neceſſity require it, leſt the native heat which is but languid in them ſhould be brought to extreme debility, and their ſubſtance decay; neither muſt any in like ſort be taken from children, for feare

of

---

of reſolving their powers by reaſon of the tenderneſſe of their ſubſtance, & rareneſs of their habit. The quantity of bloud which is to be let, muſt bee conſidered by the ſtrength of the patient, and greatneſſe of the diſeaſe: therefore if the patient bee weake, and the diſeaſe require large evacuation, it will bee convenient to part the letting of bloud, yea by the interpoſition of ſome dayes. The veine of the forehead being opened is good for the paine of the hind part of the head; yet firſt we foment the part with warme water, that ſo the skin may be the ſofter, and the bloud drawne into the veines in greater plenty. In the ſquinancie the veines which are under the tongue muſt be opened aſlant, without putting any ligatures about the neck for feare of ſtrangling. Phlebotomie is neceſſary in all diſeaſes which ſtop or hinder the breathing, or take away the voice or ſpeech, as likewiſe in all contuſions by a heavie ſtroake, or fall from high, in an apoplexie, ſquinancie, and burning feaver, though the ſtrength be not great, nor the bloud faulty in quantity or quality, bloud muſt not be let in the height of a fever. Moſt judge it fit to draw bloud from the veines moſt remote from the affected and inflamed part, for that thus the courſe of the humours may be diverted, the next veines on the contrary being opened the humours may be the more drawne into the affected part, and ſo increaſe the burden and paine. But this opinion of theirs is very erroneous, for an opened veine alwaies evacuates and diſburdens the next part. For I have ſundry times opened the veines and arteries of the affected part, as of the hands & feet in the Gout of theſe parts; of the temples in the Megrim; whereupon the paine alwayes was ſomewhat aſſwaged, for that together with the evacuated bloud, the malignitie of the Gout, and the hot ſpirits (the cauſers of the head-ach or Megrim) were evacuated. For thus *Galen* wiſheth to open the arteries of the temples in a great and contumacious defluxion falling upon the eyes, or in the Megrim or head-ach.

When and for what it is neceſſary.

13. *meth. cap. ult.*

CHAP. LX.

How to open a veine, and draw bloud from thence.

THE firſt thing is, to ſeat or place the patient in as good a poſture as you can, to wit, in his bed if he be weak; but in a chaire if ſtrong, yet ſo, that the light may fall directly upon the veine which you intend to open. Then the Surgeon ſhall rub the arme with his hand, or a warme linnen cloth, that the bloud may flow the more plenitifully into the vein. Then he ſhall bind the veine with a ligature a little above the place appointed to be opened, and hee ſhall draw back the bloud upwards towards the ligature from the lower part; and if it be the right arme, he ſhall take hold thereof with his left hand; but if the left, then with his right hand, preſſing the veine in the meane time with his thumbe a little below the place where you meane to open it, leſt it ſhould ſlip away; and that it may bee the more ſwolne by forcing up the bloud. Then with his naile hee ſhall marke or deſigne the place to be opened, and ſhall annoint it being ſo marked with butter or oyle whereby the skin may be relaxed, and the lancet enter more eaſily, and therefore the ſection may be the leſſe painefull. He ſhal hold his lancet between his thumb and fore finger, neither too neer, nor too far from the point; he ſhall reſt his other three fingers upon the patients arme, that ſo his hand may be the more ſteddy & leſſe trembling. Then ſhall he open the vein with an inciſion agreeable to the magnitude of the veſſell, & the indifferent thickneſſe of the conteined bloud ſomewhat aſlant, diligently avoiding the artery which lies under the *baſilica*, & the nerve, or tendon of the two-headed muſcle, which lyes under the Median veine. But for the Cephalicke it may be opened without danger. As much bloud as is ſufficient being drawne, according to the minde of the Phyſician, he ſhall looſe the ligature, and laying a little boulſter under, hee ſhall with a ligature bind up the wounded part to ſtay the bleeding; the ligation ſhall be neither too ſtrait, nor looſe, but ſo that the patient may freely bend and extend his arme; wherefore whileſt that is in doing he muſt not hold his arme ſtreight out, but gently bended, otherwiſe he cannot freely bend it.

How to place the patient.

Chap. LXI.

Of Cupping-glaſſes, or ventoſes.

The uſe of cupping-glaſſes.

Cupping-glaſſes are applyed eſpecially when the matter conjunct and impact in any part is to be evacuated, and then chiefly there is place for ſcarification after the cupping-glaſſes: yet they are alſo applyed for revulſion and divertion; for when an humour continually flowes down into the eyes, they may be applyed to the ſhoulders with a great flame, for ſo they draw more ſtrongly and effectually. They are alſo applyed under womens breaſts, for to ſtop the courſes flowing too immoderately, but to their thighes for to provoke them. They are alſo applyed to ſuch as are bit by venemous beaſts, as alſo to parts poſſeſſed by a peſtiferous *Bubo* or Carbuncle, ſo to draw the poyſon from within outwards. For (as *Celſus* ſaith) a Cupping-glaſſe where it is faſtned on, if the skin be firſt ſcarified, drawes forth bloud, but if it bee whole, then it draws ſpirit. Alſo they are applyed to the belly, when any groſſe or thick windineſſe, ſhut up in the guts, or membraines of the muſcles of the *Epigaſtrium*, or lower belly cauſing the Collick, is to bee diſcuſſed. Alſo they are faſtned to the Hypocondry's, when as flatulency in the liver, or ſpleene ſwels up the entraile lying thereunder, or in too great a bleeding at the noſe. Alſo they are ſet againſt the Reines in the bottome of the belly, whereas the ureters run downe to draw downe the ſtone into the bladder, when as it ſtops in the middle or entrance of the ureter. You ſhall make choice of greater and leſſer Cupping-glaſſes according to the condition of the part, and the conteined matter. But to thoſe parts whereto theſe cannot by reaſon of their greatneſſe be applyed, you may fit hornes for the ſame purpoſe.

CHAP. LXII.

Of Leaches, and their uſe.

The uſe of Leaches.

How to apply them.

How to cauſe them to fall off.

IN thoſe parts of the body whereto Cupping-glaſſes and hornes cannot be applyed, to thoſe Leaches may for the moſt part be put, as to the fundament to open the coat of the hæmorrhoide veines, to the mouth of the wombe, the gums, lips, noſe, fingers. After the Leach being filled with bloud ſhal fal off, if the diſeaſe require a large evacuation of bloud, and the part affected may endure it, Cupping-glaſſes, or hornes, or other Leaches ſhall be ſubſtituted. If the Leaches bee handled with the bare hand, they are angred, and become ſo ſtomackfull as that they will not bite; wherefore you ſhall hold them in a white & clean linnen cloath, & apply them to the skin, being firſt lightly ſcarified, or beſmeared with the bloud of ſome other creature, for thus they will take hold of the fleſh, together with the skin more greedily & fully. To cauſe them fall off you ſhall put ſome powder of Aloes, ſalt or aſhes upon their heads. If any deſire to know how much bloud they have drawne, let him ſprinkle them with ſalt made into powder, as ſoone as they are come off, for thus they will vomit up what bloud ſoever they have ſucked. If you deſire they ſhould ſucke more bloud than they are able to containe, cut off their tailes as they ſuck, for thus they will make no end of ſucking, for that it runs out as they ſuck it. The Leaches by ſucking draw the bloud not onely from the affected part whereto they are applyed, but alſo from the adjacent and diſtant parts. Alſo ſometimes the part bleeds a good while after the Leaches be fallen away, which happens not by ſcarification after the application of Cupping-glaſſes or hornes. If you cannot ſtop the bleeding after the falling away of the Leaches, then preſſe the halfe of a beane upon the wound, untill it ſtick of it ſelf, for thus it will ſtay; alſo a burnt rag may be fitly applyed with a little boulſter and fit ligature.

OF THE GOUTE.

THE EIGHTEENTH BOOKE.

CHAP. I.

The deſcription of the Goute.

THe Goute is a diſeaſe occupying and harming the ſubſtance of the Joints by the falling downe and collection of a virulent matter accompanied by the foure humors. This word *Arthritis* or Goute, is generall for every joint ſo affected; yet it enjoyes divers particular names in ſundry joints of the body: as that which falleth upon the joint of the Jaw, is termed *Siagonagra*, for that the Greekes call the Jaw *Siagon*; that which affects the necke is termed *Trachelagra*, for that the neck is in Greek termed *Trachelos*: that which troubles the backe bone is called *Rhachiſagra*, for the ſpine is termed *Rhachis*: that which moleſts the ſhoulders *Omagra*, for the joint of the ſhoulder is ſtiled *Omos*: that which affects the joints of the Collar-bones *Cleiſagra*, for that the Greeks call this bone *Cleis*: that in the Elbow, *Pechyagra*, for *Pechis* ſignifieth the elbow: the goute in the hand is called *Chiragra*, in the Hippe *Iſchias*, in the knee *Gonagra*, in the feet *Podagra*, for that the Hand, Hippe, Knee, and Foote are in Greeke termed *Cheir*, *Iſchion*, *Gony*, and *Pous*. When as there is great abundance of humours in a body, and the patient leads a ſedentary life, not ſome one, but all the joints of the body are at once troubled with the Goute.

What it is.

Particular gouts.

CHAP. II.

Of the occult cauſes of the Goute.

THe humor cauſing the Goute is not of a more knowne, or eaſily expreſt nature than that which cauſeth the plague, *Lues venerea*, or falling ſickeneſſe. For it is of a kind and nature cleane different from that which cauſeth a *Phlegmon*, *ædema*, *eryſipelas*, or *Scirrhus*; for, as *Aëtius* ſaith, it never commeth to ſuppuration like other humours, not for that, as I thinke, becauſe it happens in bloodles parts, but through the occaſion of ſome occlut malignity. Hereto may be added that the humours which cauſe the forementioned tumors, when as they fall downe upon any part, not then truly when they are turned into *pus* or matter, do they cauſe ſo ſharpe paines as that which cauſeth the Goute, for the paine thereof is farre more ſharpe, than of that humour which breedeth an ulcerated *Cancer*. Beſides theſe humours, when they fall upon the joints through any other occaſion, never turne into knots, onely that which cauſeth the Goute in the joints,

Lib. 12. cap. 12.

The reſemblance of the Gout to the Epilepſie.

The ſtrange variety of the Gout.

after it hath fallen thither, is at length hardened into a certaine knotty and as it were plaiſter-like ſubſtance to bee amended by no remedies. But ſeing it offends not the parts by which it flowes downe, (no more than the matter which creeping upwards from the lower parts to the braine, cauſeth the *Epilepſie*) as ſoone as it falleth into the ſpaces of the Joints it cauſeth cruell paine, one while with heate, another while with cold. For you may ſee ſome troubled with the Goute, who complaine that their pained Joints are burnt, there are others to whom they ſeeme colder than any ice, ſo that they cannot bee ſufficiently heated to their hearts deſire; verily you may ſometimes ſee in the ſame body troubled with the Goute, that the Joints of the right ſide will as it were burne with heat, but on the left ſide will be ſtiffe with cold; or which is more, the knee in the ſame ſide to be tormented with a hot diſtemper, and the ancle troubled with a cold. Laſtly, there ſometimes happens a ſucceſſion of paine in a ſucceſſion of dayes, as the ſame joints will be this day troubled with a hot, to morrow with a cold diſtemper, ſo that wee need not marvaile to ſee Phyſitians preſcribe one while hot, another while cold medicines againſt the ſame diſeaſe of the ſame part and body. Alſo it ſometimes happens that the malignity of this humour doth not onely not yield to medicines, but is rather made worſe, ſo that the patients affirme that they are far better when they have none, than when they have any remedyes applyed. For all things being rightly done, and according to reaſon, yet the diſeaſe will come againe at certain ſeaſons by fits: and hereupon it is ſayd by *Horace*:

Qui cupit, aut metuit, juvat illum ſic domus aut res,
Ut lippum picta tabulæ, fomenta podagram.

Riches the covetous, and fearefull ſo doe pleaſe,
As pictures ſore eyes, Bathes the Goute doe eaſe.

Certainely ſuch as have this diſeaſe hereditarily, can no more bee helped and throughly freed therefrom, than thoſe in whom the matter of the diſeaſe is become knotty, whereof *Ovid* thus ſpeaketh:

Tollere nodoſam neſcit medicina podagram.

Phyſicke cannot the knotty Goute to heale.

Lib. 3. ſect. 22. tract. 2. cap. 3.

Lib. de ther. ad Piſonem c. 15.

The matter of the gout partakes of occult malignity.

Theſe reaſons have induced many to believe that the eſſence of this diſeaſe is unknowne, for there is a certaine occult and inexplicable virulency, the author of ſo great malignity and contumacy. Which *Avicen* ſeemes to acknowledge, when hee writes that there is a certaine kinde of Goute whoſe matter is ſo acute and maligne, that if it at any time bee augmented by the force of anger, it may ſuffice to kill the party by ſuddaine death. Therefore *Galen* himſelfe writes that Treacle muſt bee uſed in all Arthriticall and gouty affects, and as I think, for no other reaſon, than for that it dries, waſtes and weakens the malignity thereof. *Gordonius* is of the ſame opinion, but addeth withall, that the body muſt be prepared and purged before wee uſe Treacle. Therefore the matter of the gout is a thin and virulent humour, yet not contagious, offending in quality rather than quantity, cauſing extreme paines, and therfore inſtigating the humours together with the caliginous and flatulent ſpirits prepared or ready for defluxion upon the affected parts. Therefore as the bitings of Aſpes, and ſtingings of Waſpes cauſe cruell pain with ſudden ſwelling and bliſtering, which is by the heat of the humours which the poyſon hath tainted, and not by the ſimple ſolution of continuity, ſeeing that we daily ſee Shoo-makers and Taylors pricking their fleſh with aules and needles without having any ſuch ſymptome. Thus the virulencie of the gout cauſeth intolerable tormenting paine, not by the abundance, becauſe it happens to many who have the gout, no ſigne of defluxion appearing in the joints, but onely by a maligne and inexplicable quality, by reaſon whereof theſe paines doe not ceaſe unleſſe abated by the helpe of medicines, or nature, or both. The recitall of the following hiſtories will give much light to that unexplicable

A hiſtorie.

cable and virulent malignity of the matter cauſing the gout. Whileſt King Charles the ninth, of happy memory, was at Burdeaux, there was brought to *Chappellaine* and *Caſtellan* the Kings Phyſicians, and *Taſte* a Phyſician of Burdeaux, *Nicholas Lambert* and my ſelfe Surgeons, a certaine Gentlewoman ſome forty yeares old, exceedingly troubled for many yeares by reaſon of a tumor ſcarce equalling the bigneſſe of a peaſe, on the outſide of the joynt of the left Hippe: one of her tormenting fits tooke her in my preſence; ſhee preſently beganne to cry and roare, and raſhly and violently to throw her body this way and that way, with motions and geſtures above a womans, yea a mans nature. For ſhee thruſt her head between her legges, laid her feete upon her ſhoulders, you would have ſaid ſhee had beene poſſeſſed of the Divell. This fit held her ſome quarter of an houre,; during all which time I heedfully obſerved whether the grieved part ſwelled any bigger than it was accuſtomed, whether there happened any new inflammation; but there was no alteration as farre as I could gather by ſight or feeling, but onely that ſhee cryed out more loudly when as I touched it. The fit paſſed, a great heate tooke her, all her body ranne downe with ſweat, with ſo great wearineſſe and weakeneſſe of all her members, that ſhee could not ſo much as ſtirre her little finger. There could bee no ſuſpicion of an Epileptick fit, for this woman all the time of her agony did perfectly make uſe of all her ſenſes, did ſpeake, diſcourſe, and had no convulſion. Neither did ſhee ſpare any coſt or diligence, whereby ſhee might bee cured of her diſeaſe by the helpe of Phyſicians, or famous Surgeons; ſhe conſulted alſo witches, wizzards and charmers, ſo that ſhee had left nothing unattempted, but all art was exceeded by the greatneſſe of the diſeaſe. When I had ſhewed all theſe things at our conſultation, wee all with one conſent were of this opinion, to apply a potentiall Cautery to the grieved part, or the tumour. I my ſelfe applyed it: after the fall of the Eſchar very blacke and virulent *ſanies* flowed out, which freed the woman of her paine and diſeaſe for ever after. Whence you may gather, that the cauſe of ſo great evill was a certaine venenate malignity, hurting rather by an unexplicable quality than quantity; which being overcome and evacuated by the Cautery, all paine abſolutely ceaſed. Upon the like occaſion, but on the right arme, the wife of the Queenes Coach-man at Amboiſe conſulted *Chappellaine*, *Caſtellan* and me, earneſtly craving eaſe of her paine, for ſhee was ſo grievouſly tormented by fits, that through impatiency, being careleſſe of her ſelfe, ſhee endeavoured to caſt her ſelfe headlong out of her chamber window, for feare whereof ſhee had a guard put upon her. Wee judged that the like monſter was to be aſſaulted with the like weapon, neither were we deceived, for uſing a potentiall cautery, this had like ſucceſſe as the former. Wherefore the bitterneſſe of the paine of the gout is not occaſioned by the onely weakeneſſe of the joints; for thus the paine ſhould be continuall, and alwaies like it ſelf; neither is it from the diſtemper of a ſimple humour, for no ſuch thing happens in other tumours of what kinde ſoever they be of; but it proceeds from a venenate, maligne, occult and inexplicable quality of the matter: wherfore this diſeaſe ſtands in need of a diligent Phyſician and a painfull Surgeon.

A terrible fit.

How an Epileptick fit differs from the gout.

CHAP. III.

Of the manifeſt cauſes of the Gout.

The firſt primitive cauſe of the gout.

ALthough theſe things may be true which we have delivered of the occult cauſe of the gout, yet there be and are vulgarly aſſigned others, of which a probable reaſon may bee rendred, wherein this malignity whereof wee have ſpoken lies hid and is ſeated. Therefore as of many other diſeaſes, ſo alſo of the gout there are aſſigned three cauſes; that is, the primitive, antecedent and conjunct; the primitive is twofold, one drawn from their firſt originall and their mothers wombe, which happens to ſuch as are generated of gouty parents, chiefly if whileſt they were conceived, this gouty matter did actually abound and fall upon the joynts. For the ſeed falls from all the parts of the body, as ſaith *Hippocrates*, and

Lib. de aëre, loc. & aqua.
Lib. 1. cap. 17.

Ariſtole affirmes *lib. de gener. animal.* Yet this cauſes not an inevitable neceſſity of having the gout, for as many begot of ſound and healthfull parents are taken by the gout by their proper & primary default; ſo many live free from this diſeaſe, whoſe fathers notwithſtanding were troubled therewith. It is probable that they have this benefit and priviledge by the goodneſſe of their mothers ſeed, and the laudible temper of the womb; wherof the one by the mixture & the other by the gentle heat, may amend and correct the faults of the paternall ſeed; for otherwiſe the diſeaſe would become hereditary, and gouty perſons would neceſſarily generate gouty; for the ſeed followeth the temper and complexion of the party generating, as it is ſhewed by *Avicen*. Another primitive cauſe is from unordinate diet, eſpecially in the uſe of meat, drink, exerciſe and Venerie. Laſtly by unprofitable humours which are generated and heaped up in the body, which in proceſſe of time acquire a virulent malignity; for theſe fill the head with vapours raiſed up from them, whence the membranes, nerves and tendons, and conſequently the joynts become more laxe and weake. They offend in feeding who eat much meat, and that of ſundry kindes at the ſame meale, who drink ſtrong wine without any mixture, who ſleep preſently after meat, and which uſe not moderate exerciſes; for hence a plenitude, an obſtruction of the veſſels, crudities, and the encreaſe of excrements, eſpecially ſerous. Which if they flow downe unto the joynts, without doubt they cauſe this diſeaſe; for the joints are weake either by nature or accident in compariſon of the other parts of the body: by nature, as if they be looſe and ſoft from their firſt originall; by accident, as by a blow, fall, hard travelling, running in the ſun by day, in the cold by night, racking, too frequent venery, eſpecially ſuddenly after meat; for thus the heat is diſſolved by reaſon of the diſſipation of the ſpirits cauſed in the effuſion of ſeed, whence many crude humours, which by an unſeaſonable motion are ſent into the ſinews & joints. Through this occaſion old men, becauſe their native heat is the more weak, are commonly troubled with the gout. Beſides alſo the ſuppreſſion of excrements accuſtomed to be avoided at certaine times, as the courſes, hæmorrhoides, vomit, ſcowring, cauſeth this diſeaſe. Hence it is, that in the opinion of *Hippocrates*, A woman is not troubled with the gout, unleſſe her courſes faile her. They are in the ſame caſe who have old and running ulcers ſuddenly healed, or *varices* cut and healed, unleſſe by a ſtrict courſe of diet they hinder the generation and increaſe of accuſtomed excrements. Alſo thoſe which recover of great and long diſeaſes, unleſſe they be fully and perfectly purged, either by nature or art, theſe humours falling into the joynts, which are the relicks of the diſeaſe, make them to become goutie; and thus much for the primitive cauſe. The internall or antecedent cauſe is, the abundance of humours, the largeneſſe of the veſſels and paſſages which run to the joynts, the ſtrength of the amandating bowels, the looſeneſſe, ſoftneſſe and imbecility of the receiving joints. The conjunct cauſe is the humour it ſelfe impact and ſhut up in the capacities and cavities of the joynts. Now the unprofitable humour, on every ſide ſent downe by the ſtrength of the expulſive faculty, ſooner lingers about the joynts, for that they are of a cold nature and denſe, ſo that once impact in that place, it cannot be eaſily digeſted and reſolved. This humour then cauſeth paine by reaſon of diſtenſion or ſolution of continnity, diſtemper, and beſides the virulency and malignity which it acquires. But it ſavours of the nature ſomtimes of one, ſometimes of more humors; whence the gout is either phlegmonous, or eryſipilatous, œdematous, or mixt. The concourſe of flatulencies, together with the flowing down humours, and as it were tumult by the hinderance of tranſpiration, encreaſeth the dolorificke diſtenſion in the membranes, tendons, ligaments and other bodies wherein the joint conſiſts.

The conjunct.

Five cauſes of the paine of the gout.

CHAP. IV.

Out of what part the matter of the Gout may flow downe upon the joints.

THE matter of the gout commeth for the moſt part from the liver, or brain; that which deſcends from the braine is phlegmatick, ſerous, thin and cleare, ſuch as uſually drops out of the noſe, endued with a maligne and venenate quality. Now it paſſeth out by the muſculous skin and *pericranium*, as alſo through that large hole by which the ſpinall marrow, the braines ſubſtitute, is propagated into the ſpine, by the coats and tendons of the nerves into the ſpaces of the joints, and it is commonly cold. That which proceeds from the liver is diffuſed by the great veine and arteries filled and puffed up, and participates of the nature of the foure humours, of which the maſſe of the bloud conſiſts, more frequently accompanied with a hot diſtemper, together with a gouty malignity. Beſides this maner of the gout which is cauſed by defluxion, there is another which is by congeſtion; as when the too weak digeſtive faculty of the joints cannot aſſimulate the juices ſent to them.

What and how the matter of the gout comes downe from the braine.

Gout by congeſtion.

CHAP. V.

The ſignes of the arthritick humour flowing from the braine.

WHen the defluxion is at hand, there is a heavineſſe of the head, a deſire to reſt, and a dulneſſe with the paine of the outer parts, then chiefly perceptible, when the hairs are turned up, or backwards; moreover, the muſculous skin of the head is puffed up as ſwolne with a certain œdematous tumour; the patients, ſeem to be much different from themſelves by reaſon of the functions of the minde hurt by the malignity of the humour, from whence the naturall faculties are not free; as the crudities of the ſtomack, and the frequent and acride belchings may teſtifie.

CHAP. VI.

The ſignes of a gouty humour proceeding from the liver.

THe right Hypocondrie is hot in ſuch gouty perſons, yea the inner parts are much heated by the bowell; bloud and choler carry the ſway, the veins are large and ſwoln, a defluxion ſuddenly falls down, eſpecially if there be a greater quantity of choler than of other humours in the maſſe of the bloud. But if, as it often falls out, the whole bloud, by meanes of crudities degenerate into phlegme and a wheyiſh humour; then will it come to paſſe, that the gout alſo, which proceeds from the liver, may be pituitous or phlegmatick, and participate of the nature of an *œdema*, like that which proceeds from the braine. As if the ſame maſſe of bloud decline towards melancholy, the gout which thence ariſeth reſembles the nature of a *ſcirrhus*; yet that can ſcarce happen, that melancholy by reaſon of the thickneſſe and ſlowneſſe to motion may fall upon the joynts. Yet notwithſtanding, becauſe we ſpeake of that which may bee of theſe, it will not bee unprofitable briefly to diſtinguiſh the ſignes of each humour, and the differences of gouts to be deduced from thence.

When the gout which proceeds from the default of the liver, aſſimulates the nature of an *œdema*.

Why the gout ſeldome proceeds from melancholy.

CHAP. VII.

By what ſignes we may underſtand this or that humour to accompany the gouty malignity.

YOu may give a gueſſe hereat by the patients age, temper, ſeaſon of the yeare, condition of the country where he lives, his diet and condition of life, the encreaſe of the paine in the morning, noone, evening or night, by the propriety of the beating, pricking, ſharpe or dull paine; by numneſs, as in a melancholy gout or itching; as in that which is cauſed by tough phlegme, by the ſenſible appearance of the part in ſhape and colour (as for example ſake in a phlegmaticke gout, the colour of the affected part is very little changed from its ſelfe, and the neighbouring well parts, in a ſanguine gout it lookes red, in a cholerick it is fiery or pale, in a melancholy livid or blackiſh) by the heat and bigneſſe which is greater in a ſanguine and phlegmatick than in the reſt, by the change, and laſtly by things helping and hurting. And there bee ſome, who for the knowledge of theſe differences wiſh us to view the patients urine, and feele their pulſe, and conſider theſe excrements which in each particular nature are accuſtomed to abound or flow, and are now ſuddenly and unaccuſtomarily ſuppreſt. For hence may be taken the ſignes of the dominion of this or that humour. But a more ample knowledge of theſe things may be drawne from the humours predominant in each perſon, and the ſignes of tumours formerly delivered. Onely this is to be noted by the way, that the gout which is cauſed by melancholy is rare to be found.

CHAP. VIII.

Prognoſticks in the Gout.

The gout frequent in the Spring & Fall. What gout uncurable.

Gal. ad aphor. 49 Sect. 6.

Why the Sciatica cauſeth lameneſſe.

BY the writings of Phyſitians the paines of the gout are accounted amongſt the moſt grievous and acute; ſo that through vehemency of pain many are almoſt mad, and wiſh themſelves dead. They have certain periods and fits according to the matter and condition of the humour wherein this maligne and inexplicable gouty virulency reſides. Yet they more frequently invade in the Spring and Autumne; ſuch as have it hereditarie are ſcarce ever throughly free therefrom, as neither ſuch as have it knotty: for in the former it was borne with them, and implanted, and as it were fixed in the originall of life: but in the other the matter is become plaiſter-like, ſo that it can neither be reſolved nor ripened: that which proceeds from a cold and pituitous matter, cauſeth not ſuch cruell tormenting pain, as that which is of a hot, ſanguine or cholerick cauſe, neither is it ſo ſpeedily healed, for that the hot and thin matter is more readily diſſolved; therefore commonly it ceaſeth not untill fourty dayes bee paſt: beſides alſo, by how much the ſubſtance of the affected part is more denſe, and the expulſive facultie more weake, by ſo much the paine is more tedious. Hence it is, that thoſe gouty paines which moleſt the knee, heele and huckle bone, are more contumacious. The gout which proceeds of a hot matter, reſts not before the fourteenth or twentieth day. That which is occaſioned by acride choler, by the bitterneſſe of the inflammation and pain cauſeth a difficulty of breathing, raving, and ſundry times a gangrene of the affected part, and laſtly death; and healed, it often leaves a palſie behinde it. Amongſt all the gouty paines, the Sciatica challengeth the prime place, by the greatneſſe of the paine and multitude of ſymptomes; it brings unquietneſſe and watching, a feaver, diſlocation, perpetuall lameneſſe & the decay of the whole legge, yea and often times of the whole body. Now lameneſſe, and leanneſſe or decay of the part are thus occaſioned, for that the decurrent humour forceth the head of the thigh-bone out of the cavity of the huckle-bone; this being forced out preſſeth the muſcles, veines, arteries, and that notable and large nerve which runs alongſt the thigh even to the furtheſt joynts of the toes, and by the way is diverſly diſperſed over the muſcles of the whole leg. Therefore becauſe the head of the thigh is put out of its place, the patient is forced to halt; becauſe the veſſels and nerves are oppreſſed, the nouriſhment and ſpirits doe not freely flow into the parts thereunder, whence proceeds their decay. Yet it ſundry times happens, that the head of the thigh being not diſplaced, many halt becauſe the viſcide humour, which is naturally implanted in that place and continually flowes thither, both for the nutrition of theſe parts, and the lubrication of the joynt for quicker motion, is hardened by heat and idleneſſe, and the other unprofitable humours which flow downe do there concrete, and ſo intercept the liberty of motion. A groſſe and viſcide humour into what joint ſoever it falleth and ſtayeth, doth the ſame. For by concretion it turnes into a plaiſter like nature at or neare the joynt, poſſeſſing the cavities thereof, and it depraveth the figure of the part, making it crooked and knotted, which formerly was ſtreight and ſmooth. Furthermore every diſtemperature cauſed by the defluxion of humours, if it ſhall lye long upon any part, depraves all the actions, and oft-times wholly aboliſheth them; ſo that there may bee three cauſes of the leaneneſſe or decay of the joint by the gout, the obſtruction or compreſſion of the veſſels, idleneſſe and a hectick diſtemper: but two of lameneſſe, diſlocation and the concretion of an adventitious humour impact in the joynt. If contrary to cuſtome and reaſon the paines of the gout doe not goe away or returne at their accuſtomed periods, moſt grievous and dangerous diſeaſes thereon follow; for the matter accuſtomed to flow downe into the joints, if it ſeaze upon the ſubſtance of the liver, cauſes a Phlegmon; if it ſtay in the larger veines, a continuall feaver; if it flow into the membrane inveſting the ribs, a Pleuriſie; if it betake it ſelfe to the guts and adhere to their coats, the Collick or *Illiaca paſsio*; and to conclude, it produceth divers other ſymptomes, according to the diverſity of the parts whereto it flowes and abides. For thus ſundry that have beene troubled with the gout, become paralitick, becauſe the matter which formerly flowed downe into the joints, ſtayes in the ſubſtance and pores of the nerves, and ſo hinders the ſpirit that it cannot freely in its whole ſubſtance paſſe though them: hence therfore comes the reſolution of the part, whereinto the nerve is inſerted. Old men can never be quite or abſolutely cured of the gout, for that the maſſe of their bloud is ſo departed from its primary & native goodneſſe, that it can no more bee reſtored, than dead or ſowred wine. The gout which proceeds from a cold cauſe, invadeth ſlowly and by little and little, and is helped by the uſe of hot things; that which is from a hot matter, quickly ſhewes it ſelfe, and is helped by the uſe of cold things. Now, although the gout more frequently returnes in the ſpring and fall, yet it comes in the midſt of winter, the nerves being weakened by the exceſſe of cold, and the humours preſſed out; otherwhiles in the midſt of ſummer, the ſame being diffuſed and diſſipated. Laſtly, it comes at any time or ſeaſon of the year, if thoſe who are ſubject to this diſeaſe feed plenteouſly, and do all things according to their owne mindes and deſire. Thoſe who are troubled with the gout, feele and perceive change of weather, ſtormes, raines, ſnowes, windes and ſuch like, before they come. A ſoutherly conſtitution of the aire, for example, fils the body with humidities, and ſtirs up the humours that lye quiet in the body, and therefore cauſe defluxions upon the weaker parts, ſuch as the joints, both by nature, as being without bloud and fleſh, as alſo by accident, for that they a long time have been accuſtomed to bee ſo tormented; therefore their paines are increaſed in a wet ſeaſon. Many of theſe that are troubled with the gout, deſire venery in the bitterneſs of their paine, becauſe the internall heat wherewith they then are inflamed doth not diſſipate into ſpirits and aire, as the feaveriſh heat doth, but diſſolves, and as it were melts downe the ſeminall humour, which diſſolved, flowes to the genitalls, filleth and diſtends them. The ſame thing befalls carryage and running horſes, for in theſe by labour, much heat ſends flatulencies to the bottome of the belly. Yet venery is very hurtfull to ſuch as are troubled with the gout, becauſe it diſſipates the ſpirits and native heate, and encreaſeth the unnaturall heat; whereby it commeth to paſſe that the nervous parts are weakened, and the paine exaſperated. Rich men, that is, ſuch as feed riotouſly on variety of dainties, and in the meane ſpace live idlely and lazily

Three cauſes of the lameneſſe or decay of the limbes.

How the gout turnes into the palſie.

Why the gout takes one in winter and the midſt of ſummer.

Why ſuch as have the gout upon them, doe oft-times deſire Venery.

Venery hurtfull in the gout.

are more frequently and cruelly tormented with the gout than poore people, who live ſparingly and hardly: Wherefore there have been ſeene not a few of ſuch rich and riotous perſons, who having ſpent their eſtates, have therewith changed their health, together with their fortune and diet, and ſo have been wholly freed from the gout.

Chap. IX.

The generall method of preventing and curing the Gout.

THoſe who deſire to prevent the gout, muſt not glut themſelves with meat, muſt be quick to labour, and abſtaine from wine and Venery, or certainly muſt not uſe them, unleſſe for their healths ſake, muſt vomit and purge at certaine times. *Hippocrates* writes, that boyes are not troubled with the gout before the uſe of venery. Yet at this day many Eunuches are ſeene to have the gout, but eſpecially thoſe who abound with idleneſſe and pleaſure, yet theſe we have heretofore mentioned are very effectuall, not onely for the prevention, but alſo for the cure of the preſent diſeaſe. Yet wee muſt diligently diſtinguiſh the cauſes, what they be, & whence they may proceed, & oppoſe thereto remedies contrary in quantity and quality. There are abſolutely three diſtinct cauſes of the gout; A tainture from the parents; a corruption of the humours by diet and aire; a native, or adventitious weakeneſſe of the joints. Againſt theſe there is a twofold indication; the firſt is the evacuation and alteration of the peccant humours, the other the ſtrengthening of the weake joints. Theſe two ſhall be performed by diet conveniently appointed, purging, blood-letting, provocation of the hæmorrhoids, courſes, vomit, ſweat, urine, and fit application of locall medicines. Therefore, when the time ſhall come, wherein the gout accuſtometh to returne by courſe, the patient ſhall have a care of himſelfe by a diligent manner of diet, hee ſhall leſſen the matter of the diſeaſe by phlebotomie (if that the gout ſhall ariſe from the blood) from the oppoſite part, that by the ſame meanes revulſion and evacuation may bee made; as if the upper parts bee inflamed, blood ſhall bee drawne from the lower; if on the contrary the lower, out of the upper, alwayes obſerving the ſtreightneſſe of the fibres. Thus the right arme being troubled with a gouty inflammation, the *Sapheia* of the right legge ſhall bee opened, and ſo on the contrary; but if this generall blood-letting being premiſed, the paine ſhall not ceaſe, it will be requiſite to open the veine next to the paine, which I have often performed with happy ſucceſſe.

Aph.30.Sect.6.

Two generall ſcopes of curing the gout.

Whence bloud muſt be let in the gout.

Yet phlebotomie hath not the like effect in all, for it is not availeable to ſuch as are continually and uncertainly troubled with gouty paines, or whoſe bodies are weake and cold, wherein phlegme onely is predominant. Wee may ſay the ſame of purging, for though it bee oft-times neceſſary, yet too frequently re-iterated, it proves hurtfull; furthermore, neither of theſe remedies is uſually very profitable to ſuch as obſerve no order in meate and drinke, which uſe Venery too intemperately, who abound with crude and contumacious humours; whoſe joynts by long vexation of the diſeaſe, have contracted a hectick diſtemper and weakeneſſe, ſo that they are departed from their naturall conſtitution, and ſuffered a great change of their proper ſubſtance. Wherefore as often as theſe greater remedies ſhall be uſed, a Phyſician ſhall be called, who according to his judgement may determine thereof. For oft-times diet proveth more availeable than medicines: therefore the Patient (if the matter of the gout bee hot) ſhall either drinke no wine at all, or elſe very much allayed, that is, as much as his cuſtome and the conſtitution of his ſtomacke can endure. A fit time for purging and bleeding is the Spring and Autumne, becauſe, according to the opinion of *Hyppocrates*, gouts reigne chiefely in theſe ſeaſons; in Autumne, for that the heate of the precedent Summer debilitateth the digeſtive faculty, the native heate being diſſipated: as alſo the eating of Summer fruits hath heaped up plenty of crude humours in the body, which eaſily flow downe into the paſſages of the joynts opened and dilated by the Summers heate:

What gouty perſons find no benefit by phlebotomy.

In what gout diet proves more effectuall than medicines.

adde hereunto that the inequality or variableneſſe of Autumne weakeneth all the nervous parts, and conſequently the joynts. But in the Spring, for that the humours forced inwards by the coldneſſe of the winter, are drawn forth from the center to the circumference of the body, and being attenuated, fall into the joints upon a very ſmall occaſion. Therefore there is great both neceſſity and opportunity for evacuation, which if it ſhall not avert the accuſtomed fit, yet it will make it more gentle and eaſie.

CHAP. X.

Of Vomiting.

To what gout vomiting is to be uſed.

What time the fitteſt therfore.

VOmiting is by all the Ancients exceedingly commended, not onely for the prevention, but alſo for the cure, eſpecially when as the matter floweth from the braine and ſtomacke ; for the phlegmatick, ſerous and cholericke humours, which uſually flow from the joints, are excluded and diverted by vomit, and alſo there is attenuation of that phlegme, which being more thicke and viſcide, adhereth to the roots of the ſtomack : yet you muſt conſider and ſee that the patient bee not of too weake a ſtomacke and braine, for in this caſe vomiting is to bee ſuſpected. For the time, ſuch as have excrementitious humours flowing downe to the ſtomack through any occaſion, as by exerciſe and motion, muſt vomit before they eate ; on the contrary, ſuch as are overcharged with an old congeſtion of humours, muſt vomit after they have eaten ſomething. Certainly it is ſafer vomiting after meat, then it is before. For the dry ſtomacke cannot, unleſſe with great contention and ſtraining, free it ſelfe from the viſcide humours impact in the coats thereof ; and hence there is no ſmall danger of breaking a veine or artery in the Cheſt or Lungs, eſpecially if the patient bee ſtrait cheſted, and long necked, the ſeaſon cold, and hee unaccuſtomed to ſuch evacuation.

A hiſtory.

How to make one vomit eaſily.

Lib. de vict. victu.

I remember that with this kind of remedy I cured a certaine Gentleman of Geneva, grievouſly moleſted with a cruell pain in his ſhoulder, and thereby impotent to uſe his left arme ; the Phyſicians and Surgeons of Lions ſeemed to omit nothing elſe for his cure. For they had uſed purging, phlebotomie, hunger, a Diet drinke of *Gudiacum* and *China* (although his diſeaſe was not occaſioned by the *Lues Venerea)* and divers other topick medicines, neither yet did they any thing availe. Now learning by him that hee was not apt to vomit, but that it was difficult to him, I wiſhed him to feed more plentifully, & that of many & ſundry meats, as fat meat, onions, leeks ; with ſundry drinks, as beare, ptiſan, ſweet and ſharpe wine, and that hee ſhould as it were overcharge his ſtomack at this meal, and preſently after get him to his bed ; for ſo it would happen, that nature not enduring ſo great confuſion & perturbation of meats & drinks, wherof ſome were corrupted already in the ſtomack, & otherſome ſcarce altered at all, nature not enduring this confuſion and perturbation, would eaſily and of its owne accord provoke the ſtomack to vomit ; which that it might the better ſucceed, he ſhould helpe forward natures endeavour, by thruſting his finger or a feather into his throat, that ſo the thick and tenacious phlegme might by the ſame meanes be evacuated : and not content to doe thus once, I wiſhed him to doe the like the ſecond & third day following, for ſo it verifieth that ſaying of *Hippocrates* : The ſecond and third day exclude the reliques of the firſt : afterwards, that hee ſhould vomit twice a moneth : chaw maſtick faſting : rub his necke and the pained part with *aqua vitæ*, ſtengthened by infuſing therein lavender, roſemary, and cloves groſly beaten : confirme his arme by indifferent exerciſe : hee performed all this, and ſo became free from his paine, and recovered the uſe of his arme. Thoſe who do not like ſuch plentifull feeding, ſhall drink a great quantity of warm water wherein radiſh roots have been boiled, and they ſhall have a care leſt by uſing their ſtomacks to this excretion by vomit they weaken the digeſtive and retentive faculty thereof. Wherefore ſuch as can naturally, ſhall thinke it ſufficient to vomit twice a moneth.]

CHAP. XI.

The other generall remedies for the Gout.

How Diureticks are good for the gout.

Iſſues or fontanels.

Where to be made.

An actuall cautery.

Pills.

Common pills with the addition of ſcamony.

Treacle, how uſefull in the gout.

Cephalick fumigation.

THe defluxion of ſerous humours is very fitly diverted from the joints by the urine by the uſe of diureticke medicines. Therefore the roots of Sorrell, parſly, *ruſcus*, *aſparagus*, and graſſe, and the like, ſhall bee boyled in broth, and given to ſuch as have the gout: for when the urine floweth much and thick, the paine is leſſened. Many have found benefit by iſſues; for the Arthritick malignity flowes forth of theſe, as by rivelets: experience ſhewes it in ſuch as are troubled with the *Lues Venerea*, for in thoſe that you cannot overcome the malignity by the proper antidote, that is, Quickſilver, they feele no greater eaſe of the pain, than by application of Cauſticks, and making of iſſues. They ſhall bee made in ſundry places according to the difference of the pained joints, to wit, in the beginning of the neck, if the defluxion proceed from the braine, and fall into the joints of the Collar-bones or ſhoulder; if into the Elbow or hand, under the muſcle *Epomis*; if into the hip, knees, and feete, ſome three fingers breadth under the knee, on the inſide: for thus there will follow more plentifull evacuation, by reaſon that the *Sapheia* runneth downe that way. Yet if the patient bee troubled with much buſineſſe, and muſt travell much on horſe-back, then ſhall they be made on the outſide of the legge, betweene the two bones thereof, that ſo they may trouble him the leſſe in riding. If any had rather uſe an actuall cautery, let him take ſuch an one as is triangular and ſharpe, that ſo hee may with more ſpeed and leſſe paine performe that which hee intends, and let him thruſt it through a plate of iron which hath a hole therein, and let the place bee marked leſt hee ſhould erre; the ulcer ſhall be kept open by putting in a pill of gold, ſilver, lint, of the root of orris, hermodactiles, gentian, waxe, wherewith ſome pouder of vitrioll, mercurie or allum ſhall be incorporated, leſt it ſhould fill up with fleſh ſooner than the Phyſician ſhall thinke fit. In the meane ſpace, the head, oft-times the originall of the evill, ſhall be evacuated by taking in the winter the pills *cochiæ*, and *de Aſſajereth*; but in ſummer *ſine quibus*, or *Imperiales*, before the Full of the Moone. ℞. *pul. hyeræ ſimp.* ʒi. *agar. recent. troch. & rhei an.* ʒii. *myroball. chebul.* ʒß. *tamarind.* ℈ii. *cum infuſione ſenæ, fiat maſſa de qua formentur pill.* vi. *pro drachma*; let the patient take two before ſupper every eighth day; the day after he ſhall drinke ſome broth of the decoction of Cicers and the Diureticke roots. Alſo theſe following pills will bee good to purge the phlegmaticke and ſerous humour. ℞. *pillular. fœtid. & de hermodactil. an.* ʒß. *formentur cum ſucco vel ſyrup. roſar. ſolut.* Or elſe, ℞. *aloës.* ʒiii. *agarici trochiſ. & rhei, an.* ʒi. *maſſæ pilul. arthrit. & de hermodact. an.* ℈ii. *diacrid.* ℈i. *cum melle roſato fiat maſſa, capiat pondus,* ʒi. as the Phyſician ſhall thinke fit, by whoſe advice theſe ſhall be uſed and changed as occaſion ſhall offer it ſelf, and the nature of the humour cauſing the diſeaſe. The day after the purging, the patient ſhall take three houres before meat half a dram of Treacle, to ſtrengthen the entrailes: pils are preferred before liquid medicines, for that by their long ſtay in the ſtomack they eaſily attract the noxious humor from the brain, & the other more diſtant parts. I have known ſome Phyſicians who mixing with ordinary pils a good quantity of ſcamony, as 7. or 8. grains, with a little ginger, leſt it ſhould hurt the ſtomack, have purged by ſtool a great quantity of ſerous humours; the day following they gave barly creame to correct the harme which the ſcamonie may have done to the ſtomacke. Others for the ſame purpoſe give treacle, which doth not onely ſtrengthen the entrailes, but alſo weakens the virulencie of the gouty malignity; the orifice of the ventricle muſt be ſhut after meate, that ſo the vapours aſcending to the braine may bee reſtrained: for this purpoſe common Drige powder, Marmelate, or conſerve of roſes are good. In a wet ſeaſon uſe Cephalicke perfumes thus made. ℞. *thuris, vernicis, & maſtich. an.* ʒi. *granorum juniperi, baccarum lauri, an.* ℥ß. *ligni aloës* ʒii. *aſſæ odoratæ* ʒi.ß. Let them bee groſly beaten; let the fume be received in tow or carded Cotton, and ſo applyed to the head. Alſo the excrementitious humours ſhall bee dried up by the following powder ſtrowed on the patients head for fifteene dayes. ℞. *fol. roſ. rub. ſenæ, ſtæchad. utriuſque an.* m. ß. *milii,* ℥iiii. *furfuris loti in vino albo,* ℥ iii. *florum chamæm. melil.*

melil. an. p i. *ſem. aniſi,* ℥ i. *ſalis com.* ℥ ii. *fiat omnium pulvis.* Let it be put into linnen bagges, with which, being warmed at the fire in a frying-pan, and kept with ſtirring, the head ſhall bee rubbed. Let the following medicine bee chawed, and kept in the mouth in the forme of a maſticatory, in the time of the falling downe of the defluxion. ℞. *cubelarum, nucis moſchat. glycyrrhiz. aniſ. an.* ʒ i. *pyrethri,* ʒ ii. *maſtich. rad. ſtaphiſagr. eryngii, an.* ʒii. Let them all be made into pouder, and mixed together, & tyed up in a little taffaty to the bigneſſe of a haſell nut, and let them be rowled up and downe the mouth with the tongue to cauſe ſpitting or ſalivation. Working with the hands, and frictions of the armes, eſpecially in the morning after the evacuation of the excrements, are good for ſuch as are troubled with the Gout in the feet, for ſo, it not onely cauſeth revulſion from the feet, but alſo the reſolution of that which is unprofitable.

Cephalicke bagges

A maſticatory.

CHAP. XII.

What Diet is convenient for ſuch as have the Goute.

AFTER the body is once fed, they muſt not returne to meat before that the concoction be perfected in the ſtomacke, leſt the liver be forced to draw by the meſaraicke veines that which is yet crude and ill digeſted, and as it were forced thence. Whence the depravation of the nutriment of the whole body; for the following decoctions doe not amend the default of the firſt. Let them make choice of meate of good juice and eaſie digeſtion, roſted for ſuch as are phlegmaticke, but boiled for ſuch as are cholericke: as they ſhall ſhun much variety at one meale, ſo muſt they eſchew the uſe of pulſes, milk-meats, ſallads, and ſharpe things, as verjuice, vinegar, the juice of oranges, and citrons. They ſhall not eat unleſſe they be hungry, and ſhall deſiſt therefrom before they be fully ſatisfied, if it be but for this, that whileſt the native heat is buſied in the digeſtion of meat plenteouſly eaten, it is diverted from the concoction of the noxious humors. The fleſh of great fowle, as ſwans, cranes, peacockes are not of laudible juice, and are with more difficulty digeſted in the ſtomacke. Some of the antients have diſallowed of the eating of Capons, and the like birds, becauſe they are ſubject to bee troubled with the Goute in the feete. Fiſhes are to be ſhunned, for that they heape up excrementitious humours, and are eaſily corrupted in the ſtomacke, yea & relaxe it by continuall uſe. Of the fleſh of beaſts veale is moſt to be commended, for that it breeds temperate blood, and laudible juice, and is eaſily digeſted. Neither in the meane time is mutton to bee found fault withall. But the like hunger or abſtinence muſt not be appointed to all men troubled with the Goute, for ſuch as are of a ſanguine and cholericke complexion, becauſe they are endued with much, and much waſting heate, are to be refreſhed with more plentifull nouriſhment; for hunger ſharpens choler, and ſo augments their paines; neither in the interim muſt they bee fed with too moiſt meates, for too much moiſture, beſides that it is the author of putrefaction, will cauſe defluxions, and draw downe the matter to the joints. Therefore the Cholericke humor muſt bee incraſſated and refrigerated by taking things inwardly, and applying things outwardly, leſt by its tenuity it ſhould fall downe into the grieved parts. To this purpoſe conduce brothes altered with lettuce, purſlaine, ſorrell, and the like herbs, and barly creames made with a decoction of the foure cold ſeeds. Phlegmaticke bodies, by reaſon that they have not ſo vigorous heate, doe as it were carry their provant about them, wherefore they muſt not be fed, neither with many nor with moiſt meats. All that are troubled with the Goute muſt ſhun thoſe things which are hard of digeſtion, and which are ſoone corrupted, for they all have a certain remiſs feaver which diminiſheth the native heat, & makes the meates apt to putrefie. Too plentifull drinking not onely of wine, but alſo of any other liquor is to be avoided. For by too great a quantity of moiſture the meat floats in the ſtomacke, and the native heat is in ſome ſort extinguiſhed, whence proceed crudities. Some phyſitians commend the uſe of white wine, for that it provokes

The fault of the firſt concoction, is not amended in the after.

Capons ſubject to the Gout.

Cholericke perſons cannot away with long faſting.

Phlegmaticke bodies in faſting feed upon themſelvs.

White wine not good for the gout.

Claret may be the ſafelier drunke.

Hydromel moſt ſafely.

A *hydroſaccharum.*

vokes urine, which is not altogether to be diſallowed if ſo be that the body bee free from excrements, otherwiſe by this, as it were a vehicle, eſpecially if the temperature of the body be ſomewhat more hot, they ſhall be carryed down into the joints. Therfore in ſuch a caſe I ſhould rather adviſe them to uſe claret, which is ſomewhat weake and aſtringent, for that it doth not ſo much offend the head nor joints, and it ſhuts and ſtrengthens the orifices of the veſſels. Yet it will bee more convenient wholly to abſtaine therefrom, and in ſtead thereof to drinke a *Hydromel* made after this manner. ℞. *aquæ* ℔. iiii. *mellis opt*. q. i. *bulliant ad conſumptionem* ℔. i. *bene deſpumando, adde ad finem, ſalviæ* p. i. *imo ſi æger ſit pituitoſus, cinamomi aut caryophyllorum momentum*. For cholerike perſons make a ſugred water thus. ℞. *aquæ fontis* ℔. iiii. *ſacchari* ℔. ß. *colentur per manicam ſine ebullitione, addendo in fine cinamomi* ʒ. ii. For thus the ſtomacke ſhall alſo be ſtrengthened; alſo he may drinke *ptiſan*, wherein at the end of the decoction ſhall bee boiled ſome dryed roſes, or elſe ſome ſyrupe of pomegranates added thereto, leſt it ſhould offend the ſtomack; as ſoone as it comes from off the fire, let it ſtand and ſettle, and then ſtraine it through an Hippocras bag, or cleane linnen cloath.

CHAP. XIII.

How to ſtrengthen the Joints.

IT is a matter of much conſequence for the prevention of this evill, to ſtrengten the joints, whereby they may be able to reſiſt the humors preternaturally falling downe upon them. Wherefore it is good morning and evening to rubbe them with *Oleum Omphacinum*, that is, oile made of olives not come to their perfect maturitie; or with oile of roſes mixed with common ſalt finely poudered. It may alſo bee mixed with common oile, adding thereto the powder of harts horne, as that which hath an aſtringent and drying faculty. Alſo it is good to bath them in this following Lye. ℞. *cort. granat. nucum cupreſ. gallarum, ſumach. cortic. querni, an.* ℥ ii. *ſalis com. alumin. roch. an.* ℥ i. *ſalviæ, roriſmar. lavendul. lauri, ivæ arthretic. an.* m. i. *roſar. rub.* m. ß. *bulliant omnia in ſex* ℔. *vini craſſi & aſtringentis & lixivio parato ex aqua chalibeata & cinere querno.* Then foment the part with ſponges or cotton clothes; after this fomentation ſhall be carefully wiped & dryed with hot linnen clothes, taking heed of cold. The juice of unripe Hawes tempered with oxycrate is a ſingular thing for this purpoſe. But if you deſire to ſtrengthen the joints weakened by a cold cauſe, then, ℞. *ſalviæ, roriſm. thymi, lavendul. laur. abſinth. an.* m. i. *caryophyl. zinzib. piperis, conquaſſatorum an.* ℥ i. *infundantur in aqua vitæ & vini rubri aſtringentis, an.* ℔. iiii. *bulliant leniter in balneo mariæ.* With this liquor foment the joints morning and evening. Some thinke it good to ſtrengthen the joynts, to tread grapes in vintage time, which if they be not able to doe, then let them waſh their feete in the Muſte or new preſſed Wine. Alſo bagges may be thus made for the ſame purpoſe. ℞. *ſalis com. alum. roch. cort. granat. ſumach. berberis, nucum cupreſſi, an.* ℥ iiii. *fol. ſalviæ, roriſmar. roſar. rub. an.* m. ß. Let them be all put in linnen bags and boyled in Lye, and ſo make a decoction for to foment the joynts.

A fomentation to ſtrengthen the joints.

The juice of hawes with oxycrate.

Bagges.

CHAP. XIIII.

Of the Palliative Cure of the Goute and the materiall cauſes thereof.

HEre alſo muſt we conſider the cauſes whence this diſeaſe proceeds, the temper of the diſeaſed body, the parts affected, & thoſe from whence it proceeds. For as theſe are not alwayes alike, ſo neither can one and the like remedy be uſefull in every Goute. For firſt thoſe which proceed of a cold cauſe require other remedies, than thoſe which ariſe from a hot, and that which proceeds from any one ſimple humour, than that which ariſeth from divers mixed together. For Choler alone cauſeth cruell paines, but tempered by the admixture of Phlegme, it becomes more gentle. Furthermore ſome remedies are good in the beginning, ſome in the encreaſe, and ſome at other times. Neither may we uſe repercuſſives in the Sciatica, as we may in the Goute of the feet and other joints; unleſſe peradventure the part be fearefully enflamed. Taking theſe things to conſideration we muſt obſerve that the Palliative cure of that Gout, which cannot abſolutely be helped, as that which is hereditary and inveterate, is performed by foure ſcopes. The firſt is, by appointing a convenient diet in the ſixe things which are termed not naturall. The ſecond by evacuating and diverting the antecedent matter, both by purging and phlebotomy. The third, by applying topicke medicines according to the condition of the morbificke humour and nature of the part. The fourth, by correcting the ſymptomes, but eſpecially the paine, whereof in theſe affects there is oft times ſo great exceſſe by reaſon of the unexplicable and invincible malignity of the virulent quality aſſociating the humour, that it alone is oft times ſufficient to kill the patient. And becauſe the variety of morbificke cauſes, brings a variety of remedies, fitted to theſe foure intentions, therefore it behoves a phyſitian to be moſt attentive in the diſtinction of the cauſes. For he may be eaſily deceived and miſtake one for another; for arthritick pains proceeding from a cold matter, if they be mitigated by the application of Narcoticke and cold medicines, it may induce us to beleeve that the materiall cauſe is hot, though really it bee not ſo; for Narcotickes aſſwage paine, not for that they are contrary to the cauſe thereof, but becauſe they take away the ſenſe by inducing a numneſſe; on the contrary, the materiall cauſe may ſometimes ſeeme cold, which notwithſtanding is hot, for that it becoms better by application of hot medicines, that is, by taking an argument from that which helps, becauſe contraries are cured by contraries, and the like preſerved by the like. But herein conſiſts the error, for that hot medicines profit not by their contrariety, but by the attenuation of the groſſe matter, by the rarefaction of the skin and diſſipating them into aire. Whence you may gather that an argument drawne from that which helpes and hurts, is very deceitfull: moreover it may happen that a large quantity of cold matter flowing down from the brain, may cauſe great pain by reaſon of the virulency, & a ſmall quantity of choler mixed therwith, which ſerves for a vehicle to carry down the tough and ſlow phlegme into the joints, whence the patient becomes thirſty and feavouriſh by reaſon of the heate and inflammation of theſe parts, whereby ſuch as are leſſe cautelous and heedy will eaſily be induced to beleeve that ſome hot matter is the occaſion of this Gout. Now when as not ſome one ſimple humour, but different by reaſon of mixture, cauſeth the Gout, the yellowiſh colour of the part may deceive one, as, if the evill matter ſhould proceed from choler onely, which by the tenuity of its ſubſtance leaving the center, eaſily poſſeſſeth the circumference of the body or part: & notwithſtanding much phlegm being as it were enraged by the admixtion of a little choler, may be the chiefe cauſe of the diſeaſe, and may peradventure be diſcovered by the encreaſe of paine in the night ſeaſon. A feaver ariſing by meanes of paine and watching may encreaſe the conceived opinion of choler, which attenuating and diffuſing the humours, drives them into the joynts, and cauſeth fiery urines, tinctured with much choller, and a quicke pulſe. Yet notwithſtanding the Phyſitian ſhall be in errour, if deceived with theſe appearances, he attempt the cure of this Gout, as ariſing from a hot, and not from a cold cauſe: yet I am not ignorant that the cure of the proper diſeaſe muſt be

Why ſtrong purges muſt bee given to ſuch as have the gout.

That judgement moſt certain which reſts upon multiplicity of ſignes.

Why we muſt uſe purging and bleeding in the gout.

Lib. de affect. ubi de Arthrit. loquitur.

Ad aph. 23. ſect. 1.

Lib. de cur. per ſang. miſsionem.

neglected for the cure of the ſymptomes. Beſides alſo it may come to paſſe, that choler may be the cauſe of the Gout, and notwithſtanding no ſignes therof may appeare in the skin, and ſurface of the affected part, becauſe the coldneſs of the ambient aire, and the force of applyed Narcoticks may have deſtroyed the colour of the juices lying therunder, and as it were imprinted a certain blackneſſe. It alſo happens, that the body being overcharged with a great quantity of groſſe and viſcide humours, the expulſive faculty may diſcharge ſome portion thereof unto the joints, but leave the reſt impact in the cavity of ſome entraile, where cauſing obſtruction and putrefaction may preſently cauſe a feaver, and that intermitting, if it be ſmall, & obſtruct only the leſſer veins, & theſe of the habit of the body. Wherefore then it is not ſufficient that the Phyſitian employ himſelfe in the cure of the Gout, but it behoves him much more to attend the cure of the feaver, which if it bee continuall, it diſcredites the phyſitian, and endangers the patient; if it bee intermitting, it eaſily becomes continuall, unleſſe it be withſtood with fit remedies, that is, unleſſe you let blood, the belly being firſt gently purged, and nature be preſently freed by a ſtronger purge of the troubleſome burden of the humours. Now it is convenient the purge be ſomewhat ſtronger than ordinary, for if it ſhould bee too weake, it will ſtir up the humors, but not carry them away, & they thus agitated will fall into the pained and weak joints, and cauſe the Gout to encreaſe. By this it appeares how deceitfull that conjecture is, which relyes & is grounded on one ſigne, as often as we muſt pronounce judgement of morbificke cauſes. Wherefore to conclude wee muſt thinke that opinion moſt certaine concerning the matter of the diſeaſe, which is ſtrengthened with multiplicity of ſignes, as thoſe which are drawne from the colour of the part, the heate or coldneſſe manifeſt to the touch, thoſe things that helpe and hurt, the patients familiar and uſuall diet, temper, age, region, ſeaſon of the yeare, propriety of paine, the exacerbation or exceſs thereof, in what daies, & in what houres of the day, the length of theſe fits, the urine and other excrements comming from the patients body. But for that not a few are in that hereſie, that they thinke that we muſt neither purge nor let blood in the Gout, we muſt here convince that opinion. For ſeing that Phyſicke is the addition of that which wants, and the taking away of thoſe things that are ſuperfluous, and the Gout is a diſeaſe which hath its eſſence from the plenty of abounding humours, certainely without the evacuation of them by purging and bleeding, wee cannot hope to cure, either it, or the paine which accompanies it. *Metrius*, in his Treatiſe of the Gout writes, that it muſt be cured by purging, uſed not onely in the declination, but alſo in the height of the diſeaſe, which wee have found true by experience; and it is conſonant to this ſaying of *Hippocrates*; in paines wee muſt purge by the ſtoole. Beſides alſo, *Galen* profeſſeth that in great inflammations, feavers, and paines, he knew no greater nor ſurer remedy than to let blood, even to the fainting of the patient. If thoſe which are in this caſe ſhall not become better by purging and phlebotomy conveniently preſcribed, then it happens by meanes of drunkenneſſe, gluttony, and the like diſtemper. For hence abundance of crude humors are heaped up, which by their contumacy yeeld themſelves leſſe obedient to medicines. Therefore ſuch gouty perſons as are intemperate and given to gluttony and venery, may hope for no health by uſe of medicines.

Chap. XV.

Of locall medicines which may be uſed to a cold Gout.

It is not ſafe to uſe repercuſſives in the gout before purging.

LIttle doe topicke medicines availe, unleſſe the body of the gouty patient ſhall be purged from excrementitious humours; beſides alſo there is danger leſt by the uſe of repelling medicines, the virulency of the humours may be driven into the entrailes, which thing hath bin the cauſe of ſodaine death to many. Now in the firſt place we will ſpeake of locall medicines which are thought meet for a phlegmatick juice, becauſe this is more frequent, than that which is from

An aſtringent Cataplaſme.

A diſcuſſing fomentation.

One partly aſtringent and partly diſcuſſing.

a hot cauſe. At the beginning in every gout, the *ſciatica* excepted, wee muſt uſe aſtringent things which have a faculty to binde or ſtrengthen the joints, and to dry and waſte the excrementitious humour. As, ℞. *fol. ſabinæ* m. ß. *nucum cupreſſi* ℥iii. *aluminis roch.* ʒi. *gum. tragacanthæ* ℥iiii. *mucaginis pſilii & cydon. quantum ſufficit, fiat cataplaſma.* Or, ℞. *ſtercoris bubuli recentis* ℔. j. *mellis roſ.* ʒiiii. *olei roſ. & aceti an.* ℥ii. *bulliant ſimul parum, fiat cataplaſma.* Or elſe, ℞. *olei roſar. & myrtill. an.* ʒii. *pulveris myrrhæ & aloes an.* ʒi. *acaciæ* ℥iiß. *incorporentur cum aqua gallarum coctarum, & fiat unguentum.* Some boyle ſage, camomile and melilote flowers, wormewood and dane-wort, of each a handfull in a ſufficient quantity of vinegar, then they put the grieved part into this decoction being warme; & by frequent uſing this medicine, it hath beene found to repell and conſume the noxious humour, not onely cold, but alſo cholericke; and alſo to ſtrengthen the part. The freſh fæces of Olives layd to the part, aſſwage paine: dryed Oranges boiled in vinegar, beaten and applyed doe the ſame. Or, ℞. *medii corticis ulmi* ℔. ß. *caudæ equin. ſtæchad. conſolid. majoris, an.* m. ß. *aluminis roch. thuris an.* ʒiii. *farin. hordei* ʒv. *lixivii com. quantum ſufficit, fiat cataplaſma ad formam pultis ſatis liquidæ.* Commonly then when as the part ſwelleth up, the paine is leſſened, for that the expulſive faculty driveth the humour from the center into the circumference of the part, that is, from within outwards; for in like ſort, ſuch as have the tooth ach have leſſe paine when their cheekes begin to ſwell.

After repercuſſives, wee muſt come to thoſe which evacuate the conteyned humour by evacuating or reſolving it. For every defluxion of humours remaining in any part requires evacuation. Neither muſt we marvaile thereat, if the digeſted humour doth not vaniſh at the firſt time; for we muſt have regard to the cold phlegme which is thick and viſcide, as alſo of the part which is ligamentous, membranous and nervous, and conſequently more denſe than fleſhy parts. ℞. *rad. Bryon. ſigilli beat. Mariæ an.* ʒiv. *bulliant in lixivio, poſtea terantur, & colentur per ſetaceum, addendo farin. hordei & ſaburum an.* ℥i. *olei chamæm.* ʒiii. *fiat cataplaſma.* Or, ℞. *farin. hordei & lupin. an.* ʒiii. *ſulphuris vivi & ſalis com. an.* ℥i. *mellis com.* ℥v *pul. aloës & myrrhæ an.* ℥ß. *aq. vit.* ℥i. *cum lixivio fiat cataplaſma.* Or, ℞. *ſucci caulium rub. aceti boni, an.* ʒiiii. *farin. hordei* ℥iß. *pul. Hermodactyl.* ℥ß. *vitellos ovorum* nu. iii. *olei chamæm.* ℥iii. *croci* ℈ii. ſome burne the roots and ſtalkes of colworts, and mixe the aſhes with hogs greace and the powder of Orris, and ſo make a pultis. Or, ℞. *Lactis vaccini* ℔. ii. *micæ panis albi quantum ſufficit, bulliant ſimul, addendo pulveris ſubtilis florum chamæm. & meliloti an.* m. ß. *croci* ℈i. *vitellos ovorum* nu. iiii. *ol. roſar.* ℥iii. *butyri recentis* ʒi. *terebinth.* ℥ii. *fiat cataplaſma ad formam pultis ſatis liquidæ.* This Cataplaſme may be applyed with good ſucceſſe, not only to phlegmatick & cold, but alſo to any gout, at any time to mitigate the extremity of the pain in men of any temper, and it muſt bee changed twice or thrice a day. Alſo Treacle diſſolved in wine, and annoynted on the part, is ſayd to aſſwage this paine. You may for the ſame purpoſe make and apply emplaſters, unguents, cerats and liniments: This may bee the forme of an emplaſter. ℞. *gummi ammoniaci, bdelii, ſtyracis, an.* ʒii. *cum aceto & aqua vit. diſſolve, & adde farin. fænugr.* ʒß. *olei chamæm. & anethi, an.* ℥ii. *ceræ quantum ſufficit, fiat emplaſtrum molle.* Or, ℞. *rad. bryon. ſigill. beat. Mariæ, an.* ℥v. *bulliant in lixivio completè, & colentur per ſetaceum, addendo olei cham.* ʒiiii. *ſevi hircini* ℥iiii. *ceræ nov. quantum ſufficit, fiat emplaſtrum molle.* Or, ℞. *gum. ammon. opopanacis galbani, an* ʒii. *diſſolvantur in aceto, poſtea colentur, adde olei liliorum, terebinth. venet. an* ℥i. *picis navalis, & cer. nov. quantum ſufficit, fiat emplaſtrum molle.* Or elſe, ℞. *ſucci rad. enul. camp. & ebuli an.* ℥iii. *rad. alth.* ℔. ß. *coquantur & colentur per ſetaceum, addendo florum cham. melil. ſambuci, roriſmar. & hyperici an.* p. ii. *nucum cupreſi,* nu. iiii. *ol. cham. aneth. hyper. liliorum, de ſpica an.* ʒii. *pinguedinis anatis, gallin. anſeris an.* ʒß. *ranas virides vivas* nu. vi. *catellos duos nuper natos, bulliant omnia ſimul, in* ℔. ii. ß. *vini oderiferi, & unà aqua vit. ad conſumptionem ſuccorum & vini, & oßium catellorum diſſolutionem, & fortiter exprimantur; expreſſioni adde terebinth.* ʒiii. *cer. quantum ſufficit. fiat emplaſtrum molle.* Alſo, *Emp. de vigo. Oxicroceum, de mucilaginibus, de meliloto* and the like mixed together, and ſoftened with a

Why the gouty humour doth not preſently vaniſh upon the uſe of repercuſſives.

Greater diſcuſſers.

A Cataplaſme good for any gout at any time.

Diſcuſſing emplaſters.

little oyle or *axungia*, are of the like faculty, and good for the ſame purpoſe.

Ointments.

Diſcuſſing fomentations.

Remedies muſt be often changed in the gout.

Let this be the forme of an ointment. ℞. *anſerem pinguem, & imple catellis duobus, de quibus deme cutem, viſcera, caput & pedes*; *item accipe ranas* nu. x. *colubros detracta cute in fruſta diſſectos* nu. iv. *mithridat. & theriac. an.* ℥ß. *fol. ſalviæ, roriſmar. thymi, rutæ, an.* m. ß. *baccarum lauri, & juniperi conquaſſat. an.* ℥i. *pulveris nuc. moſchat. zinzib. caryophyl. & piper. an.* ʒi. *de eo quod ſtillabat fiat unguentum vel linimentum cum cera & terebinth. veneta, pauca aqua vitæ addita*; this marvelouſly aſſwageth the paine of the gout ariſing from a cold cauſe. Another, ℞. *Gummi pini, & lodani, an.* ℥iv *gummi elemi & picis naval. an.* ℥ß. *terebinth. venet. claræ* ʒvi. *chamæmel. & liliorum an.* ℥iv. *vini rub.* ℔. i. ß. *aq. vit. & ſalv. an,* ʒvi. *diſſolvantur omnia ſimul lento igne, baculo ſemper agitando, deinde adde pul. ireos, flor. baccarum lauri, & hermodactyl. and* ℥iiß. *maſtiches, myrrhæ & olibani an.* ℥ii. *farinæ fabar.* ℥iv. *incorporentur omnia ſimul, fiat unguentum molle.* Or elſe, ℞. *mucag. ſeminis fænugr. in aceto extract. quantum volueris, cui miſce mellis quantum ſufficit*; let them be boyled together untill they acquire the conſiſtence of an oyntment. Theſe things ſhall be changed, as often as need ſhall ſeeme to require. Alſo anodine and diſcuſſing fomentations are good to reſolve; as this, ℞. *fol. rutæ, ſalv. roriſmar. an.* m. i. *bulliant cum aceto & vino*; and ſo make a decoction for a fomentation, which you may uſe not only in a cold gout, but alſo in a hot, becauſe it reſolveth and ſtrengtheneth the part by aſtriction, and freeth it from the defluxion: you muſt have a care that the medicines which are uſed to paines of the gout be changed now and then. For in this kinde of diſeaſe that remedy which did good a little before, and now availeth, will in a ſhort time become hurtfull.

A great diſcuſſer.

An anodine.

A veſicatory againſt the contumacy of the conjunct matter.

But if the contumacy and exceſſe of the pain be ſo great, that it will not yeeld to the deſcribed medicines, then it is fit, becauſe the diſeaſe is extreme, to uſe (according to *Hypocrates* counſell) extreme remedies, ſuch as are thoſe which follow. ℞. *axungiæ gallinæ, olei laurini maſtic. & euphorb. an.* ℥i. *pulver. euphorb. & pyreth. an.* ʒi. *fiat litus*; herewith let the part bee rubbed every day, for it is a very effectuall medicine. For *euphorbium* and pellitory by their heat attenuate and reſolve, the capons greaſe and oile of bayes, relaxe, the oyle of maſtich ſtrengtheneth the part and hindereth a new defluxion. Alſo there is made a very anodine ointment of oyle of foxes, wherein earth-wormes, the roots of elecampane and bryonie have beene boiled, with a little turpentine and waxe; this ſoftens, attenuates and reſolves the cold humour impact in the joints. Or elſe, ℞. *ſeminis ſinapi pulveriſati, & aceto acerrimo diſſoluti,* ℥iii. *mellis anacardini* ℥ii. *aqua vitæ* ℥i. *ſalis com.* ʒii. Let them bee all mixed together, and applyed to the pained part. Or, ℞. *picis nigræ,* ℥iii. *terebinth. venetæ* ℥ii. *ſulphuris vivi ſubtiliter pulveriſati* ℥iii. *olei quant. ſufficit, liqueſiant ſimul, fiat emplaſtrum*; Let it bee ſpread upon leather, and laid upon the part for two or three dayes ſpace, if the patient perceive any eaſe thereby; if otherwiſe, let it be changed as we ſaid before. Some for the ſame purpoſe apply nettles thereto, and preſently after waſh the part in ſea or ſalt water. Others foment the part with vineger wherein pidgeons dung hath beene boiled. A veſicatory made of very ſower leaven, *cantharides*, and a little *aqua vitæ*, is very powerfull to evacuate the conjunct matter. For thus the maligne and virulent *ſerum*, or whayiſh humour is let out, whence followes ſome eaſe of the pain. Now there are ſome gouty paines, which cannot bee leſſened or aſſwaged unleſſe by remedies more powerfull than the diſtemper, therefore veſicatories ought not to be rejected, ſeeing that the Ancients in this affect have alſo made uſe of actuall cauteries, as we ſhall ſhew hereafter. *Chriſtopher Andreas* in his booke termed *Oëcoitarie* [that is, Domeſtick phyſicke] much commends Oxe dung wrapped in cabbage or vine leaves, and roaſted in the embers, and ſo applyed hot to the grieved part.

CHAP. XVI.

Of locall medicines to be applied to a hot or ſanguine Gout.

HEre muſt wee in the beginning make uſe of repercuſſives, ſuch as are cold and dry, that they may contend with the morbificke matter by both their qualities; alſo let them bee aſtrictive, ſo to adde ſtrength to the part. But I would have you alwaies to underſtand that you muſt firſt premiſe generall medicines. ℞. *albuminum ovorum* nu.iv. *ſucci lactucæ & ſolani an.* ℥i. *aq.roſar.* ℥ii. *incorporentur ſimul, & fiat linimentum ſæpius renovandum.* Others take the meale of barly, lentils, *acatia*, oile of roſes, myrtles, and with a little vineger they make a cataplaſme; Or, ℞. *ſumach, myrtillorum, boli arm. an.* ʒß. *acatiæ, corticum granat. balust.an.* ℥i. *aq. plantag. & roſar. an.* ℥iii. *ol.roſati* ℥iß. *aceti* ℥i. *farinæ hordei & lentium quantum ſatis erit, fiat cataplaſma.* This is very excellent and effectuall to ſtay or hinder phlegmonous and eryſipelatous tumours. Alſo you may make a Cataplaſme *ex mucagine Cydoniorum in aqua roſarum extracta, caſſiæ fiſtula, oleo roſato, & aceto.* Or, ℞. *pampinorum vitis viridum,* m. ii. *terantur & bulliant in oxycrato ex aqua fabrorum, cui adde ſumach. conquaſſati* ℥i. *olei roſat.* ℥ii. *farinæ hordei quantum ſufficit, fiat cataplaſma.* Or elſe, ℞. *ſucci ſempervivi, hyoſcyami, & portulacæ an.* ℥iv. *corticum mali granati* ℥iß. *farinæ hordei* ℥v. *vini auſteri quantum ſufficit, fiat cataplaſma*; this is much commended, for it hath entring thereinto wine and the pomgranate pill, which both are very great aſtrictives; and the juices are exceeding cooling, the meale alſo hinders and thickens the ſanguine humours that are ready to flow downe, and make the medicine of a good conſiſtence. Another. ℞. *fol. hyoſcyami & acetoſæ an.*m.i. *involvantur papyro, & ſub cineribus coquantur, mox cum unguento populeon. aut roſat.* ℥ii. *incorporentur*; and then lay this Cataplaſme thus made warme unto the part. Another, ℞. *florum hyoſcyami* ℔. ii. *ponantur in phiala vitreata, & reconde in fimo equino donec putruerint, accipe ex putredine* ℥ii. *in quibus diſſolve olei de junipero* ʒß. *fiat linimentum ad uſum.* Others beat the pulpe of a Gourd or Citrull in a mortar, and ſo apply it. Another, ℞. *mucag. ſem. pſilii, & cyton. extract. in aqua roſar. & ſolani an.* ℥iiii. *olei roſati omphacini,* ℥iii. *vini granatorum* ℥i. *vitellos ovorum cum albumine* nu.iii. *camphoræ* ʒi. *incorporentur ſimul, fiat linimentum.* Or elſe, ℞. *ol. roſat. omphacini* ℥iv. *album. ovorum cum vitellis* nu. vi. *ſucci plantag. & ſolani, an* ℥i. *farinæ hordei* ℥iii. *incorporentur ſimul, fiat cataplaſma.* Or, ℞. *farinæ fabarum & hordei an.* ℥iii. *olei roſati,* ℥ii. *oxycrati quantum ſufficit, coquantur ſimul, fiat cataplaſma.* Another, ℞. *mucag. ſem. pſilii* ℥iiii. *ol. roſati* ℥ii. *aceti* ℥i. *vitellos ovorum,* nu. iii. *croci* ℈i. *miſce.* *Pliny* reporteth that *Sextus Pomponius* the Governour of the hither Spaine, as hee overlooked the winowing of his corne, was taken by the paine of the gout in his feet, wherefore hee covered himſelfe with the Wheat above his knees, and ſo was eaſed, his feet being wonderfully dryed; and he afterwards uſed this kind of remedy. It is note worthy, which often happeneth, that the paine cannot bee altogether eaſed by ſuch like remedies, by reaſon of the abundance of bloud impact in the part; wherefore it muſt bee evacuated: which I have done in many with good ſucceſſe, opening the veine which was moſt ſwelled and nigh to the affected part; for the paine was preſently aſſwaged. Neither muſt wee too long make uſe of repercuſſives; leſt the matter become ſo hardened, that it can ſcarce bee afterwards reſolved, as when it ſhall bee concrete into knots and plaiſterlike ſtones: reſolving medicines are to bee mixed with repercuſſives conveniently applied, ſo to diſcuſſe the humour remaining as yet in the part, whereof ſhall bee ſpoken in the following Chapter.

What repercuſſives are here required.

An excellent aſtringent cataplaſme.

Lib.22.cap.25.

Phlebotomy to evacuate the conjunct matter, and aſſwage paine.

CHAP. XVII.

Of locall medicines for a cholericke gout.

What repercuſſives are here required.

A cerate with *opium*.

The water of Snailes.

THe repercuſſives that muſt firſt be uſed in this kinde of gout ought to bee cold and moiſte, that ſo they may reſiſt both the qualities of choler: ſuch are the leaves of night-ſhade, purſlaine, houſe-leeke, henbane, ſorrell, plantaine, poppy, cold water, and the like, whereof may bee made divers compoſitions. As, ℞. *ſucci hyoſciami, ſempervivi. lactuc. an.* ℥ii. *farin. hordei* ℥i. *olei roſati,* ℥ii. *agitando ſimul fiat medicamentum*; let it bee applyed and often changed, for ſo at length it will aſſwage the inflammation. Some thinke the braine of a hogge mixed with white ſtarch, or barly meale and oile of roſes, an excellent medicine. The leaves of mallowes boyled in water, and beaten with a peſtell, and applyed, aſſwage pain. ℞. *mucag. ſem. pſilii extract. in aq. ſolani, vel roſarum* ℥ii. *farin. hordei* ℥i. *aceti q. ſ. fiat linimentum.* Or elſe, ℞. *unguent. roſat. meſuæ, & populei. an.* ℥iii. *ſucci melonum* ℥ii. *alb. ovorum,* nu. iii. *miſceantur ſimul pro litu.* Alſo a ſpunge dipped in oxycrate, and preſſed out again and applied thereto doth the ſame. Or elſe, ℞. *fol. caulium rub.* m. ii. *coquantur in oxycrato & terantur: adde ovorum vitellos tres, olei roſati* ℥iii. *farinæ hordei quantum ſufficit, fingatur cataplaſma*: Alſo you may take the crude juice of cole-worts, dane-weede, and roſes beaten and preſſed out, and of theſe incorporated with oyle of roſes and barly meale make a cataplaſme. In winter time, when as theſe things cannot bee had greene, you may uſe *unguentum infrigedans Galeni & populeon.* Or elſe, ℞. *ceræ albæ* ℥i. *croci* ℈i. *opii* ℈iiii. *olei roſati quantum ſufficit, marcerentur opium & crocus in aceto, deinde terantur & incorporentur cum cera & oleo, fiat ceratum*; ſpread it upon a cloth, & lay it upon the part, and all about it, and let it bee often renewed. Some cut Frogges open and apply them to the grieved part. It is confirmed by ſundry mens experience, that the paine of the *ſciatica*, when it would yeeld to no other remedy, to have beene aſſwaged by annoynting the part affected with the mucous water or gelly of Snailes, being uſed for the ſpace of ſeven or eight dayes; the truth whereof was aſſured mee by the worthy Gentleman the Lord of *Longemeau*, a man of great honeſty and credit, who himſelfe was troubled for ſixe moneths ſpace with the *ſciatica*. This water is thus made, Take fifty or ſixty red Snailes, put them in a copper pot or kettle, and ſprinkle them over with common ſalt, and keep them ſo for the ſpace of a day; then preſſe them in a courſe or haire cloth; in the expreſſed liquor dip linnen ragges, and apply them ſo dipped to the part affected, and renew them often. But if there bee great inflammation, the Snailes ſhall bee boyled in Vineger and Roſe-water. They ſay that Citrons or Oranges boyled in Vineger, and beaten in a mortar, and incorporated with a little barly or beane flower, are good againſt theſe paines. Or elſe, ℞. *pomorum coctorum in lacte lib.* i. *butyri* ℥i. *vitellos ovorum,* nu. ii. *aceti* ℥i. *fiat cataplaſma.* There are ſome who take cheeſe crud newly made, and mixe it in a mortar with oyle of Roſes and barly meale, and ſo apply it; it repreſſeth the inflammation and aſſwageth paine. Others mixe *Caſsia* newly extracted forth of the Cane, with the juice of Gourds or Melons. Others apply to the part the leaves of Cole-worts, and Dane-weede or ſmallage, or all three mixed together and beaten with a little Vineger. Others macerate or ſteepe an ounce of linſeed in Wurt, and make the mucilage extracted therefrom into a Cataplaſme with ſome oyle of Roſes and barly meale. Some put oyle of poppyes to the pulpe of Citrulls or Gourds being beaten, and ſo incorporate them together, and apply it.

A hiſtorie.

A particular ſtove.

This following medicine hath its credit from a certain Gaſcoine of Baſas that was throughly cured therwith, when as he had bin vexed long & much with gouty pains, above the common cuſtome of ſuch as are troubled with that diſeaſe. Thus it is; Take a great ridge tile thick & ſtrong, and heat it red hot in the fire, then put it into ſuch another tile of the ſame bigneſſe, but cold, leſt it ſhould burne the bed-clothes, then forthwith fill the hot one with ſo many Dane-wurt leaves, that the patient may ſafely lay the affected part therein, without any danger of burning it. Then let the patient

ent endure the heate that comes therefrom, and by ſweate receive the fruit thereof, for the ſpace of an houre, ſubſtituting freſh Dane-wurt leaves, if the former become too dry, as alſo another hot tile, if the former ſhall grow too cold before the houre bee ended. This being done, let the part bee dryed with warme and dry linnen clothes. Uſe this particular ſtove for the ſpace of fifteene dayes, and that in the morning faſting; afterwards annoynt the part with this following oyntment. ℞. *ſucci ebuli* ℔. i. ß. *olei com.* ℔ i. *miſceantur ſimul*, and let them be put into a ſtrait mouthed glaſſe, and well luted up; then let it boyle in *balneo Mariæ*, being firſt mixed with ſome wine, untill the halfe thereof bee conſumed, for the ſpace of tenne or twelve houres, then let it coole, and ſo keepe it for uſe, adding thereto in the time of annoynting, ſome few drops of *aqua vitæ*. It may bee annoynted twice or thrice in a day, long after meate. Moreover the roots and leaves of Dane-wurt boyled in water, beaten and applyed aſſwage paine; the oyle thereof chimically extracted performes the ſame.

An ointment of the juice of Dane-wurt.

But if the contumacious paine cannot bee mitigated by the deſcribed remedies, and becomming intolerably hot and raging, make the patient almoſt to ſwoune, then muſt wee fly to narcoticks. For although the temper of the part may bee weakened by theſe, the native heate diminiſhed or rather exſtinguiſhed; yet this is a far leſſe inconvenience than to let the whole body bee waſted by paine; Theſe things have a powerfull refrigerating and drying faculty, taking away the ſenſe of the paine, and furthermore, incraſſate, thin, acride and biting humours, ſuch as cholericke humours are. Wherefore if the matter which cauſeth the paine be thick, wee muſt abſtaine from narcoticks, or certainely uſe them with great caution. ℞. *micæ panis ſecalini parum cocti in lacte* ʒii. *vitellos ovorum*, nu. ii. *opii* ʒi. *ſuccorum ſolani, hyoſciami, mandragoræ, portulacæ, ſempervivi, an.* ℥i. Let them bee mixed together and applyed, and often changed. Or elſe, ℞. *fol. hyoſciami cicutæ, acetoſ. an.* m. i. *bulliant in oxycrato & contundantur, cumque vitellis ovorum crudorum* nu. ii. *& olei roſat.* ʒii. *farina hordei quod ſit ſatis, incorporentur, fiat cataplaſma*; with the uſe thereof I am accuſtomed to aſſwage great pains. Or elſe, ℞. *Opii* ʒiii. *camphor.* ʒß. *olei nenuph.* ℥i. *lactis* ℥ii. *unguent. roſ. Galeni* ʒiv. *incorporentur ſimul in mortario, applicentur*. Moreover, cold water applyed & dropped upon the part drop by drop, is narcotick and ſtupefactive, as *Hippocrates* affirmeth, *Aphor. 29. Sect. 5.* for a moderate numneſſe mitigateth paine; there is alſo another reaſon why it may bee profitably uſed in all paines of the Gout, for that by repelling the humours, it hindereth their defluxion into the part. Mandrage apples boyled in milke, and beaten, doe the ſame thing; alſo the leaves of henbane, hemlock, lettuce, purſlaine, being ſo boiled, doe the ſame. If any deſire to uſe theſe more cold, hee muſt apply them crude, and not boyled.

When to uſe narcoticks.

A cataplaſme with opium.

But the exceſſe of paine being mitigated, wee muſt deſiſt from the uſe of ſuch narcotickes, and they muſt rather bee ſtrengthened with hot and digerating things; otherwiſe there will bee danger leſt it bee too much weakened, the temper thereof being deſtroyed, and ſo afterwards it may bee ſubject to every kinde of defluxion. Wherefore it ſhall bee ſtrengthened with the formerly deſcribed diſcuſſing fomentations, and theſe enſuing remedies. As, ℞. *gum. ammoniaci & bdelii an.* ℥i. *diſſolvantur in aceto, & paſſentur per ſetaceum, addendo ſtyracis liquid. & farin. fænug. an.* ℥ß. *pul. ireos* ℥iiii. *olei chamæm.* ʒii. *pulveris pyrethri* ʒii. *cum cera fiat emplaſtrum molle.* Or elſe, ℞. *rad. enulæ, ebuli altheæ an* ℔. ß. *ſem. lini, fænugr. an.* ʒii. *ficuum ping.* nu. xx. *coquantur complete & trajiciantur per ſetaceum, addendo pul. euphorb.* ʒii. *olei chamæm. aneth. & rutacei, an.* ℥iii. *medullæ cervi* ℥iv. *fiat cataplaſma.* Yet you muſt uſe moderation in diſcuſſing, leſt the ſubtler part of the impact humour being diſcuſſed, the groſſer part may turne into a ſtony conſiſtence, which alſo is to bee feared in uſing repercuſſives.

How to amend the harm done by narcoticks.

Dicuſſers.

A meane to be uſed in diſcuſſing.

I alſo omitted, that, according to the opinion of the Ancients, bathes of freſh water, wherein cooling herbes have been boiled, uſed three houres after meat, conduce much to the aſſwaging of pain; for ſo uſed, they are more convenient in cholerick natures, and ſpare bodies, for that they humect the more, and quickly digeſt the thin and cholerick, and conſequently acride vapours, the pores being open-

Bathes aſſwage the paine of the gout.

ed, and the humours diſſipated by the gentle warmeneſſe of the bath. After the bath, the body muſt be annoynted with *hydræleum*, or oyle and water tempered together, leſt the native heate exhale, and the body become more weake. Meates of more groſſe juice are more convenient, as beefe, ſheeps-feet, and the like, if ſo be that the patient can digeſt them, for theſe inſpiſſate the cholerick bloud, and make it more unfit for defluxion.

How meats of groſſe juice are profitable.

Chap. XVIII.

What remedies muſt be uſed in paines of the joynts proceeding of a diſtemper onely, without matter.

A hiſtorie.

PAines alſo happen in the joynts by diſtemper without any matter, which though rare, yet becauſe I happened once to feele them, I have thought good to ſhew what remedies I uſed againſt them. I once earneſtly buſied in ſtudy, and therefore not ſenſible of ſuch externall injuries as might befall mee; a little winde comming ſecretly in by the crannies of my ſtudie, fell upon my left Hippe; at length wearied with ſtudy, as ſoone as I roſe up to goe my way, I could not ſtand upon my feete, I felt ſuch bitter paine without any ſwelling or humour which might bee diſcerned. Therefore I was forced to goe to bed, and calling to minde, that cold, which was abſolutely hurtfull to the nerves, had bred mee that paine, I attempted to drive it away by the frequent application of very hot clothes; which, though they ſcorched and bliſtered the ſound parts adjoyning thereto, yet did they ſcarce make any impreſſion upon the part where the paine was ſettled, the diſtemper was ſo great, and ſo firmely fixed therein. And I layed thereto bagges filled with fryed oates and millet, and dipped in hot red wine; as alſo oxe bladders halfe filled with a decoction of hot herbs. And laſtly, a woodden diſh almoſt filled with hot aſhes, covered over with ſage, roſmarie, and rue lightly bruiſed, and ſo covered with a cloth, which, ſprinkled over with *aqua vitæ*, ſent forth a vapour which aſſwaged the paine. Alſo browne bread newly drawne out of the oven, and ſprinkled over with Roſe-water, and applyed, did very much good. And that I might more fully expell this hurtfull cold, I put ſtone bottles filled with hot water, to the ſoales of my feete, that the braine might bee heated by the ſtreightneſſe and continuity of the nerves. At length, by the helpe of theſe remedies, I was very well freed from this contumacious diſtemper, when it had held mee for the ſpace of foure and twentie houres.

Hip.ap.10.ſect.5.

Divers remedies for paine ariſing from a cold diſtemper without matter.

A fuliginous vapour ſometimes the cauſe of the gout.

There is another kind of gouty pain ſometimes cauſed by a certain excrementitious matter, but ſo thin and ſubtle that it cannot bee diſcerned by the eyes. It is a certaine fuliginous or ſootie vapour, like to that which paſſeth from burning candles or lampes, which adhers and concreets to any thing that is oppoſed thereto; which being infected by the mixture of a virulent ſerous humour whitherſoever it runneth, cauſeth extreme paine, ſomewhiles in theſe, and otherwhiles in other joynts, unleſſe you make a way therefore, when as it ſeeketh paſſage forth, which muſt be done by hornes, cupping-glaſſes, veſicatories, cauteries, or other the like art.

CHAP. XIX.

What is to be done after the fit of the gout is over.

IT is convenient when the paine is aſſwaged, that you ſtrengthen the joints. Now, to ſtrengthen them is not onely to binde and dry, but wholly to amend the weakeneſſe left in the part by the diſeaſe, that is, to diſcuſſe the humour, if any ſuperfluity thereof remaine; but to humect the part, if the moyſture bee exhauſted and dryed up. But ſuch as are troubled with the gout, after they are freed from their paine, have notwithſtanding ſuch impotency of their joynts that they cannot goe of a long time after; for that the nerves and tendons which are in great number in the feete, being moyſtened with much phlegme, are ſo relaxed, that they can no more ſuſtaine or beare themſelves upon their feete, than paper when it is wet can bee made to ſtand. Wherefore, that they may recover the uſe of their feete, the impacted humour muſt by all meanes be diſcuſſed, and ſpent with fomentations, cataplaſmes, drying and aſtringent emplaſters. You may uſe the formerly deſcribed fomentation, encreaſing the quantity of alume and ſalt, and adding thereto a like quantity of *ſulphur vivum:* then the following emplaſter ſhall bee applyed thereto. ℞. *maſ. emplaſt. contra rupturam* ℥iiii. *tereb.* ℥ii. *pulv. roſ. rub. nucum cupreſſ. gallarum, gran. myrtil. & fol. ejuſdem, thuris, maſtich. & caryophyl. an.* ʒi. *malaxentur omnia ſimul, manibus inunctis oleo myrtino & maſtichino, fiat emplaſtrum.* Let it bee ſpread upon leather to a juſt bigneſſe, and applyed to the top and ſole of the foote. Draw over the plaſter, and the whole legge a ſtocking made of a tanned dogges skinne; this emplaſter ſtrengtheneth the nerves, draweth forth the humour impact therein, and intercepts the defluxion. But the dogge-skinne ſtocking preſerveth the native heate of the part, and for that it bindeth, hindreth the defluxion into the feete.

How to ſtrengthen the joints.

Remedies for the weakneſſe left in the joints after the paine is gone.

The benefit of a dog-skinne ſtocking.

CHAP. XX.

Of the Tophi, *or knots which grow at the joynts of ſuch as are troubled with the Gout.*

SOme that are troubled with the gout, have knotty bunches growing in their joynts, which by the Ancients were called *Tophi.* Theſe are generated by the congeſtion of groſſe, viſcide and crude phlegme, with a little admixtion of an acride and cholericke humour. Theſe matters remaine ſettled in the part, for that it being too weake cannot digeſt and depreſſe them; wherefore being there impact, they eaſily concrete into a certaine plaſter-like or chalke-like ſubſtance, whileſt by the adventitious and burning heate cauſed by paine, and the gouty malignity, their more ſubtle part is diſperſed, but the groſſer ſubſides. Yet ſometimes the unfit application of repercuſſive or diſcuſſive medicines is a cauſe of the generation of theſe *Tophi.* For by the former, the impact matter is incraſſated and gathered together; but by the latter, the ſubtle part being diſcuſſed, the remnant that ſubſides concretes into *Tophi.* Thoſe medicines which are made to mollifie, ought to have a moderately heating, and humecting faculty, that they may diffuſe, and as it were diſſolve the impact matter; ſuch is warme water, the decoction of emollient herbes, the decoction of Calves or Sheepes entrailes, heads and feete: after theſe or the like fomentations, you ſhall uſe the following medicine. ℞. *axungiæ, human. anſeris & gallinæ, medul. cervin. an.* ℥ii. *tereb. ven.* ℥i. *aq. vit. parum, ceræ quantum ſuficit, fiat unguentum molle.* Then this which followeth will bee good. ℞. *rad. alth. liliorum, bryon. lapath. acuti, an.* ℥iiii. *coquantur complete & trajiciantur per ſetaceum; adde gum. ammon. bdel. galb. opopanacis in aceto diſſolutorum* ℥i. *medul. cervin.* ℥i. ß.

Whence the *tophi* are generated.

The unfit application of diſcuſſive & repercuſſive medicines cauſe the *tophi.*

Mollifying medicines.

ʒ iß. *incorporentur ſimul, & applicentur.* Or elſe, ℞. *olei liliorum, amygd. dul. medulla cruris cer. an.* ℥ ii ß. *mucag. ſem. lini, alth. fænugr. an.* ʒ i. *ceræ quantum ſufficit; fiat ceratum.* Or elſe ℞. *empl. de vigo cum mercurio, & cerat. de æſipo humida deſcript. Philagrii, an.* ʒ. ii. *malaxentur ſimul cum oleo lilior. fiat maſſa.* Or elſe, ℞. *gum. ammon. opopan. galb. bdel. diſſolutorum in aceto, an.* ʒ ii. *panno lineo colatis, adde pulv. ſulph. nitr. ſinapi, pyrethri, an.* ʒ ß. *ſtyracis, liq. & axung. hum. an.* ʒ i. *reſ. pini, tereb. ven. an.* ℥ ß. *ceræ quantum ſufficit, fiat ceratum molle.* This which followes is thought moſt effectuall in the opinion of *Galen* and *Avicen.* ℞. *pedes porcel. bene ſalſos, nu.* iiii. *veterem pernam, cum illis coque: addendo ſub finem, radicis bryoniæ, lapath. acut. an.* ʒ iii. *axungiæ tauri, & medul. cervin. an.* ℥ i. *cum caſeo putrefacto fiat empl. molle ad uſum.* This which followes is alſo moſt effectuall. ℞. *caſei acris & putrefacti,* ʒ iiii. *pul. ſulph. vivi euphorb. & pyreth. an.* ʒ iii. *decoctionis veteris pernæ & porcellorum quod ſufficit ad incorporandum, ducantur in mortario, & fiat empl. ad uſum.* Or elſe, ℞. *ſpumæ nitri,* ℥ vi. *tereb.* ʒ ii. *olei veteris,* ʒ viii. *lixivii, quo lanæ pileorum lavantur, & ceræ quantum ſufficit, fiat ceratum ſatis molle.* After the uſe of emollients, a fumigation ſhall be made in this manner. Heat a cogle-ſtone, milſtone or bricke, red hot in the fire, take it forth, and caſt upon it a ſufficient quantity of very ſharp vinegar, & *aqua vitæ*, the riſing vapour ſhall be diligently received by the affected member, for this hath a faculty to attenuate and cut groſſe, viſcide, and plaſter-like matter, yea alſo, and to break the skin; yet that is broken oft time of its own accord, without the help of either medicine or inſtrument. To conclude, theſe medicins which are good to mollifie ſcirrhous tumors, the ſame are alſo good to ſoften the gouty knots and *tophi.* But wee muſt note that theſe knotty bunches are ſomtimes ſuppurated, not truly by the impact & plaſterlike matter, but by a new defluxion comming on a ſodain, & then it is neceſſary to make way for the conteined matter, which being done, firſt there commeth forth a humor like milk, then a plaſter-like matter, then it leaves behinde it an ulcer to be cured by applying thereto *Empl. gratia dei*, and others as the Surgeon ſhall think fit.

Lib. 10. ſimp. c. 7 ſec. 22. lib. 3. tract. 2. cap. 21.

An effectuall fumigation.

CHAP. XXI.

Of flatulencies conteined in the joints, and counterfeiting true Gouts, and of the remedies to be uſed thereto.

OFT-times there is ſmall quantity of humour, which moves the paine of the gout; but much flatulencie mixed therwith, eſpecially in great joints, as in the huckle or hippe-bone, and the knees; they ſometimes cauſe ſo great diſtention, that they drive the heads of the bones forth of their places. You may partly underſtand it is ſo, if a tenſive paine afflict the patient with any ſenſe of heavineſſe; if when you preſſe the tumour with your fingers, the place retaine no marke or impreſſion thereof, as happens in an *œdema*, but on the contrary, a flatulent ſpirit lifts it up as it were by renitency, as if one ſhould thruſt a pair of bellows which are filld with wind, hence the part cannot performe its duty, for that the ſpaces of the joints are poſſeſſed with aboundance of flatulencies, ſo that the liberty of motion is intercepted, and the member is kept as it were bound up. Many no very skillfull Surgeons putting their fingers to theſe kind of tumours, ſo that lifting up the one they preſſe down the other, when as they perceive the flatulency, as it were, riſing betweene their fingers, ſuppoſing it to bee the motion of *pus*, or matter already generated and flowing up and downe, as is uſuall in impoſtumes, they have opened it by inciſion; but when as nothing flowed forth it appeared how much they were deceived, yet in the interim, by this their raſhneſſe they have cauſed many dangerous ſymptomes, as encreaſe of pain, defluxion of humours, by force whereof the bones have beene diſlocated, and brought to the patient an uncurable lameneſſe. But theſe flatulent gouts are ſeldome without ſome phlegmatick matter, which is neither too crude, nor viſcide. Such like flatulencies are not eaſily diſcuſſed, nor at the firſt endeavour, by reaſon of a cold diſtemper which they bring to the part, and the denſity of the membranes and ligaments by which the ar-

ticulation

In what joints flatulencies are chiefly generated.

Signes of flatulencies.

How flatulencies may make you beleeve there is *pus* or matter.

Why hard to cure.

ticulation is knit and faſtened, ſo that ſcarce any part of that which is there ſhut up can breath forth of ſuch ſtrait paſſages. Therefore the cure muſt be undertaken with reſolving, diſcuſſing, and drying fomentations; as for example, with a decoction of fennell, aniſeeds, rue, chamomill, melilote, ſage, roſemary, *origanum*, calamints, horehound, and the like, boyled in wine with a little Lye, roſe vinegar, and common ſalt. This following ointment ſhall bee uſed after the fomentation. ℞. *olei chamæm. aneth. rut. lauri, an.* ℥ ii. *cum cera alba, fiat linimentum addendo aq. vitæ parum.* After you have anointed it, apply thereto this following cataplaſme. ℞. *flor. cham. melil. aneth. roſ. rub. pulv. an.* m i. *fol. malv. & abſinth. an.* m ß. *furfur,* m i. *bulliant omnia ſimul cum lixivio, & vino rubro, deinde piſtentur cum medulla panis, & farina fabarum, quantum ſufficit, fiat cataplaſma, addendo ol. roſar. & myrtin. an.* ℥ ii. Some highly approve of this following medicine for the waſting of flatulencies. ℞. *axun. ſuil.* ʒ iv. *calcis vivæ,* ℥ i ß. *terantur diligenter in mortario, & incorporata applicentur.* Or elſe, ℞. *ſtercor. caprar. cocti cum vino & aceto, an.* ℔. ß. *tereb. venet. & mell. com. an.* ℥ ii. *aq. vitæ,* ℥ ß. *pul. rad. ireos florent. & ſabin. an.* ℥ iii. *olei rut. & aneth. an.* ℥ i. *farin. fabarum quantum ſufficit.* Make a cataplaſme to the forme of a pultis. Alſo ſtoupes dipped in oxycrate, and wrung out, ſhall be applyed: in this oxycrate ſhall be boyled wormewood, *origanum*, chamomill, melilote, rue, common ſalt, adding thereto ſome *aqua vitæ*. Then the part ſhall be bound up as ſtrait as the patient can endure it; in concluſion, that the native ſtrength may by little and little bee reſtored to the part, it ſhall be fomented with Lye made of the aſhes of Oake-wood and the cuttings of vines, wherein ſhall be boyled, ſalt, *ſulphur*, choiſe alome, and wetting linnen cloaths, or ſtoups therein, and applying them, it ſhall be ſtraitly ſwathed up. Yet if great pain ſhall more cruelly vexe the part, then neglecting for a time the proper cure of the diſeaſe, you ſhall withſtand the ſymptome by rubbing the part, and anointing it with ſome diſcuſſing oile, laying thereon ſome moiſt wooll & other anodyne things.

Chap. XXII.

Of the Iſchias, *Hip-gout, or* Sciatica.

For that the hip-gout in the greatneſſe of the cauſes, bitterneſſe of pain, and vehemency of other ſymptomes, eaſily exceeds the other kindes of Gout, therefore I have thought good to treate thereof in particular. The pain of the *Sciatica* is therefore the moſt bitter, and the ſymptomes moſt violent, for that the dearticulation of the huckle bone, with the head of the Thigh-bone, is more deepe than the reſt; becauſe alſo the phlegmaticke humour which cauſeth it, is commonly more plenteous, cold, groſſe, and viſcid, that flowes down into this joint, and laſtly becauſe the *Sciatica* commonly ſucceeds ſome other chronicall diſeaſe, by reaſon of the tranſlation and falling down thither of the matter, become maligne and corrupt by the long continuance of the former diſeaſe.

Why it hath the moſt grievous ſymptomes.

But the paine not onely troubles the hippe, but entering deepe, is extended to the muſcles of the buttockes, the groines, knees, and very ends of the toes, yea often times it vexeth the patient with a ſenſe of paine in the very *vertebra* of the loines, ſo that it makes the patients, and alſo oft times the very Phyſitians and Surgeons to thinke it the wind or ſtone Collicke. The cauſe of ſuch wandering and diſperſed paine is to bee referred to the manifold diſtribution of the nerves which come to that joint from the loines and holy-bone, for they are ſent into the muſcles of the buttockes, and ſo diſperſed over the whole legge to the very ends of the toes, as it is ſhewed in our Anatomy. Therefore the paine is largely extended, that is, to what part ſoever a nerve runs which comes from the affected Hippe. Often times there is no ſwelling, no redneſſe, nor diſtemper manifeſt to the eye, by reaſon that the veines are very few which riſe into the ſurface and skinne of this part, and the humour lyes, as it were, ſunke in; which is the cauſe that divers times the excrementitious humours mixed with flatulencie, runne ſo violently into the cavity of this joint, that relaxing the ligaments

The cauſe of the large ſpreading of the paine.

The thigh-bone often diſlocated by the *Sciatica*.

gaments, as well proper as common, the head of the thigh-bone is eaſily driven out from hence, ſo that it may never be reſtored again, if it remain ſo for any ſpace of time; for that in this time the humor falling down into this cavity, by delay concretes as it were into a ſtony body, and the head of the Thigh-bone weares it ſelfe another cavity in the neighbouring bone, but the lips of the true cavity, which are griſtly, become more ſtreit and depreſt, and laſtly all the ligamentous bodies moiſtened with this excrementitious humour become more looſe and weake, whence ſucceed many and moſt grievous ſymptoms, as lameneſſe, & the decay not only of the thigh & leg, but at length of the whole body, and laſtly a ſlow and hectick feaver, which in continuance of time will conſume the patient for the cauſes formerly mentioned. Therfore let Phyſitians and Surgeons have a care that they reſiſt it at the firſt, and with ſuch powerfull remedies as are mentioned in the following chapter, hinder the ſpringing up and growth of the formerly mentioned ſymptomes.

CHAP. XXIII.

The cure of the Sciatica.

Why we muſt open a veine in the *Sciatica*.

When the *vena iſchiadica* and *ſaphia* muſt be opened in the *ſciatica*.

THough the *Sciatica* bee commonly occaſioned by tough phlegme, yet if the patient be ſtrong and abound with blood, and all things elſe conſent, it ſhall bee good to draw blood by opening a veine; for phlebotomy equally evacuates all humors; therefore the falling downe of the humors into the part affected, is thereby hindered, or retarded. Verily I have knowne no ſpeedier remedy to aſſwage the paine of inflammation, than blood-letting, being firſt made on the *Baſilica* of the grieved ſide for revulſions ſake; and then for evacuation of the conjunct matter on the *vena iſchiadica*, which is at the outſide of the ankle, if the paine of the *Sciatica* be more on the outſide; or elſe on the *Sapheia*, which is on the inſide of the ankle, if the inner parts bee more pained. The quantity of blood which is to be drawne muſt be left to the judgement of the phyſitian, without whoſe adviſe I would attempt nothing in this caſe. Alſo acride glyſters are good, if there be nothing which may hinder, as ulcers of the guts, or hæmorrhoids. ℞. *rad. acor.* ℥ ii. *centaur. rut. ſalv. roriſm. calam. origan. puleg. an.* m ß. *ſtæchad. arabic. flo. cham. melil. aneth. an.* p i. *ſem. aniſ. & fœnic. an.* ℥ ß. *fiat decoctio ad* ℔. i. *in colatura diſſolve hieræ & diaphen. an.* ℥ ß. *mellis anthoſ. ſacch. rub. an.* ℥ i. *olei liliorum* ℥ iii. *fiat clyſter.* Strong purgations are alſo here uſefull, as of *pillul. fœtid. arthritic. Aſſaiereth. de Hermodactilis*, and others uſed in phlegmaticke cauſes. *Electuarium Diacarthami* purgeth choller and phlegme. Often vomitings doe not onely evacuate the humors, but alſo make revulſion, as wee have formerly delivered. Bathes and ſweates profit no otherwiſe than a decoction of *guajacum* or *ſarſaparilla*. If heat moleſt the part, then foment it with oile of roſes and vinegar, eſpecially if the paine be deepe in, for vinegar by its tenuity pierceth to the bottome, and makes way for the oile, which of its owne nature is anodyne. After the uſe of generall medicines you ſhall apply attractive and reſolving things: emplaſters of pitch and *ſulphur*, or of *Ammoniacum*, *euphorbium*, *Terebinthina*, *Propolis*, *Galbanum*, *Bdelium*, *Opopanax*, draw the humour from within to the ſurface or ſkinne. As in like ſort alſo the chymicall oile of ſage, roſemary, pellitory of Spaine, and ſuch other like doe the ſame, which by reaſon of the tenuity of their ſubſtance, and their ſeparation from earthy impurity, have farre more powerfull and expedite faculties to penetrate and diſcuſſe. Yet muſt you uſe none of all theſe without very good judgment and deliberation, otherwiſe there will be danger of inflammation.

Strong purgations in the *ſciatica*.

There may alſo be made fomentations of diſcuſſing and reſolving herbes, as the rootes and leaves of dane-weeds, orris, Bay and Juniper berries, the ſeeds of fænugreeke, aniſe, fennell, the leaves of ſage, roſemary, chamomile, melilote, elder, and the like, boyled in wine and oyle: the following plaſter is much commended by the antients to digeſt, or reſolve and aſſwage the paine, with this which drawes forth thornes, ſplinters, and rotten bones. ℞. *ſem. urtic. mundat. ſpuma borac. ſalis ammoniaci*

moniaci, rad. ariſtoloch. rotund. colocynth. terebinth. venet. an. ʒ x. *fænug. piperis longi, xylobalſam. thur. myrrhæ, adipis cap. gum. pini, an.* ʒ v. *ceræ,* ℔. ß. *lactis ficus ſylv.* ℥ ß. *ex omnibus ſecundum artem præparatis cum olei liliorum, & vini generoſi quantitat. ſufficiente, fiat emplaſtrum.* Let it be applyed to the Hippe. Or, ℞. *ſinapi acerrimo aceto diſſoluti,* ℥ ii. *fermenti acris,* ℥ ß. *pul. hermodact.* ʒ ii. *mellis com.* ℥ iii. *tereb.* ℥ iv. *olei laur. & de ſpicâ, an.* ℥ ii. *far. fænug.* ℥ i ß. *terræ formicarum cum ovis,* ℔ i. *fol. laur. ſalv. rut. roriſmarin. an.* m. ß. *vermium terreſt. præpar.* ℔ ß. The earth with the egges and wormes ſhall be boyled apart with the white wine, and herbes cut in pieces, and theſe being ſtrained out, the reſt of the things ſhall bee added according to art, and then it ſhall be applyed to the Hippe. Or elſe, ℞. *rad. enul. camp. ſigil. ſalom. bryon. biſmal. an.* ℥ ii. *coquantur complete & terantur, trajiciantur per ſetaceum, addendo farin. fænug. & hordei, an.* ℥ i. *olei liliorum, & chamæm. an.* ℥ iii. *tereb.* ℥ iv. *ceræ quantum ſufficit, fiat cataplaſma.* It reſolves, aſſwageth pain, and calleth forth the humours to the skin. Or elſe, ℞. *rad. ſigil. beatæ Mariæ,* ℥ vi. *empl. diachyl. albi,* ʒ iv. *croci in aqua vitæ diſſoluti,* ʒ ii. *terebinth.* ℥ i. *ol. de ſpica nardi quantum ſufficit, fiat empl.* Let it be ſpread upon leather and applyed warme. I have oftentimes ſuddenly aſſwaged the paine of the *ſciatica* by putting to the pained Hip the root of black Bryony cut into ſlices, and applyed, when the matter was cold. Or elſe, ℞. *ceræ citrin. & tereb. abiet. an.* ℥ ii. *liquefiant ſimul in vaſe duplici, & ubi refrixerint, adde pulv. Hermodact.* ℥ ß. *flor. chamæm. irid. flor. an.* ʒ iii. *ſpicæ nardi, flor. thymi, an.* ʒ ii. *interioris cinamomi elect. & ſemin. naſturt. an.* ʒ ii. *croci,* ℈ iv. *malaxantur ſimul manibus axungia porci vetere non ſalita unctis, & fiat maſſa empl.* But if the paine be not by this meanes aſſwaged, then muſt we come to more powerfull medicines, as to uſe great Cupping Glaſſes applyed with much flame, and to veſicatories. As, ℞. *增 cantharid. quibus detractæ ſunt alæ,* ʒ ii. *ſtaphiſagr.* ʒ iii. *ſinapi,* ʒ i ß *fermenti acerrimi* ℥ ß. *incorporentur ſimul, & fiat veſicatorium.* Alſo bliſters may be raiſed by applying the inner rinde of Travailers joy to the wait of ſome two drammes, a little beneath the grieved part: you muſt have a care that the ulcers that remaine after the skinne of the bliſters is taken off, doe run, & be kept open for ſome time after, that ſo more of the humor conteined in the part may bee drawne away. But if wee cannot availe by theſe means, we muſt according to *Hippocrates* his counſaile, come to the laſt and extremeſt temedy. Such (ſaith he) as troubled with a long paine of the *ſciatica*, have their Hippe fall out of joint, their leg conſumes, & they become lame unleſſe they be burnt: we have alſo read the ſame approved by *Celſus*. It is the laſt (ſaith he) and moſt effectuall medicine in longer diſeaſes, to cauterize with hot irons the skinne of the Hippe in three or foure places; and then not to heale up theſe ulcers or fontenels as ſoone as may be, but to keepe them open by putting thereinto bullets of gold, or ſilver, or pills of Gentian, or waxe melted and wrought up with the powder of vitrioll, mercurie, and the like cathæretickes untill the affect againſt which we uſe this remedy be helped, for by this meanes many have bin helped. Therefore three or foure actuall cauteries, or hot irons ſhall be ſo thruſt in about the joint of the Hip, that they may enter into the fleſh ſome fingers breadth, yet ſo that you ſhun the nerves. Cauteryes here doe good, for that by heating the part, they heate and diſſolve the cold humours, they cut, attenuate, and draw forth the groſſe and viſcide, ſo that they flow out by the ulcers, together with the quitture. Over and beſides, the ligaments are ſtrengthened by their cicatrization, and their looſeneſſe helped; & by this meanes the whole part is notably corroberated.

Blacke bryony diſcuſſeth.

The uſe of cauteries in the *ſciatica.*

CHAP. XXIIII.

Of the flatulent convulſion, or convulſive contraction, which is commonly called by the French, Goute Grampe, *and by the Engliſh, the Crampe.*

What the Cramp is.

The cauſe thereof.

Who ſubject thereto.

The cure.

THat which the French call *Goute grampe*, wee heare intend to treat of, induced thereto rather by the affinity of the name, than of the thing, for if one ſpeake truly, it is a certaine kinde of convulſion generated by a flatulent matter, by the violence of whoſe running downe or motion, oft-times the necke, armes, and legs are either extended, or contracted into themſelves with great paine, but that for a ſhort time. The cauſe thereof is a groſſe and tough vapor, inſinuating it ſelfe into the branches of the nerves, and the membranes of the muſcles. It takes one on the night, rather than on the day, for that then the heat and ſpirits uſually retire themſelves into the entrailes and center of the body; whence it is that flatulencies may bee generated, which will fill up, diſtend and pull the part whereinto they runne, juſt as wee ſee lute-ſtrings are extended. This affect often takes ſuch as ſwimme in cold water, & cauſeth many to be drowned, though excellent ſwimmers, their members by this means being ſo ſtraitly contracted, that they cannot by any meanes be extended. For the ſkin by the coldneſſe of the water is contracted and condenſed, and the pores therof ſhut, ſo that the engendered flatulencies have no paſſage forth. Such as give themſelves to drunkenneſſe and gluttony, or ſloth and idleneſſe, are uſually more frequently troubled with this diſeaſe, by reaſon of their heaping up of crudities. Therefore it is cured by moderate diet, and ordering of the body, and exerciſe of each part therof, for thus they gather ſtrength, and the generation of the flatulent matter is hindered. In the very time when it takes one, the patient ſhall bee cured by long rubbing with warme clothes, and *aqua vitæ*, wherein the leaves of ſage, roſemary, time, ſavory, lavander, cloves, ginger, and the like diſcuſſing and reſolving things, have beene infuſed. The extenſion and flexion of the members or joints, and walking, are alſo good.

ke.

OF THE LUES VENEREA, AND THOSE SYMPTOMES WHICH HAPPEN BY MEANES THEREOF.

THE NINETEENTH BOOKE.

CHAP. I.

A deſcription of the Lues Venerea.

What the *Lues venerea* is.

THe French call the *Lues Venerea*, the Neapolitane diſeaſe, the Italians and Germans [as alſo the Engliſh] terme it the French diſeaſe, the Latines call it *Pudendagra*, others name it otherwiſe. But it makes no great matter how it bee called, if the thing it ſelfe bee underſtood. Therefore the *Lues Venerea* is a diſeaſe gotten or taken by touch, but chiefly that which is in uncleane copulation, and it partakes of an occult quality, commonly taking its originall from ulcers of the privie parts, and then further manifeſting its ſelfe by puſtles of the head, and other externall parts; and laſtly, infecting the entrailes and inner parts with cruell and nocturnall tormenting paine of the head, ſhoulders, joynts, and other parts. In proceſſe of time, it cauſeth knots and hard *Tophi*; and laſtly corrupts and foules the bones, diſſolving them, the fleſh about them being oft-times not hurt; but it corrupteth and weakeneth the ſubſtance of other parts, according to the condition of each of them, the diſtemper and evill habit of the affected bodies, and the inveteration or continuance of the morbificke cauſe. For ſome loſe one of their eyes, others both, ſome loſe a great portion of the eye-lids, otherſome looke very ghaſtly, and not like themſelves, and ſome become ſquint-eyed. Some loſe their hearing, others have their noſes fall flat, the pallat of their mouthes perforated with the loſſe of the bone *Ethmoides*, ſo that in ſtead of free and perfect utterance, they faulter and fumble in their ſpeech. Some have their mouthes drawne awry, others their yards cut off, and women a great part of their privities tainted with corruption. There bee ſome who have the *Urethra* or paſſage of the yard obſtructed by budding caruncles, or inflamed puſtles, ſo that they cannot make water without the helpe of a Catheter, ready to die within a ſhort time, either by the ſuppreſſion of the urine, or by a Gangrene ariſing in theſe parts, unleſſe you ſuccour them by the amputation of their yards. Others become lame of their armes, and otherſome of their legges, and a third ſort grow ſtiffe by the contraction of all their members, ſo that they have nothing left them ſound but their voice, which ſerveth for

What hurt it doth to the body.

for no other purpoſe but to bewaile their miſeries, for which it is ſcantly ſufficient. Wherefore ſhould I trouble you with mention of thoſe, that can ſcantly draw their breath by reaſon of an *Aſthma*, or thoſe whoſe bodies waſte with a hecticke feaver and ſlow conſumption? It fares farre worſe with theſe, who have all their bodies deformed by a Leproſie ariſing therehence, and have all their throttles and throates eaten with putride and cancrous ulcers; their haire falling off from their heads, their hands and feet cleft with tetters and ſcaly chinkes: neither is their caſe much better, who, having their braines tainted with this diſeaſe, have their whole bodies ſhaken by fits of the falling ſickneſſe; who troubled with a filthy and curſed flux of the belly, doe continually caſt forth ſtinking and bloudy filth. Laſtly, there are no kinds of diſeaſes, no ſorts of ſymptomes, wherewith this diſeaſe is not complicate, never to be taken away, unleſſe the virulencie of this murrain be wholly taken away, and impugned by its proper Antidote, that is, *argentum vivum*.

The Leproſie ſometimes the off-ſpring of the *Lues venerea*.

CHAP. II.

Of the cauſes of the Lues Venerea.

THere are two efficient cauſes of the *Lues venerea*; the firſt is, a certaine occult and ſpecificke quality, which cannot be demonſtrated; yet it may be referred to God, as by whoſe command this hath aſſailed mankind, as a ſcourge or puniſhment to reſtraine the too wanton and laſcivious luſts of unpure whoremongers. The other is an impure touch or contagion, and principally, that which happeneth in copulation. Whether the man or woman have their privities troubled with virulent ulcers, or bee moleſted with a virulent ſtrangury (which diſeaſe crafty Whores colour by the name of the whites) the malignity catcheth hold of the other; thus a woman taketh this diſeaſe by a man caſting it into her hot, open and moiſt wombe; but a man taketh it from a woman, which, for example ſake, hath ſome ſmall while before received the virulent ſeed of a whore-maſter polluted with this diſeaſe, the mucous ſanies whereof remaining in the wrinckles of the womans wombe, may be drawne in by the pores of the ſtanding and open yard, whence ſucceede maligne ulcers, and a virulent ſtrangury. This virulencie, like a torch or candle ſet on fire, will by little and little bee propagated and ſent by the veines, arteries and nerves to the noble parts; whoſe malignity a ſtrong liver not enduring, by the ſtrength of the naturall expulſive facultie, will ſend it into the groines, whereon follow Abſceſſes, therefore called venereall Bubo's. Theſe, if they returne in againe, and caſt not forth matter by being opened, they will, by their falling back into the veins and arteries, infect the maſſe of the bloud by the like tainture, & thence will enſue the *Lues venerea*. Yet this diſeaſe may be got by a more occult manner of touch, as by breathing only. For it is not altogether beſides reaſon and experience, that a woman long troubled with this diſeaſe, may by importunate and often kiſſing, transfuſe malignity into a child; for the tender and ſoft ſubſtance of a little childe may bee altered, infected, and by little and little corrupted by receiving of filthy, and in their whole kinde maligne vapours. For it is knowne, and now vulgarly believed, that mid-wives by receiving the child of a woman infected with this diſeaſe, to have got this affect, the malignity being taken and drawne into their bodies through the pores of their hands by the paſſages of the veines and arteries. Neither doth it ſpare any condition, ſexe, nor age of men: for, not onely whoſoever uſe copulation, but ſuch as onely lye with them, may bee taken by this virulencie; yea verily, if they onely lye in the ſheets or coverings which retaine his ſweat, or the virulencie caſt forth by an ulcer. The ſame danger may aſſaile thoſe who ſhall drinke in the ſame veſſell after ſuch as are troubled with this diſeaſe. For by the impure touch of their lips, they leave a virulent *ſanies* and ſpittle upon the edges of the cup, which is no leſſe contagious in its kinde than the virulencie of leprous perſons, or the fome of madde dogs. Wherefore it is no marvell if children nurſed by an infected nurſe, draw in the ſeeds of this diſeaſe together

The *Lues venerea* the ſcourge of whoremongers.

Venereall Bubo's returning in again occaſion the *Lues venerea*.

The *Lues venerea* may be got by the only communication of vapours.

How nurſes may infect children, and they their nurſes.

gether with the milk, which is only bloud whitened in the breaſts; or infected ſucking children by their hot and ulcerated mouthes, may tranſ-fuſe this malignity into the body of the nurſe, by the rare, looſe and porous ſubſtance of the dugs which it frequently ſucketh.

A hiſtorie.

This following hiſtory is very memorable to this purpoſe. A certaine very good Citizen of this Citie of Paris granted to his wife being a very chaſte woman, that conditionally ſhee ſhould nurſe her owne child of which ſhee was lately delivered, ſhee ſhould have a nurſe in the houſe to eaſe her of ſome part of the labour: by ill hap, the nurſe they tooke was troubled with this diſeaſe; wherefore ſhee preſently infected the childe, the child the mother, the mother her husband, and hee two of his children who frequently accompanied him at bed and board, being ignorant of that malignity wherewith hee was inwardly tainted. In the meane while the mother when ſhee obſerved that her nurſe childe came not forward, but cryed almoſt perpetually, ſhee asked my counſell to tell her the cauſe of the diſeaſe; which was not hard to bee done, for the whole body thereof was repleniſhed with venereall ſcabs and puſtles, the hired nurſes and the mothers nipples were eaten in with virulent ulcers; alſo the fathers, and the two other childrens bodies, whereof the one was three, the other foure yeares old, were troubled with the like puſtles and ſcabs. I told them that they had all the *Lues venerea*, which tooke its originall and firſt offſpring by maligne contagion from the hired nurſe. I had them in cure, and by Gods helpe healed them all, except the ſucking child, which died in the cure. But the hired nurſe was ſoundly laſhed in the priſon, and ſhould have beene whipped through all the ſtreets of the Citie, but that the magiſtrate had a care to preſerve the credite of the unfortunate family.

CHAP. III.

In what humour the malignity of the Lues venerea *reſides.*

THough in the opinion of many the antecedent cauſe of this diſeaſe be the maſſe of bloud conteining the foure humours, yet I had rather place the matter, and primary, and chief ſeat thereof in groſſe and viſcide phlegme infected with the maligne quality of the venereous venome, and from this beginning and foundation, I thinke by a certaine contagious growth it ſooner or later infects the other humours, as each of them is diſpoſed or apt to ſuffer. Of which my opinion there are many arguments, but this chiefely, That by the evacuation of a phlegmaticke humour, whether by the mouth and ſalivation, or by ſtoole, urine, or ſweate in men of what temper ſoever, whether cholerick, ſanguine or melancholy, the diſeaſe is helped or cured. Secondly, for that the exceſſe of paine is more by night than by day, becauſe then the phlegme bearing ſway, ſevers the *periostium* from the bone, or elſe offends it and the reſt of the membranous and nervous bodies by the acrimony of its malignity. Thirdly, becauſe the patients are hurt by the uſe of cold things, but uſually finde benefit by hot medicines, whither they bee oyntments, plaſters, fumigations, or whatſoever elſe, inwardly taken, or outwardly applyed. Fourthly, for that in venereous puſtles, there is found a certaine hardneſſe at the roote, though outwardly they make ſhew of choler or bloud. For being opened, you ſhall finde them ſtuffed with a certaine plaſter-like and tophous matter, or elſe with tough phlegme, or viſcous *pus*; whence ariſe theſe hard *tophi*, or bony excreſſences upon the bones, if not from phlegmaticke humours there heaped up and concrete? Fifthly, for that the ſpermaticke and cold parts doe primarily and principally feele the harme of this diſeaſe. Sixtly, for that the ulcers which over-ſpread the body by meanes of this diſeaſe, admit of no cure, unleſſe you firſt cauſe ſweats. Therefore if the matter of the diſeaſe, and ſuch ulcers as accompany it were hot and dry, it would grow worſe, and be rather increaſed by a decoction of *Guajacum*, the roots of *China*, or *ſarſaparilla*. Seventhly, becauſe oft-times this diſeaſe, the ſeede thereof being taken or drawne into the body, ſo lyeth hid for the

Why the paine is worſe upon the night than on the day.

(2)

This diſeaſe ſometimes lyes long hid in the body before it ſhew it ſelfe.

ſpace of a yeare, that it ſhewes no ſigne thereof, which happens not in diſeaſes proceeding from an hot matter, which cauſeth quick and violent motions. By this it appeareth that the *baſis* and foundation of the *Lues venerea* is placed or ſeated in a phlegmatick humour; yet may I not deny, but that other humours confuſed therewith may be alſo in fault, and defiled with the like contagion. For there are ſcarce any tumours which proceed from a ſimple humour, and that of one kinde; but as in tumours, ſo here the denomination is to be taken from that humour which carryeth the chiefe ſway.

Chap. IIII.

Of the ſignes of the Lues Venerea.

When the *Lues venerea* is lately taken, maligne ulcers appeare in the privities, ſwellings in the groines, a virulent ſtrangury runneth oft-times with filthy *ſanies*, which proceeds either from the *proſtata*, or the ulcers of the *urethra*; the patient is troubled with paines in his joynts, head, and ſhoulders, and as it were breakings of his armes, legges and all his members, they are weary without a cauſe, ſo that neither the foot nor hand can eaſily performe his duty; their mouths are inflamed, a ſwelling troubles their throats, which takes away their freedom of ſpeaking & ſwallowing, yea of their very ſpittle; puſtles riſe over all their bodies, but chiefly certaine garlands of them engirt their temples and heads; the ſhedding or loſſe of the haire, diſgraceth the head and chin; and leaneneſſe deformeth the reſt of the body; yet all of theſe uſe not to appeare in all bodies, but ſome of them in ſome. But the moſt certaine ſignes of this diſeaſe are, a callous ulcer in the privities, hard and ill conditioned, and this ſame is judged to have the ſame force in a prognoſticke, if after it be cicatrized, it retaine the ſame callous hardneſſe; the Bubo's, or ſwellings in the groines to returne backe into the body without comming to ſuppuration, or other manifeſt cauſe: theſe two ſignes, if they concurre in the ſame patient, you may judge or foretell that the *Lues venerea* is either preſent, or at hand; yet this diſeaſe happeneth to many without the concourſe of theſe two ſignes, which alſo bewrayeth it ſelfe by other manifeſt ſignes, as ulcers and puſtles in the reſt of the body, rebellious againſt medicines though powerfull, and diſcreetely applyed, unleſſe the whole body bee annoynted with *Argentum vivum*. But when as the diſeaſe becommeth inveterate, many become impotent to venery, and the malignity and number of the ſymptomes encreaſe, their paines remaine fixed and ſtable, very hard and knotted *tophi* grow upon the bones; and oft-times they become rotten and foule, as alſo the hands and feete by the corruption of ſalt phlegme are troubled with chops or clefts, and their heads are ſeazed upon by an *ophiaſis* and *alopecia*; whitiſh tumours with roots deepe faſtned in, ariſe in ſundry parts of the body, filled with a matter like the meate of a cheſnut, or like a tendon; if they be opened they degenerate into divers ulcers, as putride, eating, and other ſuch, according to the nature and condition of the affected bodies. But why the paines are more grievous on the night ſeaſon: this may bee added to the true reaſon wee rendred in the precedent Chapter; firſt for that the venereous virulencie lying as it were aſleepe is ſtirred up and enraged by the warmeneſſe of the bed and coverings thereof; Secondly, by reaſon of the patients thoughts which on the night ſeaſon are wholly turned and fixed upon the onely object of paine.

The moſt certaine ſignes of the *Lues venerea*.

Two other cauſes of the exceſſe of paine in the night.

CHAP. V.

Of Prognoſticks.

The ſignes of a curable *Lues Venerea.*

IF the diſeaſe be lately taken, aſſociated by a few ſymptomes, as with ſome ſmall number of puſtles, and little & wandring paines, and the body beſides bee young and in good caſe, and the conſtitution of the ſeaſon bee good and favourable, as the ſpring, then the cure is eaſie, and may bee happily performed. But on the contrary, that which is inveterate and enraged by the fellowſhip of many and maligne ſymptomes, as a fixed paine of the head, knots and rottenneſſe of the bones, ill natured ulcers in a body very much fallen away and weake, and whereof the cure hath beene already ſundry times undertaken by Empyricks, but in vaine; or elſe by learned Phyſicians, but to whoſe remedies, approved by reaſon and experience, the malignity of the diſeaſe and the rebellious virulency hath refuſed to yeeld, is to be thought uncurable, eſpecially, if to theſe ſo many evils, this bee added, that the patient bee almoſt waſted with a conſumption and hectick leanenеſſe, by reaſon of the decay of the native moiſture. Wherefore you muſt onely attempt ſuch by a palliative cure; yet bee wary here in making your prognoſticke: for many have beene accounted in a deſperate caſe, who have recovered; for by the benefit of God and nature, wonders oft-times happen in diſeaſes. Young men who are of a rare or laxe habit of body are more ſubject to this diſeaſe, than ſuch as are of a contrary habit and complexion. For as not all who are converſant with ſuch as have the Plague, or live in a peſtilent aire, are alike affected; ſo neither all who lye or accompany with ſuch as have the *Lues venerea*, are alike infected or tainted. The paines of ſuch as have this diſeaſe, are farre different from the paines of the Gout. For thoſe of the Gout returne and torment by certaine periods and fits, but the other are continuall and almoſt alwaies like themſelves; Gouty paines poſſeſſe the joynts, and in theſe condenſe a plaſter-like matter into knots; but thoſe of the Pocks are rather faſtened in the middeſt of the bones, and at length diſſolve them by rottenneſſe and putrefaction. Venereous ulcers which are upon the yarde are hard to cure, but if being healed, they ſhall remaine hard and callous, they are ſignes of the diſeaſe lying hidde in the body.

The ſignes of an uncurable one.

How theſe pains differ from thoſe of the gout.

The *Lues venerea* bcomes more gentle than formerly it was.

Generally, the *Lues venerea* which now reigneth is farre more milde and eaſie to bee cured than that which was in former times, when as it firſt began amongſt us: beſides, each day it ſeemeth to bee milder than other. Aſtrologers think the cauſe hereof to bee this, for that the cœleſtiall influences which firſt brought in this diſeaſe, in ſuccceſſe of time by the contrary revolutions of the Starres, loſe their power and become weake; ſo that it may ſeeme ſomewhat likely, that at length after ſome few yeares it may wholly ceaſe; no otherwiſe than the diſeaſe termed *Mentagra*, which was very like this in many ſymptomes, and troubled many of the Romans in the raigne of *Tiberius*; and the *Lichen*, which in the time of *Claudius* (who ſucceeded *Tiberius*) vexed not onely *Italy*, but all *Europe* beſides. Yet Phyſicians had rather take to themſelves the glory of this leſſe raging diſeaſe, and to referre it to the many and wholſome meanes, which have beene invented, uſed and oppoſed thereto by the moſt happy labours of noble wits.

CHAP. VI.

How many, and what meanes there are to oppugne this diſeaſe.

Why the decoction of *Guajacum* is not ſufficient to impugne the diſeaſe.

MAny ſorts of remedies have beene found out by many to oppugne and overcome this diſeaſe. Yet at this day there are onely foure which are principally uſed. The firſt is by a decoction of *Guajacum*; the ſecond by unction; the third by emplaſters, and the fourth by fumigation; all of them by *Hydrargyrum*, the firſt excepted. Yet that is not ſufficiently ſtrong and powerfull; for experience hath taught, that the decoction of *Guajacum* hath not ſufficient ſtrength to extinguiſh the venome of the venereous virulency, but onely to give it eaſe for a time; for becauſe it heates, attenuates, provokes ſweate and urine, waſtes the excrementitious humours by drying them, it ſeemeth to cure the diſeaſe, for that thereupon, for ſome time, the paine and all other ſymptomes ſeeme more remiſſe; but theſe endeavours are weake and deceitfull, as whereby that only which is more ſubtle in the humours in fault, is exhauſted and diſperſed by ſweat.

Hydrargyrum is ſufficient to overcome the diſeaſe.

But *Hydrargyrum*, as a certaine higher power, conteines therein all the power of *Guajacum*, yet much more excellent and efficacious; for beſides that it heats, attenuates, cuts, reſolves and dryes, it provokes ſweat and urine, and beſides it expels noxious humours upwards and downewards, by the mouth and ſtoole. By which evacuations not onely the more ſubtle, but alſo the more groſſe and fœculent excrements, wherein the ſeat of this diſeaſe is properly fixed, are diſperſed and evacuated; by which the Phyſician may bee bold to aſſure himſelfe of certaine victory over the diſeaſe. But after the uſe of the decoction of *Guajacum*, freſh paines and knots ariſe by the reliques of the more groſſe and viſcous humours left in the cavities of the entrailes; but *Hydrargyrum* leaves no reliques behind it.

CHAP. VII.

How to make choice of the wood Guajacum.

The faculty.

THat is preferred before the reſt, which is of a great logge, of a dusky colour, new, gummy, with a freſh ſtrong ſmell, an acride and ſomewhat biting taſte, the barke cleaving very cloſe to the wood. It hath a faculty to heat, rarifie, attenuate, attract, to cauſe ſweat, and move urine, and beſides by a ſpecifick property to weaken the virulency of the *Lues Venerea*.

The parts.

The hot and fiery faculty of the barke.

There are three ſubſtances taken notice of in this wood: the firſt is the barke, the other is a whitiſh wood which is next to the barke, the third is the heart of the wood, that is, the inner, blackiſh, and more dusky part thereof. The barke is the more dry, wherefore you ſhall uſe it whenas you would dry more powerfully; the middle ſubſtance is more moiſt, becauſe it is more ſucculent and fat; that which lyeth betweene both is of a milde temper. Wherefore the two laſt are more convenient for delicate natures and rare bodies, which require leſſe drying. Furthermore, the barke muſt be given to denſe and ſtrong natures, that by the more fierie force thereof, the humours may be made more fluide, and the paſſages of the body more paſſable. But I would here bee underſtood to meane ſuch barke as is not putride and rotten with age, to which fault it is very ſubject, for that long before it bee ſhipped by our people, the wood lyeth in heapes upon the ſhore in the open aire, untill they can finde chapmen for it; which, when it is brought aboard, it is ſtowed in the hold or bottome of the ſhip, where beneath by the ſea through the chinkes of the bords, and above by the mariners, it uſually gathereth much dirt. When it is brought hither to us, it is bought and ſold by weight, wherfore that it may keep the weight, the Druggiſts lay it up in vaults and cellars under ground, where the ſurface thereof bedewed with much moiſture can ſcarce eſcape mouldineſſe and rottenneſſe. Wherefore I doe not like to give the decoction either of the barke or wood which is next thereto to ſickle people.

CHAP. VIII.

Of the preparation of the decoction of Guajacum.

First you muſt have your *Guajacum* ſhaved into ſmall pieces, and to every pound of the ſhavings, adde of faire water eight, ten, or twelve pints, more or leſſe as the nature of the party, and condition of the diſeaſe ſhall ſeeme to require, according to the rule of the formerly mentioned indications. Let the water be hot or warme, eſpecially if it be in winter, that ſo it may the more eaſily & throughly enter into the body of the wood, & draw into it ſelfe the faculties thereof in the ſpace of twenty foure houres, wherein it is macerated; then boyle it *in balneo*, to avoyd *empyreuma*, or taſte of fire, which it will contract by boyling it over a hot fire. Yet ſome nothing regard this, but thinke the patient ſufficiently ſerved, if they make a decoction in an earthen pot well glaſed, over a gentle fire, ſo that no part of the liquor may runne over the mouth of the veſſel, for that thus ſo much of the ſtrength of the decoction might vaniſh away. Howſoever it be made, let it be boyled to the conſumption of half, a third, or fourth part, as the nature of the patient, & diſeaſe ſhall ſeem to require. There be ſome who mixe divers ſimples therwith, which have an occult and proper ſimpathy with that part of the body which is principally hurt by the diſeaſe, which at the leaſt may ſerve inſtead of a vehicle to carry the faculties of the decoction thither where the diſeaſe moſt reigneth. Others adde thereto purging medicines, whoſe judgement I cannot approve of, for that I thinke it is not for the patients good to attempt two evacuations at once, that is, to expell the humors by ſweat by the habit of the body, and by purging by the belly; for that as much urine, ſo alſo much ſweat ſhewes little evacuation by ſtoole. For theſe two motions are contrary, which nature cannot brooke at once. For purging drawes from the circumference to the Center, but ſweat runs a quite contrary courſe, and this is the opinion of many & great phyſicians. This firſt decoction being boyled out, & ſtrained the like quantity of water ſhall be put to the ſtuffe, or maſſe, that ſo being boyled again without any further infuſion, & ſtrained, with the addition of a little cinamon for the ſtrengthening of the ſtomacke, the patient may uſe it at his meales, and betweene his meales, if he be dry, for his ordinary drinke. The quantity of the firſt decoction to be taken at once, ought to be ſome five or ſixe ounces, and it ſhall be drunke warm, that ſo it may be the ſooner brought into action, and leſt the actuall coldneſſe ſhould offend the ſtomacke; and then the patient being well covered, ſhall keep himſelf in bed, and there expect ſweat, which if it come ſlowly on, it ſhall bee helped forwards with ſtone bottles filled full of hot water, and put to the ſoles of the feet. If any parts in the interim ſhall bee much pained, they ſhall bee comforted by applying of ſwines bladders halfe filled with the ſame decoction heated. Neither will it bee unprofitable before the decoction bee drunke, to rubbe over all the body with warme linnen clothes, that by this meanes the humours may be attenuated, and the pores of the skinne opened. When he ſhall have ſweat ſome two houres, the parts oppoſite to the grieved places, ſhall firſt be wiped, then preſently, but more gently, the grieved parts themſelves, leſt a greater confluxe of humours flow thereto. Theſe things being done, he ſhall keep himſelf in bed, ſhunning the cold aire untill he be cooled and come to himſelfe againe, ſome two houres after, hee ſhall ſo dine, as the diſeaſe and his former cuſtome ſhall ſeeme to require; ſixe houres after, betaking himſelfe to his bed, hee ſhall drinke the like quantity of the decoction, and order himſelfe as before. But if he be either weake, or weary of his bed, it ſhall bee ſufficient to keepe the houſe without lying downe; for although he ſhall not ſweate, yet there will be a great diſſipation of the vapours, and venenate ſpitits, by inſenſible tranſpiration; for the *Lues venerea* by the onely communication of theſe, often times catcheth hold, and propagates it ſelfe in lying with a bedfellow tainted therewith. But as it is requiſite to have let blood, and purged the body by the adviſe of a phyſitian, before the taking of the decoction of *Guajacum*; ſo whileſt hee doth take it, it much conduceth to keepe the belly ſoluble

The proportion of the *Guajacum* to the water.

Why the decoction ought to be performed with a dry heat.

Whether it bee fit to adde purges to a decoction of *Guajacum*.

Hip. aph. ult. ſect. 6.

How, and in what quantity this decoction muſt be taken.

How to dry the ſweat of the body.

(which

How long this decoction muſt be uſed.

The manner of diet.

(which is much bound by the heat & drineſſe of ſuch a drink) and to preſerve the purity of the firſt veines by a glyſter, or laxative medicine taken every fifth, or ſixt day. But for the uſe of it, we muſt warily obſerve, taking indication not onely from the malignity, and contumacy of the diſeaſe, but alſo from the particular nature of the patient; for ſuch as have their body waſted by heat and leaneneſſe, and their skinne dry and ſcaily (whence you may gather a great aduſtion of the humours, and, as it were, a certaine incineration of the habit of the body) muſt more ſparingly make uſe of theſe things, but rather temper the body by humecting things taken inwardly, and applyed outwardly, as bathes, ointments without quickſilver, and other ſuch like things. And then a very weake decoction of *Guajacum* ſhall bee uſed for a few dayes before your unction with Quicke-ſilver. A more plentifull diet, as it drawes forth the diſeaſe, which of its owne nature is long, ſo a more ſparing and ſlender diet makes the ulcers more rebellious and contumacious, by a hecticke drineſſe.

To whom, and what manner of wine may be allowed.

The deſcription of China.

The preparation.

Of *Sarſaparilla.*

Therefore a middle courſe muſt be kept, and meats made choice of which are fit, and naturally engender good and laudible juice in the body. For it is not only great ignorance, but much more cruelty, to goe about to conteine all patients without any difference, within the ſtrait allowance of four ounces of Ship-bisket, and twelve damaske prunes: for I judge it farre better to diet the patient with Lambe, Veale, Kid, Pullets, fat Larkes, and Blacke-birds, as thoſe which have a farre greater familiarity with our bodies, than Prunes and the like Junkets. Let his bread bee made of white wheat, well leavened, neither too new, or tough, neither too old or hard. Let his drinke be made of the maſſe, or ſtrainings of the firſt decoction of *Guajacum* boiled with more water, as was formerly mentioned; yet if there ariſe any great weakeneſſe of the faculties, you may permit the uſe of ſome little wine, drinking eſpecially before each meale a cup of the laſt mentioned decoction. Let him avoyd ſleepe preſently after meat, for ſo the head is filled with groſſe vapoures. Paſſions or perturbations of the mind muſt alſo be avoyded, for that by theſe the ſpirits are inflamed and diſſipated; all delights of honeſt pleaſure are to be deſired, but venery wholly avoyded, as that which weakens all the nervous parts. Many in ſtead of a decoction of *Guajacum*, uſe a decoction of *China*. Now this *China* is the roote of a certain ruſh, knotty, rare, & heavie, when it is freſh, but light when it is waxed old; it is alſo without ſmell, whence many judge it voyd of any effectuall quality, it is brought into uſe out of *India*; it is thus prepared, it is cut into thin round ſlices, boyld in fountaine or river water, and is given to patients to drink morning and evening after this manner. ℞. *rad. chin. in taleol. ſect.* ℥ ii. *aquæ font.* ℔ xii. *infundantur per hor.* xii. *& coquantur ad conſumption. tertiæ partis.* Let him take ℥ vi. in the morning, and ſo much at night; let him expect a ſweat in his bed: a ſecond decoction may be made of the maſſe remaining of the firſt, but with a leſſe quantity of water put thereto, which alſo by longer boyling may draw forth the ſtrength remaining in the maſſe, & be uſed at meals for ordinary drink. There are ſome who make a third decoction therof, but that is wholy unprofitable and unuſefull. *Sarſaparilla* is prepared alſo juſt after the ſame manner.

Chap. IX.

Of the ſecond manner of curing the Lues venerea, *which is performed by friction, or unction.*

When the body muſt be, prepared with humecting things before unction.

THe cure of the *Lues venerea* which is performed by unction and friction is more certaine, yet not in every kinde, condition and ſeaſon thereof. For if the diſeaſe bee inveterate from an humour, tough, groſſe, viſcous, and more tenaciouſly fixed in the ſolid parts, as you may gather by the knotty tumours of the bones; for then we are ſo farre from doing any good with a friction uſed at the firſt, that on the contrary wee bring the patient in danger of his life, unleſſe we ſhall have firſt prepared the humour to expulſion, by emollient & digeſting things firſt uſed. But if it be lately taken with moveable paines, puſtles, and ulcers in the jawes, throate, and privie parts, then may it be eaſily cured without ſuch preparatives, eſpecially if the humour be ſufficiently obedient, and as it were prepared of it ſelfe, and its owne nature. Therefore firſt uſing generall medicines, you may afterwards come to uſe the unction with *Hydrargyrum.*

CHAP. X.

Of the choice, preparation and mixing of Hydrargyrum.

H*ydrargum* which is cleere, thinne, white and fluide, is the beſt: on the contrary, that which is livid, and not ſo fluide, is thought to be adulterated by the admixture of ſome lead. That it may be the purer, ſtraine it through ſome ſheepes leather, for by preſſing it, when it is bound up, it paſſeth through by its ſubtlety, and leaves the filth and leaden droſſe behinde it on the inſide. Then it may be boyled in vinegar with ſage, roſemary, time, chamomile, melilote, and ſtrained againe, that ſo many waies cleanſed, it may enter into ointments and plaiſters. To kill it more ſurely, it ſhall bee long wrought, and as it were ground in a mortar, that it may bee broken and ſeparated into moſt ſmall particles, that by this meanes it may not bee able to gather it ſelfe into the former body: to which purpoſe you may alſo adde ſome *ſulphur*, or ſublimate, as we ſhall ſhew hereafter. It is moſt uſually mixed with hogs greaſe, adding thereto ſome oyle of turpentine, nutmegs, cloves, ſage, and *Galens* treacle. If a *Leucophlegmatia* together with the *Lues venerea* affect the body, then hot, attenuating, cutting, and drying things ſhall be added to the medicine, which ſhall be provided for unction; the ſame ſhall be done when as we would have it to enter into the ſubſtance of the bones. But if the patient be of a cholericke temper, and his blood eaſie to be inflamed, you ſhall make choice of leſſe hot, attractive and diſcuſſing things. As when the body ſhall be repleniſhed with knotty and ſcirrhous tumours, or ſqualide by exceſſive dryneſſe, then ſhall emollient and humecting things bee mixed therewith. But that ſuch ointments may have a better conſiſtence, I uſe to adde to each pound thereof, four, five, or ſixe yolkes of hard egges. Therefore this ſhall be the forme of the ointment called Vigoes. ℞. *axung. porci,* ℔ i. *olei chamæm. anethi, maſtich. & laurini, an* ℥ i. *ſtyrac. liquid.* ʒ x. *rad. enulæ, camp. parum tritæ, & ebuli, an.* ℥ iii. *pul. euphorb.* ℥ ß. *vini oderif.* ℔ i. *bulliant omnia ſimul uſque ad conſumptionem vini, deinde colentur: colaturæ adde lythargyræ auri,* ℥ vi. *thuris, maſtich. an.* ʒ vi. *reſ. pini,* ℥ i ß. *tereb. venet.* ℥ i. *argenti vivi,* ℥ iv. *ceræ albæ,* ℥ i ß. *liquefactis oleis, cum cera incorporentur omnia ſimul, fiat linimentum ad uſum.* Or elſe, ℞. *argenti vivi præparati,* ℥ vi. *ſublimiti,* ʒ ß. *ſulphuris vivi,* ℥ ß. *axung. porci, ſalis expertis,* ℔ i. *vitellos ovorum ſub cineribus coctorum,* nu. iii. *olei terebinth. & laurini, an.* ℥ ii. *theriac. vet. & methridat.* ℥ ß. *fiat linimentum ut artis eſt.* You ſhall compoſe it thus, firſt the *ſublimatum* and *ſulphur* ſhall be finely poudered, then ſome part of the *Argentum vivum* and hogs greaſe put to them, then preſently after, ſome of the hard yolkes of egges, continually and diligently ſtirring and mixing them all together. All theſe being well incorporate, adde ſome more *argentum vivum*, hogges greaſe, and yolks of egges, and incorporate them with the former; at the laſt adde the oiles, then Treacle, and Mithridate, and ſo let them all be beaten together for a whole daies ſpace, and thus you ſhall make an ointment of a good conſiſtence, which I have often uſed with good ſucceſſe. Yet the hogges greaſe ſhall be firſt boyled with the hot herbs good for the ſinewes, as ſage, roſemary, time, marjerome, lavander, and others which the ſeaſon affoords. For ſo the *axungia* acquires a more attenuating faculty, and conſolidating of thoſe parts which the *Lues venerea* afflicts. Beſides, when unguents are made for this purpoſe, that ſuch virulency may be drawne from within outwards, by ſweats and tranſpiration through the pores of the ſkinne, no man need doubt, but that they ought to be furniſhed with relaxing, rarifying, and attractive faculties. But *axungia*, beſides that it is very fit to kill the *argentum vivum*, it alſo relaxeth and mollifieth. Now *Oleum laurinum, de ſpica, rutaceum,* rarifie, digeſt, and aſſwage paine. Turpentine alſo extinguiſheth

guiſheth, and bridleth the *argentum vivum*, moderately heates, reſolves and ſtrengthens the nervous parts. But *argentum vivum* is the proper antidote of the *Lues venerea*, as that which cures it howſoever uſed, drying by the ſubtlety of the parts, and provoking ſweat. Verily Treacle and Methridate ſomewhat conduce to retund the virulency of this diſeaſe, but unleſſe *argentum vivum* aſſiſt as a ferret to hunt, and an *alexiterium* to impugne the diſeaſe, they can doe no great matter.

Chap. XI.

How to uſe the Unction.

THe body and humours apt to cauſe or nouriſh a *plethora* or inflammation, being prepared by digeſtive ſyrupes, and evacuated by purging and bleeding as is fitting, according to the direction of ſome Phyſitian, the patient ſhall be ſhut up in a parlour or chamber, hot either by nature or art, & free from cold blaſts of wind. For cold is moſt pernitious in this diſeaſe, both for that it hurts the nervous parts, already ill affected by reaſon of the diſeaſe, as alſo for that it leſſens the efficacy of medicines. Wherefore many doe ill in this, who, whether in winter or ſummer, anoint their patients in a large room, expoſed on every ſide to the winds. They deale ſomewhat more wiſely, who put a cloath faſtened like halfe a tent preſently behinde the patient, though anointed by the fire ſide, ſo to keep away the cold aire from him. Yet it is ſafeſt to ſet, and anoint the patient either in a little roome, or elſe in ſome corner of a large roome, ſeparated from the reſt of the room by ſome hangings, and building a ſtove, or making ſome fire therein, for ſo he may ſtand or ſit as he beſt likes, the longer, and with the leſſe offence, and be equally heated on every ſide, whereas ſuch as are anointed in a chimney by a fires ſide cannot but be heated unequally, being ready to burne on the one ſide, whileſt the other is cold, which motions are contrary and hurtfull to that we require: beſides, if the patient ſhall bee weake, hee cannot ſtand and endure the heat of the fire. Or if hee bee ſhamefac't, he will bee unwilling to ſhew all his body at once naked to the Surgeon, but he may without any harme, and with modeſty, lying on a bed in a little roome, wherein a ſtove is made, have all his limmes anointed about the joints, and preſently bound up, either with ſtoupes, or carded cotton, or browne paper.

Cold moſt hurtfull to ſuch as are troubled with the *Lues venerea*.

Chap. XII.

What cautions to be obſerved in rubbing or anointing the patient.

HE ſhall be anointed or rubbed over with the ointmēt in the morning, the concoction & diſtribution of the meat being perfected, which functions otherwiſe would not be well performed, the powers of nature being diſtracted into ſeverall operations. Yet if the patient ſhall be weak, you may ſome houre before the unction, give him ſome gelly, the yolk of an egge, or ſome broath made of meate, boiled to pieces, but very ſparingly, leſt nature, intent upon the concoction of ſolid meats, or in great quantity, ſhould bee drawne away from that which we intend. At firſt let onely the joints of the limmes be anointed, as about the wreſts, elbowes, knees, anckles, ſhoulders. But afterward, if the patient ſhall be more ſtrong, and a greater commotion of the humours and body ſeem neceſſary, the emunctories of the principall parts may alſo be anointed, and the whole ſpine of the backe; yet having much care, and alwaies ſhunning the principall and noble parts, leſt we ſhould doe as thoſe butcherly Empericks doe, who equally, and in like manner daube and rubbe over all the body, from the ſoles of the feete, to the crowne of the head: moreover, diligent regard muſt bee had of thoſe parts, which are ſeazed upon by the ſymptomes of this diſeaſe, that they may bee more anointed, and that it may be more throughly rubbed in. Yet you muſt al-

waies begin your anointing or rubbing at thoſe parts which are leſſe offended, leſt the humours ſhould be drawne in greater meaſure to the grieved part. And as gentle frications do not ſufficiently open the pores of the skin, ſo more ſtrong and hard ones ſhut them up, cauſe paine, and more plentifully attract the morbificke matter. Wherefore it will be more convenient to uſe moderate frictions, taking indication from the ſtrength of the patient, as that whereto we muſt ſtill have the chiefe regard. There is alſo another thing wherto the phyſitian & Surgeon muſt diligently attend, as that, which if it be not carefully prevented, will either haſten the death of the patient, or make him ſubject to a relapſe; that is, the quantitie of the remedies and unctions, and the number of the frictions. Which conſideration, together with that which is of the degrees of the temperaments of the whole body, and each part thereof, much troubles and exerciſeth the mindes of good Phyſitians, and maketh the art conjecturall, it is ſo farre from being attained to by Empericks. Yet we muſt endeavour by method and reaſon, that by the rule of indications ſo frequently mentioned, we may attaine to the knowledge thereof, as neare as may bee. For to have perfect knowledge hereof, and to ſay that thoſe need only foure, others five, and other ſome ſixe, more or fewer frictions at the beginning, which Empericks commonly doe, is a thing both impoſſible and vaine. All theſe muſt bee changed and ordered according to the malignity and continuance of the diſeaſe, and the condition of the affected bodies. Verily wee muſt ſo long uſe frictions and unctions, untill the virulent humours bee perfectly evacuated by ſpitting and ſalivation, by ſtoole, urine, ſweat or inſenſible tranſpiration. Which you may underſtand by the falling away & drying up of the puſtles and ulcers, and the ceaſing of the paines and other ſymptomes proper to this diſeaſe. In many, by reaſon of the more denſe and compact habite of the body, nature is more ſlow in excretion. Yet I have learnt by long experience that it is beſt to anoint and chafe ſuch twice in a day, to wit, morning and evening, ſixe houres after meate. For ſo you ſhall profit more in one day, than by the ſingle frictions of three dayes. But on the contrary, I have often, and with good ſucceſſe, rubbed over but each other day more rare and delicate bodies, giving them one or two dayes reſt to recollect their ſtrength, which by the too much diſſolution of their ſpirits becomming too weak, were not ſufficient to expell the relicks of the morbifick matter. And certainly about the end of the appointed friction, eſpecially when as the patients begin to fluxe at the mouth, the bodies, together with the noxious humors are made ſo fluid by the means of the precedent frictions, that one friction is then more efficacious, than two were at the beginning. Therefore as *Galen* bids, when as the diſeaſe is great, and the ſtrength of the patient infirme, that wee ſhould part our blood lettings, and draw a little and a little at once; ſo alſo here when as we ſhall obſerve nature ſtirred up, and ready bent to any kinde of evacuation by the mouth, ſtoole, or other like, you ought not to uſe any unction or friction oftner than once in a day, yea certainely it will bee better to intermit for ſome few dayes. For thus *Maſſa* reports, that there was a certaine man who almoſt waſted with a conſumption, being continually afflicted with the moſt grievous paines of this diſeaſe, & reputed in a deſperate caſe by other phyſitians, was notwithſtanding at length recovered by him, when as hee had anointed him thirty ſeven times, putting ſome time between for the recovery of his ſtrength. I my ſelf have obſerved others, who thus, by the interpoſition of one or two dayes, being rubbed over ſome fifteene or ſeventeene times, have perfectly recovered. Wherefore you muſt take this courſe in reſolved and weake bodies, yet in the interim muſt you have a care, that the frictions bee not too weak, and ſo few, that the morbifick cauſe may not be touched to the quick: for in this kinde of diſeaſe nature doth not of it ſelfe endeavour any Criſis, or excretion; it requires the auxiliary forces of medicines, by whoſe aſſiſtance it may expell all the malignity. Theſe are ſignes of ſuch a Criſis, either at hand, or already preſent, if the patient be ſo reſtleſſe, ſo loath all things, that hee cannot remaine in one place either ſtanding or lying, he can neither eat nor drinke, if he be oppreſſed with a continuall wearineſſe, almoſt ready to ſwoune, yet have a good and equall pulſe, and gripings in his belly afflict him with bloody & viſcous dejections, untill at length nature after one or two dayes, portion of the morbifick matter being ſpent, be ſomwhat

Where to begin the unction.

What it is that maketh the art of Phyſick conjecturall.

Who muſt be rubbed over once, who twice in a day, and who but every other day.

Lib. de venæ ſect.

Nature is not ſufficiently able to expell the virulent matter.

Signes that the criſis is nigh.

freed, and all paines and ſymptomes ſo much abated, as the excretions have proceeded. But whereas medicines are not ſufficient in number or ſtrength, there followes an unperfect *Criſis*, which leaves behind it ſome relicks of the morbifick matter, which like leven do ſo by little & little infect the whole maſs of the humors, that oft-times after ten years ſpace, the diſeaſe riſeth as out of an ambuſh, or lurking hole, and becomes farre worſe than before. But wee muſt in like maner have a care leſt theſe medicines, that are either given inwardly, or applyed outwardly, be not too ſtrong: for by cauſing ſuch colliquation of the radicall moiſture and ſolid parts, many have been brought into an incurable conſumption. In others ſordid and putride ulcers have thence ariſen in the mouth, which having eaten a great part of the pallate and tongue, have degenerated into a deadly *Cancer*. In others hereupon the tongue hath ſo ſwelled up, that it hath filled the whole capacity of the mouth, ſo that it could not be bended to any part of the mouth for chawing, whereupon they have by little and little beene famiſhed. In other ſome there hath beene cauſed ſo great colliquation of humours, that for a whole moneth after, tough and filthy ſlaver hath continually flowed out of their mouths. Other ſome have the muſcles of their jawes relaxed; others troubled with a convulſion, ſo that during the reſt of their lives they can ſcarce gape. Others by loſing a portion of their jaw, have loſt ſome of their teeth. But you muſt not alwaies ſo long anoint and chafe the body, untill a fluxe of the mouth or belly appeare. For you may finde ſundry perſons, who, if you ſhould anoint or rub them to death, you cannot bring them to fluxe at the mouth; yet theſe will recover notwithſtanding, excretion being made either by inſenſible tranſpiration, or evacuation of urine, or ſome gentle fluxe of the belly, either procured by art, or comming of it ſelfe. In which caſe I have obſerved that many have received much good by a purging decoction of *Guajacum*, adminiſtred according to the quantity of the peccant humor, and given for ſome dayes in the morning, adding thereto white wine, if the body abounded with tough and viſcide humours. Dyſenteryes, or bloody fluxes cauſed by unctions, may be helped by Glyſters, wherein much hogs-greaſe is diſſolved to rotund the acrimony cauſed by the medicine and humor which nouriſheth the Dyſentery. Alſo new Treacle diſſolved in new milke, is thought wonderfully to mitigate this ſymptome.

Inconveniences following upon immoderate unctions.

For what perſons a purging decoction of *Guajacum* is good.

The cure of a Dyſentery occaſioned by too ſtrong friction.

Chap. XIII.

Of the third manner of Cure, which is performed by cerates, and emplaſters, as the ſubſtitutes of unctions.

For that ſundry by reaſon of the name, abhorre the uſe of friction, which is performed by the forementioned ointments, therefore there is found out another manner of cure, by cerates and emplaſters, as ſubſtitutes of Frictions, but that uſually is ſomewhat ſlower: for which purpoſe it is not needfull onely to uſe the things which are deſcribed by *Vigo*, but you may alſo deviſe other, which are more or leſſe anodyne, emollient, attenuating, diſcuſſing, or drying, according to the condition of the preſent diſeaſe, ſymptomes, humors and patient, never omitting *Hydrargyrum*, the onely antidote of this diſeaſe. Such emplaſters mitigate paines and knots, and reſolve all hardneſſe, and are abſolutely very effectuall, for continually ſticking to the body, they continually operate. Wherefore they are of prime uſe in relapſes of this diſeaſe, or when the humours are thicke and viſcous, or otherwiſe lye deepe in the body, and very difficult to roote out. But for that they worke more ſlowly oft times, ſuch as uſe them are forced at length to uſe ſome frictions to ſtimulate nature, and cauſe the ſpeedier excretion. Yet in ſome whoſe bodies and humours have beene fluid, either by nature or art, the applyed emplaſters have in three dayes ſpace procured evacuation ſufficient for the diſeaſe, ſo that if they had not beene taken away, they would have cauſed a colliquation, like that which we lately mentioned in too violent friction. Wherefore you ſhall

The cure by emplaſters more ſlow.

In what caſe they are chiefly uſefull.

The deſcription of an emplaſter.

ſhall uſe the like diſcretion in taking off theſe, as you uſe in your unctions and friction. In ſtead of *Emp. de Vigo*, this following may be fitly uſed. ℞. *maſſæ emp. de melil. & oxycrocei, an.* ℔ß. *argenti vivi extin.* ℥ vi. *oleo laurino, & de ſpica, reducantur ad formam emplaſtri.* Theſe plaſters muſt be equally ſpread upon leather, and layd upon the ſame places of the joints, as were formerly mentioned in the cure by frictions. Yet ſome there bee, who cover with the plaſter all the arme, from the hand even to the ſhoulder, and all the legge, from the toppe of the knee, even to the ends of the toes, which thing I doe not diſallow of, if ſo bee that the places of the joints bee covered over with a thicker plaſter. They muſt bee left ſticking there ſo long, untill nature be ſtirred up and provoked to cauſe excretion of the virulent humours. Yet if in the interim, great itching ſhall ariſe in the parts, you may take them off ſo long untill the parts ſhall be fomented with a decoction of the flowres of chamomile, melilote, red roſes, and the like, made in wine, to diſcuſſe that which cauſed the itching, and then you may lay them on againe. Some, to hinder the riſing of any itch, lay not the bare plaſter to the part, but cover it over with ſarcenet, ſo to keepe it from ſticking, and thus intercept the tranſpiration of the part, the cauſe of itching. They ſhall bee ſtronger or weaker, and lye to the part a longer or ſhorter ſpace, as long as the indications, ſo often formerly mentioned, ſhall ſeem to require. The effects of emplaſters are the ſame as of frictions, for they cauſe excretion, one while by inſenſible tranſpiration, otherwhiles by a *Diarrhæa*, or fluxe of the belly; ſometimes by urines, but moſt frequently (which *Criſis* is alſo moſt certaine) by ſalivation. Sordide and virulent ulcers often breed in the mouth, tongue, pallate, and gummes by ſalivation, by reaſon of the acrimony of the virulent humors adhering to the ſides of the mouth: to hinder the growth of theſe, many inject glyſters made of emollient things, eſpecially at the beginning of the ſalivation, ſo to draw downwards the humours forcibly flying up in greater quantity than is fit, although the part it ſelfe may endure them.

What excretion beſt in this diſeaſe.

To avoyd the ulcers of the mouth.

To cure them.

There are alſo ſome, who to the ſame end give a purging medicine at the very time when as the humours are ready to move upwards, the which I thinke is not a ſafe courſe. The cure of ſuch ulcers is farre different from the cure of others. For they ought by no meanes to bee repercuſſed or repelled, how enflamed ſoever they be, but onely to bee mitigated by anodyne gargariſmes, ſo onely to leſſen the heat, and that by this frequent waſhing of the mouth, you may hinder the ſticking or furring of viſcide humours to ſuch like ulcers. A decoction of barly, cowes milk warm, held and gargled in the mouth, the mucilages of the ſeeds of mallowes, marſh-mallowes, *pſilium*, lettuce, line extracted in the water of barly, mallowes, and pellitory of the wall, are good for this purpoſe; for thus the ulcers become more milde, and the tenacity of the adherent humours is looſed. You muſt at the firſt beware of ſtrong detergent medicines, for almoſt all ſuch have acrimony joyned with them, which will encreaſe the pain, but chiefly in the ſtate of the diſeaſe: for ſo, the ulcers gently cleanſed by frequent gargling, would become worſe by the uſe of acride things. Therefore it ſhall be ſufficient to make uſe of the forementioned medicines, ſo to hinder the encreaſe of the filth, and inflammation of the ulcers, if ſo bee that ſuch ulcers be not too exceeding maligne and burning. For if it ſhall happen either by the powerfull efficacy of the applyed plaſters, or by the violence of nature in its motion of the ill humours upwards, that ſuch ſtore of viſcous, and groſſe humours are carryed to the mouth, that it wants little, but that the part it ſelfe is over-ruled by the morbificke matter, ſo that by the violence and continuance of the fluxe, the mouth and jawes become ſo ſwelled, that a gangrene is to be feared, by hindering the entrance of the ſpirits, and extinguiſhing of the native heat of theſe parts. In this caſe wee are forced to leave the proper cure for to withſtand the accidents, and for this purpoſe we uſe reſtrictive & repelling things, ſuch as are barly water, plantain, night-ſhade, knot-graſſe, ſhepheards Purſe, &c. with ſyrupe of roſes, violets, quinces, berberies, pomegranates, &c. alſo ſuch are the mucilages and decoctions of the ſeeds of lettuce, *pſilium*, quinces, plantaine, cucumbers, melons, white poppy, henbane, in the waters of roſes, plantaine, night-ſhade, water-lillies, wood bine, &c. Alſo it is convenient to procure ſweats by ſtoves, or the application of any hot and dry

Reeſtrictive & repelling gargariſmes.

To dry the ulcers of the mouth.

Manner of diet when the mouth is ulcerated.

To make their drinke nouriſhing.

dry things; for thus the humours which run forth of the veſſels into all the ſurface of the body, are diverted. But when as the courſe of the humours running to the mouth, is beginning to ſtoppe, and the tumours and ulcers begin to leſſen, then nothing hinders, but that we may uſe gently detergent things, as *ſyr. roſarum ſiccarum, mel roſatum, Diamoron, Dianucum*, and the like. But when it is time to dry the ulcers, they may be lightly touched with alome water, or with *aqua fortis*, ſuch as goldſmiths have uſed for the ſeparation of mettals. They may alſo frequently uſe drying gargariſmes made with aſtriction of the waters of roſes, plantaine, night-ſhade, ſheepheards purſe, knot graſſe, and dogges tongue, boiling therein *balauſtia, roſ. rub. myrtil. ſumach. alumen. acacia, berber. gallæ, malicor.* and the like. During the time of fluxing or ſalivation you muſt diet and feed the patient with liquid meats, and thoſe of good juice, and eaſie digeſtion, for that then he can neither chaw, ſwallow, nor digeſt hard things. For nature wholly intent upon the excretion of the noxious and peccant humours, as alſo weakened by the bitterneſſe of paine, watchings, and unquietneſſe, and conſequently a great reſolution of the ſpirits, cannot inſiſt powerfully upon the worke of concoction. Therefore he ſhall be fed with reare new layd egges, caudles of the ſame, barly creames, culeſſes made of a decoction of knuckles of veale, and a capon, and gellyes, and with theſe in ſmall quantity, but frequently adminiſtred, alwaies gargling his mouth before hee eate. For his drinke he ſhall uſe a decoction of *Guajacum* aromatized with a little cinamon, but if any deſire that the drinke ſhall become nouriſhment, for that the patients cannot feed on more ſolid meats, you may give them old wine, claret and thinne, mixed with ſome barly water. Some there are who ſteep ſome crummes of pure manchet in the aforeſaid wine, and then preſſe it out, but yet ſo, that there may ſome part of the bread remain therein, which may make it more nouriſhing, and leſſe ſharpe or acride. Others ſteepe bread hot out of the oven, in wine, for the ſpace of a night, then they diſtill it all over in *balneo Mariæ*; the liquor which firſt comes over is more ſtrong and hot, but that which flowes out afterwards, more milde, and ſuch as the patient may uſe to mixe with his wine without any danger, for his better nouriſhment, and the recovery of his ſtrength.

For to refreſh the ſpirits in fear of fainting, Muskedine, Hippocras, roſe vinegar, and the like, put to the noſe to ſmell to, will be ſufficient, unleſſe peradventure the patient ſhould naturally abhorre ſuch things, for ſo they would rather deject the powers and ſpirits. In the interim you muſt have care of the belly, that you keep it open by gentle and emollient glyſters.

Chap. XIIII.

Of the fourth manner of curing the Lues venerea.

The hurt that followes upon fumigations.

What fumigations good.

SOme have deviſed a fourth manner of curing the *Lues venerea*, which is by *ſuffitus* or fumigations. I doe not much approve hereof, by reaſon of ſundry maligne ſymptomes which thence ariſe, for they infect and corrupt by their venemous contagion, the braine and lungs, by whom they are primarily and fully received, whence the patients during the reſidue of their lives have ſtinking breaths. Yea many while they have beene thus handled, have beene taken hold of by a convulſion, and a trembling of their heads, hands, & legges, with a deafeneſſe, apoplexie, and laſtly miſerable death, by reaſon of the maligne vapours of ſulphur and quickſilver, whereof *cinnabaris* conſiſts, drawne in by their mouth, noſe, and all the reſt of the body. Wherefore I can never approve the uſe of ſuch fumigations which are to bee received in fumes by the mouth and noſtrills for to work upon the whole body; yet I doe not diſlike of that, which is undertaken for ſome one part onely, as to dry up ill conditioned ulcers, which ſo affect it, that they cannot bee overcome by any other meanes, or for to diſperſe or digeſt knots, or to reſolve fixed paines, otherwiſe unmoveable. Theſe fumigations by reaſon of the admixture of *Argentum vivum* have an attenuating, cutting, reſolving, and colliquating faculty. Thoſe who prepare theſe fumigations for the cure of the whole diſeaſe and body, take this courſe. They put the patient under a tent or canopy made cloſe on every ſide, leſt any thing ſhould expire, and they put in unto him a veſſell filled with hot coales, whereupon they plentifully throw *Cinnabaris*, that ſo they may on every ſide enjoy the riſing fume, juſt after the ſame manner as Farriers uſe to ſmoake their horſes for the glaunders: they repeat this every day ſo long, untill they begin to fluxe at the mouth. The principall matter or *baſis* of ſuch fumigations, as we have already noted, is *cinnabaris* conſiſting of *ſulphur* and *argentum vivum* mixed together; there is added alſo, *radix ireos flor. thus, olibanum, myrrha, juncus odoratus, aſſa odorata, maſtiche, terebinthina, & theriaca,* all which have a faculty to reſolve and ſtrengthen the ſpirits, and nature, and correct the ſtench and evill quality of the *argentum vivum*. There are alſo other fumigations made after another manner, but that alſo when as the *argentum vivum* is extinct, and as it were fixt after this manner; let ſome lead bee melted, and let there be powred or put thereto ſome *argentum vivum*, then let it all be poudred, adding thereto Antimony, Aloes, Maſtich, coproſe, orpiment, and Benjamin made into pouder, and framed into Trochiſces with ſome turpentine. Or elſe, ℞. *cinnabaris*, ℥ i. *ſtyracis rub. & calamitæ, nucis moſchat. an.* ʒ iii. *benzoini*, ℥ ß. *excipe terebinthin. fiant trochiſci ponderis* ʒ ii. for the foreſaid uſe. The *terebinthina* is added to incorporate the dry things, and the gums are added to yeild matter to the fume. But virulent ulcers of the *Lues venerea* ſhall not be fumigated before they be cleanſed; alſo this following fumigation is good. ℞. *cinnabaris*, ℥ i. *benzoini, myrrhæ, ſtyracis, olibani, opopanacis, an.* ℥ ß. *maſtiches, macis, thuris, an.* ʒ ii. *excipiantur terebinthina, & fiat ſuffumigium.*

The common manner of uſing them.

The matter of them.

Trochiſces for fumigations.

CHAP. XV.

The cure of the ſymptomes, or ſymptomaticke affects of the Lues venerea, *and firſt of the Ulcers of the Yard.*

Callous and maligne ulcers in this diſeaſe may grow all over the yard; but theſe are far more maligne which ariſe on the prepuce, than thoſe that grow on the *Glans*, or nut of the yard. Now they are rebellious to the common medicines of ulcers which happen other waies, & they are alſo ſubject to turne into a gangrene, ſo that ſundry, who have not in time provided for themſelves by the uſe of *argentum vivum*, are forced for their negligence to ſuffer the loſſe of their *Glans*, and oft times of their whole yard. Yet I am of opinion that I thinke we muſt begin the cure of all ulcers of the yard with the generall remedies of ulcers. For all ulcers ariſing in theſe parts by reaſon of copulation, are not virulent. But when as we ſhall finde that we doe no good by this meanes, and that the diſeaſe notwithſtanding growes worſe and worſe, then muſt we come to make uſe of ſuch things as receive *argentum vivum*, that by theſe we may reſiſt the virulency which is ready to diſperſe it ſelfe over all the body, yet it is abſolutely neceſſary that all theſe things be endued with ſuch faculties as may retund the maligne acrimony of this venome, ſuch an one is this following *collyrium* of *Lanfranck*. ℞. *vini albi*, ℔ i. *aq. roſ. & plantag. an.* quart. i. *auripig.* ʒ ii. *viridis æris*, ʒ i. *aloes, myrrhæ, an.* ℈ ii. *terantur ſubtiliſsime, & fiat collyrium.* Alſo theſe ulcers may bee profitably touched with mercury water, or *aqua fortis* which the Goldſmiths have uſed, or elſe mercury in pouder, or our *ægyptiacum*: but the falling away of the Eſchar ſhall bee procured with *baſilicon*, or freſh butter. Yet I think it not fit to uſe theſe acrid things without very great caution, for fear of a gangrene, which eaſily happens to this part. But if ſuch ulcers are ſo ſtubborne, that they will not yeild to theſe remedies, then muſt we come to the friction or unction of the groines, *perinæum*, and ulcers, with the ointments formerly preſcribed for the generall friction. Alſo fumigations may bee made, as wee mentioned in the former chapter. For thus at length the malignity of the virulent humour will be overcome, and the callous hardneſſe mollified; and laſtly

The ulcers of the prepuce more maligne than thoſe of the *Glans*.

Lanfranckes *Collyrium*.

ly the ulcers themſelves cleanſed, and being cleanſed, conſolidated. Sometimes after the perfect cure of ſuch ulcers, there will appeare manifeſt ſignes of the *Lues venerea* in many, which ſhewed not themſelves before, for that the virulency flowed forth of the running ulcers, and now this vent being ſtopt, it flowes backe into the body, and ſhewes ſignes thereof in other parts; and theſe men have need of a generall unction.

Chap. XVI.

How a Gonnorhœa *differeth from a * virulent ſtrangury.*

* This which by our Author is here termed *ſtranguria virulenta*, & in Frēch *Chaudepiſſe*, is the ſame which by other Authors is uſually termed *Gonnorrhœa virulenta*, & by us vulgarly in Engliſh the running of the Reines.

EVen to this day very many have thought that the virulent ſtrangury hath ſome affinity with the *Gonnorhœa* of the Ancients, but you ſhall underſtand by that which followes, that they are much different. For a *Gonnorhœa* is an unvoluntary effuſion of ſeed running from the whole body to the genitals, by reaſon of the reſolution and palſey of the retentive faculty of theſe parts, as it is delivered by *Galen, lib. de loc. affect.* This diſeaſe befalleth others by the collection of the bloud and ſeminall matter by the veſſels of the whole body, which not turning into fat and good fleſh, takes its courſe to the genitals; but on the contrary, a virulent ſtrangury is a runnning, or rather dropping out of the urenary paſſage, of a yellowiſh, livide, bloudy, filthy *ſanies*, like to *pus* or matter not well concocted, oftentimes fretting and exulcerating the paſſage with the acrimony, and cauſing a painefull erection of the yard, and diſtenſion of all the genitall parts. For in this erection there is cauſed as it were a convulſive contraction of theſe parts. And hence it is that the patients complaine, that they feele as it were a ſtring ſtretched ſtiffe in that part, which drawes the yard as it were downewards. The cauſe hereof is a groſſe and flatulent ſpirit, filling and diſtending by its plenty, the whole channell or hollow nerve; yea, verily, the whole porous ſubſtance of the yard. If to theſe ſymptomes this be added, that the urenary paſſage be exulcerated, a grievous paine afflicts the patient whileſt he makes water, for that the ulcers are irritated by the ſharpe urine paſſing that way. Such a virulent ſtrangury or running of the reines oft-times continueth for two or three yeares ſpace: but the *Gonnorhœa*, or running of the ſeed cannot endure ſo long, but that it will bring the body to an extreme and deadly leanneſſe, for that the matter of the ſeed is of the more benigne and laudible portion of the bloud, as you may perceive by thoſe who have too immoderately uſed copulation but the ſpace of one night. For ſuch have their faces more leane and lanke, and the reſt of their bodies enervated, languiſheth and becommeth dull. By this we have delivered, it may be perceived that the running of a virulent ſtrangury, is not the running of a ſeminall humour, fit for generation of iſſue, but rather of a viſcous and acride filth, which hath acquired a venenate malignity by the corruption of the whole ſubſtance.

What a virulent ſtrangury is.

The cauſe of the convulſive diſtenſion of the yard.

Vid. Auth. definit. med. apud Galen.

What kind of matter floweth forth in a virulent ſtrangury.

Chap. XVII.

Of the cauſes and differences of the ſcalding, or ſharpeneſſe of the urine.

The cauſe of a particular repletion of the privie parts.

THe heat or ſcalding of the water, which is one kinde of the virulent ſtrangury, ariſeth from ſome one of theſe three cauſes, to wit, repletion, inanition and contagion. That which proceeds from repletion, proceeds either from too great abundance of bloud, or by a painefull and tedious journey in the hot ſunne, or by feeding upon hot, acride, diureticke and flatulent meats, cauſing tenſion and heat in the urenary parts, whence proceeds the inflammation of them and the genitall parts, whence it happens that not onely a ſeminall, but alſo much other moiſture may flow unto theſe parts, but principally to the *proſtata*, which are glandules ſituate at the roots, or beginning of the necke of the bladder, in which place the ſpermaticke veſſels end; alſo abſtinence from venery cauſeth this plenitude in ſome who have uſually had to doe with women, eſpecially the expulſive faculty of the ſeminall and urenary parts being weake, ſo that they are not of themſelves able to free themſelves from this burden. For then the ſuppreſſed matter is corrupted, and by its acrimony contracted, by an adventitious and putredinous heat, it cauſeth heate and paine in the paſſage forth. The *proſtata* ſwelling with ſuch inflamed matter, in proceſſe of time become ulcerated, the abſceſſe being broken. The purulent *ſanies* dropping and flowing hence alongſt the urinary paſſage cauſes ulcers by the acrimonie, which the urine falling upon, exaſperates, whence ſharpe paine, which alſo continueth for ſome ſhort time after making of water, and together therewith by reaſon of the inflammation, the paines attraction, and the vaporous ſpirits diſtenſion, the yard ſtands and is contracted with paine, as wee noted in the former chapter. But that which happens through inanition, is acquired by the immoderate and unfit uſe of venery, for hereby the oily and radicall moiſture of the forementioned glandules is exhauſted, which waſted and ſpent, the urine cannot but be troubleſome and ſharpe by the way to the whole *urethra*. From which ſenſe of ſharpe paine, the ſcalding of the urine hath its denomination. That which comes by contagion, is cauſed by impure copulation with an unclean perſon, or with a woman, which ſome ſhort while before hath received the tainted ſeed of a virulent perſon, or elſe hath the whites, or her privities troubled with hidden and ſecret ulcers, or carrieth a virulent ſpirit ſhut up or hidden there, which heated and reſuſcitated by copulation, preſently infects the whole body with the like contagion, no otherwiſe than the ſting of a Scorpion or *Phalangium*, by caſting a little poiſon into the ſkinne, preſently infects the whole body, the force of the poiſon ſpreading further than one would believe, ſo that the partie falls downe dead in a ſhort while after. Thus therefore the ſeminall humour conteined in the *proſtatæ*, is corrupted by the tainture of the ill drawne thence by the yard, and the contagion infects the part it ſelfe; whence followes an abceſſe, which caſting forth the virulency by the urenary paſſage, cauſeth a virulent ſtrangury; and the maligne vapour carryed up with ſome portion of the humour unto the entrailes and principall parts, cauſe the *Lues venerea*.

The cauſes of the inanition of the genitall parts.

The reaſon of a contagious ſtrangury.

Chap. XVIII.

Prognoſticks in a virulent ſtrangury.

WEE ought not to be negligent or careleſſe in curing this affect, for of it proceed pernicious accidents, as wee have formerly told you, and neglected, it becomes uncurable, ſo that ſome have it run out of their urenary paſſage during their lives; oft-times to their former miſery is added a ſuppreſſion of the urine, the *proſtata* and neck of the bladder being inflamed and unmeaſurably ſwelled. Copulation, and the uſe of acride or flatulent meates encreaſe this inflammation, and alſo together therewith cauſe an *Iſchuria*, or ſtoppage of the urine; they are worſe at the change of the moone: certaine death followes upon ſuch a ſtoppage; as I obſerved in a certaine man, who troubled for ten yeares ſpace with a virulent ſtrangury, at length dyed by the ſtoppage of his water. He uſed to be taken with a ſtopping of his urine, as often as he uſed any violent exerciſe, and then he helped himſelf by putting up a ſilver Catheter, which for that purpoſe he ſtill carryed about him; it happened on a certaine time, that he could not thruſt it up into his bladder, wherefore he ſent for me, that I might helpe him to make water, for which purpoſe when I had uſed all my skill, it proved in vaine: when he was dead, and his body opened, his bladder was found full and very much diſtended with urine, but the *proſtata* preternaturally ſwelled, ulcerated, and full of matter reſembling that, which formerly uſed to run out of his yard, whereby you may gather, that this virulency flowes from the *proſtata*, which runs forth of the yard in a virulent ſtrangury, and not from the

A virulent ſtrangurie continues with ſome during their lives.

A hiſtory.

From what part the matter of a virulent ſtrangury flowes.

Reines, as many have imagined. Certainely, a virulent ſtrangury, if it be of any long continuance, is to be judged a certaine particular *Lues venerea*, ſo that it cannot bee cured unleſſe by frictions with *Hydrargyrum*. But the ulcers which poſſeſſe the neck of the bladder are eaſily diſcerned from theſe which are in the body or capacity thereof. For in the latter the filth comes away as the patient makes water, and is found mixed with the urine, with certaine ſtrings or membranous bodies comming forth in the urine: to theſe may be added, the farre greater ſtinch of this filth which iſſueth out of the capacity of the bladder. Now muſt wee treat of the cure of both theſe diſeaſes, that is, the *Gonnorhœa* and virulent ſtrangury, but firſt of the former.

Chap. XIX.

The chiefe heads of curing a Gonnorhœa.

Diet.

For a ſtrangury occaſioned by repletion.

For the decay of the retentive faculty.

Let a Phyſitian be called, who may give direction for purging, bleeding and diet, if the affect proceed from a fulneſſe and abundance of blood and ſeminall matter; all things ſhall bee ſhunned which breed more bloud in the body, which increaſe ſeed, and ſtirre to venery. Wherefore he muſt abſtaine from wine, unleſſe it be weak and aſtringent, and he muſt not onely eſchew familiarity with women, but their very pictures, and all things which may call them into his remembrance, eſpecially if he love them dearly; ſtrong exerciſes do good, as the carrying of heavie burdens even until they ſweat, ſwimming in cold water, little ſleepe, refrigerations of the loines and genitall parts by annoynting them with *unguentum roſatum refrigerans Galeni & nutritum*, putting thereupon a double cloth ſteeped in oxycrate, and often renewed. But if the reſolution or weakneſſe of the retentive faculty of theſe parts bee the cauſe of this diſeaſe, contracted by too much uſe of venery before they arrive at an age fit to performe ſuch exerciſe; in this caſe ſtrengthening and aſtringent things muſt both bee taken inwardly, and applied outwardly. But now I haſten to treat of the virulent ſtrangurie, which is more proper to my purpoſe.

Chap. XX.

The generall cure both of the ſcalding of the water, and the virulent ſtrangury.

Diet.

Wee muſt diverſly order the cure of this diſeaſe, according to the variety of the cauſes and accidents thereof. Firſt, care muſt be had of the diet, and all ſuch things ſhunned as inflame the bloud, or cauſe windineſſe; of which nature are all diuretick and flatulent things, as alſo ſtrong and violent exerciſes. Purging and bleeding are convenient, eſpecially, if fulneſſe cauſe the affect. Womens companies muſt be ſhunned and thoughts of venereous matters; the patient ought not to lye upon a ſoft bed, but upon a quilt or matterice, and never, if he can helpe it, upon his back; boyled meats are better than roaſted, eſpecially boyld with ſorrel, lettuce, purſlain, cleanſed barly, & the four cold ſeeds beaten, for ſauce, let him uſe none, unleſſe the juice of an orange, pomgranate, or verjuice; let him ſhun wine, and in ſtead thereof uſe a decoction of barly and liquerice, a *hydromel*, or *hydroſaccharum* with a little cinamon, or that which is termed *Potus divinus*. In the morning let him ſup of a barly creame wherein hath beene boyled a *nodulus* of the foure cold ſeedes beaten together with the ſeedes of white poppy; for thus it refrigerateth, mitigateth and cleanſeth; alſo the ſyrups of marſhmallowes and maiden-haire are good. Alſo purging the belly with halfe an ounce of *Caſsia*, ſometimes alone, otherwhiles with a dram or halfe a dram of Rubarbe in pouder put thereto, is good. And theſe following pils are alſo convenient.

Pills.

℞. *maſſa pilul. ſine quibus* ℈i. *rhei electi* ʒß. *caphuræ gr.* iiii. *cum terebinthina formentur pilulæ*; let them bee taken after the firſt ſleep. Venice turpentine alone, or adding thereto

The force of Venice turpentine in this diſeaſe.

ſome Rubarbe in pouder, with oyle of ſweet almonds newly drawne without fire, or ſome ſyrupe of maiden-hair is a ſingular medicine in this caſe, for it hath an excellent lenitive and cleanſing faculty, as alſo to helpe forwards the expulſive facultie, to caſt forth the virulent matter contained in the *proſtatæ*. You may by the bitterneſſe perceive how it reſiſts putrefaction and you may gather how it performes its office in the reines and urenary parts, by the ſmell it leaves in the urine after the uſe thereof. But if there bee any who cannot take it in forme of a bole, you may eaſily make it potable, by diſſolving it in a mortar with the yolk of an egge and ſome white wine, as I learned of a certaine Apothecary, who kept it as a great ſecret. If the diſeaſe come by inanition or emptineſſe, it ſhall be helped by fatty injections, oily and emollient potions, and inwardly taking and applying theſe things which have the like faculty, and ſhunning theſe things which cauſed the diſeaſe. How to cure that which happens by contagion or unpure copulation, it ſhall bee abundantly ſhewed in the enſuing chapter.

How to bee made potable.

CHAP. XXI.

The proper cure of a virulent ſtrangury.

An injection to ſtay inflammation.

FIRST we muſt begin with the mitigation of paine, and ſtaying the inflammation, which ſhall be performed by making injection into the *urethra* with this following decoction warme. ℞. *ſem. pſilii, lactucæ, papav. albi, plantag. cydon. lini, hyoſciami albi, an.* ʒ ii. *detrahantur mucores in aquis ſolani & roſar. ad quantitatem ſufficientem, adde trochiſc. alborum Rhaſis camphoratorum in pollinem redactorum,* ʒ i. *miſce ſimul, & fiat injectio frequens.* For this becauſe it hath a refrigerating faculty, will help the inflammation, mitigate pain, and by the mucilaginous faculty lenifie the roughneſſe of the *urethra*, and defend it by covering it with the ſlimy ſubſtance, againſt the acrimony of the urine and virulent humours. In ſtead hereof you may uſe cowes milk newly milked, or warmed at the fire. Milk doth not only conduce hereto being thus injected, but alſo drunk, for it hath a refrigerating and cleanſing faculty and by the ſubtlety of the parts it quickly arrives at the urenary paſſages. Furthermore it will be good to anoint with *cerat. refriger. Galeni addita camphora*, or with *ceratum ſantalinum, ung. comitiſſæ*, or *nutritum*, upon the region of the kidneyes, loines and *perinæum*, as alſo to anoint the Cods and Yard. But before you uſe the foreſaid ointments or the like, let them be melted over the fire, but have a care that you make them not too hot, leſt they ſhould loſe their refrigerating quality, which is the thing we chiefly deſire in them. Having uſed the foreſaid ointment, it will be convenient to apply thereupon ſome linnen clothes moiſtened in oxycrate compoſed *ex aquis plantaginis, ſolani, ſempervivi, roſarum*, and the like.

The faculties of milke againſt a virulent ſtrangury.

How to make water without paine.

If the patient bee tormented with intollerable paine in making water, and alſo ſome ſmall time after, as it commonly commeth to paſſe, I would wiſh him that he ſhould make water putting his yard into a chamber-pot filled with milke or water warmed. The paine by this meanes being aſſwaged, we muſt come to the cleanſing of the ulcers by this or the like injection. ℞. *hydromelitis ſymp.* ℥ iv. *ſyr. de roſis ſiccis, & de abſinth. an.* ℥ ß. *fiat injectio.* But if there be need of more powerfull deterſion, you may ſafely adde, as I have frequently tryed, a little *ægyptiacum*. I have alſo found this following decoction to bee very good for this purpoſe. ℞. *vini albi oderiferi,* ℔ ß. *aquar. plantag. & roſ. an.* ℥ ii. *auripigmenti,* ʒ ß. *viridis æris,* ℈ i. *aloës opt.* ʒ ß. *pulveriſentur pulveriſanda, & bulliant ſimul.* Keep the decoction for to make injection withall. You may encreaſe or diminiſh the quantity and force of the ingredients entring into this compoſition, as the patient and diſeaſe ſhall ſeeme to require. The ulcers being thus cleanſed, we muſt haſten to dry them, ſo that we may at length cicatrize them. This may be done by drying up the ſuperfluous moiſture, and ſtrengthening the parts that are moiſtened and relaxed by the continuall defluxion, for which purpoſe

Detergent injections.

How the cleanſed ulcers may be dryed.

poſe this following decoction is very profitable. ℞. *aq. fabrorum*, ℔ i. *pſidiarum, balauſt. nucum expreſ. conquaſſatorum, an.* ʒ i ß. *ſemin. ſumach. & berber. an.* ʒ ii. *ſyrup. roſar. & de abſinth. an.* ℥ i. *fiat decoctio.* You may keepe it for an injection to be often injected into the *urethra* with a ſyringe, ſo long as that there ſhall no matter or filth flow out thereat, for then there is certaine hope of the cure.

CHAP. XXII.

Of Caruncles, or fleſhy exereſcences which ſometimes happen to grow in the Urethra, *by the heat or ſcalding of the urine.*

How caruncles come to grow upon the ulcers of the genitall parts.

A Sharpe humour which flowes from the Glandules termed *Proſtatæ*, and continually runs alongſt the urenary paſſage, in ſome places by the way it frets, and exulcerates by the acrimony the *urethra* in men, but the necke of the wombe in women. In theſe, as alſo is uſuall in other ulcers, there ſometimes growes up a ſuperfluous fleſh, which oft times hinders the caſting or comming forth of the ſeed & urine by their appropriate and common paſſage, whence many miſchieves ariſe; whence it is that ſuch ulcers as have caruncles growing upon them muſt be diligently cured. But firſt we muſt know whether they be new or old. For the latter are more difficultly to bee cured than the former, becauſe the caruncles that grow upon them become callous and hard, being oft times cicatrized. Wee know that there are caruncles, if the *Cathater* cannot freely paſſe alongſt the paſſage of the urine, but findes ſo many ſtops in the way, as it meets with Caruncles that ſtop the paſſage; if the patient can hardly make water, or if his water runne in a very ſmall ſtreame, or two ſtreames, or crookedly, or onely by droppe and droppe, with ſuch tormenting paine that he is ready to let goe his excrements, yea and oft times doth ſo, after the ſame manner as ſuch as are troubled with the ſtone in the bladder. After making water, as alſo after copulation, ſome portion of the urine and ſeed ſtayes at the rough places of the caruncles, ſo that the patient is forced to preſſe his yard, to preſſe forth ſuch reliques. Sometimes the urine is wholly ſtopped, whence proceeds ſuch diſtention of the bladder, that it cauſeth inflammation, and the urine flowing backe into the body, haſtens the death of the patient. Yet ſometimes the urine thus ſuppreſt, ſweats forth preternaturally in ſundry places, as at the fundament, *perinæum*, cod, yard, groines. As ſoone as we, by any of the forementioned ſignes, ſhall ſuſpect that there is a Caruncle about to grow, it is expedient forthwith to uſe means for the cure therof; for a caruncle from a very little beginning doth in a ſhort time grow ſo bigge, that at the length it becomes incureable, verily you may eaſily gheſſe at the difficulty of the cure by that we have formerly delivered of the eſſence hereof, beſides, medicines can very hardly arrive thereat. The fitteſt ſeaſon for the undertaking thereof is the ſpring, and the next thereto is winter; yet if it be very troubleſome, you muſt delay no time. Whileſt the cure is in hand, the patient ought wholly to abſtain from venery, for by the uſe thereof, the kidneyes, ſpermaticke veſſels, *proſtata*, and the whole yard, ſwell up and waxe hot, and conſequently draw to them from the neighbouring and upper parts, whence aboundance of excrements in the affected parts, much hindering the cure. You muſt beware of acrid and corroding things in the uſe of detergent injections, for that thus the *urethra* being endued with moſt exquiſite ſenſe, may bee eaſily offended, whence might enſue many and ill accidents. Neither muſt wee be frighted if at ſome times wee ſee blood flow forth of ſecret or hidden caruncles. For this helpes to ſhorten the cure, becauſe the diſeaſe is hindered from growth, by taking away portion of the conjunct matter, the part alſo it ſelfe is eaſed from the oppreſſing burden, for the materiall cauſe of caruncles is ſuperfluous blood. Wherfore unleſſe ſuch bleeding happen of it ſelfe, it is not amiſſe to procure it by thruſting in a *Cathater* ſomewhat hard, yet with good adviſe. If the Caruncles be inveterate, and callous, then muſt they be mollified by fomentations, ointments, cataplaſmes, plaſters, and fumigations; you may thus a make fomentation. ℞. *rad. alth. & lilior. alb. an.* ℥ iv. *rad. bryoniæ, & fænicul.*

Callous caruncles hard to cure.

Signes.

The ſuppreſt urine comes forth whereas it can get vent.

The particular cure.

A fomentation.

nicul. an. ℥ i ß. *fol. malvar. violarum, parietar. & mercur. an.* m ß. *ſem. lini, fænugr. an.* ℥ ß. *caricas ping.* nu.xii. *florum chamæm. & melil. an.* p i. *contundantur contu denda, & incidenda incidantur, bulliant omnia in aqua communi*: make a fomentation, and apply it with ſoft ſponges. Of the maſſe of the ſtrained-out things, you may make a cataplaſme after this manner. ℞. *prædicta materialia, terantur, & trajiciantur, adde axungia porci, unguenti baſiliconis, an.* ℥ ii. *fiat cataplaſma*: let it be applyed preſently after the fomentation. You may uſe this following liniment whileſt the cataplaſme is providing. ℞. *unguenti alth. & agrippæ an.* ℥ i ß *æſipi humida, & axung. human. an.* ℥ i. *butyri recentis, olei lilior. & chamæm. an.* ʒ vi. *liqueſiant ſimul, addendo aqua vitæ* ℥ i. *fiat linimentum*: let it bee applyed outwardly upon the part wherein the Caruncles are. For the ſame purpoſe plaſters ſhall bee applyed, which may bee diverſified, and fitted as you ſhall thinke good; yet *Emplaſtrum de Vigo* truly made, exceedeth all the reſt in a mollifying faculty, and in waſting ſuch callous hardneſſe. The following fumigation is alſo good for the ſame purpoſe; take ſome pieces of a mille-ſtone (for this wee uſe in ſtead of the *pyrites* mentioned by the Ancients) or elſe ſome Brickes of a large ſize, after they are heated hot in the fire, let them be put into a pan, and ſet under a cloſe ſtoole, then cauſe the patient to ſit thereon, as if hee were going to ſtoole, then poure upon the hot ſtones equall parts of very ſharpe vinegar, and very good *Aqua vitæ*, and caſting clothes about him, that nothing may exhale in vaine: let him receive the aſcending vapour at his Fundament, *Perinæum*, *Scrotum*, and *Urethra*. Moreover, that this medicine may worke the better effect, you may put the Patient naked into the Barrell noted with this letter A. ſo that he may ſit upon a ſeate or borde perforated on that part, whereas his Genitalls are, then place the pan holding the hot ſtones between his legges, then preſently ſprinkle the ſtones with the forementioned liquor, by the doore marked with the letter, B. Thus the Patient ſhall eaſily receive the fume that exhales therefrom, and none thereof bee loſt, he covering and vailing himſelfe on every ſide. Such a fumigation, in *Galens* opinion, hath a faculty to penetrate, cut, reſolve, ſoften and digeſt ſcirrhous hardneſſes.

CHAP.

Chap. XXIII.

What other remedies ſhall be uſed to Caruncles occaſioned by the Lues venerea.

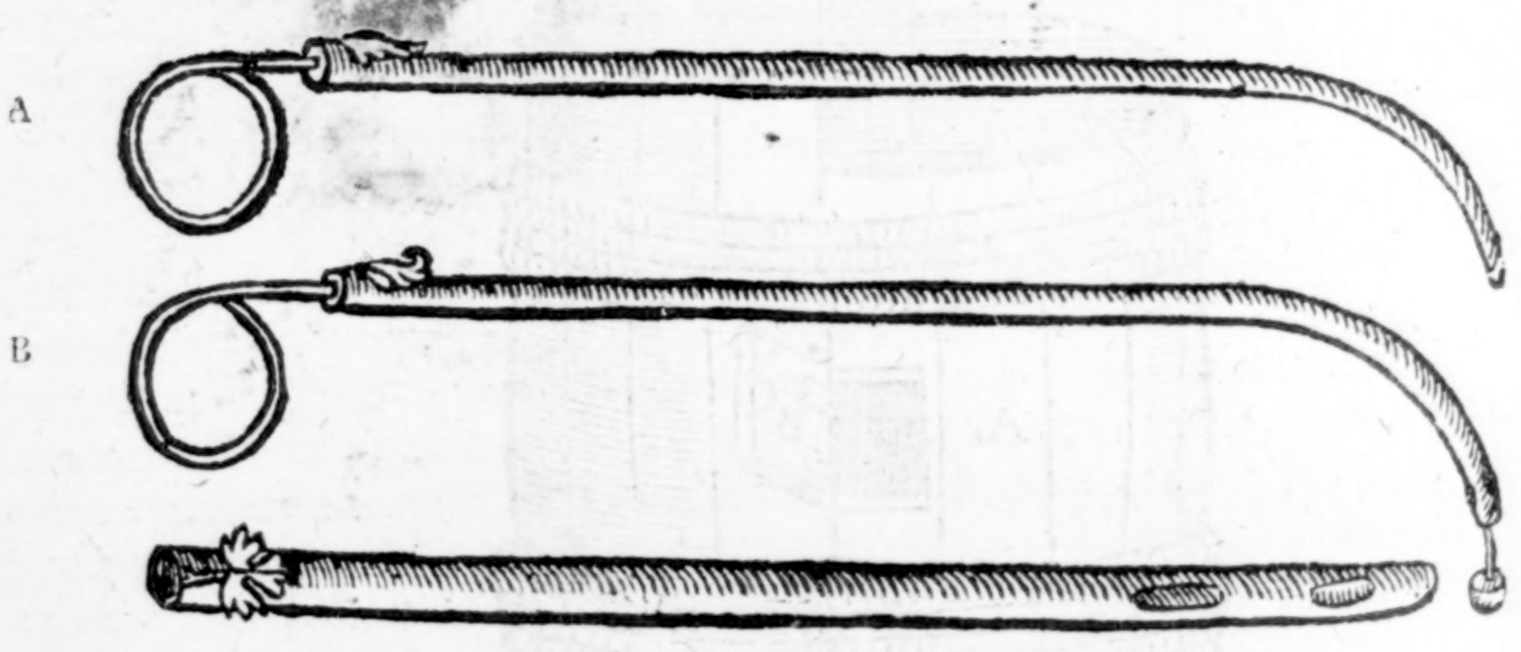
Particular deſaults of the *Lues venerea* not to be cured unleſſe by the generall remedy of the virulency.

BUT if you ſuſpect that theſe Caruncles come or are occaſioned by a virulent humour, or the malignity of the *Lues venerea*, it is meet that the patient obſerve ſuch a diet as uſually is preſcribed to ſuch as are troubled with the *Lues venerea*; let him uſe a decoction of *Guajacum*, and let the *perinæum* and the whole yard bee anointed with ointment made for the *Lues venerea*; otherwiſe the Surgion will loſe his labour. In the interim whileſt hee ſhall ſweat in his bed, he ſhall bee wiſhed to hold betweene his legges a ſtone bottle filled with hot water, or elſe a hot bricke wrapped in linnen cloathes, moiſtened in vinegar and *aqua vitæ*; for thus the heat and vapour will aſcend to the genitalls, which, together with the helpe of the applyed ointment, will diſſolve the matter of the Caruncles, and being thus ſoftened, they muſt be conſumed with convenient medicines.

Caruncles if callous, muſt firſt be ſoftened.

Wherefore firſt if they become callous, or cicatrized (which you may ſuſpect if they caſt forth no excrementitious humidity) they ſhall be exaſperated, excoriated and torne with a leaden *Cathæter* having a rough button at the end like a round file. He ſhall ſo long uſe the *Cathæter* put into the *Urethra*, thruſting it up and downe the ſame way ſo long and often as hee ſhall thinke fit for the breaking and tearing the Caruncles, hee ſhall permit them thus torne to bleed freely, ſo to eaſe the affected part. You may alſo for the ſame purpoſe put into the *Urethra* the *Cathæter* marked with this letter B. whereinto putting a ſilver wiar ſharp at the upper end, that by often thruſting it in and out, it may wear and make plain the reſiſting caruncles. Verily by this meanes I have helped many much perplexed with the teare-full danger of this diſeaſe. Some better like of the *Cathæter* marked with the letter A. being thus uſed: it is thruſt into the *Urethra* with the prominent cutting ſides downewards, and then preſſing the yard on the outſide cloſe with your hand to the *Cathæter* in the place where the Caruncles are, it is drawn forth againe.

Cathæters fit to weare aſunder, or teare Caruncles.



A. *ſheweth the* Cathæter *with the inſerted ſilver wiar, but not hanging forth thereat.*

B. *ſheweth the* Cathæter *with the inſerted ſilver wiar hanging forth at the end.*

A pouder to waſte caruncles.

The thus torne Caruncle ſhall bee ſtrawed over with the following pouder, being very effectuall to waſte and conſume all Caruncles of the privities without much paine. ℞. *herb. ſabin. in umbra exſiccat.* ʒ ii. *ocræ, antimon. tuth. præparat. an.* ʒ ß. *fiat pulv. ſubtiliſſimus*, let it bee applyed in the following manner. Put the powder into the pipe or *Cathater* having holes in the ſides thereof, the which is the lowermoſt of the laſt deſcribed. Then put the *Cathater* into the urenary paſſage untill the ſlit or opennеſſe of the ſide come to the Caruncle, then into the hollowneſſe of the *Cathater* put a ſilver wiar, wrapped about the end with a little linnen ragge, which as it is thruſt up, will alſo thruſt up the pouder therwith, untill it ſhall come to the ſlit againſt the caruncle, then will it adhere to the caruncle, bloody by reaſon of the late attrition. Then ſhall you draw forth the *Cathater*, firſt twining it about, that ſo it may not ſcrape off the pouder againe. If intollerable paine hereupon happen, it ſhall bee aſſwaged, and the inflammation reſtrained by the following injection. ℞. *ſuccorum portulacæ, plantag. ſolani, & ſempervivi, an.* ℥ ß. *album ovorum,* nu. vi. *agitentur diu in mortario plumbeo*; let it be injected warme into the *urethra* with a ſyringe. In ſtead hereof you may alſo make uſe of another injection, which is formerly preſcribed. Neither will it be unprofitable to apply repercuſſives to the genitalls, to hinder pain and inflammation. You may alſo uſe other medicines, having a faculty to conſume the Caruncle, amongſt which theſe following are excellent. ℞. *viridis æris, auripigmenti, vitriol. Rom. aluminis roch. an.* ℥ ii. *infundantur omnia in acet. acerrimo, atque inter duo marmora in pollinem redigantur*: then let it be expoſed to the ſummer ſunne, and dryed, againe infuſed in ſharp vinegar, and then as before grownd upon a marble, ſo that you ſhall finde nothing ſharpe with your fingers; laſtly let it be oppoſed to the ſunne untill it may bee made into moſt ſubtle pouder, and all the acrimony be vaniſhed, which will be commonly in eight dayes ſpace. Then, ℞. *ol. roſat.* ℥ iv. *lythargyri* ℥ ii *coquantur ad ignem, quouſque coïerint in emplaſt. ſolidæ conſiſtentiæ, ab igne tum ſemotis, adde pulv. prædict.* ℥ ii. let them bee mixed with a ſpatula, and put upon the fire untill it come to ſo hard a conſiſtence, that it will ſticke to a waxe candle, or lead wiar, ſo that it may not come off by handling with your hands. The Surgeons of *Montpelier*, uſe this medicine: This following is another, ℞. *tuthiæ præpar.* ʒ vi. *antimonii*, ʒ iii. *trochiſc. alborum, Rhaſ. camphorat.* ʒ i. *corticis granati, aluminis uſti, an.* ʒ i ß. *ſpongiæ uſtæ,* ℈ ii. let them all be made into pouder: then, ℞. *ung. diapompholigos, & alb. Rhaſis, an.* ℥ ii. *miſceantur cum prædictis pulveribus in mortario plumbeo, & diu agitentur*: let a very fine ragge bee ſpread over with this ointment, and wrapped about a waxe candle, and ſo thruſt into the *Urethra*, and then draw forth the candle againe by twining it a contrary way; ſo let the end of the ragge hang out of the yard, ſo to plucke it forth againe, when as you ſhall thinke it hath done what it can to the Caruncle, which is, when it hath covered it with the medicine with which it was ſpread. Some alſo make waxe candles with a ſlender, but ſtiffe weeke, whoſe end, which is to be put to weare and conſume the Caruncle, is compoſed of the following medicine. ℞. *emplaſtri nigri, vel diachylonis treati* ℥ ii. *pul. ſabinæ, ocræ, vitriol. Rom. calcin. pul. mer. an.* ʒ ß. *omnia liqueſcant ſimul ad dictum uſum.* Whileſt the cure ſhall bee in hand by theſe following medicines, let the patient bee carefull that he ſo ſhake his yard after making water, that he may ſhake forth all the reliques of the urine which may chance to ſtoppe at the Caruncles; for if but one droppe ſhould ſtay there, it would be ſufficient to ſpoile the whole operation of the applyed medicines. After that the Caruncle ſhall bee worne away and wholly conſumed by the deſcribed medicines, which you may know by the urine flowing forth freely, and in a full ſtreame, and by thruſting up a *Cathæter* into the bladder without any ſtoppage; then it remaines that the ulcers be dryed & cicatrized; for which purpoſe the following injection is very powerfull and effectuall, and without any acrimony. ℞. *aq. fabrorum* ℔ ß. *nuc. cupreſſ. gallar. cort. granat. an.* ʒ i ß. *alum. roch.* ʒ ß. *bulliant omnia ſimul ſecund. art.* ſo make a decoction for an injection, which you ſhall uſe ſo long, untill no excrementitious humidity diſtill out of the yard. The following pouder dryes more powerfully, and conſequently haſtens forwards cicatrization, and it is alſo without acrimony. ℞. *lapidem calamin. lotum, teſtas ovorum uſtas, corallum rubrum, corticem granat. comminue omnia in pollinem*; let this pouder be uſed to the ulcers, with a waxe candle joyned to ſome *unguentum deſiccativum rubrum*, or ſome ſuch like thing. Alſo ſtrings or rods of lead thruſt into the *urethra* as thicke as the paſſage will ſuffer, even to the ulcers, being firſt beſmeared with quickſilver, and kept in day and night as long as the patient can endure, are good to be uſed. For

they dry by their touch and cicatrize, they dilate the urenary paſſage without paine, and laſtly hinder the ſides of the ulcer from corrupting one another.

Chap. XXIIII.

Of venereall Buboes, *or ſwellings in the Groines.*

The efficient and materiall cauſes of venereous Bubo's.

What Bubo's foretell the *Lues venerea.*

THe virulency of the *Lues venerea* is ſometimes communicated to the Liver, which if it have a powerfull expulſive faculty, it expells it into the groines, as the proper emunctories thereof, whence proceed venereall Bubo's. The matter of theſe for the moſt part is abundance of cold, tough, and viſcous humours, as you may gather by the hardneſſe and whiteneſſe of the tumour, the pravity of the paine, and contumacy of curing; which alſo is another reaſon, beſides theſe that wee formerly mentioned, why the virulency of this diſeaſe may bee thought commonly to faſten it ſelfe in a phlegmaticke humour. Yet ſometimes venereall Bubo's proceed from a hot, acride and cholericke humour, aſſociated with great pain and heat, and which therupon often degenerate into virulent & corroding ulcers. Some venereous Bubo's are ſuch conjoyned accidents of the *Lues venerea*, that they foretell it; ſuch are theſe which for a ſmall while ſhew a manifeſt tumour, and ſuddenly without any manifeſt occaſion hide themſelves againe, and returne backe to the noble parts. Others are diſtinct from the *Lues venerea* though they have a ſimilitude of eſſence and matter therewith, and which therefore may be healed, the *Lues venerea* yet remaining uncured. Such are theſe which are uſually ſeen, and which therefore compared with the former may be termed ſimple and not implicit. For the cure, you muſt not uſe diſcuſſing medicins, leſt reſolving the more ſubtle part, the groſſer dregs become impact and concrete there; but much leſſe muſt we uſe repercuſſives, for that the matter is virulent. Wherefore onely attractive and ſuppurating medicines are here to bee uſed, agreeable to the humour predominant and cauſing the tumour, as more hot things in ædematous and ſcirrhous tumours, than in thoſe which reſemble the nature of a *phlegmon* or *eryſipelas*: the indication taken from the rarity and denſity of bodies inſinuates the ſame variety.

Cupping.

A potentiall Cautery.

The applying of cupping glaſſes is very effectuall to draw it forth. But when as it is drawne forth, you ſhall forthwith apply an emplaſticke medicine, and then you ſhall come to ſuppuratives. When the tumour is ripe it ſhall be opened with a potentiall cautery, if it proceed from a cold cauſe; for by the inducing of heat the reſidue of the crude matter is more eaſily concocted, beſides when as an ulcer of this kinde is opened, the matter will bee more eaſily evacuated, neither ſhall it bee fit to uſe any tent, but onely to apply pledgets. The reſidue of the cure ſhall bee performed by detergent medicines, and then if need require, the patient ſhall be let blood, and the humours evacuated by a purging medicine, but not before the perfect maturity thereof.

Chap. XXV.

Of the Exoſtoſis, *bunches or knots growing upon the bones by reaſon of the* Lues Venerea.

The matter of knots, and virulent *Tophi.*

An emplaſter againſt the bunching out of the bones.

HArd Tumours, *Exoſtoſes* and knots have their matter from thicke and tough phlegme, which cannot be diſſolved, unleſſe by hot medicines, which have a mollifying & diſſolving faculty. For which purpoſe, beſides thoſe medicines which uſually are applyed to ſcirrous tumours, you muſt alſo make uſe of *arg. viv.* commonly after this manner. ℞. *empl. filii Zach. & Ceronei, an.* ℥iii. *euphorb.* ℥ß. *emplaſt. de vigo,* ℥ii. *cerat. æſyp. deſcript. Philagr.* ℥i. *argent. vivi extinct.* ℥vi. *fiat emplaſtrum.* Spread it upon leather for your uſe. In the meane ſpace let the patient obſerve a ſparing dyet; for thus hee ſhall bee helped, if ſo be that the ſubſtance of the bones be yet unperiſhed. For if it be putrefyed & rotten, then the deſcribed medicines are of no uſe, but you muſt of neceſſity lay bare the bone, either by inciſion, or elſe by an actuall or potentiall cautery; but I had rather doe it with an actuall, for that it extracts the virulency impact in the bones, as alſo it haſtens the abſceſſe, or falling away of the corrupted bone. It ſhall be of a convenient figure to cauterize the bone, as, round, ſquare or long. I uſually, before the application of ſuch a Cauſtick, firſt divide the fleſh that lyes over it with an inciſion knife, that ſo the paine may be the leſſe, becauſe the fleſh cannot be burnt through but in a long time, by which the fire may come to the bone. But it will not bee amiſſe, before wee treat of this art, firſt to conſider the nature of the rottenneſſe of the bones.

Chap. XXVI.

Why the bones become rotten, and by what ſignes it may be perceived.

That ſolution of Continuity which is in the bones, is called by *Galen*, *Catagma*. This uſually is the cauſe of rottenneſſe; for, bones that are grated, bruiſed, rent, perforated, broken, luxated, inflamed and diſpoiled of the fleſh and skin, are eaſily corrupted; for diſpoyled of their covering, they are altered by the appulſe of the aire, which they formerly never felt, whence alſo their bloud and proper nouriſhment is dryed up and exhauſted. Beſides alſo, the *ſanies* running downe by reaſon of wounds and old ulcers, in proceſſe of time, faſtens it ſelfe into their ſubſtance, and putrefies by little and little; this putrefaction is encreaſed and cauſed by the too much uſe of oily and fatty medicines, as moiſt and ſuppurate things; for hence the ulcer becommeth more filthy and maligne, the fleſh of the neighbouring parts groweth hot, is turned into *pus*, which preſently falling upon the bone lying under it, inflames it. Laſtly, the bones are ſubject to the ſame diſeaſes, as the fleſh that lyeth under them is; beſides alſo according to *Galen*, the beginning of inflammation oft-times proceeds from the bones; but they beat not, becauſe, according to the opinion of the ancients, pulſation is a dolorificke motion of the Arteries, but the bones want ſenſe. Which verily I cannot deny, but alſo we muſt confeſſe that the membrane that encompaſſeth them, and the arteries that enter into their body, are endued with moſt exquiſite ſenſe. Wherefore the arteries compreſſed and waxing hot by reaſon of the inflamed bone, cauſe a ſenſe of paine in the *perioſtium*, ſo that the patients complaine of a dull and deepe paine, as it were ſunke into the ſubſtance of the bones. The rottenneſſe or corruption is oft-times manifeſt to the eye, as when the bone is laid bare, for then it varieth from the naturall colour, and becomes livide, yellowiſh or blacke. Otherwiſe you may perceive it by touch, as by ſearching it with a probe, as when you meet with any inequality or roughneſſe, or when by but gently touching it, your probe runs into the ſubſtance of the bone, as into rotten wood, for a bone is naturally hard, but being rotten, becomes ſoft. Yet hardneſſe is not an infallible ſigne of a ſound bone. For I have ſeene rotten and bared bones, to have ſometimes growne ſo hard, by the appulſe of the aire, that a Trepan could not, without a ſtrong endeavour, enter them. Alſo the rottenneſſe of the bone is known by the condition of the filth which flowes forth of the ulcer, for it is not onely more thin and liquid, but alſo more ſtinking. Furthermore, ſuch ulcers have a ſoft, looſe and watery fleſh; beſides alſo, they are untoward and rebellious to ſarcotick & epuloticke medicines; to which if they chance to yeeld and be cicatrized, yet within a ſhort while after the ſcarre will relent of its own accord, for that nature, deſtitute of the firm and ſound foundation of the bones, cannot build up a laudible and conſtant fleſh. Neither is it ſufficient that the Surgeon know certainly that the bone is rotten and corrupt, it is furthermore fit he know, whether this corruption be ſuperficiary, or pierce deepe into the ſubſtance of the bone, that he may know how much of the bone muſt bee ſcailed. For ſcailing is the onely cure of that which is corrupted; now it is ſcailed by that which dryes excee-

The cure of a rotten bone.

ceedingly, and drawes forth all the humidity, aſwell the excrementitious, the author of the rottenneſſe, as the alimentary. For thus it remaines without bloud and nouriſhment, and conſequently life alſo; whence it muſt of neceſſity ſcaile or fall off, being deſtitute of the glue or moiſture which joyned it to the ſound parts in vicinity and communion of life, like as leaves which fall away from the trees, the humidity being exhauſted, by which, as by glue, they adhered to the boughes. For this purpoſe Catagmatick powders are prepared to amend the corruption which is onely ſuperficiary. ℞. *pul. aloes, cretæ combuſtæ, pompholygos, an.* ʒii. *ireos flor. ariſtoloch. rot. myrrh. ceruſſæ, an.* ʒi. *pul. oſteor. combuſt.* ʒß. *terantur ſubtiliſſ. fiat pulvis*; let it bee applyed either alone by it ſelfe, or elſe with hony and a little *aqua vitæ*. Alſo the following emplaſter being applyed, ſtirs up nature to the excluſion of the broken bones, and cleanſeth the ulcers from the more groſſe and viſcide *ſanies*. ℞. *cer. nov. reſ. pini, gum. ammon. & elemi, an.* ʒvi. *tereb.* ℥iii. *pul. maſtich. myrrh. an.* ℥ß. *ariſtol. rot. ireos flor. aloes, opopan. euphorb. an.* ʒi. *olei roſati quantum ſufficit, fiat emplaſt. ſecundum artem. Euphorbium*, according to *Dioſcorides*, takes off the ſcailes of bones in one day. Hereto alſo conduceth *Emp. de betonica.* Or, ℞. *olei caryophyl.* ℥ß. *camph.* ʒii. *miſceantur ſimul in mortario, & utere.* But if that part of the bone which is corrupt cannot thus be taken away, then muſt you uſe the ſcailing Trepans and Scrapers deſcribed formerly in wounds of the head; eſpecially if any more great or ſolid bone bee foule. Furthermore the here deſcribed Trepan will be good to perforate the rotten bone in many places where it is corrupted, untill, as it were, a certaine bloudy moyſture iſſue forth at the holes; for thus it more freely enjoyes the aire, and alſo the force of the medicines admitted by theſe holes works more powerfully.

A catagmatick powder.

CHAP. XXVII.

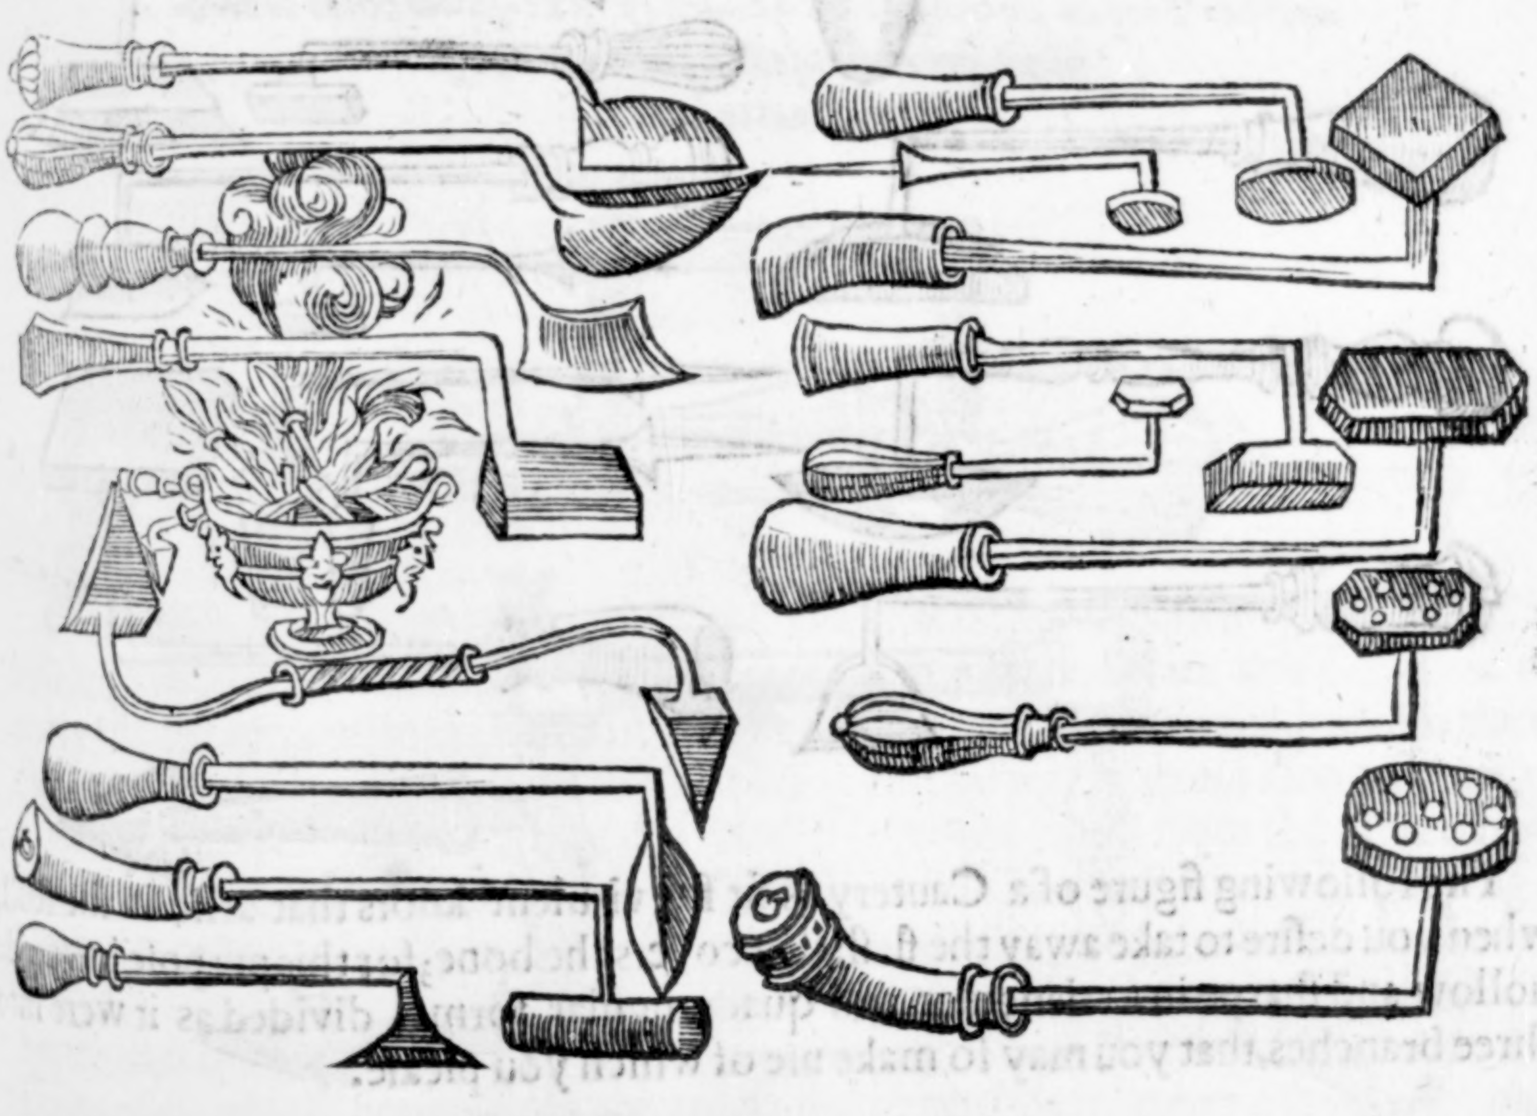
Of actuall & potentiall Cauteries.

BUT if the deſcribed remedies cannot take place, by reaſon of the malignity or magnitude of the rottenneſſe, then muſt wee come to actuall and potentiall cauteries. But I ſhould rather approve of actuall, becauſe by ſtrengthening the part, they conſume the excrementitious humours wherewith it is overcharged, to wit, the matter of the *Caries*; which is not ſo effectually performed by potentiall cauteries. Yet are we oft-times forced to uſe theſe, to pleaſe the patients which are terrified at and affraid of hot irons. Potentiall Cauteries are *aqua fortis*, *aqua vitrioli*, ſcalding oyle, melted *ſulphur* and boyling, and the like; in pouring on of which I would have the Surgeon to bee prudent and induſtrious, leſt he ſhould raſhly violate the neighbouring ſound parts by the burning touch of theſe things; which his temerity would cauſe vehement paines, inflammations and other horride ſymptomes. For actuall cauteries, their variety in figure is ſo great, that it cannot bee defined, much leſſe ſet downe in writing; for they muſt be varied according to the largeneſſe of the rottenneſſe, and the figure and conformation of the fouled bones. Such as are more uſuall I have thought good here to delineate unto you, content onely to admoniſh you thus much, that ſome of theſe work by pricking, ſome by cutting, ſome flatwiſe, and other ſome with their points made to the forme of an Olive leafe.

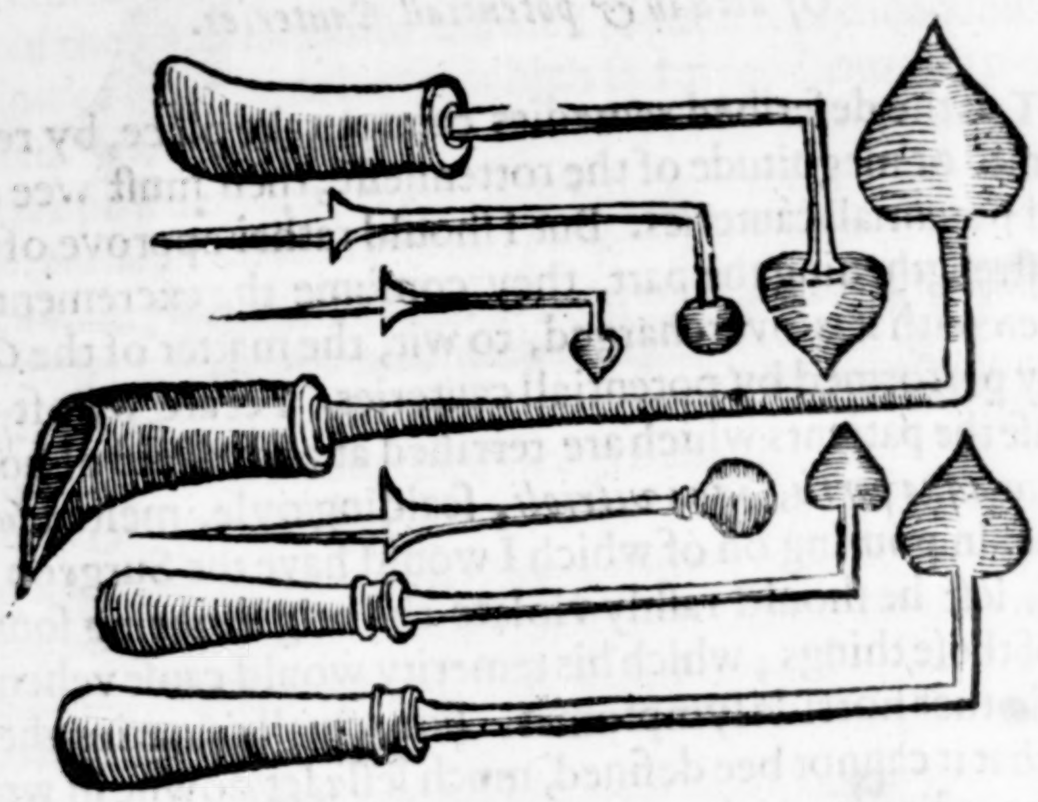
Actuall Cauteries to be preferred before potentiall.

Potentiall Cauteries.

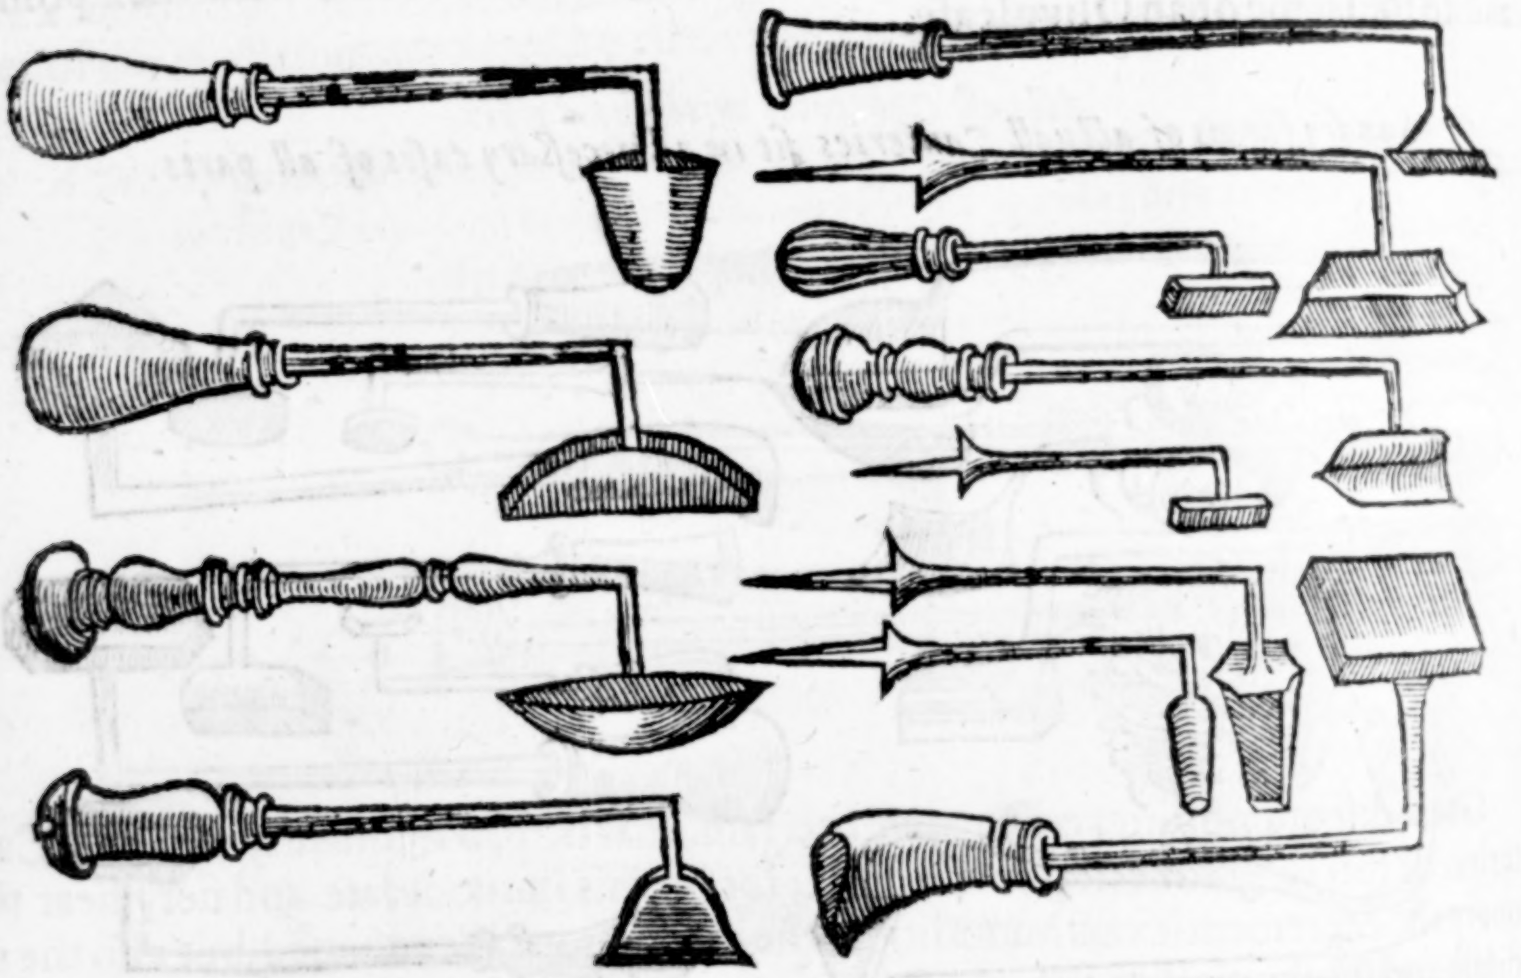
Sundry forms of actuall Cauteries fit in all neceſſary caſes of all parts.



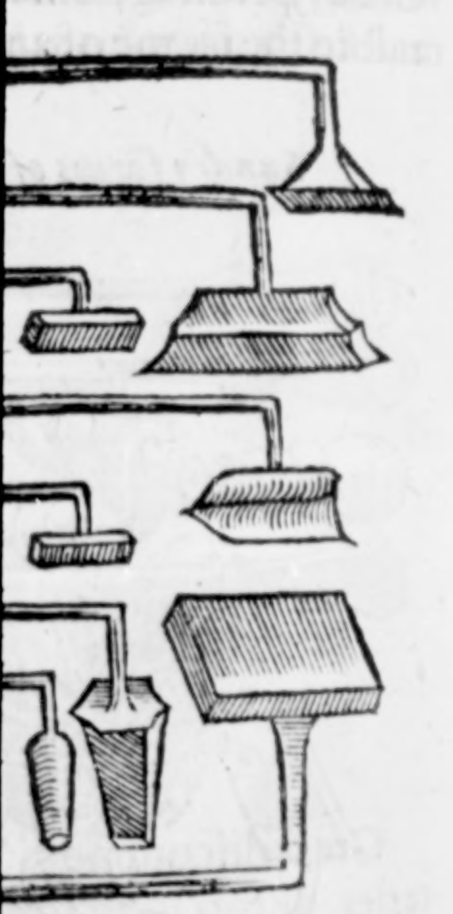
Other Cauteries.



Other Cauteries for the same purpose.



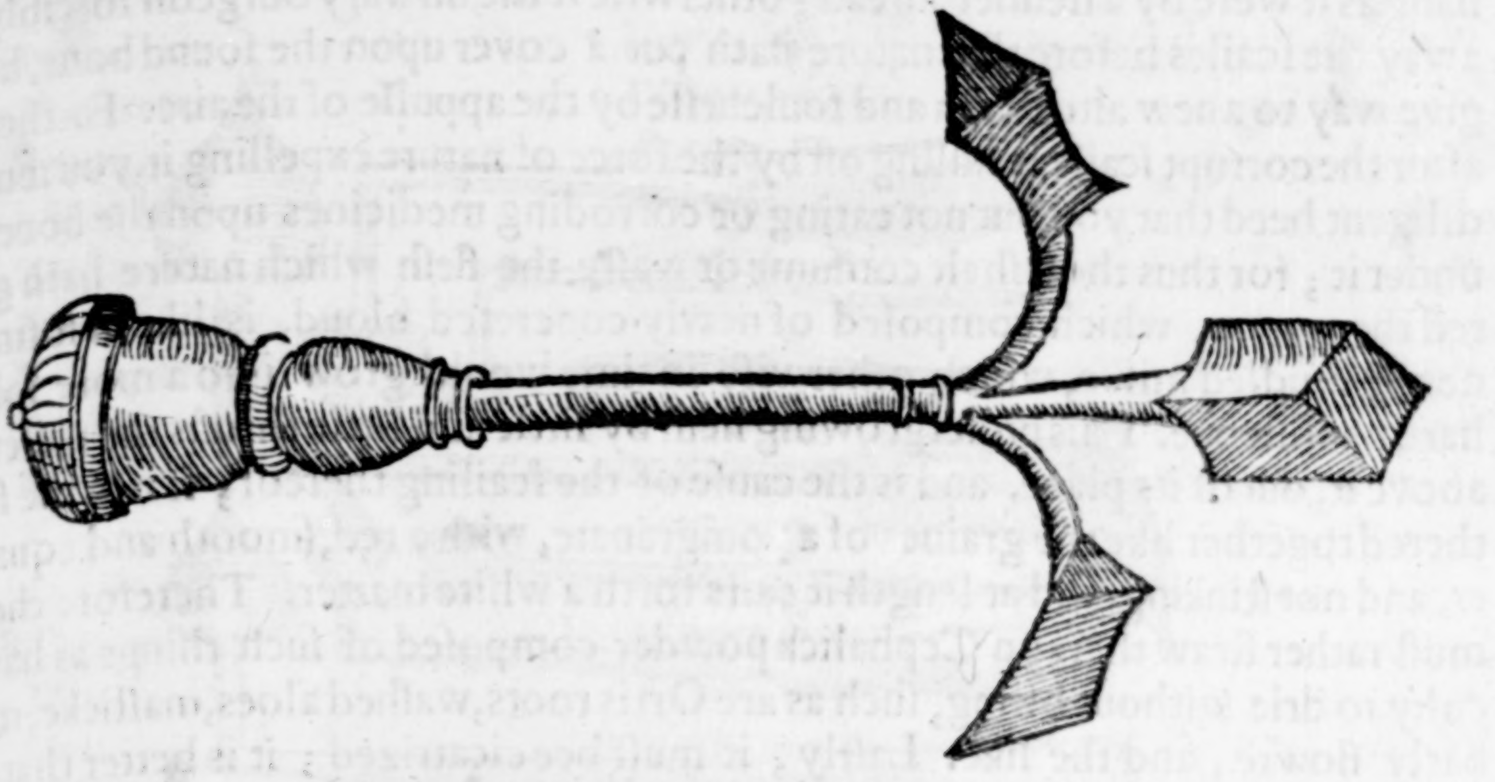
The following figure of a Cautery is fit for virulent knots that ariſe in the ſcull, when you deſire to take away the fleſh that covers the bone; for this purpoſe it is made hollow and ſharpe in a triangular and quadrangular forme, divided as it were into three branches, that you may ſo make uſe of which you pleaſe.



ots that arise in the ſcull,
for this purpoſe it is made
, divided as it were into
aſe.

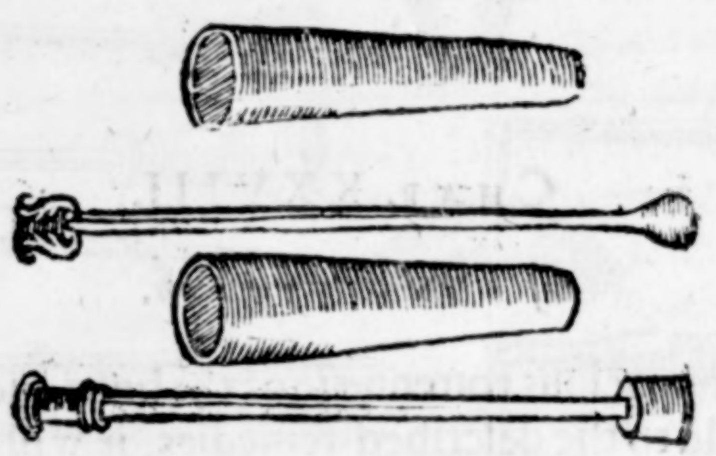
The

The figure of a hollow and cutting Cauterie.



The Cauteries whoſe formes are hereafter expreſt take place in rotten bones that lye deep in, wherein you cannot make uſe of the formerly deſcribed without touching of the neighbouring ſound parts. To avoyd which danger you ſhall put your Cautery even to the bone through an iron pipe, which may keep the neighbouring and fleſhy parts from burning.

Actuall Cauteries with their pipes.



Great diſcommodities enſue upon too raſh, that is, too frequently applyed Cauteries, or too long adhering to the bone; for by this immoderate and fiery heat not onely the excrementitious humidity of the rotten bone is conſumed, but alſo the radicall and ſubſtantiall moiſture of the part is exhauſted, wherein alone nature, endeavouring to caſt off the corrupt ſcailes, and ſever the ſound from the rotten bone, and to ſubſtitute fleſh, ſtands and conſiſts. Whereof, the meaſure of applying of Cauteries ought to be taken from the greatneſſe of the rottenneſſe, and the excrementitious, or after a manner foaming humidity ſweating through the pores of the bone. But before you preſſe your cautery into the rotten bone which lies very deep in, as that which happens in the thigh bone, and upon other very fleſhy parts, you muſt diligently defend the neighbouring, ſound and fleſhy parts, as it were with a covering, for that the humour diffuſed by the touch of the fire, burns the other places whereunto it diffuſeth it ſelfe like ſcalding oyle. After the cauterization you muſt helpe forwards the falling away of the ſcailes, by ſometimes dropping in our oyle of whelpes, being made ſcalding hot. This oyle, though very fit for this purpoſe, yet doe I not iudge it fit to uſe it too often, it may ſuffice to have dropped it in ſome twice or thrice. For at length it may violate the ſound bone, that lyes under the rotten, by the oyly, ſubtle and moiſt ſubſtance. Furthermore, a bone is the moſt dry part of the body, therefore unctuous and moiſt medicines are contrary to its temper and conſiſtence. But it conduceth often and gently to move the ſcailes al-

Manner of applying of Cauteries.

Oile of whelpes helps forwards the caſting off of ſcailes.

ready

A caution in moving the ſcailes of burnt bones.

ready beginning to ſeparate themſelves, and it haſtens the ſlackeneſſe of nature in caſting them off. Yet may you not uſe force, unleſſe peradventure when as they hang as it were by a ſlender thread; otherwiſe if the unwary Surgeon forcibly pluck away the ſcailes before that nature hath put a cover upon the ſound bone, hee ſhall give way to a new alteration and fouleneſſe by the appulſe of the aire. Furthermore, after the corrupt ſcaile is falling off by the force of nature expelling it, you muſt have diligent heed that you put not eating or corroding medicines upon the bone that is under it; for thus thou ſhalt conſume or waſte the fleſh which nature hath generated thereupon, which compoſed of newly concreted bloud, is like in ſoftneſſe to newly crudled milke, which otherwiſe in time would grow into a more ſolid and hard conſiſtence. This undergrowing fleſh by little aud little thruſts the rotten bone above it, out of its place, and is the cauſe of the ſcailing thereof; it is at the firſt gathered together like the graines of a pomgranate, with a red, ſmooth and equall *ſanies*, and not ſtinking, and at length it caſts forth a white matter. Therefore then wee muſt rather ſtraw thereon Cephalick powder compoſed of ſuch things as have a faculty to drie without biting, ſuch as are Orris roots, waſhed aloes, maſticke, myrrhe, barly flowre, and the like. Laſtly, it muſt bee cicatrized; it is better that ſcailes of bones fall away of themſelves by the onely force of nature, than to be plucked away by the force of medicines or inſtruments; becauſe, ſuch as are too violently and forcibly plucked away, leave corners like to fiſtulous ulcers. Neither ought the corrupted membranes when they are turned into *pus* to bee plucked away too violently, or to bee touched by too acride medicines; for paine hereupon ariſing, hath divers times cauſed inflammation, convulſion and other pernicious ſymptomes. Therefore it is better to commit this buſineſſe to nature, which in ſucceſſe of time, by making uſe of the expulſive faculty, will eaſily free it ſelfe from this rotten ſubſtance; for that which is quick as farre as it is able, will ſtill put away that which is dead from it.

Cephalick pouders of what compoſed.

Chap. XXVIII.

Of a vulnerary potion.

BUt if the contumacious rottenneſſe of the bone and alſo a rebellious ulcer ſhall not yeeld to the deſcribed remedies, it will bee convenient to preſcribe a vulnerary potion to the patient. For nature helped by ſuch a potion, hath to my knowledge ſundry times done wondrous things, in the amendment of corrupt bones, and conſolidation of ulcers. For theſe potions though they doe not purge the noxious humours away by ſtoole, yet are they wondrous effectuall to cleanſe ulcers, and free them from the exceſſe of excrementitious humours, to cleanſe the bloud, and purge it from all impurity, to agglutinate broken bones, and knit the ſinewes. I have here thought good to ſpeake of them, and chiefly, for that they were much commended by the Ancients, but neglected by the moderne Phyſicians and Surgeons. But if the cure of wounds and old ulcers be performed by deterſion, and the repoſition of the loſt ſubſtance, what medicine can ſooner or rather do it than that, which by its admirable and almoſt divine force ſo purgeth the bloud, that thereof, as from a fit and laudible matter, the fleſh or any other loſt ſubſtance may be fitly reſtored, and the part recover its former union? But if fiſtulous Ulcers, Cancers, Gouts & the like diſeaſes be offended by the uſe of ſalt, ſpiced, acride meates and others which are of ſubtle parts, as muſtard, onions and garlike, or any other exceſſe in meat, or drinke; why may they not become milde and gentle by medicated and contrary meats and drinks, or at leaſt bee reduced to a more equall temper? Therefore that Surgeons may know of what things ſuch compoſitions may ariſe, I have here thought good to reckon them up, that you may learn what they are.

St. Johns wurte.

Of all theſe the Surgeon ſhall make choice according to the mind and judgement of the Phyſician, ſuch as he ſhall thinke fit and proper to every ulcer or wound, or to each wounded and ulcerated part, according to the condition of the time, the temper of the patient and kinde or nature of the diſeaſe. You may make drinkes not onely of the decoctions of theſe, but alſo of their juices in white wine, or *œnomel*, which are good not onely to purifie the maſſe of the bloud, to cleanſe ſanious, virulent, filthy and diſſenterious ulcers, but alſo to drive away putrefaction, ſcail bones, diſſolve clotted bloud in bruiſes, to draw, plucke out and exterminate all ſtrange bodies, as I have often obſerved to my great admiration. They are compoſed uſually after this manner. ℞. *ſavic. bugul. ſcabioſ. beton. ſcord. nepet. an.* m. ß. *uvar. mund. ſem. hyper. & card. ben. an* ℥i. *trium flor. cord. an.* p. ii. *coquantur complete in aq. communi; poſtea in fine adde vini alb. mel. roſ. & cinnam. quod ſufficit, fiat decoctio, coletur per manicam.* Let him drink ℥iii. in the morning 3. houres before dinner. You may alſo with good ſucceſſe make injections with the ſame liquor into fiſtulous and ſinuous ulcers, as alſo to waſh the ſordid ulcers therewith. You may alſo boile the ſame ſimples, as herbs, flowers and ſeeds in the patients broths, that ſo they may acquire a medicinable and nouriſhing faculty. For the time of the affect, wherein you may with good ſucceſſe make uſe of theſe, we have read in *Guido*, that he uſed not to preſcribe theſe potions to his patients when as they were newly wounded, for that they commonly are compoſed of things hot and opening, which heat and attenuate the bloud, whence there would be danger of a defluxion, upon the affected part. Wherefore when the matter is come to ſuppuration, when as there nothing remains, but to cleanſe the ulcer and fil it with fleſh, no inflammation as now remaining in the part, I judge theſe potions may then be uſed with good ſucceſſe.

The forme of a vulneraty potion.

In what time of the diſeaſe they are chiefly to be uſed.

CHAP. XXIX.

Of Tetters, Ring-wormes or Chops occaſioned by the Lues venerea.

UPon the cure of the *Lues venerea*, uſually Tetters and Chops happen thereupon, which make furrowes in the palmes of the hands & ſoles of the feet. They acquire their matter from ſalt phlegme, or aduſt choler, or the reliques of the venereous virulency ſent thither. The cure eſpecially whenas the diſeaſe is grown old, is difficult, by reaſon that the humour hath long accuſtomed to flow that way, & for that it hath corrupted the habite of the part by the continuall defluxion; but the cure is more eaſie if the diſeaſe bee newly bred. Now you may know it is newly bred by the redneſſe, accompanyed by a great itching, and not only a drineſs of the skin, but alſo a thickneſs & denſeneſs thereof. That which is old, beſides theſe fore-recited ſigns, have ſcaily & branlike hardneſſes conjoined therewith, which by ſcratching & rubbing caſt off ſcailes. For general medicines, the diſtemper of the liver & habit of the body muſt be corrected, which by the occaſion of the former diſeaſe & remedies apt to inflame the bloud, cannot but much ſwerve from their native temper. This may be done by diet conveniently appointed, by purging and altering medicines, bleeding, bathing, applying of cupping-glaſſes and horns. For topick or particular medicines, waſh ſuch as are newly or lately bred with the following water which dries and is of ſubtle parts. ℞.*aq.roſ.& pariet.an* ℥i.*aq.alum.*℥ii.*calc.*℥ii.*alum.*ʒiii.*pul.ſubl.*℈iiii.*fiat lent.et minim.ebul.in baln.mar.* This water ſhall bee made more or leſſe forcible according to the condition of the diſeaſe. Or, ℞.*ol.tart.*℥ii.*ſap.com.*℥iv.*m ſc.fiat unguent.ad uſum.* If the Phyſician ſhall think good, let the patient uſe a decoction of *Guajacum*, but that very weak. But old Tetters and Chops muſt be ſoftned with emollient, attenuating and inciding decoctions, as alſo with liniments, ointments and plaſters having the ſame effect. Then let the reſidue of the cure be performed by fumigations ſuch as this which followes. ℞.*pul.cinab.*℥ii. *lad.aſſ.odor.ſtirac cal.an.*℥ß.*olib.maſtic.an* ʒiii.*olei tart & theriac.q.ſ.fiant trochiſci*; uſe at each time ſome ℥ß.of them, and let only the affected parts receive the ſmoak. Some commend the rubbing of the hands with the following medicine. Take the aſhes of wine lees, make thereof a lie, & ſtrain it though an hypocras bag, then put thereto ſome rennet, let them be well mixed together in a mortar, and herewith let the hands be rubbed or waſhed. Or, ℞.*unguent.enul.*℥ii.*fugit.*℥ii. Or elſe, ℞.*reſ.pini*, ℥i.*ceruſ.*℥ß.*argent.viv.* ʒiii.*ſucci citri & lapath.acut.an.*℥ß. Let them be incorporated & make a liniment to be uſed to the part. If to this you adde ſublimate ſo waſhed & prepared, as women uſe for their faces, you ſhall make it more effectuall. Others take burnt alume made into powder, and incorporated with the yolke of an egge, the juice of Citrons, and a little aloes diſſolved in *oxymel ſcilliticum.*

CHAP. XXX.

Of curing the Lues Venerea *in infants and little children.*

INfants oft-times conceive the ſeeds of this diſeaſe in the wombs of their mothers, and are borne infected therewithall, puſtles preſently ariſing over all the bodies, infecting with the like diſeaſe as many nurſes as give them ſuck; they ſcarce ever recover thereof, for that they contracted the diſeaſe from their firſt conformation. But ſuch as are ſomewhat bigger, if they chance to catch the diſeaſe after they are born by ſucking ſom infected nurſe, or by any other occaſion or kind of contagion, often times receive cure. For firſt, you ſhal cauſe the nurſe to uſe the *aqua theriacalis* hereunder deſcribed, for the ſpace of 20 or more daies, that ſo ſhe may the better arm her ſelf againſt the contagion of this diſeaſe, & yeeld milk which may have the faculty both of meat and medicine; ſhe ſhall be carefull as often as ſhe gives the child ſuck, to waſh and dry her teat or pap, leſt the

The cure.

virulency that the child breathes out at his mouth, be impact in the little holes of the teat through which the milk flowes out. Now the puſtules of little children ſhall bee anointed with ſome ointment that receives *argentum vivum* in ſome ſmall quantity, as *unguentum enulatum cum mercurio*, or the like. Then ſhall it be ſwathed or bound up in ſwathes and clothes aired with the formerly deſcribed fumigations. For the reſt, it ſhall be kept as warm as you can in ſome warm place. Theſe & the like muſt be done not in one continued courſe, but at ſeverall ſeaſons, otherwiſe it is to be feared, that it would cauſe ulcers to ariſe in the mouth, or elſe ſalivation. If any ulcers ariſe in the mouth and ſpread therein, they ſhall be touched with the formerly deſcribed waters, but made ſomewhat weaker, having regard to the tender age of the patient; if the infant ſhall get this diſeaſe of its nurſe, let the nurſe be preſently changed, for it being otherwiſe nouriſhed with tainted and virulent bloud, can never be healed. Many have by theſe meanes recovered; but ſuch as have periſht, have not periſht by the default of medicines, but by the malignity and vehemency of the diſeaſe.

A deſcription of the aqua Theriacalis, *or treacle water formerly mentioned.*

A treacle water.

The manner of making it.

℞. *raſur. interior. ligni ſancti gummoſi*, ℔ ii. *polypod. querni*, ℥ iv. *vini albi dulcedinis expertis* ℔ ii. *aquæ fontan. puriſſ.* ℔ viii. *aquar. cichor. & fumar. an.* ℥ iv. *ſem. junip. heder. & baccar. lauri an.* ℥ ii. *caryophil. & macis, an.* ℥ ß. *cort. citri ſaccharo condit. conſ. roſ. anthos, cichor. bugloſ. borag. an.* ℥ ß. *conſ. anulæ camp. theriac. vet. & mithrid. an.* ℥ ii. diſtill them all in *balneo Mariæ* after the following manner. Let the *Guajacum* bee infuſed in equall parts of wine and the forementioned waters for the ſpace of twelve houres, and the reſidue of the things in that which remaines of the ſame wine and waters for ſixe houres ſpace, beating ſuch things as may require it, then let them bee mixed altogether, that ſo the liquor may be endued with all their faculties. Which that it may be the more effectually performed, let them be boyled, put up in glaſſe bottles cloſely ſtopped for ſome three or four hours ſpace, in a large kettle filled with boiling water, then let them be put into a glaſſe alembicke, and ſo diſtilled. Give ℥ iv. of this diſtilled liquor at once, being aromatized with ʒ i. of cinamon, and ℈ i. of *Diamargariton*, and ℥ ß. of ſugar, to give it a pleaſing taſte. Such a drinke doth not onely retunde the virulency of the *Lues venerea*, but ſtrengthens the noble parts. *Rondeletius* makes an *aqua theriacalis* after this manner. ℞. *theriac. vet.* ℔ i. *acetoſ.* m iii. *rad. gram.* ℥ iii. *puleg. card. ben. an.* m ii. *flor. chamæm.* p ii. *temperentur omnia in vino albo, & diſtillentur in vaſe vitrio:* reſerve the water for uſe; whereof let the patient take ℥ ii. with ℥ iii. of ſorrell and bugloſſe water: he wiſheth this to be done when he ſhall enter into bed or a ſtove; for ſo this diſtilled liquor will cauſe ſweat more eaſily, and mitigate paine, whether given by it ſelfe, or with a decoction of Grommell, or of *chyna*, or burre-docke roots; yet if the patient bee of a phlegmaticke conſtitution, hee ſhall uſe a decoction of *Guajacum* in ſtead of a decoction of *chyna*, for it penetrates more ſpeedily, by reaſon of its ſubtlety, of parts, and alſo expells the dolorificke matter.

Rondeletius his Treacle water.

The End of the Nineteenth Booke.

OF THE SMALLPOCKS AN MEAZLES:

AS ALSO OF VVORMES AND THE LEPROSIE.

THE TWENTIETH BOOKE.

CHAP. I.

Of the cauſes of the Small Pockes and MeaZles.

FOR that the ſmall Pocks and Meazles are diſeaſes, which uſually are forerunners and foretellers of the plague, not onely by the corruption of humours, but oft times by default of the aire; moreover, for that wormes are oft times generated in the plague, I have thought good to write of theſe things, to the end that by this treatiſe the young Surgeon may bee more amply and perfectly inſtructed in that peſtilent diſeaſe. Alſo I have thought good to treat of the Leproſie as being the off-ſpring of the higheſt corruption of humours in the body. Now the ſmall pocks are puſtles, and the meazels ſpots which ariſe in the top of the skinne by reaſon of the impurity of the corrupt blood ſent thither by the force of nature. Moſt of the Antients have delivered that this impurity is the reliques of the menſtruous blood remaining in the body of the infant, being of that matter from whence it drew nouriſhment in the wombe, which lying ſtill or quiet for ſome ſpace of time, but ſtirred up at the firſt opportunity of a hotter ſummer, or a ſoutherly or rainy ſeaſon, or a hidden malignity in the aire, and boyling up, or working with the whole maſſe of the blood, ſpread or ſhew themſelves upon the whole ſurface of the body. An argument hereof is, there are few or none who have not beene troubled with this diſeaſe, at leaſt once in their lives, which when it begins to ſhew it ſelfe, not content to ſet upon ſome one, it commonly ſeazeth upon more: now commonly there is as much difference betweene the ſmall pockes and meazles, as there is between a Carbuncle and a peſtilent *Bubo*. For the ſmall pocks ariſe of a more groſſe and viſcous matter, to wit, of a phlegmaticke humour. But the meazles of a more ſubtle and hot, that is, a cholericke matter, therefore this yeilds no markes thereof, but certaine ſmall ſpots without any tumour, and theſe either red, purple, or blacke. But the ſmall pockes are extuberating puſtles, white in the midſt, but red in the circumference, an argument of blood mixed with choler

What the ſmall pockes and Meazles are.
Their matter.

Why the Meazles doe not itch.

Prognoſtickes.

ler, yet they are ſcarce knowne at the beginning, that is, on the firſt or ſecond day they appeare; but on the third and fourth day they bunch out and riſe up into a tumour, becomming white before they turne into a ſcab; but the meazles remaine ſtill the ſame. Furthermore the ſmall pockes pricke like needles by reaſon of a certaine acrimony, and cauſe an itching; the meazles doe neither, either becauſe the matter is not ſo acride and biting, or elſe for that it is more ſubtle, it eaſily exhales, neither is it kept ſhut up under the skinne. The patients often ſneeſe when as theſe matters ſeek paſſage out, by reaſon of the putride vapoures aſcending from the lower parts upwards to the braine. They are held with a continuall feaver, with paines in their backes, itching of their noſe, head-ach, and a vertiginous heavineſſe, and with a kinde of ſowning or fainting, a nauſeous diſpoſition, and vomiting, a hoarſeneſſe, difficult and frequent breathing, an inclination to ſleepe, a heavineſſe of all the members, their eyes are fiery and ſwollen, their urine redde and troubled. For prognoſtickes, wee may truely ſay thus much, That the matter whence this affect takes its originall, partakes of ſo malign, peſtilent and contagious a quality, that not content to mangle and ſpoile the fleſhy parts, it alſo eates corrupts the bones, like the *Lues venerea*, as I obſerved not onely in *Anno Don* 8. but alſo in divers other yeares, whereof I thinke it not amiſſe to ſet downe this notable example.

A hiſtorie.

What grievous and pernitious ſymptomes may happen by the ſmall pockes.

The daughter of *Claude Piquè* bookſeller, dwelling in S. *James* his ſtreet at *Paris*, being ſome foure or five yeeres old, having beene ſicke of the ſmall pockes for the ſpace of a month, and nature could not overcome the malignity of the diſeaſe, there roſe abſceſſes upon the *ſternon* and the joints of the ſhoulders, whoſe eating and virulent matter, corroded the bones of the *ſternon*, and divided them inſunder; alſo it conſumed a great part of the toppe of the ſhoulder-bone, and the head of the bladebone: of this thing I had witneſſes with me, *Marcus Myron* phyſitian of *Paris*, and at this preſent the Kings chiefe phyſitian, *John Doreau* Surgeon to the *Conte de Bryane*, the body being diſſected in their preſence. Alſo you may obſerve in many killed by the malignity of this diſeaſe, and diſſected, that it cauſeth ſuch impreſſion of corruption in the principall parts, as brings the dropſie, ptiſick, a hoarſeneſſe, *Aſthma*, bloody fluxe ulcerating the guts, and at length bringing death, as the puſtles have raged or raigned over theſe or theſe entrailes, as you ſee them to do over the ſurface of the body; for they do not only moleſt the externall parts, by leaving the impreſſions and ſcarres of the puſtles and ulcers, rooting themſelves deepe in the fleſh, but alſo oft times they take away the faculty of motion, eating aſunder, and weakening the joints of the elbow, wreſt, knee and ancle. Moreover ſundry have been deprived of their ſight by them, as the Lord of *Guymenay*, others have loſt their hearing, and otherſome their ſmelling, a fleſhy excreſcence growing in the paſſages of the noſe and eares. But if any reliques of the diſeaſe remaine, and that the whole matter thereof bee not expelled by the ſtrength of nature, then ſymptomes afterwards ariſe, which ſavour of the malignity of the humour, yea and equall the harme of the ſymptomes of the *Lues venerea*.

CHAP. II.

Of the cure of the Small Pockes and Meazles.

The cure.

THe cure of this diſeaſe uſeth to bee divers, according to the condition of the humour free from, or partaker of the venenate quality. For if it partake of malignity, and the childe bee a ſucking childe, ſuch things ſhall be given to the Nurſe as may infringe and overcome the ſtrength of the malignity, as wee ſhall ſhew more at large, when wee come to treat of the cure of children which are ſick of the plague; howſoever it be, the child muſt be kept in a warm roome free from winde, and muſt bee wrapped and covered with ſcarlet cloathes, untill the pockes come forth. There ſhall bee provided for the Nurſe medicated brothes with purſlaine, lettuce, ſorrell, ſuccory, borage, and French barly bound up in a cloth. She ſhall ſhun all ſalt, ſpiced and baked meates, and in ſtead of wine drinke a decoction of liquerice, raiſons and ſorrell roots. She ſhall alſo take purging medicines, as if ſhe were ſicke of the ſame diſeaſe, that ſo her milke may become medicineable. Laſtly, ſhee ſhall obſerve the ſame diet as is uſually preſcribed to ſuch as have the plague. You ſhall give the child no pappe, or if you give it any, let it bee very little. But if the child be weaned, let him abſtaine from fleſh, untill the feaver have left him, and the pocks bee fully come forth: in ſtead of fleſh let him feed on barly and almond creames, chicken brothes, wherein the fore-named herbes have beene boyled, ponadoes, gellies, culaſſes, prunes and raiſons. Let his drinke bee a priſan made of French barly, graſſe and ſorrell roots, or with a nodula containing the foure cold ſeeds, the pulpe of prunes and raiſons, with the ſhavings of Ivory and harts-horne; Betweene meales the ſame decoction may be mixed with ſome ſyrupe of violets, but not of roſes or any other aſtringent ſyrupe, leſt wee hinder the courſe and inclination of the humour outwards. Let his ſleepe be moderate, for too ſound ſleep drawes back the mater to the center, and encreaſeth the feaver; you muſt neither purge, nor draw bloud the diſeaſe increaſing or being at the height, unleſſe peradventure there bee a great plenitude, or elſe the diſeaſe complicate with other, as with a pleuriſie, inflammation of the eyes, or a ſquinancie which require it, leſt the motion of nature ſhould be diſturbed; but you ſhal think it ſufficient to looſe the belly with a gentle glyſter: but when the height of the diſeaſe is over, and in the declenſion thereof, you may with *Caſſia* or ſome ſtronger medicine evacuate part of the humours and the reliques of the diſeaſe. But in the ſtate and increaſe it is better to uſe ſudorificks, which by attenuating the humours and relaxing the pores of the ſkin may drive the cauſe of the diſeaſe from the center to the circumference, which otherwiſe reſiding in the body might bee a cauſe of death; as I and *Richard Hubert* obſerved in two maides, whereof one was foure, and the other ſeventeene years old; for we diſſecting them both being dead, found their entrailes covered with ſcabby or cruſted puſtles, like thoſe that break forth upon the ſkin. We muſt not think that a bleeding at noſe at the beginning of the diſeaſe, or in the firſt foure or five dayes ſhould carry away the matter and originall of the diſeaſe, for nevertheleſſe the pocks will come forth; but for that this is a true and naturall *criſis* of this diſeaſe, as that which is carryed to the ſurface and circumference of the body, ſuch bleeding muſt not be ſtopped, unleſſe you feare it will cauſe ſowning. The matter ſhall bee drawne out with a decoction of figs, husked lentils, citron ſeeds, the ſeeds of fennell, parſly, ſmallage, roots of graſſe, raiſons and dates. For ſuch a decoction, certainly if it have power to cauſe ſweat, hath alſo a faculty to ſend forth unto the skin the morbificke humour; the ſeeds of fennell and the like opening things relaxe and open the pores of the ſkin; figges lenifie the acrimonie of the matter, and gently cleanſe, the lentils keepe the jawes and throate, and all the inward parts from puſtles, and hinder a fluxe by reaſon of their moderate aſtriction, but having their huskes on, they would bind more than is required in the diſeaſe; dates are thought to comfort the ſtomack, and citron ſeeds to defend the heart from malignity, liquerice to ſmooth the throat, and hinder hoarſneſſe and cauſe ſweat. But theſe things ſhall be given long after meat, for it is not fit to ſweat preſently after meat; ſome there bee who would have the child wrapped in linnen clothes ſteeped in this decoction being hot, and afterwards hard wrung forth. Yet I had rather to uſe bladders or ſpunges, or hot bricks for the ſame purpoſe; certainly a decoction of millet, figges and raiſons, with ſome ſugar, cauſeth ſweat powerfully. Neither is it amiſſe whileſt the patient is covered in all other parts of his body, and ſweats, to fan his face, for thus the native heat is kept in & ſo ſtrengthened, and fainting hindred, and a greater excretion of excrementitious humours cauſed. To which purpoſe you may alſo put now and then to the patients noſe a *nodulus* made with a little vinegar & water of roſes, camphire, the powder of ſanders, and other odoriferous things which have a cooling faculty, this alſo will keepe the noſe from puſtles.

The child muſt have no pappe.

How ſound ſleepe doth harme in this diſeaſe.

Of purging, bleeding, and ſudorificks.

A hiſtory.

A ſudorificke decoction.

When it is beſt to procure ſweat.

CHAP. III.

What parts muſt be armed againſt, and preſerved from the Pocks.

THe eyes, noſe, throte, lungs, and inward parts ought to be kept freer from the eruption of puſtles than the other parts; for that their nature and conſiſtence is more obnoxious to the malignity of this virulency, and they are eaſilyer corrupted and blemiſhed. Therefore leſt the eyes ſhould be hurt, you muſt defend them when you firſt begin to ſuſpect the diſeaſe, with the eye-lids, alſo moiſtening them with roſe-water, verjuice or vinegar, and a little Camphire. There are ſome alſo who for this purpoſe make a decoction of Sumach, berbery-ſeeds, pomgranate pills, aloe,ſand a little ſaffron; the juice of ſowre pomgranates, and the water of the whites of egges dropped in with roſe-water, are good for the ſame purpoſe; alſo womans milke mixed with roſe-water and often renewed, and laſtly, all ſuch things as have a repercuſſive quality. Yet if the eyes bee much ſwolne and red, you ſhall not uſe repercuſſives alone, but mixe therewith diſcuſſers and cleanſers, ſuch as are fit by a familiarity of nature to ſtrengthen the ſight; and let theſe bee tempered with ſome fennell or eye-bright water. Then the patient ſhall not looke upon the light or red things for feare of paine and inflammation; wherefore in the ſtate of the diſeaſe when the pain and inflammation of the eyes are at their height, gently drying and diſcuſſive things properly conducing to the eyes are moſt convenient, as waſhed aloes, tuttye and Antimonie in the water of fennell, eye bright and roſes. The formerly mentioned nodulus will preſerve the noſe, and linnen clothes dipped in the fore-ſaid aſtringent decoction, put into the noſthrils and outwardly applyed. We ſhall defend the jawes, throate and throttle, and preſerve the integrity of the voice by a gargle of oxycrate, or the juice of ſowre pomgranates, holding alſo the grains of them in their mouths, & often rouling them up & down therein, as alſo by nodula's of the ſeeds of *pſilium*, quinces & the like cold & aſtringent things. We muſt provide for the lungs & reſpiration by ſyrupes of jujubes, violets, roſes, white poppyes, pomgranats, water-lillies, and the like. Now when as the pocks are throughly come forth, then may you permit the patient to uſe ſomewhat a freer diet, and you muſt wholly buſie your ſelfe in ripening and evacuating the matter, drying and ſcailing them. But for the meazels, they are cured by reſolution onely, and not by ſuppuration; the pocks may bee ripened by annoynting them with freſh butter, by fomenting them with a decoction of the roots of mallowes, lillies, figs, line-ſeeds and the like. After they are ripe, they ſhall have their heads clipped off with a paire of ſizzers, or elſe bee opened with a golden or ſilver needle, leſt the matter conteined in them, ſhould corrode the fleſh that lyes thereunder, and after the cure, leave the prints or pockholes behinde it, which would cauſe ſome deformity; the *pus*, or matter being evacuated, they ſhall be dryed up with *unguent. roſat.* adding thereto ceruſſe, litharge, aloes and a little ſaffron in powder; for theſe have not onely a faculty to dry, but alſo to regenerate fleſh; for the ſame purpoſe the floure of barly and lupines are diſſolved or mixed with roſe-water, and the affected parts annoynted therewith with a fine linnen ragge; ſome annoint them with the ſwathe of bacon boiled in water and wine, then preſently ſtrow upon them the floure of barly or lupines, or both of them. Others mixe crude hony newly taken from the combe, with barly floure, and therewithall annoint the puſtles ſo to dry them; being dryed up like a ſcurfe or ſcab, they annoint them with oyle of roſes, violets, almonds, or elſe with ſome creame, that they may the ſooner fall away, the puſtles being broken; tedious itchings ſollicite the patients to ſcratch, whence happens excoriation and filthy ulcers, for ſcratching is the occaſion of greater attraction. Wherfore you ſhall bind the ſick childs hands, and foment the itching parts with a decoction of marſh mallowes, barly and lupines, with the addition of ſome ſalt. But if it bee already excoriated, then ſhall you heale it with *unguent. album camphorat.* adding thereto a little powder of Aloes or *Cinnabaris*, or a little *deſiccativum rubrum*. But if notwithſtnding all your application of repelling medicines,

How to defend the eyes.

When the eyes muſt not be defended by repercuſſives onely.

How to defend the noſe.

How the mouth

How the lungs.

How to prevent pock-arres.

Remedies for excoriation.

puſtules,

puſtles nevertheleſſe break forth at the eyes, then muſt they be diligently cured with all manner of *Collyria*, having a care that the inflammation of that part grow not to that bignes, as to break the eies, & that which ſomtimes happens to drive them forth of their proper orbes. If any cruſty ulcers ariſe in the noſthrils, they may be dryed and cauſed to fall away by putting up of oyntments. Such as ariſe in the mouth, palate and throat, with hoarſeneſſe and difficulty of ſwallowing, may be helped by gargariſmes made with barly water, the waters of plantaine and chervill, with ſome ſyrupe of red roſes, or *Diamoron* diſſolved therein; the patient ſhall hold in his mouth ſugar of roſes or the tablets of *Elect. diatragacanth. frigid.* The Pock-arres left in the face, if they bunch out undecently, ſhall be clipped away with a paire of ſizzers, and then annointed with freſh *unguent. citrin.* or elſe with this liniment. ℞. *amyli triticei, & amygdalarum excorticatarum, an.* ʒiß. *gum. tragacanth.* ʒß. *ſeminis melonum, fabarum ſiccarum excorticat. farinæ hordei, an.* ℥iiii. Let them all bee made into fine powder, and then incorporated with roſe-water, and ſo make a liniment, wherewith anoynt the face with a feather; let it bee wiped away in the morning, waſhing the face with ſome water and wheat bran; hereto alſo conduceth *lac virginale*; Gooſe, ducks and Capons greaſe are good to ſmooth the roughneſſe of the skin, as alſo oile of lillies; hares bloud of one newly killed and hot is good to fill and plaine, as alſo whiten the Pock-holes, if they bee often rubbed therewith. In ſtead hereof many uſe the ſwathe of Bacon rubbed warme thereon; alſo the diſtilled waters of beane flowers, lilly roots, reed-roots, egge-ſhels, and oile of egs are thought very prevalent to waſte and ſmoothe the Pock-arres.

For the ulcers of the mouth and jawes.

To help the unſightly ſcars of the face.

A Diſcourſe of certaine monſtrous creatures which breed againſt nature in the bodies of men, women, and little children, which may ſerve as an induction to the enſuing diſcourſe of worms.

As in the *macrocoſmos* or bigger world, ſo in the *microcoſmos* or leſſer world there are winds, thunders, earthquakes, ſhowres, inundations of waters, ſterilities, fertilities, ſtones, mountaines and ſundry ſorts of fruits and creatures thence ariſe. For who can deny but that there is winde conteined ſhut up in flatulent abſceſſes, and in the guts of thoſe that are troubled with the cholicke? Flatulencies make ſo great a noyſe in divers womens bellies, if ſo be you ſtand neare them, that you would think you heard a great number of frogs croaking on the night time: That water is contained in watery abſceſſes, and the belly of ſuch as have the dropſie, is manifeſted by that cure which is performed by the letting forth of the water; in fits of Agues the whole body is no otherwiſe ſhaken and trembles, than the earth when it is heard to bellow, and felt to ſhake under our feet. He which ſhall ſee the ſtones which are taken out of the bladder, & come from the kidnies and divers other parts of the bodie, cannot deny but that ſtones are generated in our bodies. Furthermore wee ſee both men & women who in their face, or ſome other parts, ſhew the impreſſion, or imprinted figure of a cherry, plumb, ſervice, fig, mulberry & the like fruit; the cauſe hereof is thought to be the power of the imagination concurring with the formative faculty, and the tenderneſſe of the yeelding and waxe-like *embryon*, eaſie to be brought into any forme or figure by reaſon of the proper and native humidity. For you ſhall find that all their mothers whileſt they went with them have earneſtly deſired or longed for ſuch things, which, whileſt they have too earneſtly agitated in their mindes, they have trans-ferred the ſhape unto the childe, whileſt that they could not enjoy the things themſelves. Now who can deny but that bunches on the backe, and large wens reſemble mountaines? Who can gainſay, but that ſqualide ſterility may bee aſſimulated to the hectick dryneſs of waſted and conſumed perſons? and fertility deciphered by the body diſtended with much fleſh and fat, ſo that the legs can ſcarce ſtand under the burden of the belly? But that divers creatures are generated in one creature, that is, in man, and that in ſundry parts of him, the following hiſtories ſhall make it evident.

A compariſon between the bigger and leſſer world.

The generation of wind in mans body.

Of water.

Of ſtones.

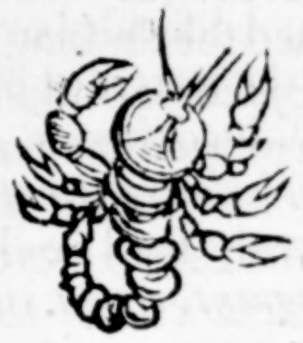
Of fruits from the firſt conformation.

Hollerius tels that a certaine Italian by frequent ſmelling to the herbe Baſill had a Scorpion bred in his braine, which cauſed long and vehement paine, and at length death;

Lib. de morb. inter cap. 1.

death; therefore I have here expreſt the figure of that Scorpion found when as his braine was opened.

The figure of a Scorpion.

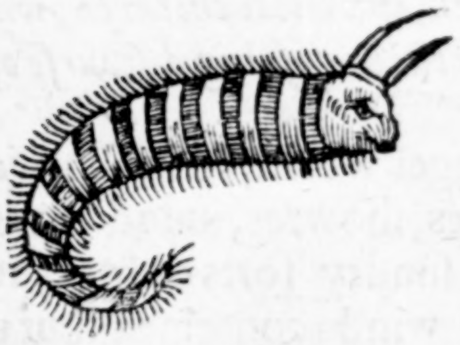


It makes ***Hollerius*** conjecture of the cauſe and originall of this Scorpion, probable for that *Chryſippus*, *Dyophanes* and ***Pliny*** write, that of baſill beaten betweene two ſtones, and laid in the ſun, there will come Scorpions.

Lib. 5. de part. morbis cap. 7.

Fernelius writes that in a certaine ſouldier, who was flat noſed, upon the too long reſtraint or ſtoppage of a certaine filthy matter that flowed out of the noſe, that there were generated two hairy wormes of the bigneſſe of ones finger, which at length made him mad, he had no manifeſt feaver, and he died about the twentieth day: this was their ſhape, by as much as we can gather by ***Fernelius*** his words.

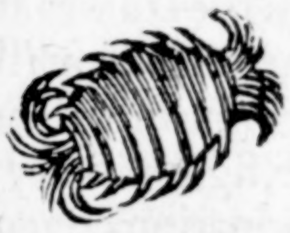
The effigies of the wormes mentioned by Fernelius.



A hiſtory.

Lewes Duret a man of great learning and credit, told mee that hee had come forth with his urine, after a long and difficult diſeaſe, a quick creature, of colour red, but otherwiſe like in ſhape a Millepes, that is, a Cheſlope, or Hog-louce.

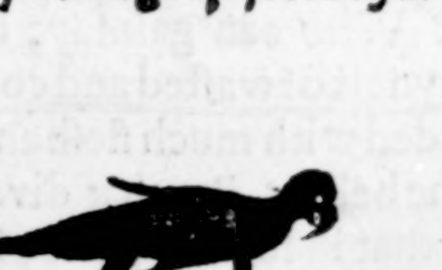
The ſhape of a Millepes caſt forth by urine.



A hiſtorie.

Count *Charles* of ***Manſfieldt***, laſt ſummer troubled with a grievous and continuall feaver, in the duke of *Guiſes* place caſt forth a filthy matter at his yard, in the ſhape of a live thing almoſt juſt in this forme.

The ſhape of a thing caſt forth by urine.



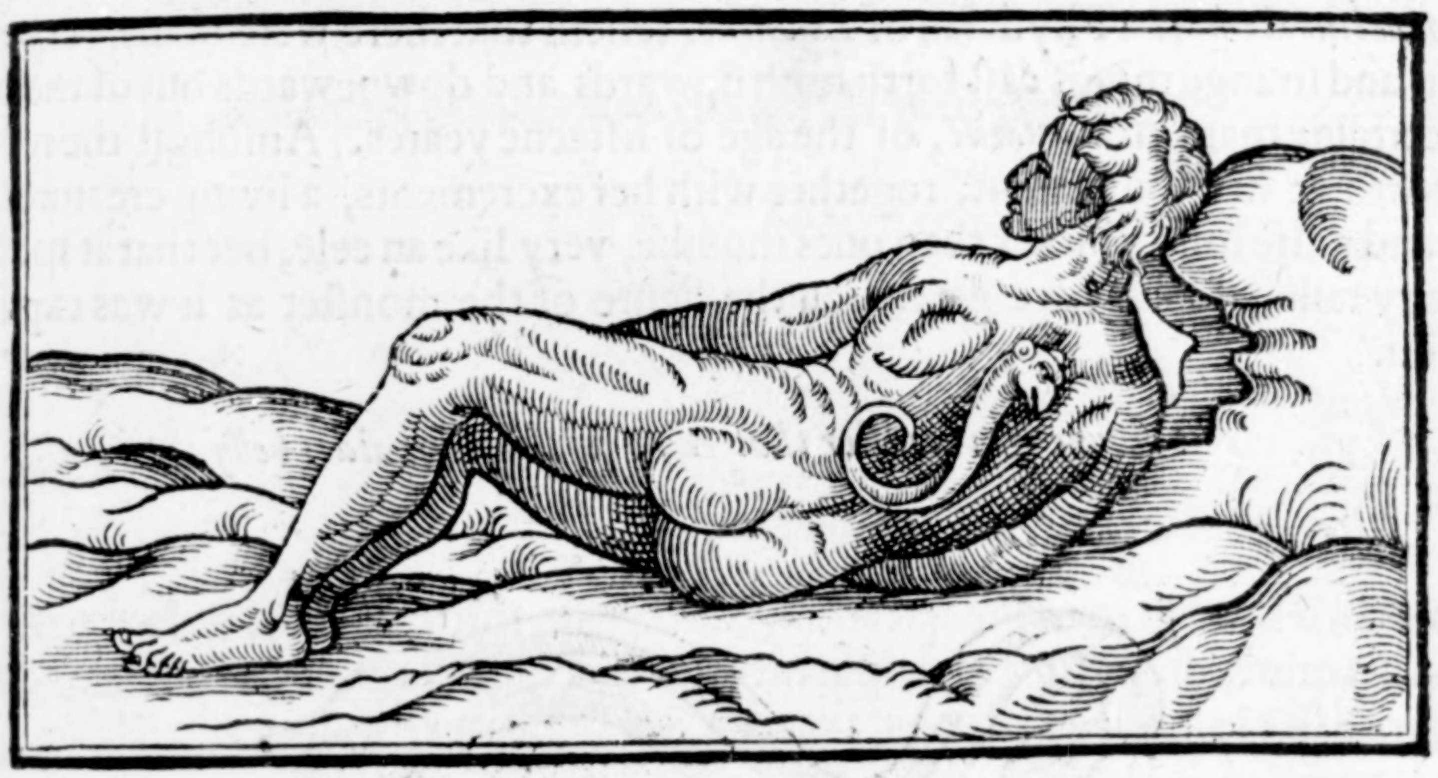
Mon-

Nicolaus Flor. Gord. lib. 7. c. 18.

Monſtrous creatures alſo of ſundry formes are alſo generated in the wombes of women; ſomewiles alone, otherwhiles with a *mola*, and ſometimes with a child naturally and well made, as frogs, toads, ſerpents, lizzards: which therefore the Ancients have tnrmed the Lumbards brethren, for that it was uſuall with their women, that together with their naturall and perfect iſſue they brought into the world wormes, ſerpents, and monſtrous creatures of that kinde generated in their wombes, for that they alwaies more reſpected the decking of their bodies, than they did their diet. For it happened whileſt they fed on fruits, weeds and traſh, and ſuch things as were of ill juice, they generated a putride matter, or certainely very ſubject to putrefaction and corruption, and conſequently opportune to generate ſuch unperfect creatures. *Jonbertus* telleth that there were two Italian women, that in one moneth brought forth each of them a monſtrous birth; the one that marryed a Tailor, brought forth a thing ſo little, that is reſembled a Rat without a taile; but the other a Gentlewoman, brought forth a larger, for it was of the bigneſſe of a Cat; both of them were black, and as ſoone as they came out of the wombe, they ran up high on the wall, and held faſt thereon with their nailes. *Licoſthenes* writes that in *Anno Dom.* 1494. a woman at *Cracovia*, in the ſtreete which taketh name from the holy Ghoſt, was delivered of a dead child, who had a ſerpen faſtned upon his back, which fed upon this dead child, as you perceive by this following figure.

Lib. error popul.

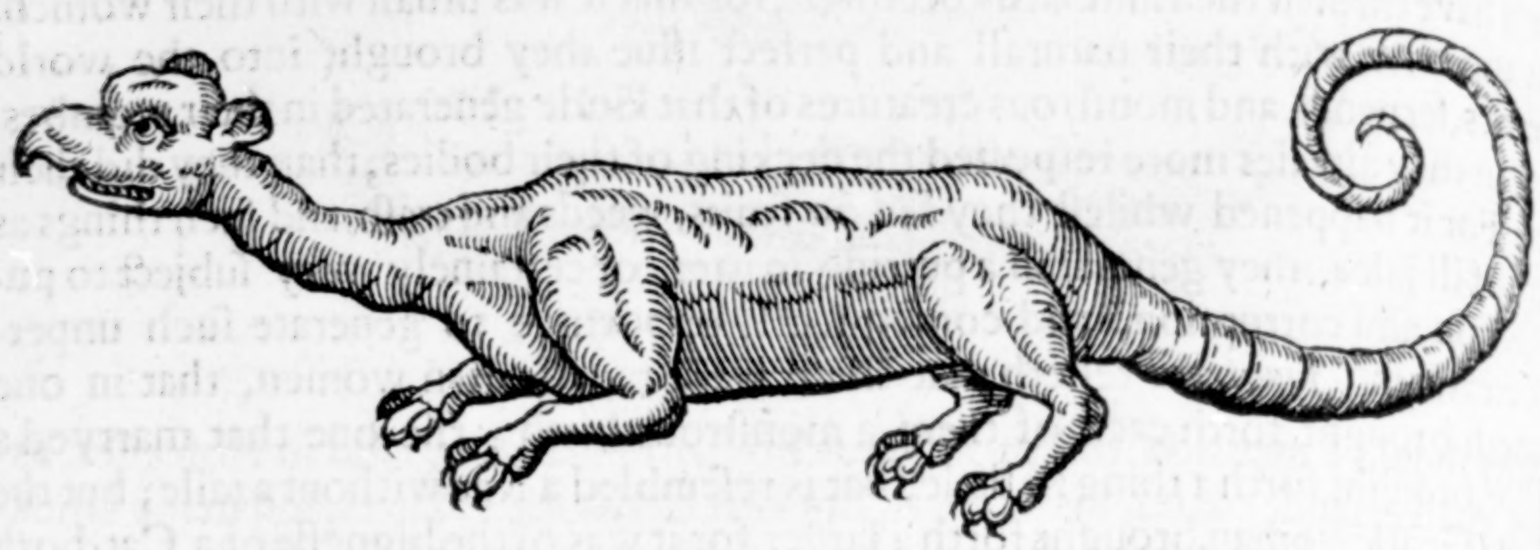
The figure of a ſerpent faſtned to a child.



Lib. de occult. nat. mir. cap. 8.

Levinus Lemnius tels a very ſtrange hiſtory to this purpoſe. Some few yeares agone (ſaith he) a certaine woman of the Iſle in Flanders, which being with child by a Sailer, her belly ſwelled up ſo ſpeedily, that it ſeemed ſhee would not bee able to carry her burden to the terme preſcribed by nature; her ninth moneth being ended, ſhe calls a midwife, and preſently after ſtrong throwes and paines, ſhee firſt brought forth a deformed lumpe of fleſh, having as it were two handles on the ſides, stretched forth to the length and manner of armes, and it moved and panted with a certain vitall motion, after the manner of ſpunges and ſea-nettles; but afterwards there came forth of her wombe a monſter with a crooked noſe, a long and round necke, terrible eies, a ſharpe taile, and wonderfull quick of the feet, it was ſhaped much after this manner.

The ſhape of a monſter that came forth of a womans wombe.

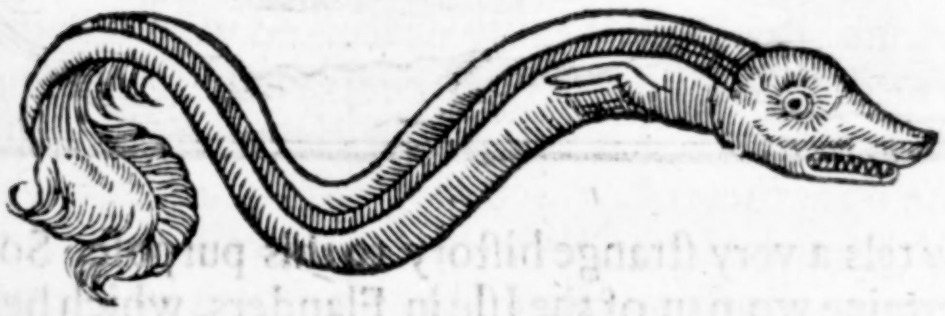


As ſoone as it came into the light it filled the whole roome with a noiſe and hiſſing, running to every ſide to finde out a lurking hole wherein to hide its head, but the women which were preſent, with a joynt conſent fell upon it, and ſmothered it with cuſhions, at length the poore woman wearied with long travell, was delivered of a boy, but ſo evilly entreated and handled by this monſter, that it died as ſoone as it was chriſtened.

Lib. de divinis natur. characteriſmis.

Cornelius Gemma a Phyſician of *Lovaine*, telleth that there were many very monſtrous and ſtrange things caſt forth both upwards and downewards out of the belly of a certaine maid of *Lovaine*, of the age of fifteene yeares. Amongſt the reſt, ſhe caſt forth at her fundament, together with her excrements, a living creature ſome foot and halfe long, thicker than ones thumbe, very like an eele, but that it had a very hairy taile; I have here given you the figure of the monſter as it was expreſſed by him.

The figure of a monſter that came forth of a maides belly.



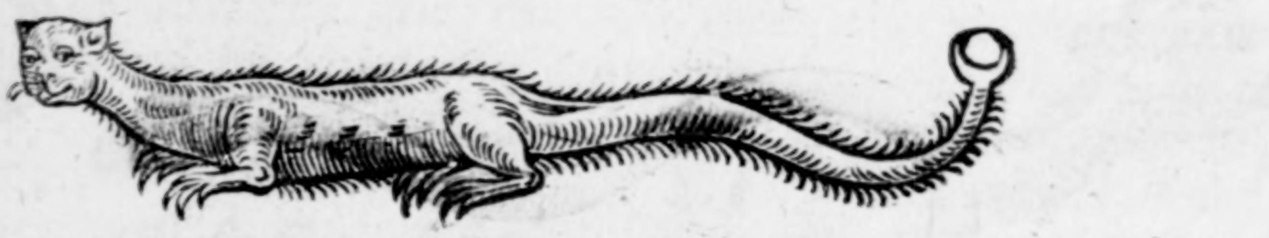
A hiſtorie.

Maſter *Peter Barque* and *Claude le Grand*, Surgeons of *Verdun*, lately affirmed to mee that they cured the wife of a certaine Citizen of *Verdun*, which out of an Abſceſſe broken in the belly, caſt forth a great number of wormes, together with the quitture, and theſe were of the thickneſſe of ones finger, with ſharpe heads, which ſo gnawed her guts, that the excrements for a long time came forth at the ulcer, but now ſhe is perfectly recovered.

A hiſtorie.

Anthony Benenius a Phyſician of *Florence* telleth that one *John Menuſierus*, a man of fourty yeares of age, troubled with continuall paines at his ſtomacke, was often at the point of death, neither found he any helpe by the counſels of many Phyſicians which hee uſed. At length comming to have his advice, hee gave him a vomit, by meanes whereof hee caſt up a great quantity of corrupt and putride matter, yet was hee not thereby eaſed of his paine. Therefore he gave him another vomit, by force whereof he caſt up much matter like to the former, and together therewith a worme of foure fingers long, having a red round head, of the bigneſſe of a great peaſe, covered over the body with a ſoft downineſſe, with a forked taile, in manner of an halfe moone, going upon foure feet, two before, and two behind.

The figure of a worme caſt forth by vomit.



Why ſhould I mention the prodigious bodies which are found in Abſceſſes, as ſtones, chalke, ſand, coales, ſnaile-ſhels, ſtrawes, hay, hornes, haires, and many kinds of living and dead creatures? For there is nothing in the generation of theſe things (cauſed by corruption, preceded by much alteration) which may make us admire, or hold us in ſuſpence, eſpecially if we ſhall conſider that nature, the fruitfull parent of all things, hath put divers portions and particles of the univerſall matter whereof the greater world is compoſed into this microcoſmos, or little world, man; whereby he might the rather ſeem to be made to the reſemblance and form of the greater. Wherefore it ſo deſports it ſelfe here, that it may counterfeit and reſemble all the actions and motions which it uſeth to performe in the ſcene of the greater world, in this little one, if ſo be that matter be not wanting.

The efficient & materiall cauſes of ſuch things as are preternaturally generated in our bodies.

Chap. IIII.

Of the wormes which uſe to breed in the guts.

A Groſſe, viſcide and crude humour is the materiall cauſe of wormes, which having got the beginning of corruption in the ſtomacke, is quickly carried into the guts, and there it putrefies, having not acquired the forme of laudible *Chylus* in the firſt concoction. This, for that it is viſcide, tenaciouſly adheres to the guts, neither is it eaſily evacuated with the other excrements; therfore by delay it further putrefies, & by the efficacy of heat, it turns into the matter and nouriſhment for wormes. This alimentary humour being conſumed, unleſſe ſome freſh ſupply the want thereof, which may eaſe their hunger, they move themſelves in the guts with great violence, they cauſe grievous and great paines, yea, and oft-times they creep up to the ſtomack, and ſo come forth by the mouth, and ſometimes they aſcend into the holes of the palate, and come forth at the noſe. Wormes are of three ſorts; for ſome are round & long, others broad and long, others ſhort & ſlender. The firſt are called by the Ancients, *Teretes*, that is, round; for that they are long and round. The ſecond are named *Tenia*, for that their bodies are long & broad like a rowler or ſwathe. The third are termed *Aſcarides*, for that they commonly wrap themſelves up round. Other differences of wormes are taken from their colours, as red, white, black, aſh-coloured, yellowiſh. Some alſo are hairy, with a great head like the little fiſh which the French call Chabot, we, a Millers-thumbe; in ſome diſeaſes many wormes are generated and caſt forth by the fundament, as ſmall as haires, and uſually of colour white, and theſe are they which are called *Aſcarides*. The diverſity of colours in wormes proceedeth not from the like diſtinct diverſity of humours whereof they are generated. For the melancholicke and cholericke humour by their qualities are wholly unfit to generate wormes. But this manifold variety in colour, is by reaſon of the different corruption of the chylous or phlegmaticke humour whereof they are bred. The long and broad wormes are oftentimes ſtretched alongſt all the guts, being like to a mucous or albuminous ſubſtance, and verily I ſaw one voided by a woman, which was like to a ſerpent, and ſome ſixe foote long; which ought not to ſeeme ſtrange, ſeeing it is noted by the Ancients, that they have ſeene wormes ſo long, as the length of the whole guts, that is, ſeven times the length

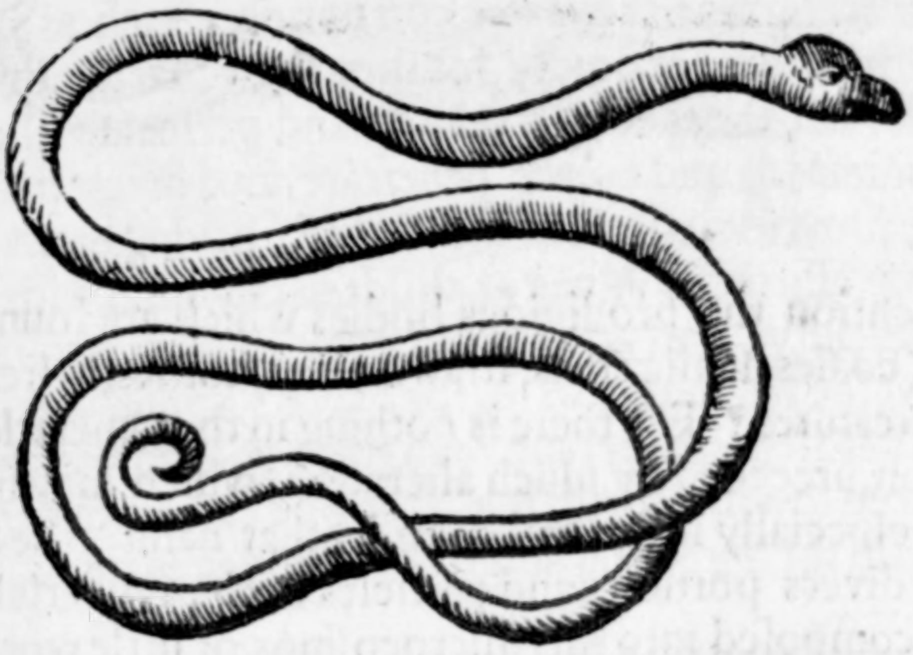
How wormes are generated.

The reaſon that they ſometimes come forth at the mouth.

The differences of wormes.

A hiſtory.

length of ones body. *Wierus* writes that he ſaw a country man who voided a worme eight foot and one inch long, in head and mouth reſembling a Ducke, which therefore I have thought good here to expreſſe.



The figure of a worme, generated in, and caſt forth of the Guts.

Signes of *Aſcarides.*

Valeriola affirmeth that he ſaw a worme above nine foote long. Now as wormes differ in ſhape, ſo are their places of generation alſo different. For the round and long wormes are commonly generated in the ſmaller guts, the reſt in the greater, but eſpecially the *Aſcarides*: none breede in the ſtomacke, as that which is the place of the firſt concoction. There truely the matter which breedeth theſe wormes, gets the firſt rudiment of corruption, but comes to perfection onely in the guts; they breed in ſome infants in their mothers bellies, by the pravity and corrupt nature of the humour flowing from the mother for the nouriſhment of the childe, which for that then they doe not expell it by ſiege, it by delay putrefieth the more, and yeeldes fit matter for the breeding of wormes, as ſome have obſerved out of *Hippocrates*. Laſtly, wormes breed in people of any age that are Belly-Gods and given to gluttony, as alſo in ſuch as feed upon meats of ill juice, and apt to corrupt, as crude ſummer fruits, cheeſe, and milke-meates. But to know in what part of the Guts the wormes doe lurk, you muſt note, that when they are in the ſmall guts, the patients complain of a paine in their ſtomacke, with a dogge-like appetite, whereby they require many and ſeverall things without reaſon, a great part of the nouriſhment being conſumed by the wormes lying there; they are alſo ſubject to often fainting, by reaſon of the ſympathy which the ſtomacke, being a part of moſt exquiſite ſenſe, hath with the heart, the noſe itches, the breath ſtinkes, by reaſon of the exhalations ſent up from the meat corrupting in the ſtomacke; through which occaſion they are alſo given to ſleep, but are now and then waked therefrom by ſuddaine ſtartings and feares; they are held with a continued and ſlow feaver, a dry cough, a winking with their eielids, and often changing of the colour of their faces. But long and broad wormes, being the innates of the greater guts, ſhew themſelves by ſtooles repleniſhed with many ſloughes, here and there reſembling the ſeedes of a Musk-melon or cucumber. *Aſcarides* are knowne by the itching they cauſe in the fundament, cauſing a ſenſe as if it were Ants running up and downe; cauſing alſo a *teneſmus*, and falling downe of the fundament. This is the cauſe of all theſe ſymptomes; their ſleepe is turbulent and often clamorous, when as hot, acride and ſubtle vapors, raiſed by the wormes from the like humor and their foode, are ſent up to the head; but ſound ſleep by the contrary, as when a miſty vapour is ſent up from a groſſe and cold matter. They dream they eate in their ſleepe, for that while the wormes doe more greedily conſume the chylous matter in the guts, they ſtirre up the ſenſe of the like action in the phantaſie. They grate or gnaſh their teeth by reaſon of a certaine convulſifick repletion, the muſcles of the temples and jawes being diſtended by plenty of vapours. A dry cough comes by the conſent of the vitall parts ſerving for reſpiration, which the naturall, to wit, the *Diaphragma* or midriffe, ſmit upon by acride vapoures, and irritated as though there were ſome humour to bee expelled by coughing. Theſe ſame acride fumes aſſailing the orifice of the ventricle, cauſe either a hicketting, or elſe a fainting, according to the condition of their conſiſtence, groſſe or thin; theſe carryed up to the parts of the face cauſe an itching of the noſe, a darkeneſſe of the ſight, and a ſuddaine changing of the colour in the cheeks. Great wormes are worſe than little ones, red than white, living than dead, many than few, variegated than thoſe of one colour, as thoſe which are ſignes of a greater corruption. Such as are caſt forth bloody and ſprinkled with blood, are deadly, for they ſhew that the ſubſtance of the guts is eaten aſunder; for oft-times they corrode and perforate the body of the gut wherein they are conteined, and thence penetrate into divers parts of the belly, ſo that they have come forth ſometimes at the Navell, having eaten themſelves a paſſage forth, as *Hollerius* affirmeth. When as children troubled with the wormes draw their breath with difficulty, and waxe moiſt over all their bodies, it is a ſigne that death is at hand. If at the beginning of ſharpe feavers, round wormes come forth alive, it is a ſigne of a peſtilent feaver, the malignity of whoſe matter they could not endure, but were forced to come forth. But if they be caſt forth dead, they are ſignes of greater corruption in the humours, and of a more venenate malignity.

Why wormes of divers coloures are more dangerous.

CHAP. V.

What cure to bee uſed for the Wormes.

IN this diſeaſe there is but one indication, that is, the excluſion or caſting out of the wormes, either alive or dead, forth of the body, as being ſuch that in their whole kinde are againſt nature; all things muſt bee ſhunned which are apt to heap up putrefaction in the body by their corruption, ſuch as are crude fruits, cheeſe, milke-meats, fiſhes, and laſtly ſuch things as are of a difficult and hard digeſtion, but prone to corruption. Pappe is fit for children, for that they require moiſt things, but theſe ought to anſwer in a certaine ſimilitude to the conſiſtence and thickneſſe of milke, that ſo they may the more eaſily be concocted & aſſimulated, & ſuch only is that pap which is made with wheat flower, not crude, but baked in an oven, that the pappe made therewith may not be too viſcide nor thicke, if it ſhould onely bee boyled in a panne as much as the milke would require; or elſe the milke would bee too terreſtriall, or too wateriſh, all the fatty portion thereof being reſolved, the cheeſy and whayiſh portion remaining, if it ſhould boile ſo much as were neceſſary for the full boiling of the crude meate; they which uſe meale otherwiſe in pappe yeild matter for the generating of groſſe and viſcide humours in the ſtomacke, whence happens obſtruction in the firſt veines and ſubſtance of the liver, by obſtruction wormes breede in the guts, and the ſtone in the kidneyes and bladder. The patient muſt be fed often, and with meates of good juice, leſt the worms through want of nouriſhment, ſhould gnaw the ſubſtance of the guts. Now when as ſuch things breed of a putride matter, the patient ſhall be purged, and the putrefaction repreſt by medicines mentioned in our treatiſe of the plague. For the quick killing and caſting of them forth, ſyrupe of Succory, or of lemmons with rubarbe, a little Treacle, or Mithridate, is a ſingular medicine, if there be no feaver; you may alſo for the ſame purpoſe uſe this following medicine. ℞. *cornu cervi, pul. raſur. eboris, an.* ʒ i ß. *ſem. tanacet. & contra verm. an.* ʒ i. *fiat decoctio pro parva doſi, in colatura infunde rhei optimi,* ʒ i. *cinam.* ℈ i. *diſſolve ſyrupi de abſinthio* ℥ ß. make a potion, give it in the morning three houres before any broath. Oyle of Olives drunke, kills wormes, as alſo water of knot-graſſe drunke with milke, and in like manner all bitter things. Yet I could firſt wiſh them to give a glyſter made of milke, hony and ſugar, without oyles and bitter things, leſt ſhunning thereof, they leave the lower guts, and come upwards, for this is naturall to wormes, to ſhunne bitter things, and follow ſweet things. Whence you may learne, that to the bitter things which you give by the mouth, you muſt alwaies mixe ſweet things, that allured by the ſweetneſſe, they may devour them more greedily, that ſo they may kill them. Therefore I would

The generall indications of curing the wormes.

Wherefore, and wherewith ſuch as have the wormes muſt be purged.

Hartſ-horne good againſt the wormes.

A plaſter againſt the wormes.

would with milke and Sugar, mixe the ſeeds of centaury, rue, wormewood, aloes, and the like: harts-horne is very effectuall againſt wormes, wherefore you may infuſe the ſhavings thereof in the water or drinke that the patient drinkes, as alſo to boile ſome thereof in his brothes. So alſo treacle drunke or taken in broth, killeth the wormes; purſlaine boiled in brothes, and deſtilled and drunke, is alſo good againſt the worms, as alſo ſuccory and mints, alſo a decoction of the leſſer houſe-leek and ſebeſtens given with ſugar before meate; it is no leſſe effectuall to put wormeseeds in their pap, and in roaſted apples, and ſo to give them it. Alſo you may make ſuppoſitories after this manner, and put them up into the fundament. ℞. *coralli ſub. albi, raſuræ eboris, cornu cervi uſti, ireos an.* ℈ ii. *mellis albi* ℥ ii ß. *aquæ centinodiæ q. ſ. ad omnia concorporanda, fiant Glandes*: let one be put up every day, of the weight of ʒ ii. for children; theſe ſuppoſitories are chiefly to bee uſed for *Aſcarides*, as thoſe which adhere to the right gut. To ſuch children as can take nothing by the mouth, you ſhall apply cataplaſmes to their navells made of the pouder of cummin ſeeds, the floure of lupines, worme-wood, ſoutherne wood, tanſie, the leaves of Artichokes, rue, the pouder of *coloquintida*, citron ſeeds, aloes, arſemart, horſe mint, peach leaves, *Coſtus amarus*, *Zedoaria*, ſope and oxe gall. Such cataplaſmes are oft times ſpred over all the belly, mixing therewith aſtringent things for the ſtrengthening of the part, as oile of myrtles, Quinces and maſtich; you may alſo apply a great onion hollowed in the midſt, and filled with Aloes and Treacle, and ſo roaſted in the embers, then beaten with bitter almonds, and an oxe gall. Alſo you may make emplaſters of bitter things, as this which followes. ℞. *fellis bubuli, & ſucci abſinthii, an.* ℥ ii. *colocyn.* ℥ i. *terantur & miſceantur ſimul, incorporentur cum farina lupinorum*: make hereof an emplaſter to be laid upon the Navell.

Liniments and ointments may bee alſo made for the ſame purpoſe to anoint the belly, you may alſo make plaſters for the navell of *Pillulæ Ruff.* anointing in the meane time the fundament with hony and ſugar, that they may bee chafed from above with bitter things, and allured downewards with ſweete things. Or elſe take wormes that have beene caſt forth, dry them in an iron pan over the fire, then pouder them, and give them with wine or ſome other liquor to bee drunke, for ſo they are thought quickly to kill the reſt of the wormes. Hereto alſo conduceth the juice of citrons, drunke with the oile of bitter almonds, or ſallade oile. Alſo ſome make bathes againſt this affect of wormewood, galls, peach leaves boiled in water, and then bathe the childe therein.

A caution.

A feaver ſometimes a ſymptome and ſometimes a diſeaſe.

But in curing the wormes, you muſt obſerve that this diſeaſe is oft times entangled with another more grievous diſeaſe, as an acute and burning feaver, a fluxe or ſcouring, and the like, in which (as for example ſake) a feaver being preſent and conjoyned therewith, if you ſhall give wormſeeds, old Treacle, myrrhe, aloes, you ſhall encreaſe the feaver and fluxe, for that bitter things are very contrary to the cure of theſe affects. But if, on the contrary, in a fluxe whereby the wormes are excluded, you ſhall give corrall, and the floure of Lentiles, you ſhall augment the feaver, making the matter more contumacious by dry and aſtringent things. Therefore the Phyſitian ſhall be carefull in conſidering whether the feaver bee a ſymptome of the wormes, or on the contrary it bee eſſentiall, and not ſymptomaticke, that this being knowne, hee may principally inſiſt in the uſe of ſuch medicines as reſiſt both affects, as purging and bitteriſh in a feaver and wormes, but bitter and ſomewhat aſtrictive things in the wormes and fluxe.

CHAP.

CHAP. VI.

A ſhort deſcription of the Elephantiaſis *or Leproſie, and of the cauſes thereof.*

This diſeaſe is termed *Elephantiaſis* becauſe the skinne of ſuch as are troubled therewith, is rough, ſcabious, wrinckled and unequall, like the skin of an Elephant. Yet this name may ſeem to be impoſed thereon by reaſon of the greatneſſe of the diſeaſe. Some from the opinion of the Arabians have termed it *Lepra* or Leproſie (but unproperly, for the *Lepra* is a kinde of Scab and diſeaſe of the skinne, which is vulgarly called *Malum ſancti manis)* which word for the preſent we will uſe, as that which prevailes by cuſtome and antiquity. Now the Leproſie (according to *Paulus*) is a Cancer of the whole body, the which (as *Avicen* addes) corrupts the complexion, forme and figure of the members. *Galen* thinkes the cauſe ariſeth from the errour of the ſanguifying faculty, through whoſe default the aſſimulation in the fleſh and habite of the body is depraved, and much changed from it ſelfe, and the rule of nature. But *ad Glauconem*, hee defines this diſeaſe, An effuſion of troubled or groſſe blood into the veines and habit of the whole body. This diſeaſe is judged great, for that it partakes of a certaine venenate virulency, depraving the members and comelineſſe of the whole body. Now it appeares that the Leproſie partakes of a certaine venenate virulency by this, that ſuch as are melancholicke in the whole habit of their bodies, are not leprous. Now this diſeaſe is compoſed of three differences of diſeaſes. Firſt it conſiſts of a diſtemper againſt nature, as that which at the beginning is hot and dry, and at length the ebullition of the humours ceaſing, and the heat diſperſed, it becomes cold and dry, which is the conjunct cauſe of this ſymptome. Alſo it conſiſts of an evill compoſition or conformation, for that it depraves the figure and beauty of the parts. Alſo it conſiſts of a ſolution of continuity, when as the fleſh and skin are cleft in divers parts with ulcers and chops: the leproſie hath for the moſt part 3. generall cauſes, that is, the primitive, antecedent, & conjunct: the primitive cauſe is either from the firſt conformation, or comes to them after they are born. It is thought to be in him from the firſt conformation, who was conceived of depraved & corrupt menſtruous blood, & ſuch as enclined to melancholly; who was begot of the leprous ſeed of one or both his parents; for leprous perſons generate leprous, becauſe the principall parts being tainted and corrupted with a melancholy and venenate juice, it muſt neceſſarily follow that the whole maſſe of blood and ſeed that falls from it, and the whole body ſhould alſo be vitiated. This cauſe happens to thoſe that are already born, by long ſtaying & inhabiting in maritime countries, whereas the groſſe and miſty aire, in ſucceſſe of time, induceth the like fault into the humours of the body; for that, according to *Hippocrates*, ſuch as the aire is, ſuch is the ſpirit, and ſuch the humours. Alſo long abiding in very hot places, becauſe the blood is torrified by heate, but in cold places, for that they incraſſate, and congealing the ſpirits, doe after a manner ſtupefie, may bee thought the primitive cauſes of this diſeaſe. Thus in ſome places of *Germany* there are divers leprous perſons, but they are more frequent in *Spaine* and over all *Africa*, then in all the world beſide, and in *Languedoc*, *Provence* and *Guyenne*, are more than in whole *France* beſides. Familiarity, copulation, and cohabitation with leprous perſons, may be reckoned amongſt the cauſes thereof, becauſe they transferre this diſeaſe to their familiars by their breath, ſweat and ſpittle left on the edges of the pots or cuppes. This diſeaſe is alſo cauſed by the too frequent uſe of ſalt, ſpiced, acride and groſſe meates, as the fleſh of Swine, Aſſes, Beares, Pulſe, milke-meats; ſo alſo groſſe and ſtrong wines, drunkenneſs, gluttony, a laborious life, full of ſorrow and cares, for that they incraſſate, and as it were burne the blood. But the retention of melancholy excrements, as the ſuppreſſion of the hæmorrhoids, courſes, ſmall pockes and meazells, as alſo a quartaine feaver accuſtomed to come at ſet times; the drying up of old ulcers, for that they defile the maſſe of the blood with a melancholy droſſe and filth. Now you muſt underſtand that the cauſe of the leproſie by the retention of the ſuperfluities, happens becauſe the corrupt blood is not evacua-

Lib. 4. cap. 1.

There is a certaine hidden virulency in the Leproſie.

The primitive cauſe of a Leproſie.

How they may be leprous from their firſt conformation.

ted, but regurgitates over the whole body, and corrupts the blood that ſhould nouriſh all the members; wherefore the aſſimulative faculty cannot well aſſimulate by reaſon of the corruption and default of the juice, and thus in concluſion the Leproſie is cauſed. The antecedent cauſes are the humours diſpoſed to aduſtion and corruption into melancholy by the torride heat; for in bodies poſſeſſed with ſuch heat, the humours by aduſtion eaſily turne into melancholy, which in time acquiring the malignity and corruption of a virulent and venenate quality, yeelds a beginning and eſſence to the leproſie. The conjunct cauſes are the melancholy humors which are now partakers of a venenate and maligne quality, and ſpread over the whole habite of the body, corrupting and deſtroying it firſt by a hot and dry diſtemper, and then by a cold and dry, contrary to the beginnings of life. For hence inevitable death muſt enſue, becauſe our life conſiſts in the moderation of heate and moiſture.

The antecedent cauſe of a Leproſie.

The conjunct cauſe.

How it comes to be deadly.

Chap. VII.

The ſignes of a Leproſie, breeding, preſent, and already confirmed.

THe diſpoſition of the body and humors to a Leproſie is ſhewed by the change of the native and freſh colour of the face, by that affect of the face, which is commonly called *Gutta roſacea*, red & blackiſh ſuffuſions and puſtles, the falling away of the haires, a great thirſt, and a drineſſe of the mouth both by night & day, a ſtinking breath, little ulcers in the mouth, the change of the voice to hoarſeneſſe, a deſire of venery above nature and cuſtome. Now there are foure times of this diſeaſe, the beginning, encreaſe, ſtate and declenſion. The beginning is when as the malignity hath not yet gone further than the inner parts and bowells, wherupon the ſtrength muſt needs be more languid. The encreaſe is when as the virulency comes forth, & the ſigns & ſymptoms are every day encreaſed in number & ſtrength. The ſtate is when as the members are exulcerated. The declenſion is, when as the aſpect of the face is horride, the extreme parts fall away by the profundity and malignity of the ulcers, ſo that none, no not of the common ſort of people, can doubt of the diſeaſe. According to the doctrine of the Antients, wee muſt in ſearching out of the ſignes of this diſeaſe being preſent, have chiefe regard to the head. For the ſignes of diſeaſes more properly and truely ſhew themſelves in the face, by reaſon of the ſoftneſſe and rarity of the ſubſtance therof, and the tenuity of the ſkin that covers it; wherefore a blacke and aduſt humour diffuſed thereunder, eaſily ſhewes it ſelfe, and that not onely by the mutation of the colour, but alſo of the Character and bulke, and oft times by manifeſt hurting it. Wherefore you muſt obſerve in the head whether it have ſcaules, and whether in the place of thoſe haires that are fallen away, others more tender, ſhort and rare grow up, which is likely to happen through defect of fit nouriſhment to preſerve and generate haires, through corruption of the hairy ſcalpe that ſhould be ſtored with ſuch nouriſhment, and of the habit it ſelfe, and through the unfitneſſe thereof to containe haires; laſtly by the acrimony of the vapoures ſent up from the aduſt humours and entrailes, fretting aſunder the rootes of the haires. But if not onely the haire, but alſo ſome portion of the ſkin and fleſh about the rootes of the haire, come away by pulling, it is an argument of perfect corruption: let this therefore be the firſt ſign of a leproſie. II. A ſecond & very certain ſigne is, a numerous & manifeſt circumſcription of round and hard puſhes or puſtles under the eie-browes, & behind the eares and in ſeverall places of the face, reſembling round and hard kernells, occaſioned by the default of the aſſimulating faculty. The cauſe of this default is the groſſeneſſe of the flowing nouriſhment, by which meanes it being impact, and ſtopping in the ſtraitneſſe of the way, it growes round at it were compaſſed about in the place whereas it ſticks, and by the means of the crudity, for that it is not aſſimulated, and by delay, it is further hardned. The

The beginning of a Leproſie.

The encreaſe.

The ſtate.

The declenſion.

The firſt ſigne of the Leproſie.

third ſigne is,the more contract and exact roundneſſe of the eares, their groſſeneſſe,
and as it were grainy ſpiſſitude or denſeneſſe; the cauſe of their roundneſs is the conſumption
of the flaps & fleſhy part through want of nouriſhment,and exceſs of heat;
but the occaſion of their grainy ſpiſſitude is the groſneſſe of the earthy nouriſhment
flowing thither. The fourth ſign is a lion-like wrinkling of the forehead,which is the
reaſon that ſome terme this diſeaſe *morbus leoninus*; the cauſe hereof is the great drineſſe IIII. Why it is called *morbus leoninus*.
of the habit of the body,which alſo is the reaſon that the barke of an old oak is
rough and wrinkled. The fifth is,the exact roundneſſe of the eyes,and their fixt and V.
immoveable ſteddineſſe;verily the eyes are naturally almoſt round,yet they appeare
obtuſe and ſomewhat broad on the foreſide, but end in a *Conus* on the hind part, by
reaſon of the concourſe and figure of the muſcles and fat inveſting them. Therefore
theſe being conſumed either through defect of laudible nouriſhment, or elſe by the
acrimonie of the flowing humour, they are reſtored to their proper figure & roundneſs.
Now the muſcles which moved the eyes being conſumed,and the fat which facilitated
their motion waſted,it comes to paſſe that they ſtand ſtiffe and unmoveable,
being deſtitute of the parts yeelding motion,and the facility thereof. The ſixth ſigne
is,the noſtrils flat outwardly, but inwardly ſtrait and contracted, that is, an earthy VI.
& groſſe humour forced from within outwards,which ſwels the ſides or edges of the
noſtrils; whence it is,that the paſſages of the noſe appear as it were obſtructed by the
thickneſſe of this humour; but they are depreſſed and flatted by reaſon of the reſt of
the face and all the neighbouring parts ſwoln more than their wont;adde hereto that
the partition is conſumed by the acrimony of the corroding and ulcerating humour
ſent thither,which makes them neceſſarily to be depreſt, & ſend forth bloudy ſcabs.
The ſeventh,is the lifting up,thickneſſe and ſwelling of the lips,the filthineſſe,ſtinke VII.
and corroſion of the gums by acride vapours riſing to the mouth; but the lips of Leprous
perſons are more ſwolne by the internall heat burning and incraſſating the humours,
as the outward heat of the Sun doth in the Moores. The eighth ſigne is the VIII.
ſwelling & blackneſſe of the tongue, and as it were varicous veins lying under it; becauſe
the tongue,being by nature ſpongious and rare,is eaſily ſtored with excrementitious
humours,ſent from the inner parts unto the habit of the body: which ſame is
the cauſe why the grandules placed about the tongue above and below, are ſwolne
hard & round,no otherwiſe than ſcrophulous or meazled ſwine. Laſtly,all their face
riſeth in red bunches or puſhes,and is over-ſpread with a duskie and obſcure redneſs;
the eies are fiery, fierce and fixed, by a melancholick chachectick diſpoſition of the
whole body,manifeſt ſignes whereof appeare in the face by reaſon of the forementioned
cauſes; yet ſome leprous perſons have their faces tinctured with a yellowiſh,
others with a whitiſh colour, according to the condition of the humor,which ſerves
for a *Baſis* to the leprous malignity. For hence Phyſicians affirme that there are three
ſorts of Leproſies,one of a rediſh black colour,conſiſting in a melancholick humour;
another of a yellowiſh greene, in a cholericke humour; another in a whitiſh yellow,
grounded upon aduſt phlegme. The ninth ſigne is a ſtinking of the breath,as alſo of IX.
all the excrements proceeding from leprous bodies,by reaſon of the malignity conceived
in the humours. The tenth is,a hoarſneſſe,a ſhaking, harſh and obſcure voyce X.
comming as it were out of the noſe, by reaſon of the lungs, recurrent nerves, and
muſcles of the throttle tainted with the groſſeneſſe of a virulent and aduſt humour;
the forementioned conſtriction & obſtruction of the inner paſſage of the noſe; and
laſtly, the aſperity and inequality of the weazon by immoderate dryneſſe, as it happens
to ſuch as have drunk plentifully of ſtrong wines without any mixture. This
immoderate drineſſe of the muſcles ſerving for reſpiration makes them to bee trouled
with a difficulty of breathing. The eleventh ſigne is very obſervable, which is a XI.
Morphew or defædation of all the skin, with a dry roughneſſe and grainy inequality,
ſuch as appears in the skins of plucked geeſe,with many tetters on every ſide,a filthy
ſcab,and ulcers not caſting off onely a branlike ſcurfe,but alſo ſcailes and cruſts.
The cauſe of this dry ſcab,is the heat of the burning bowels & humours,unequally
contracting and wrinkling the skin, no otherwiſe than as leather is wrinkled by the
heat of the Sun or fire. The cauſe of the filthy ſcab & ſerpiginous ulcers,is the eating
and corroding condition of the melancholy humour, and the venenate corruption,

it alſo being the author of corruption, ſo that it may be no marvell if the digeſtive faculty
of the liver being ſpoyled, the aſſimulative of a maligne and unfit matter ſent
into the habit of the body cannot well nor fitly performe that which may be for the
XII. bodies good. The twelfth is, the ſenſe of a certain pricking, as it were of goads or needles
over all the skin, cauſed by an acride vapour hindred from paſſing forth, and
XIII. intercepted by the thickneſſe of the skin. The thirteenth is a conſumption and emaciation
of the muſcles which are betweene the thumbe and fore-finger, not onely by
reaſon that the nouriſhing and aſſimulating faculties want fit matter wherewith they
may repaire the loſſe of theſe parts, for that is common to theſe with the reſt of the
body, but becauſe theſe muſcles naturally riſe up unto a certaine mountanous tumor,
therefore their depreſſion is the more manifeſt. And this is the cauſe that the ſhoulders
of leprous perſons ſtand out like wings; to wit, the emaciation of the inner part
XIIII. of the muſcle *Trapezites*. The fourteenth ſigne is the diminution of ſenſe, or a numneſſe
over all the body by reaſon that the nerves are obſtructed by the thickneſſe of
the melancholick humour hindring the free paſſage of the animal ſpirit, that it cannot
come to the parts that ſhould receive ſenſe, theſe in the interim remaining free which
are ſent into the muſcles for motions ſake, and by this note I chiefly make tryall of
leprous perſons, thruſting a ſomewhat long and thick needle ſomewhat deep into the
great tendon endued with moſt exquiſite ſenſe, which runs to the heel, which, if they
do not well feele, I conclude, that they are certainly leprous. Now, for that they thus
loſe their ſenſe, their motion remaining entire, the cauſe hereof is that the nerves
which are diſſeminated to the skin are more affected, and thoſe that run into the muſcles
are not ſo much; & therefore when as you prick them ſomewhat deep, they feel
XV. the prick, which they do not in the ſurface of the skin. The fifteenth is the corruption
of the extreme parts poſſeſſed by putrefaction and a gangrene, by reaſon of the
corruption of the humours ſent thither by the ſtrength of the bowels, infecting with
the like tainture the parts wherein they remain: adde hereto that the animal ſenſitive
faculty is there decayed, and as often as any faculty hath forſaken any part, the reſt
XVI. preſently after a manner neglect it. The ſixteenth is, they are troubled with terrible
dreames, for they ſeeme in their ſleep to ſee divels, ſerpents, dungeons, graves, dead
bodies, and the like, by reaſon of the black vapours of the melancholie humour
troubling the phantaſie with black and diſmall viſions, by which reaſon alſo ſuch as
XVII. are bitten of a mad dog feare the water. The ſeventeenth is, that at the beginning and
in the increaſe of the diſeaſe they are ſubtle, crafty and furious by reaſon of the heat
of the humours & bloud; but at length in the ſtate and declenſion they become crafty
and ſuſpicious, the heat and burning of the bloud and entrailes decaying by little
and little; therefore then fearing all things whereof there is no cauſe, & diſtruſting of
their owne ſtrength they endeavour by craft, maliciouſly to circumvent thoſe with
XVIII. whom they deal, for that they perceive their powers to faile them. The eighteenth is,
a deſire of venery above their nature, both for that they are inwardly burned with a
ſtrange heat, as alſo by the mixture of flatulencies therewith (for whoſe generation
the melancholick humour is moſt fit) which are agitated, & violently carried through
the veins and genitall parts by the preternaturall heat; but at length when this heate
is cooled, and that they are fallen into a hot and dry diſtemper, they mightily abhor
venery, which then would bee very hurtfull to them, as it alſo is at the beginning of
the diſeaſe, becauſe they have ſmall ſtore of ſpirits and native heat, both which are
XIX. diſſipated by venery. The nineteenth is, the ſo great thickneſſe of their groſſe and livide
bloud, that if you waſh it, you may finde a ſandy matter therein, as ſome have
XX. found by experience, by reaſon of the great aduſtion and aſſation thereof. The twentieth
is, the languidneſſe & weakneſſe of the pulſe (by reaſon of the oppreſſion of the
vitall and pulſifick faculty by a cloud of groſſe vapours). Herewith alſo their urine
ſometimes is thick and troubled, like the urine of carriage beaſts, if the urenary veſſels
be permeable and free; otherwiſe it is thin, if there be obſtruction, which only ſuffers
that which is thin to flow forth by the urenary paſſages; now the urine is oftentimes
of a pale aſh-colour, and oft-times it ſmels like as the other excrements do in this diſeaſe.
Verily there are many other ſignes of the Leproſie, as the ſlowneſſe of the belly
by reaſon of the heat of the liver, often belchings by reaſon that the ſtomack is troubled

bled by the refluxe of a melancholy humour, frequent ſneeſing by reaſon of the fulneſſe of the braine; to theſe, this may be added moſt frequently, that the face and all the skin is unctuous or greaſie, ſo that water powred thereon, will not in any place adhere thereto: I conceive it is by the internall heat diſſolving the fat that lies under the skin, which therfore alwaies lookes as if it were greaſed or anointed therewith in leprous perſons. Now of theſe forementioned ſignes, ſome are univocall, that is, which truly and neceſſarily ſhew the Leproſie: otherſome are equivocall or common, that is, which conduce as well to the knowledge of other diſeaſes as this. To conclude, that aſſuredly is a Leproſie which is accompanied with all, or certainely the moſt part of theſe forementioned ſignes.

Why their faces ſeeme to bee greaſie.

CHAP. VIII.

Of Prognoſticks in the Leproſie; and how to provide for ſuch as ſtand in feare thereof.

THe Leproſie is a diſeaſe which paſſeth to the iſſue, as contagious almoſt as the plague, ſcarce curable at the beginning, uncurable when as it is confirmed, becauſe it is a *Cancer* of the whole body; now if ſome one *Cancer* of ſome one part ſhall take deepe root therein, it is judged uncurable. Furthermore the remedies which to this day have bin found out againſt this diſeaſe, are judged inferiour and unequall in ſtrength thereto. Beſides, the ſignes of this diſeaſe doe not outwardly ſhew themſelves before that the bowels be ſeazed upon, poſſeſſed and corrupted by the malignity of the humour, eſpecially in ſuch as have the white Leproſie, ſundry of which you may ſee about **Burdeaux**, & in little **Brittain**, who notwithſtanding inwardly burn with ſo great heat, that it will ſuddenly wrinkle and wither an apple held a ſhort while in their hand, as if it had laid for many daies in the Sun. There is another thing that increaſeth the difficulty of this diſeaſe, which is an equall pravity of the three principall faculties whereby life is preſerved. The deceitfull and terrible viſions in the ſleepe, and numneſſe in feeling, argue the depravation of the animall faculty; now the weakneſſe of the vitall faculty is ſhewed by the weakneſſe of the pulſe, the obſcurity of the hoarſe and jarring voice, the difficulty of breathing, and ſtinking breath; the decay of the naturall is manifeſted by the depravation of the work of the liver in ſanguification, whence the firſt and principall cauſe of this harme ariſeth. Now becauſe wee cannot promiſe cure to ſuch as have a confirmed Leproſie; and that we dare not do it to ſuch as have been troubled therewith but for a ſhort ſpace, it remains that we briefly ſhew how to free ſuch as are ready to fall into ſo fearefull a diſeaſe. Such therefore muſt firſt of all ſhun all things in diet and courſe of life whereby the bloud and humours may be too vehemently heated, whereof we have formerly made ſome mention. Let them make choice of meats of good or indifferent juice, ſuch as we ſhall deſcribe in treating of the diet of ſuch as are ſick of the plague; purging, bleeding, bathing, cupping, to evacuate the impurity of the bloud, and mitigate the heat of the liver, ſhall bee preſcribed by ſome learned Phyſician. *Valeſius de Tarenta* much commends gelding in this caſe, neither do I think it can be diſliked. For men ſubject to this diſeaſe may be effeminated by the amputation of their teſticles, and ſo degenerate into a womaniſh nature, and the heat of the liver boyling the bloud, being extinguiſhed, they become cold & moiſt, which temper is directly contrary to the hot & dry diſtemper of Leprous perſons; beſides the Leprous being thus deprived of the faculty of generation, that contagion of this diſeaſe is taken away which ſpreadeth and is diffuſed amongſt mankind by the propagation of their iſſue.

CHAP. I.

The cauſe of writing this Treatiſe of Poyſons.

FIVE reaſons have principally moved me to undertake to write this Treatiſe of poyſons, according to the opinion of the Ancients. The firſt is, that I might inſtruct the Surgeon what remedies muſt preſently be uſed to ſuch as are hurt by poyſons, in the interim whilſt greater meanes may bee expected from a Phyſician. The ſecond is, that hee may know by certaine ſignes and notes ſuch as are poyſoned or hurt by poyſonous meanes, and ſo make report thereof to the Judges, or to ſuch as it may concerne. The third is, that thoſe Gentlemen and others who live in the Countrey, and farre from Cities and ſtore of greater meanes, may learne ſomething by my labours by which they may helpe their friends bitten by an Adder, madde Dogge, or other poyſonous creature, in ſo dangerous, ſudden and uſuall a caſe. The fourth is, that every one may beware of poyſons, and know their ſymptomes when preſent, that being knowne, they may ſpeedily ſeeke for a remedie. The fifth is, that by this my labour all men may know what my good-will is, and how well minded I am towards the common wealth in generall, and each man in particular, to the glory of God. I doe not here ſo much arme malicious and wicked perſons to hurt, as Surgeons to provide to helpe and defend each mans life againſt poyſon; which they did not underſtand, or at leaſt ſeemed not ſo to doe, which taking this my labour in evill part, have maliciouſly interpreted my meaning.

What is to be accounted poyſon.

But now at length, that wee may come to the matter; I will begin at the generall diviſion of poyſons, and then handle each *ſpecies* thereof ſeverally: but firſt let us give this rule; That, Poyſon is that which either outwardly applyed or ſtruck in, or inwardly taken into the body, hath power to kill it, no otherwiſe, than meate well dreſt is apt to nouriſh it. For *Conciliator* writes, that the properties of poyſon are contrary to nouriſhments in their whole ſubſtance, for as nouriſhment is turned into bloud, and in each part of the body whereto it is applyed to nouriſh, by perfect aſſimulation is ſubſtituted in the place of that portion which flowes away each moment.

Thus on the contrary poyſon turnes our bodies into a nature like it ſelfe and venenate, for as every agent imprints the force and qualities thereof in the ſubject patient, thus poyſon by the immoderation of faculties in their whole nature contrary to us, changeth our ſubſtance into its nature, no otherwiſe than fire turneth chaffe in a moment into its owne nature, and ſo conſumes it. Therefore it is truly delivered by the Ancients, who have diligently pryed into the faculties of naturall things, that it is Poyſon that may kill men by deſtroying and corrupting their temper, and the compoſure and conformation of the body. Now all poyſons are ſaid to proceed either from the corupt aire, or from living creatures, plants and mineralls, or by an artificiall malignity in diſtilling, ſubliming and diverſly mixing of poyſonous and fuming things. Hence ariſe ſundry differences of poyſons; neither doe they all worke after the ſame manner; for ſome corrupt our nature by the unmeaſurableneſſe of the manifeſt and elementary qualities whereof they conſiſt, others from a ſpecifick and occult propertie. Hence it is that ſome kill ſooner than otherſome; neither is it true, that all of them preſently aſſaile the heart, but others are naturally at deadly ſtrife with other parts of the body, as *Cantharides* with the bladder, the ſea Hare with the lungs, the *Torpedo* with the hands, which it ſtupefieth, though the fiſhers rod bee betwixt them. Thus of medicines, there are ſome which are apt preſently to comfort and ſtrengthen the heart; others the brain, as *ſtæchas*; others the ſtomack, as Cinamon; Alſo there are ſome poyſons which work both waies, that is, by manifeſt and occult qualities, as *Euphorbium*; for that both by the exceſſive heate and the whole ſubſtance, or the diſcord of the whole ſubſtance with ours, corrupts our nature. An argument hereof is, that Treacle, which by its quality is manifeſtly hot, infringeth the force thereof, as alſo of all others of an occult property. Poiſons which work by an occult and ſpecifick property, do not therefore doe it, becauſe they are too immoderately hot, cold, dry, moiſt; but for that they are abſolutely ſuch, and have that eſſence from the ſtars and cœleſtiall influence, which is apt to diſſolve and deſtroy the ſtrength of mans body, becauſe being taken, but even in a ſmall quantity, yet are they of ſo pernicious a quality, that they kill almoſt in a moment. Now poyſons do not onely kill being taken into the body, but ſome being put or applyed outwardly; neither doe venimous creatures only harme by their ſtinging and biting, but alſo by their excrements, as ſpittle, bloud, the touch and breath.

The differences of poyſons.

All poyſons have not a peculiar Antipathy with the heart.

CHAP. II.

How poyſons being ſmall in quantity, may by their only touch cauſe ſo great alterations.

IT ſeemeth ſtrange to many, how it may come to paſſe, that poyſon, taken or admitted in a ſmall quantity, may almoſt in a moment produce ſo pernicious effects over all the body, and all the parts, faculties, and actions, ſo that being admitted but in a little quantity, it ſwels up the body into a great bigneſſe. Neither ought it to ſeeme leſſe ſtrange, how Antidotes and Counter-poyſons, which are oppoſed to poyſon, can ſo ſuddenly breake and weaken the great and pernicious effects thereof, being it is not likely that ſo ſmall a particle of poyſon or Antidote can divide it ſelfe into ſo many, and ſo far ſevered particles of our body. There are ſome (ſaith *Galen*) who thinke that ſome things by touch onely, by the power of their quality, may alter thoſe things which are next to them, and that this appeares plainly in the ſea *Torpedo*, as that which hath ſo powerfull a quality, that it can ſend it alongſt the fiſhers rod to the hand, and ſo make it become torpide or numbe. But on the contrary, Philoſophers teach, that accidents, ſuch as qualities are, cannot without their ſubjects remove and diffuſe themſelves into other ſubjects. Therefore *Galens* other anſwer is more agreeable to reaſon, that ſo many and great affects of poyſons and remedies ariſe either from a certaine ſpirit or ſubtle humidity; not truly, for that this ſpirit and ſubtle humidity may be diſperſed over the whole body and all the parts thereof which it affects,

Cap. 5. lib. 6. de locis affect.

fects, but that little, which is entred the body, as caſt in by the ſtroake of a Spider, or the ſting of a Scorpion, infects and corrupts all the next parts by contagion with the like quality, theſe others that are next to them, untill from an exceeding ſmall portion of the bloud, if the ſtroake ſhall light into the veines, it ſhall ſpread over the whole maſſe of bloud; or of phlegme, if the poyſon ſhall chance to come to the ſtomacke, and ſo the force thereof ſhall bee propagated and diffuſed over all the humours and bowels. The doubt of Antidotes is leſſe, for theſe being taken in greater quantity, when they ſhal come into the ſtomack, warmed by the heat of the place, they become hot, & ſend forth vapours, which ſuddenly diffuſed over the body by the ſubtlety of their ſubſtance, doe by their contrary forces dull and weaken the malignity of the poyſon. Wherefore you may often ſee when as Antidotes are given in leſſe quantity than is fit, that they are leſſe prevalent, neither doe they anſwer to our expectation in overcomming the malignity of the poyſon; ſo that it muſt neceſſarily follow that theſe muſt not onely in qualities, but alſo in quantiy bee ſuperiour to poyſons.

The true reaſon of the wondrous effects of poyſons.

CHAP. III.

Whether there be any ſuch poyſons as will kill at a ſet time?

TO the propounded queſtion; whether there may be poyſons which within a certaine and definite time (put caſe a moneth or yeare) may kill men, *Theophraſtus* thus anſwers; of poyſons, ſome more ſpeedily performe their parts, others more ſlowly, yet may you finde no ſuch as will kill in ſet limits of time, according to the will and deſire of men. For that ſome kill ſooner or later than others; they do not this of their owne or proper nature, as Phyſicians rightly judge, but becauſe the ſubject upon which they light, doth more or leſſe reſiſt or yeeld to their efficacie. Experience ſheweth the truth hereof; for the ſame ſort of poyſon in the ſame weight and meaſure given to ſundry men of different tempers and complexions, will kill one in an houre, another in ſixe houres, or in a day, and on the contrary will not ſo much as hurt ſome third man. You may alſo obſerve the ſame in purging medicines. For the ſame purge given to divers men in the ſame proportion, will purge ſome ſooner, ſome later, ſome more ſparingly, others more plentifully, and otherſome not at all; alſo with ſome it will worke gently, with otherſome with paine and gripings. Of which diverſity there can no other cauſe be aſſigned, than mens different natures in complexion & temper, which no man can ſo exactly know and comprehend, as to have certain knowledge thereof, as how much and how long the native heat can reſiſt and labour againſt the ſtrength of the poyſon, or how pervious or open the paſſages of the body may bee whereby the poyſon may arrive at the heart and principall parts. For in ſuch (for example ſake) as have the paſſages of their arteries more large, the poyſon may more readily and ſpeedily enter into the heart together with the aire that is continually drawn into the body.

No poyſons kill in a ſet time.

How poyſons come to kill ſooner or later.

CHAP. IIII.

Whether ſuch creatures as feed upon poyſonous things be alſo poyſonous, and whether they may be eaten ſafely and without harme?

DUcks, Storkes, Hernes, Peacocks, Turkies, and other birds, feed upon Toads, Vipers, Aſpes, Snakes, Scorpions, Spiders, Caterpillers, & other venemous things. Wherfore it is worthy the queſtioning, whether ſuch like creatures nouriſhed with ſuch food, can kill or poyſon ſuch perſons as ſhall afterward eat them? *Matthiolus* writes that all late Authors, who have treated of poyſons, to be abſolutely of this opinion, That men may ſafely and without any danger feed upon ſuch creatures, for that they convert the beaſts into

Such things as feed upon poyſon may be eaten without danger.

to their nature after they have eaten them, and on the contrary, are not changed by them. This reaſon though very probable, yet doth it not make theſe beaſts to be wholly harmeleſſe, eſpecially if they be often eaten or fed upon. *Dioſcorides* and *Galen* ſeeme to maintaine this opinion, whereas they write, that the milke, which is nothing elſe than the relented bloud, of ſuch beaſts as feed upon ſcammonie, hellebore, and ſpurge, purgeth violently. Therefore Phyſicians, deſirous to purge a ſucking childe, give purges to the nurſes, whence their milke becomming purging, becomes both meat and medicine to the childe. The fleſh of Thruſhes, which feed upon Juniper berries, ſavours of Juniper. Birds that are fed with worme-wood or Garlike, either taſt bitter, or have the ſtrong ſent of Garlike. Whitings taken with garlike, ſo ſmell thereof, that they will not forgoe that ſmell or taſte by any ſalting, frying or boyling, for which ſole reaſon, many who hate garlike, are forced to abſtain from theſe fiſhes. The fleſh of Rabbits that feed upon Pennyroyall and Juniper, ſavour of them; Phiſicians wiſh that Goats, Cows, and Aſſes, whoſe milke they would uſe for Conſumptions or other diſeaſes, ſhould bee fed ſome ſpace before, and every day with theſe or theſe herbs which they deeme fit for the curing of this or that diſeaſe. *Lib. de ſimp. facult.* For *Galen* affirmes that hee doubts not, but that in ſucceſſe of time the fleſh of creatures will be changed by the meats whereon they feed, and at length ſavour thereof. Therefore I do not allow that the fleſh of ſuch things as feed upon venemous things ſhould be eaten for food, unleſſe it bee ſome long ſpace after they have diſuſed ſuch repaſt, and that all the venome bee digeſted and overcome by the efficacy of their proper heat, ſo that nothing thereof may remaine in taſt, ſmell or ſubſtance, but bee all vaniſhed away. The occaſion of ſudden death in many. For many dye ſuddenly, the cauſe of whoſe deaths are unknowne, which peradventure was from nothing elſe, but the ſympathy and antipathy of bodies, for that theſe things cauſe death and diſeaſe to ſome, that nouriſh otherſome [according to our vulgar Engliſh proverbe; That which is one mans meate is another mans Poyſon.]

Chap. V.

The generall ſignes of ſuch as are poyſoned.

Common ſignes of ſuch as are poyſoned.

WEE will firſt declare what the generall ſignes of poyſon are, and then will we deſcend to particulars, whereby we may pronounce that one is poyſoned with this or that poyſon. We certainly know that a man is poyſoned, when as hee complaines of a great heavineſſe of his whole body, ſo that hee is weary of himſelfe; when as ſome horrid and loathſome taſte ſweats out from the orifice of the ſtomacke to the mouth and tongue, wholly different from that taſte that meat, howſoever corrupted, can ſend up: when as the colour of the face changeth ſuddenly, ſomewhiles to blacke, ſometimes to yellow, or any other colour, much differing from the common cuſtome of man; when nauſeouſneſſe with frequent vomiting, troubleth the patient, and that hee is moleſted with ſo great unquietneſſe, that all things may ſeeme to bee turned upſide downe. Wee know that the poyſon workes by the proper, and from the whole ſubſtance, when as without any manifeſt ſenſe of great heate or coldneſſe, the patient ſownes often with cold ſweats, for uſually ſuch poyſons have no certaine and diſtinct part wherewith they are at enmity, as *cantharides* have with the bladder. But as they worke by their whole ſubſtance, and an occult propriety of forme; ſo doe they preſently and directly aſſaile the heart, our eſſence and life, and the fortreſſe and beginning of the vitall faculty. Now will wee ſhew the ſignes whereby poyſons, that worke by manifeſt and elementary qualities, may be knowne. Signes of hot poyſons. Thoſe who exceed in heate, burne or make an impreſſion of heat in the tongue, the mouth, throate, ſtomacke, guts, and all the inner parts, with great thirſt, unquietneſſe, and perpetuall ſweats. But if to their exceſſe of heate they bee accompanyed with a corroding and putrefying quality, as Arſenicke, Sublimate, Roſe-ager or Ratſ-bane, Verdegreace, Orpiment, and the like, they then cauſe in the ſtomack ſtomacke and guts intolerable pricking paines, rumblings in the belly, and continuall and intolerable thirſt. Theſe are ſucceeded by vomitings, with ſweats ſomewhiles hot, ſomewhiles cold, with ſwounings, whence ſuddaine death enſues. Poyſons that kill by too great coldneſſe, induce a dull or heavie ſleepe, or drowzineſſe, from which you cannot eaſily rouze or waken them; ſometimes they ſo trouble the braine, that the patients performe many undecent geſtures and anticke trickes with their mouthes and eyes, armes and legges, like as ſuch as are franticke; they are troubled with cold ſweats, their faces become blackiſh or yellowiſh, alwayes ghaſtly, all their bodies are benummed, and they dye in a ſhort time unleſſe they be helped; poyſons of this kinde are Hemlock, Poppie, Nightſhade, Henbane, Mandrage. Dry poyſons are uſually accompanied by heate with moiſture, for although *ſulphur* bee hot and dry, yet hath it moiſture, to hold the parts together, as all things which have a conſiſtence have, yet are they called dry, by reaſon that dryneſſe is predominant in them: ſuch things make the tongue and throate dry and rough, with unquenchable thirſt; the belly is ſo bound, that ſo much as the urine cannot have free paſſage forth; all the members grow ſquallide by dryneſſe, the patients cannot ſleepe; poyſons of this kinde are Lytharge, Ceruſſe, Lime, Scailes of Braſſe, Filings of Lead, prepared antimony. On the contrary, moiſt poyſons induce a perpetuall ſleep, a fluxe or ſcouring, the reſolution of all the nerves and joints, ſo that not ſo much as the eyes may be faithfully conteined in their orbes, but will hang as ready to fal out; the extreme parts, as the hands, feet, noſe and ears corrupt & putrefie, at which time they are alſo troubled with thirſt by reaſon of their ſtrong heat, alwaies the companion of putrefaction, & oft times the author thereof: now when this commeth to paſſe, death is at hand. Very many deny that there can be any moiſt poyſons found, that is, ſuch as may kill by the efficacy of their humidity, becauſe there are no ſuch things to bee found, as may come to the fourth degree of moiſture. Yet there is an example that averres the contrary, which was of one, who ſleeping on the night, was bitten by a Serpent, as *Gilbertus Anglicus* affirmeth; for dying thereof, when as his ſervant, deſirous to awaken his Maſter out of his ſleepe, tooke him by the arme, all the fleſh being putrefied, fell off, and preſently the bones alſo fell aſunder, being deprived of their fleſh, which could not happen, unleſſe by exceſſe of the venemous humidity which lay hid in the teeth and ſpittle of the ſerpent. Alſo wee have found it noted by *Hippocrates*, that in a rayny, humide, and ſoutherly conſtitution of the yeare, it happened by the maligne violence of the venenate and putrefying humidity, that the fleſh of the armes and legges becomming rotten, fell away by peecemeale, and the bones remained bare; yea alſo and the bones themſelves in ſome, putrefyed and fell away: neither certainely doth the *Lues venerea* kill by any other meanes, than by a fretting and putrefying force of humidity, by whoſe efficacy the ſolidity of the bones is diſſolved; then much more the fleſh may bee tainted and conſumed by putrefaction.

Signes of cold poyſons.

Signes of dry poyſons.

Signes of moiſt poyſons.

A hiſtory.

Sect. 3. lib. 3. epid.

The *Lues venerea* kills by exceſſe of moiſture.

To theſe and ſuch poyſons which worke by a manifeſt and elementary faculty, when as they ſhall bee received into the body after what manner ſoever, you ſhall forthwith oppoſe their contraries, and if by chance it bee not manifeſt, what, and of what diſtinct kind of poyſon that is, you muſt know that ſuch poyſons as worke by occult properties, it is not by reaſon as yet found out how they will affect the body, but onely by experience. Therefore to theſe you muſt oppoſe their like antidotes, which may by their whole ſubſtance ſtrengthen the heart and vitall faculty, and withſtand the ſtrength of the poyſon. But to this our diſtinction of poyſons, working by a manifeſt and elementary quality, their opinion is contrary, who affirme that the venome of all poyſonous beaſts are therefore cold, for that ſuch as are bitten or ſtung with them, are forthwith felt to bee colder than a ſtone. And that ſerpents for fear of cold, when as winter is at hand, keep themſelves in holes and dens under ground, or elſe as vipers uſe to doe, lye under ſtones, under which, you may often finde them ſtiffe and numbe, and ſo unapt for motion, that you may eaſily take them up in your hand. But the coldneſſe that is perceived or felt in ſuch as are bitten or ſtung, is not occaſioned by the coldneſſe of the poyſon, but by the abſence of the naturall heate, withdrawing it ſelfe in the very inſtant of the ſtroake, from the ſurface

All poyſons are not cold.

Why ſuch as are poyſoned or ſtung, are cold.

face into the center of the body, both for the defence of the heart, as the principall part, as alſo for that there is nothing, which ſo much diſſipates, or ſo much oppugnes the vitall heat, as poyſon (of what kinde ſoever it be) doth.

Chap. VI.

How, or by what meanes to ſhunne, or eſchew Poyſons.

What ſuch as feare poyſoning muſt obſerve in their diet.

Why ſleepe is hurtfull.

Why and how vomit muſt be procured.

IT is a matter of much difficulty to avoyd poyſons, becauſe ſuch as at this time temper them, are ſo throughly prepared for deceit and miſchief, that they will deceive even the moſt wary and quick-ſighted; for they ſo qualifie their ingrate taſte and ſmell, by the admixture of ſweet and well ſmelling things, that they cannot eaſily bee perceived even by the skillfull. Therefore ſuch as feare poyſoning, ought to take heed of meates cooked with much art, very ſweete, ſalt, ſoure, or notably endued with any other taſte. And when they are oppreſt with hunger or thirſt, they muſt not eate nor drinke too greedily, but have a diligent regard to the taſte of ſuch things as they eate or drinke; beſides, before meat let them take ſuch things as may weaken the ſtrength of the poyſons; ſuch as is the fat broth of good nouriſhing fleſh meats; in the morning let them arme themſelves with treacle or mithridate, and conſerve of roſes, or the leaves of rue, a wallnut and dry figs; beſides, let him preſently drinke a little draught of Muskedine or ſome other good wine; when one ſuſpects hee hath taken any poyſon in meat or drinke, let him forbeare ſleeping. For beſides that the force of poyſon is oft times ſo rapid, that it conſumes our life in a ſhort ſpace, as fire doth ſtubble, as alſo for that it is drawne more inwardly into the ſecret paſſages of the body by ſleepe. Wherefore in ſuch a caſe it is better to procure vomit by drinking *Hydrӕleum* warme, or butter diſſolved in warme oyle, or a decoction of line, or fenugreeke ſeedes, or fat broth, for thus the received poyſon is alſo caſt forth therewith, or elſe the acrimony thereof retunded, and the belly looſed.

When and wherewith they ſhall be purged.

The cure of poyſoned wounds.

You may ſee this by daily experience, for cauſtickes, veſicatories, and the like acrid things being applyed to an anointed part, will not bliſter nor exulcerate the part. Neither doth the vomit conduce onely in this, that it excludeth the poyſon, but it ſhewes either by the taſte, ſmell, or colour, the kinde of the taken poyſon; ſo that then by uſing the proper Antidote, it may bee the more eaſily and ſpeedily reſiſted, yet notwithſtanding if you conceive that the poyſon have deſcended deeper into the Guts, you may with a glyſter draw away the reſt thereof which adheres to the coats of the Guts. But if the patient cannot vomit, then ſhall ſome purging medicine be given him forthwith, and ſuch as are thought more particularly to reſiſt poyſon, ſuch as are Agaricke, Aloes, the leſſer Centaury, Rubarbe and other things, according to the direction of the learned Phyſitian. Then ſhall you adminiſter glyſters made with *Caſsia*, fatty decoctions, ſheeps ſuet, or butter or Cowes milke, with the mucilages of Line ſeed, *pſilium* ſeeds, quince ſeeds, and other ſuch things as are uſually given in a Dyſentery, or bloody fluxe, that ſuch things may hinder the adheſion of the poyſon to the coates of the guts, and by their unctuouſneſſe retunde the acrimony of the poyſon, and mitigate if any thing ſhall already be ulcerated, and abſolutely defend the ſound parts from the maligne effects of the poyſon. But let this be a perpetuall rule, That the poyſon bee ſpeedily drawne backe by the ſame way it entred into the body; as, if it entred by ſmelling in at the noſtrills, let it bee drawne back by ſneeſing; if by the mouth into the ſtomack, let it be excluded by vomit; if by the fundament into the belly, then by gliſter; if by the privities into the wombe, then by *metrenchites* or injections made therinto; if by a bite, ſting or wound, let revulſion bee made by ſuch things as have a powerfull attractive faculty; for thus we make diverſions, that by theſe we may not onely hinder the poyſon from aſſailing the heart, but alſo that by this means we may draw it from within outwards. Wherfore ſtrong ligatures caſt about the armes, thighes and legges, are good in this caſe. Alſo large cupping glaſſes applyed with much flame to ſundry parts of the body, are good. Alſo bathes of warme water, with a decoction of ſuch things as reſiſt poyſon, as ſoutherne wood, calaminte, rue, betony, horehound, penny royall, bayes, *ſcordium*, ſmallage, ſcabious, mints, valerian, and the like, are good in this caſe. Alſo ſweates are good, being provoked ſo much as the ſtrength of the patient can endure. But if he be very wealthy, whom we ſuſpect poyſoned, it will bee ſafer to put him into the belly of an oxe, horſe or mule, and then preſently into another aſſoone as the former is cold, that ſo the poyſon may bee drawne forth by the gentle and vaporous heate of the new killed beaſt; yet doe none of theſe things without the adviſe of a Phyſitian, if it may conveniently be had.

CHAP. VII.

How the corrupt or venemous Ayre may kill a Man.

By how many, and what meanes the aire may be infected

THE aire is infected and corrupted by the admixture of maligne vapours, either ariſing from the unburied bodies of ſuch as are ſlaine in great conflicts, or exhaling out of the earth after earth-quakes, for the aire, long pent up in the cavities and bowells of the earth, and deprived of the freedome and commerce of the open aire, is corrupted, and acquires a maligne quality, which it preſently transferreth unto ſuch as meet therewith. Alſo there is a certaine malignity of the aire which accompanieth thunders, and lightnings, which ſavoures of a ſulphureous virulency, ſo that whatſoever wilde beaſtes ſhall devoure the creatures killed therewith, they become madde, and dye immediately; for the fire of lightning hath a farre more rapid, ſubtle, and greater force than other fires, ſo that it may rightly be termed a Fire of Fires.

How thunders and lightnings may infect the aire.

An argument hereof is, that it melteth the head of a ſpear, not harming the wood, and ſilver and gold, not hurting the purſe wherein it is conteined. Alſo the aire is infected by fumigations, which preſently admitted into the body and bowels by the mouth and noſe in reſpiration, by the ſkinne and arteries in perſpiration, doth eaſily kill the ſpirits and humours being firſt infected, and then within a ſhort ſpace after, the ſolid ſubſtance of the principall parts, & chiefly of the heart being turned into their nature, unleſſe the man be firſt provided for by ſneeſing, vomiting, ſweating, purging by the belly, or ſome other excretion. For that poyſon which is carryed into the body by ſmell is the moſt rapid & effectuall, by ſo much as a vapor or exhalation is of more ſubtle & quicklier piercing eſſence than an humor. Yet notwithſtanding, wilt thou ſay, it is not credible, that any can be kild by any vapor raiſed by the force of fire, as of a Torch, or a Warming-pan, for that the venenate quality of the thing that is burnt, is diſſipated and conſumed by the force of the fire, purging and cleanſing all things. This reaſon is falſly faigned to the deſtruction of the lives of careleſſe people; for ſulphureous brands kindled at a cleere fire, doe notwithſtanding caſt forth a ſulphureous vapour. Whether doe not *Lignum aloes* and Juniper, when they are burnt in a flame, ſmell leſſe ſweetly?

Whether the vapour that ariſeth from a burnt thing may poyſon one.

A hiſtory.

Pope *Clement*, the ſeventh of that name, the Uncle of our Kings Mother, was poyſoned by the fume of a poyſonous Torch that was carryed lighted before him, and dyed thereof. *Mathiolus* telleth, that there were two Mountebanks in the market place of *Sienna*, the one of which, but ſmelling to a poyſoned gilly-flower given him by the other, fell downe dead preſently.

A certaine man not long ago, when he had put to his noſe, and ſmelled a little unto a pomander, which was ſecretly poyſoned, was preſently taken with a *Vertigo*, and all his face ſwelled, and unleſſe that hee had gotten ſpeedy helpe by ſternutatories and other meanes, hee had died ſhortly after of the ſame kinde of death that Pope *Clement* did.

The ſafeſt preſervative againſt ſuch poyſons, is not to ſmell to them: moreover, ſome affirme, that there are prepared ſome poyſons of ſuch force, that being anointed but on the ſaddle, they will kill the rider; & others, that if you but anoint the ſtirrops

rops therwith, they will ſend ſo deadlie poyſonous a qualitie into the rider, through his boots, that he ſhall die therof within a ſhort time after: which things, though they be ſcarce credible, becauſe ſuch poyſons touch not the naked skin, yet have they an example in nature, whereby they may defend themſelves. For the *Torpedo* ſends a narcoticke, and certainelie deadlie force, into the arme, and ſo into the bodie of the Fiſher, the cords of the net being between them.

CHAP. VIII.

That every kinde of Poyſon hath its proper and peculiar Signes and Effects.

AS poyſons are diſtinct in *ſpecies*, ſo each *ſpecies* differs in their ſignes and effects; neither is it poſſible to find anie one kinde of poyſon, which may be accompanied or produce all the ſignes and effects of all poyſons, otherwiſe Phyſitians ſhould in vaine have written of the ſignes and effects of each of them, as alſo of their proper remedies & antidotes. For what kind of poyſon ſhall that be, which ſhall cauſe a burning heat in the ſtomack, bellie, liver, bladder & kidneies, which ſhall cauſe a hicketting, which ſhall cauſe the whole body to tremble and ſhake, which ſhall take away the voice and ſpeech, which ſhall cauſe convulſions, ſhall weaken the pulſificke facultie, which ſhall intercept the freedome of breathing, which ſhall ſtupefie and caſt into a dead ſleepe, which ſhall together, and at once cauſe a *Vertigo* in the head, dimneſſe in the ſight, a ſtrangling, or ſtoppage of the breath, thirſt, bleeding, feaver, ſtoppage of the urine, perpetuall vomiting, redneſſe, lividneſſe, and paleneſs of the face, reſolution of the powers, and manie other things, all which are cauſed by all ſorts of poyſon. Laſtly, no bodie will denie, but that hot poyſons may kill more ſpeedily than cold, for that they are more ſpeedily actuated by the native heat.

Hot poyſons kill ſooner than cold.

CHAP. IX.

The Effects of Poyſons from particular venemous things, and what Prognoſticks may thence bee made.

Lib. 2. cap. 27. The bites of all wild beaſts are virulent.

IT is the opinion of *Cornelius Celſus*, and almoſt of all the antients, That the bite of everie beaſt had ſome virulencie, but yet ſome more than otherſome. They are moſt virulent that are inflicted by venemous beaſts, as Aſpes, Vipers, Water-ſnakes, and all kindes of Serpents, Baſiliſkes, Dragons, Toads, Mad dogges, Scorpions, Spiders, Bees, Waſpes, and the like. They are leſſe maligne, which are of creatures wanting venome, as of Horſes, Apes, Cats, Dogges not mad, and manie other things, which though of their owne nature they are without poiſon, yet in their bites there is ſomething more dolorificke and ill natured, than in common wounds inflicted by other occaſions: I beleeve that in their ſlaver or *ſanies*, there is ſomething, I know not how to terme it, contrarie to our nature, which imprints a maligne qualitie in the ulcer, which alſo you may obſerve in the tearings or ſcratchings of ſuch creatures as have ſharpe clawes, as Lions and Cats. Moreover manie affirme that they have found by experience, that the bites of men are not altogether without virulencie, eſpecially of ſuch as are red haired and freckled, cheiflie when as they are angred; it is probable that the bites of other perſons want this malignitie, ſeeing that their ſpittle will cure ſmall ulcerations. Wherefore if there ſhall happen difficultie of cure in a wound, cauſed by a mans biting, which is neither red haired nor freckled, neither angrie; this happens not by meanes of the ſpittle, nor by anie maligne qualitie, but by reaſon of the contuſion, cauſed by the bluntneſſe of the teeth, not cutting, but bruiſing the part, for being not ſharp, they cannot ſo eaſily enter the fleſh, unleſſe by bruiſing and tearing, after the manner of heavie and blunt ſtroaks

The bites of a red haired man virulent.

ſtroaks and weapons, wounds being occaſioned by ſuch are more hard to bee cured, than ſuch as are made by cutting and ſharp weapons. But of the fore-ſaid bitings of venemous creatures, there are few which doe not kill in a ſhort ſpace, and almoſt in a moment, but principally if the poiſon be ſent into the bodie by a live creature, for in ſuch poiſon there is much heat; alſo there is therein a greater tenuity, which ſerves as vehicles thereto into what place or part ſoever of the bodie they tend, the which the poiſons taken from dead creatures are defective of. Wherefore ſome of theſe kill a man in the ſpace of an houre, as the poiſon of Aſpes, Baſiliskes and Toads; others not unleſſe in two or three daies ſpace, as of water Snakes; a Spider, and Scorpion require more time to kill, yet all of them admitted but in the leaſt quantity, doe in a ſhort ſpace cauſe great and deadly mutations in the bodie, as if they had breathed in a peſtiferous aire, and with the like violence, taint and change into their owne nature all the members and bowels, by which theſe ſame members do in the time of perfect health change laudible meats into their nature and ſubſtance. The place whereas theſe poiſonous creatures live, & the time, conduce to the perniciouſneſſe of the poiſon, for ſuch as live in drie, mountanous and ſun-burnt places kill more ſpeedily than ſuch as be in moiſt and mariſh grounds; alſo they are more hurtfull in winter than in ſummer; and the poiſon is more deadly which proceeds from hungry, angry and faſting creatures, than that which comes from ſuch as are full and quiet; as alſo that which proceeds from young things, chiefly when as they are ſtimulated to venery, is more powerfull than that which comes from old & decrepite; from females worſe than from males; from ſuch as have fed upon other venemous things, rather than from ſuch as have abſtained from them, as from ſnakes which have devoured toads, vipers which have fed upon ſcorpions, ſpiders & Caterpillers. Yet the reaſon of the efficacie of poyſons depends from their proper, that is, their ſubtle or groſſe conſiſtence, & the greater or leſſe aptneſſe of the affected body to ſuffer. For hot men that have larger & more open veins & arteries, yeeld the poiſon freer paſſage to the heart. Therefore thoſe which have more cold & ſtraight veſſels, are longer ere they die of the like poiſon; ſuch as are full, are not ſo ſoon harmed as thoſe that are faſting: for meats, beſides that by filling the veſſels, they give not the poiſon ſo free paſſage, they alſo ſtrengthen the heart by the multiplication of ſpirits, ſo that it more powerfully reſiſts pernicious venome. If the poiſon worke by an occult and ſpecifick propertie, it cauſeth the cure and prognoſtick to be difficult, and then muſt we have recourſe to Antidotes, as theſe which in their whole ſubſtance reſiſt poyſons, but principally to treacle, becauſe there enter into the compoſition thereof medicines which are hot, cold, moiſt and drie: whence it is, that it retunds and withſtands all poiſons, chiefly ſuch as conſiſt of a ſimple nature, ſuch as theſe which come from venemous creatures, plants and mineralls; and which are not prepared by the deteſtable art of empoiſoners.

Contuſed wounds harder to heale than ſuch as are cut.

Why treacle retunds the force of all ſimple poyſons.

CHAP. X.

What cure muſt bee uſed to the bitings and ſtingings of venemous beaſts.

Cure muſt ſpeedily bee uſed without any delay to the bites and ſtingings of venemous beaſts, which may by all meanes diſperſe the poyſon, and keepe it from entring into the body; for when the principall parts are poſſeſſed, it boots nothing to uſe medicines afterwards. Therefore the Ancients have propounded a double indication to leade us to the finding out of medicines in ſuch a caſe, to wit, the evacuation of the virulent and venenate humour, and the change or alteration of the ſame and the affected body. But ſeeing evacuation is of two ſorts, to wit, univerſall, which is by the inner parts, and particular, which is by the outward parts. We muſt begin at the particular, by ſuch topick medicines as are fit to draw out, and retund the venome; for we muſt not alwaies begin a cure with generall things, as ſome thinke, eſpecially in externall diſeaſes, as wounds, fractures, diſlocations, venemous bites and punctures. Wherefore

A double indication in the cure of venemous bites.

Lotions fit for venemous bites.

Lib. de theriaca.

Treacle outwardly applyed and inwardly taken good againſt venemous bites.

The force of *Echium.*

The efficacie of Cauteries againſt venemous bites.

The force of Precipitate againſt venemous wounds.

hereto as ſpeedily as you may, you ſhall apply remedies fit for the bites & punctures of venemous beaſts, as for example, the wounds ſhall bee preſently waſhed with urine, with ſea-water, *aqua vitæ*, or wine, or vineger wherein old treacle or muſtard ſhall be diſſolved. Let ſuch waſhing be performed very hot, and ſtrongly chafed in, and then leave upon the wound and round about it, linnen ragges, or lint ſteeped in the ſame liquor. There be ſome who thinke it not fit to lay treacle thereto, becauſe, as they ſay, it drives the poyſon in. But the authority of *Galen* convinceth that opinion, for he writeth that if treacle be applyed to this kind of wounds before that the venome ſhall arrive at the noble parts, it much conduceth. Alſo reaſon confutes it; for vipers fleſh enters the compoſition of treacle which attracts the venome by the ſimilitude of ſubſtance, as the Load-ſtone draweth iron, or Amber ſtrawes. Moreover, the other ſimple medicines which enter this compoſition, reſolve and conſume the virulencie and venome, and being inwardly taken, it defendeth the heart and other noble parts, and corroborateth the ſpirits. Experience teacheth that mithridate fitly given in the ſtead of treacle worketh the like effect. The medicines that are taken inwardly and applyed outwardly for evacuation, muſt bee of ſubtle parts, that they may quickly inſinuate themſelves into every part to retund the malignity of the poyſon; wherefore garlike, onions, leeks, are very good in this caſe, for that they are vaporous; alſo *ſcordium*, rue, *dictamnus*, the leſſer Centaury, horehound, rocket, the milkie juice of unripe figs, and the like, are good; there is a kind of wilde bugloſſe amongſt all other plants, which hath a ſingular force againſt venemous bites, whence it is termed *Echium* and *viperinum*, and that for two cauſes; the firſt is, becauſe in the purple flowers that grow amongſt the leaves, there is a reſemblance to the head of a viper or adder. Another reaſon is, becauſe it heales the biting of a viper not onely applyed outwardly, but alſo helpeth ſuch as are bitten, being drunke in wine, yea, and will not ſuffer thoſe that have lately drunke thereof to bee bitten at all. Wilde time hath the like effect; though theſe oft-times agree with the poyſon in quality as in heate, yet doe they helpe in diſcuſſing and reſolving it: yet, as much as wee may, wee muſt labour to have evacuation and alteration together. It is moſt convenient, if the part affected will permit, to apply large cupping-glaſſes with much flame and hornes; alſo ſucking is good, the mouth being firſt waſhed in wine wherein ſome treacle is diſſolved, and with oile, leſt any thing ſhould adhere thereto, for it will hinder it, if ſo be the mouth bee no where ulcerated. It is good alſo to apply horſe-leaches; ſome wiſh to apply to the wound, the fundaments of hens or turkies that lay egges, for that ſuch are opener behinde, firſt putting ſalt upon them that they may gape the wider, ſhutting their beaks and opening them now & then leſt they ſhould be ſtifled, and ever and anon to ſubſtitute others in ſtead of ſuch as die or are ſuffocated; for thus it is thought the poyſon is drawne forth, and paſſeth into the bird by the fundament. There bee others which had rather apply to the wound live birds cut aſunder in the midſt, and ſo laid to hot, for that they gheſſe theſe reſiſt poyſon by a naturall diſcord. But certainely it is by their heate whereby they doe not onely digeſt toads, aſpes, vipers, ſcorpions and other venemous things, but alſo weare aſunder and ſoften ſand, ſtones, and moſt dry and ſtony ſeeds in their gizzards; wherefore we muſt think them very good to draw out the poyſon and diſſipate it. But nothing is ſo forcible to diſperſe and retund the venome, as the impreſſion of cauteries, eſpecially actuall, for a hot iron workes more effectually and ſpeedily, and cauſeth an ulcer which will remaine open a longer time. Wherefore to cauſe the ſpeedier falling away of the eſchar, you ſhall ſcarifie it to the quick, and then plentifully anoint the place. For thus the poyſon will the ſooner paſſe forth. But this muſt bee done before the poyſon enters far into the body, for otherwiſe Cauteries will not only do no good, but further torment the patient, and weaken him to no purpoſe. Let drawing plaſters be laid to the wound & neighbouring parts, made of *Galbanum*, turpentine, blacke pitch, and other gummy and reſinous things. After the falling away of the Eſchar, *baſilicon* ſhall bee applyed, quickned with a litle Precipitate, for it is very effectuall in theſe caſes, for that it draweth forth the virulent *ſanies* out of the bottome of the wound, neither doth it ſuffer the wound to bee cloſed ſpeedily. To which purpoſe they put in a piece of of a ſpunge, or a roote of Gentian or Hermodactyll,

ctyll, or ſome acride medicine, as *ægyptiacum* or Precipitate mixed with the powder of Alume, or a cauſtick beaten to powder. But you muſt alwaies obſerve this, that with your ointments you muſt alwaies mixe ſome Treacle or Mithridate, or the juice of *hypericon*, or the like, which have power to attract and diſperſe the poyſon, and cleanſe the ulcer; yet if too vehement heat ſhall cauſe ſuch paine as is likely to bring a gangrene by the diſſipation of the ſpirits, then neglecting the cure of the proper diſeaſe for a time, wee muſt labour to correct the ſymptome. But in this caſe you muſt obſerve this rule, that you let no bloud, give no purging medicine, nor glyſter, nor vomit, nor uſe no bath, nor other thing that may procure ſweat, untill three daies be paſt after the bite or ſting. In the meane ſpace, let the patient ſhun all manner of labour, but chiefely venery, leſt by cauſing an agitation of the humours, the poyſon get ſooner to the heart. Therefore then it is time to uſe univerſall evacuations, when as you ſhall ſuſpect that the poyſon is diffuſed over the veines and whole inner part of the bodie beſides. Before you ſhall give nothing, unleſſe medicines of Treacle or Mithridate and the like things, which have a faculty to reſiſt poyſon, and ſtrengthen the whole body by their benigne and vitall vapour, although their ſubſtance goe no further than the ſtomack. Thus pills when they are ſwallowed, though they goe no further than the ſtomacke, yet doe they draw matter out of the joints and head; and ſtrong glyſters, though they paſſe no further than the guts, yet by their quality diffuſed further with the vapour, they draw from the moſt diſtant parts; yet you muſt give an Antidote, not onely more powerfull than the poyſon in quality, but alſo greater in quantitie, that ſo it may the more eaſily overcome and expell the poyſon. Wherefore you muſt give it twice in a day, and continue it ſo long untill you ſhall know that the ſtrength of the poyſon is weakned and overcome by the remiſſion and decay of the maligne ſymptomes. Yet in the meane while, you muſt not neglect the diſtemper cauſed in the part by the poyſon, but muſt rather correct it by the application of remedies contrary to the diſtemper, as by cold things, if great heat afflict the affected part and whole bodie; by hot things on the contrary, if it ſeeme as cold as a ſtone, which oft-times happens. And let thus much ſuffice for the generall cure of poyſons: now will we come to their particular cure.

When hot things are not convenient for poyſoned wounds.

Antidotes muſt be given in great quantities.

CHAP. XI.

Why dogges ſooner become mad than other creatures, and what bee the ſignes thereof.

DOgges become mad ſooner than other creatures, becauſe naturally they enjoy that temper and condition of humours which hath an eaſie inclination to that kinde of diſeaſe, and as it were a certaine diſpoſition, becauſe they feed upon carrion and corrupt, putride and ſtinking things, and lap water of the like condition; beſides the trouble and vexation of loſing their maſters, makes them to runne every way, painfully ſearching and ſmelling to every thing, and neglecting their meat. A heating of the bloud enſues upon this paines, and by this heate it is turned into a melancholy, whence they become madde. But yet dogges doe not alway become mad by meanes of heat, but alſo by occaſion of cold, that is, by contrary cauſes, for they fall into this diſeaſe not onely in the dog-daies, but alſo in the depth of winter. For dogges abound with melancholike humours, to wit, cold and drie. But ſuch humours as in the ſummer through exceſſe of heate, ſo in the depth of winter by conſtipation and the ſuppreſſion of fuliginous excrements, they eaſilie turn into melancholie. Hence followes a very burning and continuall feaver, which cauſeth or bringeth with it a madneſſe. Adde hereto, that in the depth of winter the heate which is contained within is redoubled, and in like manner as the ſcorching heate in ſummer, it breeds and turnes the humours into melancholie. Alſo dogges become madde by contagion, as ſuch as are bitten by another madde dogge. A mad dog hath ſparkling and fierie eies, with a fixed looke, cruell and a ſquint, hee carries his head heavily, hanging downe towards the ground, and ſomewhat on one ſide,

Dogs naturally ſubject to madneſſe.

Dogs become mad, not onely in the heat of ſummer, but alſo in the depth of winter.

hee gapes, and thruſts forth his tongue, which is livide and blackiſh; and being ſhort breathed, caſts forth much filth at his noſe, and much foaming matter at his mouth; in his gate, as if he ſuſpected and feared all things, he keepeth no one or certain path, but runs one while to this ſide, another while to that, and ſtumbling like one that is drunke, he oft-times falleth downe on the ground; he violently aſſailes whatſoever he meets withall, whether it bee man, tree, wall, dog, or any thing elſe; other dogs ſhun him, and preſently ſent him a farre off. But if another unawares chance to fall foule on him, he yeelds himſelfe to his mercy, fawnes upon him, and privily labours to get from him, though hee be the ſtronger & greater. Hee is unmindfull of eating and drinking, he barkes not, yet he bites all he meets without any difference, not ſparing his maſter, as who at this time hee knowes not from a ſtranger or enemie. For it is the property of melancholie to diſturbe the underſtanding, ſo that ſuch perſons as are melancholike, doe not onely rage againſt, and uſe violence to their friends and parents, but alſo upon themſelves. But when as he ſees water, he trembles and ſhakes, and his haires ſtands up on end.

Why melancholike perſons hurt themſelves.

Chap. XII.

By what ſignes we may know a man is bitten of a mad dog.

The bite of a mad dog not very painefull at the firſt.

IT is not ſo eaſie at the firſt to know a man that is bitten with a mad dogge; and principally for this reaſon, becauſe the wound made by his teeth cauſeth no more pain than other wounds uſually do; contrary to the wounds made by the ſting or bite of other poyſonous creatures, as thoſe which preſently after they are inflicted, cauſe ſharpe paine, great heat, ſwelling and abundance of other maligne accidents, according to the nature of the poyſon; but the malignity of the bite of a mad dogge appeares not before that the venome ſhall invade the noble parts. Yet when you are ſuſpicious of ſuch a wound, you may acquire a certaine knowledge and experience thereof by putting a piece of bread into the quitture that comes from the wound. For if a hungry dog neglect, yea more fly from it, and dare not ſo much as ſmell thereto, it is thought to bee a certaine ſigne that the wound was inflicted by a madde dogge. Others adde, That if any give this piece of bread to hens, that they will die the ſame day they have eaten it; yet this latter, I making experiment thereof, failed, for devouring this virulent bread, they became not a jot the worſe. Wherefore I think the former ſigne to be the more certaine, for dogs have a wonderfull and ſure ſmelling faculty, whereby they eaſilie ſent and perceive the malignitie of the like creature. But when as the raging virulencie hath invaded the noble parts, then the patients, becomming ſilent and ſorrowfull, thinke of many things, and at the beginning make a noiſe with their teeth; they make no anſwer to the purpoſe, they are more teſtie than ordinarie, and in their ſleepes they are troubled with dreames, and ſtrange phantaſies, and fearfull viſions, and laſtly, they become affraid of the water. But after that the poiſon hath fixed it ſelfe into the ſubſtance of the noble parts, then all their faculties are diſturbed, all the light of their memorie, ſenſes, reaſon and judgement is extinguiſhed. Wherefore becomming ſtarke mad, they know not ſuch as ſtand by them, nor their friends, no nor themſelves, falling upon ſuch as they meet withall, & themſelves with their teeth, & nailes & feet. Often twitchings like convulſions do ſuddenly riſe in their limbs; I judge them occaſioned by extraordinary drineſs, which hath as it were wholly drunk up all the humiditie of the nervous parts; there is a great drineſſe of the mouth with intolerable thirſt, yet without any deſire of drink, becauſe the mind being troubled, they become unmindful & negligent of ſuch things as concerne them, and are needful for them; the eyes look fierie & red, & all the face is of the ſame colour; they ſtill think of dogs, and ſeem to ſee them, yea and deſire to bark and bite juſt after the maner of dogs; I conjecture that the virulent humour hath changed all the humours & the whole body into the like nature, ſo that they think themſelves alſo dogs; whence their voice becomes hoarſe by much endevouring to barke, having forgot all decen-

Signes of the bite of a mad dogge.

Signes by which you may gather that the noble parts are tainted.

Why men becomming mad barke like dogs.

cie, like impudent dogs, to the great horrour of the beholders. For their voice growes hoarſe by reaſon of the great dryneſſe of the *aſpera arteria*; they ſhun the light, as that which is enemy to melancholy, wherewith the whole ſubſtance of the braine is repleniſhed; on the contrary, they deſire darkeneſſe, as that which is like and friendly to them. But they are affraid of the water (though good to mitigate their great diſtemper of heat and drineſſe) and they fly from looking-glaſſes, becauſe they imagin they ſee dogs in them, whereof they are much affraide, by reaſon whereof they ſhun the water and all polite and cleare bodies which may ſupply the uſe of a looking-glaſſe; ſo that they throw themſelves on the ground, as if they would hide themſelves therein, leſt they ſhould be bitten againe: for they affirme that he which is bitten by a mad dog, alwaies hath a dog in his minde, and ſo remaines fixed in that ſad cogitation. Wherefore thinking that he ſees him in the water, he trembles for feare, and therefore ſhuns the water. Others write that the body by madneſſe becommeth wondrous dry, wherefore they hate the water, as that which is contrary thereto, being abſolutely the moiſteſt element, and ſo they ſay that this is the reaſon of their fearing the water. *Ruffus* writes that madneſſe is a kinde of melancholie, and that feare is the proper ſymptome thereof, according to *Hippocrates*; wherefore this or that kind of melancholie begets a feare of theſe or theſe things, but chiefly of bright things, ſuch as looking-glaſſes and water, by reaſon that melancholie perſons ſeeke darkeneſſe and ſolitarineſſe, by reaſon of the black corruption of the humour wherewith they abound. They fall into cold ſweats, a fomie, ſtinking and greeniſh matter flowes from the ulcer, by reaſon of the heat of the antecedent cauſe and ulcerated part. The urine moſt commonly appeares watriſh, by reaſon that the ſtrainers, as it were, of the kidnies, are ſtraitned by the heat and drineſſe of the venome. Yet ſometimes alſo it appears more thick and black, as when nature powerfully uſing the expulſive facultie, attempts to drive forth by urine the melancholy humour, the ſeat of the venome. Alſo ſometimes it is wholly ſuppreſt, being either incraſſated by hot dryneſſe, or elſe the mind being carried other waies, and forgetfull of its owne duty, untill at length the patients, vexed by the cruelty of ſo many ſymptomes, and overcome by the bitterneſſe of pain, die frantick, by reaſon that medicines have not been ſpeedily and fitly applyed. For few of thoſe who have uſed remedies in time, have periſhed of this diſeaſe.

Why they ſhun the light.

Why they are affraid of the water.

Aphor. 25. ſect. 6.

The bite of a mad dog taken in hand in time, is for the moſt part curable.

CHAP. XIII.

Prognoſticks.

WE cannot ſo eaſily ſhun the danger we are incident to by mad dogs, as that of other beaſts, by reaſon he is a domeſtick creature, and houſed under the ſame roofe with us. The virulency that reſides in his foame or ſlaver is hot and dry, maligne, venenate and contagious, ſo that it cauſeth a diſtemper like it ſelfe, in the body whereto it ſhall apply it ſelfe, and ſpread it ſelfe over the whole body by the arteries; for it doth not onely hurt when as it is taken in by a bite or puncture, but even applyed to the skin, unleſſe it be forthwith waſhed away with ſalt water or urine. Neither doth this venome hurt equally or at all times alike, for it harms more or leſſe, according to the inclination of the aire to heat or cold, the depth of the wound, the ſtrength of the patients body, and the ill humours thereof, and their diſpoſition to putrefaction, the freedome and largeneſſe of the paſſages. Now maligne ſymptomes happen ſooner or later, as in ſome about the fourtieth day, in others about ſixe moneths, and in others a yeare after. There be ſome who thereupon are troubled with the falling ſickneſſe, and at length grow mad: ſuch as fall into a feare of the water, never recover. Yet *Avicen* thinks their caſe is not deſperate, if as yet they can know their face in a glaſſe; for hence you may gather, that all the animall faculties are not yet overthrowne, but that they ſtand in need of ſtrong purgations, as we ſhall ſhew hereafter. *Aëtius* tels that there was a certaine Phyloſopher, who taken with this diſeaſe and a feare of water, when as hee deſcended with a great courage unto the bath, and in the water beholding the ſhape of the dog that bit him, hee made a ſtand, but aſhamed thereof, he forthwith cryed out,

The venome of a mad dog applied outwardly only, may cauſe madneſſe.

Whether the *Hydrophobia* or feare of water be incurable.

A hiſtory.

Quid cani cum Balneo? (*i*) What hath a dog to doe with a Bath? which words being uttered, he threw himſelfe forcibly into the Bath, and fearleſly dranke of the water thereof, and ſo was freed from his diſeaſe together with his erroneous opinion. It is a deadly ſigne to tumble themſelves on the ground, to have a hoarſe voice, for that is an argument that the weazon is become rough by reaſon of too exceſſive dryneſſe. Finally, the principall parts being poſſeſſed, there is no recovery or life to be hoped for. Men may fall mad, though they bee not bit by a mad dog. For as the humours are often inflamed of themſelves, and cauſe a *Cancer* or Leproſie, ſo do they alſo madneſſe in melancholie perſons. The bites of vipers and other venemous creatures cauſe not like ſymptomes to theſe that come by the biting of a mad dog, becauſe they die before ſuch can come forth or ſhew themſelves. Great wounds made by mad dogs are not equally ſo dangerous as little, for from the former, great plenty of venemous matter flowes out, but in the latter it is almoſt all kept in.

CHAP. XIIII.

What cure muſt be uſed to ſuch as are bitten by a mad dog.

A hiſtory.

The force of Sorrell.

The force of Docks.

A hiſtory.

THis caſe alſo requires ſpeedy remedies, for ſuch things are in vaine which come long after the hurt. The Lawyer *Baldus* experienced this to his great harme; for being by chance lightly bit in the lip by a little dog wherwith he was delighted, not knowing that he was mad, & neglecting the wound, by reaſon of the ſmallneſſe thereof, after ſome foure moneths ſpace, he died mad, having then in vaine aſſayed all maner of medicines. Wherefore obſerving theſe things both for evacuation, as alſo for alteration, which we have formerly mentioned in the generall cure of wounds inflicted by the bite or ſting of venemous creatures, and by all the meanes there ſpecified, we muſt draw forth the venome; and if the wound be large, then ſuffer it to bleed long and much, for ſo ſome part of the poyſon will be exhauſted; if it be not great, it ſhall be enlarged by ſcarification, or an occult cauterie, neither ſhall it be healed or cloſed up at the ſooneſt, till fourty daies be paſſed. Sorrel beaten and applied to the wound, and the decoction thereof taken inwardly, is very effectuall in this caſe, as *Aëtius* affirmes. To the ſame purpoſe you may with good ſucceſſe make a lotion and friction with muſtard diſſolved in urine or vinegar, leaving upon the wound a double cloth moiſtned in the ſame decoction: laſtly, all acride, biting and very attractive medicines are convenient in this caſe. Wherefore ſome apply Rocket boyled and beaten with butter and ſalt; others take the flowre of *Orobus*, and temper it with hony, ſalt and vinegar, and apply it hot. Horſe-dung boyled in ſharpe vinegar, or brimſtone beaten to powder and tempered with ones ſpittle, is good. Alſo black pitch melted with ſome ſalt, and a little *Euphorbium* mixed therewith and ſo applied, is good. Some write, that the haires of the dogge whoſe bite cauſed the madneſſe, applyed by themſelves, by their ſympathie or ſimilitude of ſubſtance draw the venome from within outwards; for ſo a Scorpion beaten and applied to the place whereas it ſtung, by drawing out the poyſon that it ſent in, reſtores the patient to health, both theſe by often experience are affirmed to have certaine event. Others chaw unground wheat, and lay it upon the wound, others roaſt beanes under hot embers, then huske them and cleave them, and ſo apply them. Alſo the wound may be wholeſomely waſhed and fomented with a decoction of Docks, and then the herb beaten may be applyed thereto; alſo the patient may drinke the decoction; and by this one remedy *Aëtius* affirmes that he hath recovered divers; for thus it moves urine plentifully, which is thought much to conduce to the cure of this diſeaſe. There be ſome who apply the leaves of betony and nettles beaten with common ſalt; others make a medicine to the ſame purpoſe and after the ſame manner of an Onion, the leaves of Rue and ſalt. Yet the reſt are exceeded by Treacle diſſolved in *aqua vitæ* or ſtrong wine, and rubbed hard upon the part, ſo that the bloud may follow, laying upon the wound when you have wiped it, clothes dipped in the ſame medicine, then preſently apply garlike or onions beaten with common ſalt and turpentine: by this onely remedy I freed one of the daughters of *Madamoiſelle de Gron* from the ſymptomes of madneſſe, and healed the wound, when as a mad dog had bit her grievouſly in the calfe of the right leg. Alſo it is good preſently to eate garlick with bread, and then to drinke after it a draught of good wine, for garlicke by its ſpirituous heate will defend the noble parts from poyſon. There bee ſome who wiſh to eate the roſted liver of the dog that hurt them, or elſe the liver of a goat, of which remedies as yet I have had no experience. Others preſcribe a dram of the ſeeds of *Agnus caſtus* to be drunke with wine and butter. Others the powder of river-crabs, burnt and drunke in wine. Or, ℞. *rad. gentianæ* ʒii. *aſtacorum fluviatilium in fumo combuſt. & in pollinem redact.* ʒiii. *terræ ſigill.* ℥ß. *miſce.* give ʒi of this ſame powder in the decoction of river-crabs, & let them drink thereof oft at ſundry times. Many have caſt themſelves into the ſea, neither have they thence had any helpe againſt madneſſe, as *Ferrand Pozet* the Cardinall teſtifieth in his booke of poyſons; wherefore you muſt not relie upon that remedie, but rather you muſt have recourſe to ſuch things as are ſet downe in the books of Phyſicians, and approved by certaine and manifold experience. But ſeeing that no poyſon can kill, unleſſe it be taken or admitted into the body, we muſt not fear any harme by ſprinkling our bodies with the *ſanies* of a mad dogge, viper, toad, or any other ſuch like venemous creature, if ſo bee that it be preſently wiped or waſhed cleane away.

A hiſtory.

Leaping into the ſea no certaine remedy againſt madneſs.

CHAP. XV.

What cure muſt be uſed to ſuch as feare the water, but yet are able to know themſelves in a glaſſe.

The force of Antimony againſt madneſs.

Such as have not their animal faculty as yet orecome by the malignity of the raging venome, muſt have ſtrong purgations given them. Wherefore, if in any caſe Antimonie bee uſefull, then is it in this, as that which cauſeth ſweats, looſeth the belly, and procures vomiting. For it is a part of extreme and dangerous madneſſe to hope to overcome the cruel malignity of this poyſon already admitted into the bowels, by gentle purging medicines. Aſſuredly, ſuch and ſo great danger is never overcome without danger. Bathes alſo conduce, which may diſperſe and draw forth the poyſon by cauſing ſweats. Alſo many and frequent treacle potions are good, to retund the venome, and ſtrengthen the bowels; alſo it will be fitting to give them water and all other liquid things, which they ſo much abhorre, in a cup with a cover. Alwaies let ſuch as are poiſoned, or bitten or ſtung, by a mad dog or other venemous beaſt, keep themſelves in ſome warme and light place, that the poyſon which by coldneſſe is forced in, may be the readilier drawne out by the means of heat, and the ſpirits bee recreated by the brightneſſe of the aire, and therefore move from the center to the circumference of the body, and let the roome be perfumed with ſweet things. To eat very hot and ſalt things preſently at the beginning, as onions, leeks, all ſpiced meats, and ſtrong wine not allaied, ſeems not to be beſides reaſon; becauſe ſuch things by their ſpirituous heat hinder the diffuſion of the poyſon over the body, and ſtrengthen the filled entrailes. There be ſome alſo that would have them to feed upon groſſe and viſcous meats, which by obſtructing the veſſels, may hinder the paſſage of the poyſon to the heart and other parts; and by the ſame reaſon it will be better to fill themſelves with meate to ſatietie, than otherwiſe, becauſe the malignity of humours is encreaſed by hunger, than which, nothing can be more harmfull to venemous wounds. Yet within a ſhort while after, as within five or ſixe dayes, they muſt returne to a mediocritie, and uſe all things temperate, boiled meats rather than roaſted, and that in a decoction of opening things, ſo to move urine. Laſtly, they muſt keep ſuch a diet as melancholike perſons ought to do; neither ſhall they let bloud, leſt ſo the poyſon ſhould bee further drawne into the veines; but it is good that the patients body be ſoluble from the very firſt. Let their drinke be wine indifferently allayed with water, *oxymel ſimplex*, or the ſyrupe of the juice of Citron with boiled water; or elſe this following

Julep

Why ſleepe is hurtfull to ſuch as are bitten by a mad dog, and all ſuch as are poyſoned.

Julep. ℞. *ſucci limonum, & malorum citri, an.* ℥ ß. *ſuc. gran. acid.* ℥ ii. *aquæ acetoſæ, min. & roſ. an.* ℥ i. *aq. font. coct. quantum ſufficit, fiat Julep, ut artis eſt.* Sleep is to be avoided untill the force of the poyſon is abated, for by ſleep the humours flow back into the bowells. All things that reſiſt poyſon muſt bee given any way whatſoever, as lemons, oranges, *angelica* rootes, gentian, tormentill, burnet, vervine, *carduus benedictus*, borage, bugloſſe, and the like. Let all things that are afterwards ſet before the patient be meats of good juice, ſuch as are veale, kid, mutton, partridge, pullets, capons, and the like.

Chap. XVI.

Of the biting of a Viper or Adder, and the ſymptomes and cure thereof.

The bites of vipers how virulent.

The ſymptoms.

THe remedies that were formerly mentioned againſt the bitings of madde dogges, the ſame may bee uſed againſt all venemous bites and ſtings, yet neverthleſſe each poyſon hath his peculiar antidote. Vipers or Adders (as we vulgarly terme them) have in their gummes, or the ſpaces betwene their teeth, little bladders filled with a virulent *ſanies*, which is preſſed out into the part that they bite with their teeth. There forthwith ariſeth a pricking paine, the part at the firſt is much ſwollen, and then the whole body, unleſſe it be hindred: groſſe and bloody filth ſweats out of the wound, little bliſters riſe round about it, as if it were burnt, the wound gnawes, and as it were feeds upon the fleſh, great inflammation poſſeſſeth the liver and the gummes, and the whole body becomes very dry, becomming of a yellowiſh or pale colour, with thirſt unquenchable; the bellie is griped by fits, a cholericke vomiting moleſteth them, the ſtomacke is troubled with a hicketting, the patients are taken with often ſownings, with cold ſweate, the forerunner of death, unleſſe you provide by fit medicines for the noble parts, before the poyſon ſhall invade them. *Mathiolus* tells that he ſaw a countrie-man, who, as he was mowing a meadow, by chance cut an Adder in two with his ſithe, which when he thought it was dead, he tooke the one halfe whereon the head remained, without any feare in his hand, but the enraged creature, turning about her head, cruelly bit him by one of his fingers, which finger as men uſually doe (eſpecially when as they thinke of no ſuch thing) hee put into his mouth, and ſucked out the blood and poyſon, and preſently fell downe dead.

A hiſtory.

A hiſtory.

When as *Charles* the ninth was at *Montpelier*, I went into the ſhop of one *Farges* an Apothecary, who then made a ſolemne diſpenſation of Treacle, where not ſatisfying my ſelfe with the looking upon the vipers which were there in a glaſſe, ready for the compoſition, I thought to take one of them in my hands, but whileſt that I too curiouſly and ſecurely handled her teeth which were in her upper jaw, covered with a skinne, as it were a caſe to keepe the poyſon in, the beaſt catched hold of the very end of my fore-finger, and bit me in the ſpace which is betweene the naile and the fleſh; whence preſently there aroſe great pain, both by reaſon of the part endued with moſt exquiſite ſenſe, as alſo by the malignity of the poyſon: forthwith I exceeding ſtraitly bound my finger above the wound, that ſo I might preſſe forth the blood and poyſon, leſt they ſhould diffuſe themſelves further over the body. I diſſolved old treacle in *aqua vitæ*, wherein I dipped and moiſtened cotton, and ſo put it to the wound, and within a few dayes I throughly recovered by this onely medicine. You may uſe in ſtead of Treacle, Mithridate and ſundry other things, which by reaſon of their heat are powerfull drawers, as a ſquill roſted in hot embers, garlicke and leeks beaten and applyed, barly floure tempered with vinegar, hony, and goats dung, and ſo applyed like a pultis. Some thinke it ſufficient forthwith to waſh and foment the wound with vinegar, ſalt, and a little hony. *Galen* writes that the poyſon inflicted by the bite of a viper, may bee drawne forth by applying to the wound the head of a viper, but otherſome apply the whole viper beaten to maſh.

Remedies for the bite of a viper.

Lib. de theriac.

Chap. XVII.

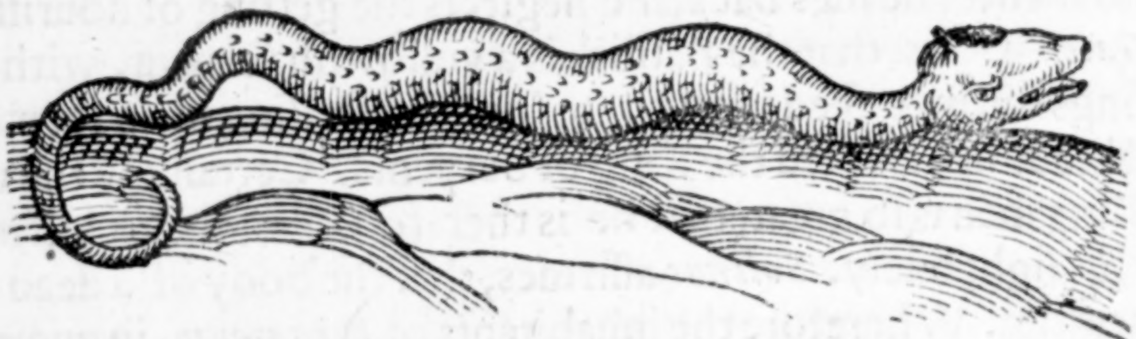
Of the Serpent called Hæmorrhous.

THE Serpent *Hæmorrhous* is ſo called, becauſe by his biting hee cauſeth blood to droppe out of all the paſſages of the wounded bodie; hee is of a ſmall bodie, of the bigneſſe of a viper, with eies burning with a certaine fierie brightneſſe, and a moſt beautifull ſkinne. The backe of him (as *Avicen* writes) is ſpotted with manie blacke and white ſpots, his necke little and his taile verie ſmall: the part which he bites, forthwith growes blackiſh, by reaſon of the extinction of the native heat, which is extinguiſhed by ſuch poiſon which is contrarie thereto in its whole ſubſtance. Then followes a paine of the ſtomacke and heart, theſe parts being touched with the peſtiferous qualitie of the poiſon. Theſe paines are ſeconded by vomiting, the orifice of the ventricle being relaxed by a *Diarrhæa*, the retentive facultie of all the parts of the bellie being weakened, and the veines which are ſpred through the guts, not being able to retaine the blood conteined in them. For the blood is ſeen to flow out, as in ſtreams, from the noſe, mouth, eares, fundament, privities, corners of the eies, rootes of the naile, and gums, which putrefie, the teeth falling out of them. Moreover there happens a difficultie of breathing, and ſtoppage of the urine, with a deadlie convulſion.

The *Hæmorrhous* why ſo called.

Wonderfull bleedings.

The cure is forthwith to ſcarifie, and burne the bitten part, or elſe to cut it quite off, if that it may be done without danger of life, and then to uſe powerfullie drawing Antidotes.



The figure of the ſerpent Hæmorrhous.

Chap. XVIII.

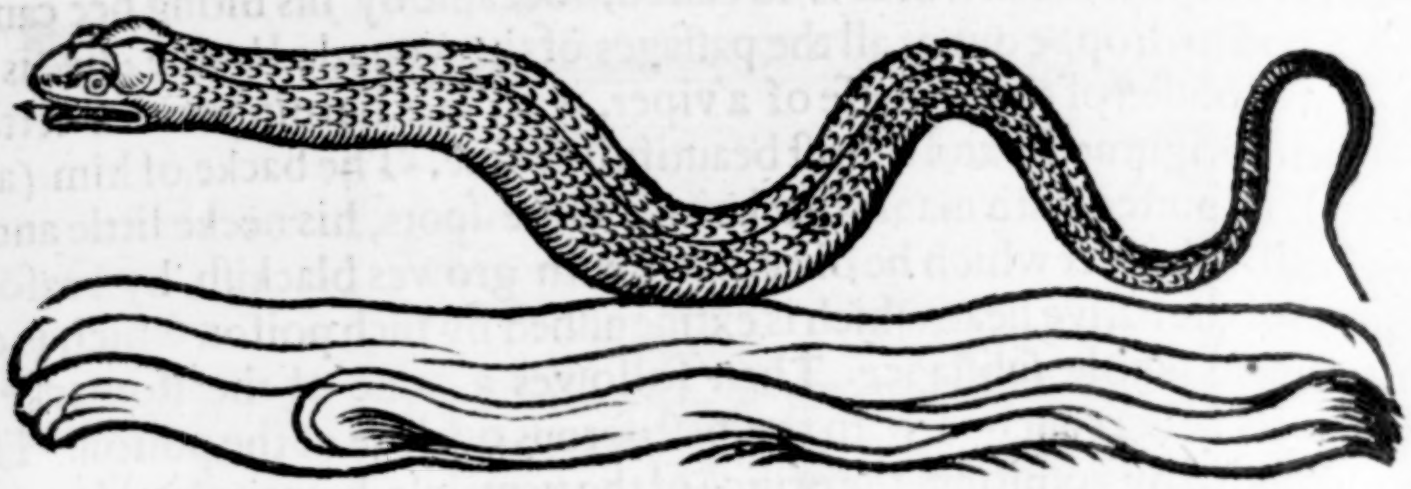
Of the Serpent called Seps.

THe Serpent *Seps* is ſo called, becauſe it cauſeth the part which it bites, forthwith to putrefie, by reaſon of the cruell malignitie of its poyſon. It is not much unlike the *Hæmorrhous*, but that it curles or twines up the taile in divers circles. *Pauſanias* writes that this ſerpent is of an aſh-colour, a broad head, ſmall necke, bigge bellie, writhen taile, and as he goes, hee runs aſide like a crabbe. But his skin is variegated and ſpotted with ſeverall colours, like to Tapiſtrie. By the crueltie of his cauſticke and putrefying venome, hee burnes the part which he hath bit, with moſt bitter paine; he cauſeth the ſhedding of the haires, and as *Aëtius* addeth, the wound at the firſt caſteth forth manifeſt blood, but within a little while after, ſtinking filth. The putrefyed affected parts waxe white, and the bodie all over becomes of the colour of that ſcurſe, which is termed *Alphos*, ſo that by the wickedneſſe of this putrefactive poiſon, not onely the ſpirits are reſolved, but alſo the whole bodie conſumed, as by fire, a peſtilent carbuncle, and other putride tumours, ariſing from a hot and humide or ſuffocating conſtitution of the aire. Now for the remedies, they muſt be ſuch as are formerly preſcribed againſt the bitings of a viper.

The reaſon of the name, and deſcription of the *Seps*.

The ſymptoms.

The Figure of the Serpent Seps.



Chap. XIX.

Of the Baſiliske or Cockatrice.

THe Baſiliske far exceeds all kinds of Serpents in the curſtneſs of its poyſon. Therefore it is affirmed by *Nicander*, that into what place ſoever he comes, other venemous creatures do forthwith flie thence, for that none of them can ſo much as endure his hiſſing; for he is thought to kill all things even with this,& not with his biting and touch only; beſides, if any of them haſten to get anie meate or drinke, and perceive that the Baſiliske is not farre from thence, he flies back,and neglects the getting of nouriſhment neceſſarie for life. *Galen* writes, that the Baſilisk is a yellowiſh ſerpent, with a ſharpe head, and three riſings diſtinguiſhed with white ſpots, and riſing up in forme of a crowne, by reaſon whereof hee is ſtiled the King of Serpents. Certainely the violence of his poyſon in killing men is ſo great, that he is therefore thought to kill men, and other creatures by his ſight onely. *Solinus* affirmes, that the body of a dead Baſiliske hath wondrous faculties. Wherefore the inhabitants of *Pergamum*, in ancient times,gave a mightie price for one, to hang upon the joiſtes of the temple of *Apollo*, ſo to drive away the Spiders and Birds, leſt they ſhould there weave their webs, or the other build their neſts in that ſacred place. Verily no ravenous creature will touch their carkaſſe; but if conſtrained by hunger they doe touch it, then they forthwith fall downe dead in the ſame place: and this happens not onely by eating their body,but alſo by devouring the bodies of ſuch beaſts as are killed by their bitings. They kill the trees and ſhrubs by which they paſſe, not onely by their touch, but even with their breath. Amongſt the weſterne Æthiopians is the fountaine *Nigris*, neer which there is a ſerpent called *Catablepas*, ſmall in bodie, and ſlow, having a great head; which it ſcarce can carrie, but that it lies alwaies upon the ground, otherwiſe it would kill abundance of people, for it forthwith kills all that ſee the eyes thereof, the Baſiliske hath the ſame force; he is bred in the province of *Cyrene*, of the length of ſome twelve fingers, with a white ſpot in his head, reſembling a crowne; he chaſeth away all ſerpents with his hiſſe: Weaſels are the deſtruction of ſuch monſters: thus it pleaſed nature,that nothing ſhould be without its equall; they aſſaile them in their dennes, being eaſily knowne by the barrenneſſe or conſumption of the ſoile. Theſe kill them alſo by their ſent, and they die, and the fight of nature is ended: thus nature to the magnanimous Lion,leſt there ſhould be nothing which he might fear, hath oppoſed the weake creature the Cocke, by whoſe crowing onely he is terrefied and put to flight. *Eraſiſtratus* writes,that a golden yellowneſſe affects the bitten part of ſuch as are hurt by a Baſiliske, but a blackneſſe and tumour poſſeſſeth the reſt of the body, all the fleſh of the muſcles within a while after falling away piecemeale. An antidote againſt this muſt be made of a dramme of *Caſtoreum* diſſolved

CHAP. XX.

Of the Salamander.

THe Salamander kils not onely ſuch as it bites by making a venemous impreſſion, but it alſo infects the fruits and herbs over which it creeps, with a ſpittle or groſſe moiſturewhich ſweats out of all the bodie, to the great danger of the health and life of ſuch as eat theſe things at unawares: wherfore it need not ſeeme ſtrange, which is received by ſome late writers, that ſome families have all died by drinking water out of pits, whereinto a Salamander by accident was fallen. For if it ſhall creepe upon a tree, it infects all the fruit with the qualities of cold and moiſt poyſon, wherein it yeelds not to Aconite.

The malignity of a Salamander.

The temper of her.

Aetius writes that ſuch as are infected with the poyſon of a Salamander, certaine parts of their bodie grow livide, ſo that they fall away often, being putrefyed. At the firſt there appeare white ſpots over the body, then red, afterwards blacke with putrefaction, and the falling away of the haires. The cure is, to procure vomit, to looſe the belly with a glyſter, and to give them Treacle and Mithridate in potions. *Avicen* preſcribes the ſame things againſt this kinde of poyſon as againſt *opium*, by reaſon of the cold nature of them both; the proper antidote is turpentine, *ſtyrax*, nettle ſeeds, and cypreſſe leaves. *Dioſcorides* writes that the Salamander is a kind of Lizard dull, variegated, and which is falſly reputed not to be burnt by fire. But *Pliny* ſaith ſhe is ſo cold, that ſhe extinguiſheth the fire by her touch onely, being laied upon hot coales. On the contrary, *Mathiolus* ſaith that caſt into a great flame, they are quickly conſumed. It is eaſie out of *Aetius* to reconcile theſe diſagreeing opinions; This creature, ſaith hee, paſſeth through a burning flame, and is not hurt, the flame dividing it ſelfe and giving her way, but if ſhee continue any time in the fire, the cold humour being conſumed in her, ſhe is burnt. Now the Salamander is black, variegated, with yellow ſpots, ſtarre-faſhion.

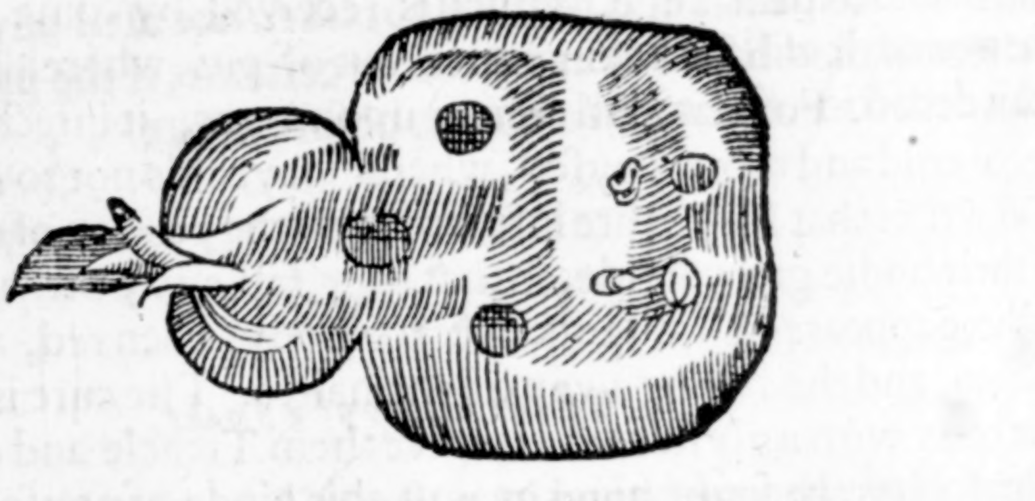
The effigies of a Torpedo.



Chap. XXII.

Of the Bitings of Aſpes.

THE wound which is made by an Aſpe is very ſmall, as if a needle were thruſt into the part, and without any ſwelling. Theſe ſymptomes follow upon her bite, ſuddaine darkneſſe clouds their eyes, much agitation in all their bodies, but gentle notwithſtanding; a moderate paine of the ſtomacke troubles them, their foreheads are continually troubled with convulſive twitchings, their cheeks tremble, and their eye-lids fall gently to reſt and ſleep; the blood which flowes from the wound is little, but blacke; death no longer deferred than the third part of a day, will take them away by convulſions, unleſſe you make reſiſtance with fitting remedies. The male Aſp makes two wounds, the female four, as it alſo happens in the bitings of vipers. Now for that the poyſon of Aſps congeals the blood in the veines and arteries, therefore you muſt uſe againſt it ſuch things as

Symptomes.

Cure.

are hot & ſubtle of parts, as mithridate or treacle diſſolved in *aqua vitæ*, and the ſame powred into the wound; the patient muſt be warmed by bathes, frictions, walking, and the like. When as the hurt part becommeth purple, black or greene, it is a ſigne that the native heat is extinct and ſuffocated by the malignity of the venome. Therefore then it is beſt to amputate the member, if the partie bee able to endure it, and there be nothing which may hinder. *Vigo* writes, that he ſaw a Mountebank at Florence, who, that he might ſell the more of his Antidotes, and at the better rate, let an Aſpe to bite him by the finger, but he died thereof ſome foure houres after. To the ſame purpoſe you may reade *Mathiolus*, whereas hee writes that thoſe Impoſtors or Mountebanks to cozen the better, and deceive the people, uſe to hunt and take vipers and aſpes long after the ſpring, that is, then whenas they have caſt forth their moſt deadly poyſon; then they feed them with meats formerly unuſuall to them, ſo that by long keeping and care, at the length they bring it to paſſe, that they put off a great part of their venemous nature; neither being thus ſatisfied, they make them oftentimes to bite upon pieces of fleſh, that ſo they may caſt forth into them the venome which is contained in the membraine betweene their teeth and gums. Laſtly, they force them to bite, licke and ſwallow downe an aſtringent medicine, which they compoſe and carry about for the ſame purpoſe, that ſo they may obſtruct the paſſages by which the venome uſed to flow out, for thus at length their bites will be harmeleſſe, or without great danger. This therefore is their art, that ſo they may ſell their counterfeit treacle to the people at a high rate, as that which is a moſt ſafe remedy againſt all poiſonous bites. *Chriſtopher Andrew* in his book called *oicoiatria*, writes, that the Ilands of Spaine are every-where full and ſtored with ſerpents, aſpes, and all ſorts of venemous beaſts, againſt whoſe bites they never obſerved or found any benefit in treacle. But the efficacie of the following Antidote is ſo certaine and excellent, and approved by ſo manifold experience, that in the confidence thereof, they will not bee affraid to let themſelves bee bitten by an Aſpe. Now this medicine is compoſed of the leaves of Mullet, Avenes & red ſtock Gilly flowers in like quantity, which they boile in ſharpe vinegar and the urine of a ſound man, and therewith foment the wounded part. Yet if he have not taken nor uſed any thing of a good while after the wound, it will be better and more certaine, if the patient drinke three ounces of this decoction faſting two houres before meate.

CHAP. XXIII.

Of the biting of a Snake.

I Have thought good in a true hiſtory to deliver the virulent malignity of the bite of a ſnake, and the remedies thereof. When as King *Charles* the ninth was at Moulins, *Mouſier Le Feure*, the Kings Phyſician, and I were called to cure the Cooke of the Lady of Caſtelpers. Who gathering hoppes in a hedge to make a ſalad, was bit on the hand by a ſnake that there lay hid, hee putting his had to his mouth, ſucked the wound to eaſe the paine by ſucking forth the venome. But his tongue forthwith ſwelled ſo bigge, that he could not ſpeak his mind: beſides his whole arme, even to his ſhoulder, was in like ſort much ſwelled, his paine was ſo vehement, that it made him ſwoune twice in my preſence, his face was wan and livid like to a dead body, and though I deſpaired of his recovery, yet not ſuffering him to bee quite forſaken, I waſhed his mouth with treacle diſſolved in white wine, and gave him ſome thereof to drinke, adding thereto ſome *aqua vitæ*. I opened his ſwolne arme with many and deepe ſcarifications, eſpecially in the place where he was hurt, I ſuffered the bloud which was wholly ſerous and ſanious, to flow more plentifully, I waſhed the wounds with treacle and mithridate diſſolved in *aqua vitæ*, and then I put him exceeding warme in bed, procuring ſweat, and making him to lie awake, leſt ſleep ſhould draw the poyſon inwards to the entrailes. I by theſe meanes ſo farre prevailed, that on the day after hee was freed from all his maligne ſymptomes. Therefore I judged it onely remained

A hiſtorie.

The cure.

for a perfect cure, that the wound ſhould be long kept open and waſhed with treacle, neither was I deceived, for within a few dayes he was perfectly recovered.

Chap. XXIV.

Of the bitings of Toads.

The bites of toads how harmfull.

Hough Toads want teeth, yet with their hard & rough gums they ſo straitly preſſe or pinch the part which they ſhall take hold on, that they will force their poiſon thereinto, and ſo over the whole body by the pores of the preſſed part. Moreover, they caſt forth their venome by urine, ſpittle and vomit upon herbes, but chiefly upon Strawberries, the which they are reported greatly to affect. Hence many ſuddenly and ignorantly catch their deaths.

A hiſtory.

The ſymptomes occaſioned by the poyſon of toads.

May frogs.

The cure.

I heard from a man of very good credit, that there were two merchants not farre from the Citie *Tholouſe*, who whileſt dinner was providing, walked into the garden that belonged to the Inne, where they gathered ſome ſage leaves, and unwaſhed as they were, put them into their wine. They had not as yet dined, when being taken with a ſudden *Vertigo*, the whole Inne ſeemed to run round, then loſing their ſight, they fell into a ſowne, intermixed now and then with convulſions. But they ſtammered with their lippes and tongues becomming blacke; a froward and horrid look with continuall vomiting, and a cold ſweat, the forerunner of death, which preſently ſeazed upon them, their bodies becomming exceedingly much ſwolne. But the Juſtices of the place ſuſpecting that they were poyſoned, made the Inne-keeper and the Gueſts to be apprehended, being examined, they all conſtantly & with one voice anſwered, that the dead parties ate of the ſame meat and drinke which the reſt did, but onely that they put ſage into their wine. A Phyſician was asked the queſtion whether ſage might be poyſoned; he anſwered, it might: but to come to the purpoſe, that it muſt appeare whether any venemous creature had poyſoned the plant with her ſpittle or venemous *ſanies*. This which was lightly pronounced, and only by conjecture, was by the eye found to bee true. For at the roote thereof there was found a hole in the ground full of Toads, who got out by putting in of warme water, made it credible that the plant was poyſoned by their ſpittle and urine, whereby you may underſtand how unwiſely they doe, who devoure herbes and fruits newly gathered without waſhing. Alſo we muſt take heed leſt falling aſleep in the fields, wee lye not neere the holes which toads or other venemous beaſts of the like nature have made their habitation. For thence a venemous or deadly aire may be drawn into the lungs. For the ſame cauſe wee muſt abſtaine from eating of frogs in the moneth of May, becauſe then they engender with toads. Oxen in feeding ſometimes lick up ſmall toads together with the graſſe, which preſently will breed their great harme, for thereupon the oxen ſwell ſo big, that they often burſt withall. Neither is the venome of toads deadly only being taken inwardly, but even ſprinkled upon the skin, unleſs they forthwith wipe the place, & waſh it with urine, water & ſalt. Such as are poiſoned by a toad turn yellow, ſwell over all their bodies, are taken with an Aſthmaticke difficultie of breathing, a *Vertigo*, convulſion, ſowning, and laſtly by death it ſelfe. Theſe ſo horrid ſymptoms are judged inherent in the poyſon of toads, not only by reaſon of the elementary qualities therof, coldneſs & moiſture, which are chiefly predominant therein; but much rather by the occult property which is apt to putrefie the humors of that body whereto it ſhall happen. Therfore it wil be convenient to procure vomit, eſpecially if the poiſon be taken by the mouth, to give glyſters, & to weaken the ſtrength of the poiſon by hot and attenuating Antidotes, as treacle & mithridate diſſolved in good wine; but in concluſion to digeſt it by bathes, ſtoves, and much and great exercise. *Rondeletius* in his book *de Piſcibus*, affirmes the ſame things of the curſed venome of toads, as we have formerly delivered: yet that they ſeldome bite, but that they caſt forth either their urine, the which they gather in a great quantity in a large bladder, or elſe their venemous ſpittle or breath againſt ſuch as they meete withall, or aſſaile; beſides, the herbs which are tainted by their poiſonous breath, but much more ſuch as are ſprinkled with their ſpittle or urine, are ſufficient to kill ſuch as eate them. The Antidotes are juice of betonie, plantaine, mugwurt, as alſo the bloud of Tortoiſes made with flower into pils, and forthwith diſſolved in wine, and drunken. *Pliny* writes that the hearts and ſpleens of toads reſiſt poiſon. The vulgar opinion is falſe, who thinke that the toad-ſtone is found in their heads, which is good againſt poyſon.

Antidotes againſt the poyſon of toads.

Chap. XXV.

Of the ſtinging of a Scorpion.

The deſcription of a Scorpion. His taile.

A Scorpion is a ſmall creature with a round bodie in forme of an egge, with many feet, and a long taile conſiſting of many joints, the laſt whereof is thicker and a little longer than the reſt, at the very end thereof is a ſting, in ſome two, hollow and replete with cold poyſon, the which by the ſting it caſts into the obvious body; it hath five legs on each ſide forked with ſtrong clawes, not unlike to a Crab or Lobſter, but the two foremoſt are bigger than the reſt; they are of a blackiſh or ſootie colour, they goe aſide, aſide; and oft-times faſten themſelves with their mouthes and feet ſo faſt to men, that they can ſcarce be plucked therehence. There be ſome who have wings like the wings of Locuſts, waſting the corn & all green things with their biting and burning. Such are unknown in France. Theſe flee over divers Countries like winged Ants. This is likely to be true by that which *Mathiolus* writes, that the husbandmen in Caſtile in Spain, in digging the earth oft-times finde a ſwarm of Scorpions, which betake themſelves thither againſt winter. *Pliny* writes, that Scorpions laid waſte a certaine part of Æthiopia, by chaſing away the inhabitants. The Ancients made divers kinds of Scorpions, according to their varietie or difference of colours, ſome being yellow, others browne, rediſh, aſh-coloured, greene, whitiſh, blacke, duskie; ſome have wings, and ſome are without. They are more or leſſe deadly according to the countries they inhabite. In Tuſcanie and Scythia they are abſolutely deadly, but at Trent and in the Iland Pharos their ſtinging is harmleſſe. The place ſtung by a Scorpion preſently begins to be inflamed, it waxeth red, growes hard and ſwels, and the patient is againe pained, hee is one while hot, another while cold, labour preſently wearies him, and his paine is ſomewhiles more and ſomewhiles leſſe, he ſweats and ſhakes as if he had an Ague, his haire ſtands upright, paleneſſe diſcolours his members, and hee feels a paine, as if he were pricked with needles over all his skin, wind flieth out backwards, he ſtrives to vomit and goe to ſtoole, but doth nothing, he is moleſted with a continuall feaver and ſowning, which at length proves deadly, unleſſe it be remedied. *Diſcorides* writes, that a Scorpion beaten and laid to the place where he ſtung, is a remedy thereto, as alſo eaten roaſted to the ſame purpoſe. It is an uſuall, but certaine remedy to anoint the ſtung place with the oyl of Scorpions. There be ſome who drop into the wound the milkie juice of figs, others apply thereto Calamint beaten, otherſome uſe barly meale-mixed with a decoction of Rue. Snailes beaten together with their ſhels, and laid thereon preſently aſſwage pain. *Sulphur vivum* mixed with turpentine, and applyed plaſter-wiſe, is good; as alſo the leaves of Rue beaten & laid thereto. In like ſort alſo the herbe *Scorpioides*, which thence tooke its name, is convenient, as alſo a bryony root boiled and mixed with a little ſulphur and old oile. *Diſcorides* affirmes Agarick in powder or taken in wine to be an Antidote againſt poyſons, verily it is exceeding good againſt the ſtingings or bitings of ſerpents. Yet the continuall uſe of a bath ſtands in ſtead of all theſe, as alſo ſweat and drinking wine ſomewhat alaid. Now Scorpions may bee chaſed away by a fumigation of *Sulphur* and *Galbanum*; alſo oile of Scorpions dropped into their holes, hinders their comming forth. Juice of radiſh doth the ſame. For they will never touch one that is beſmeared with the juice of radiſh or garlike, yea verily, they will not dare to come neare him.

Winged Scorpions.

Symptomes.

Lib. 2. cap. 10. & lib. 6. cap. 44.

Lib. 3. cap. 1.

Scorpions chaſed away with the juice of garlick or Radiſhes.

CHAP. XXVI.

Of the ſtinging of Bees, Waſpes, &c.

The ſymptoms.

The cure.

BEes, Waſpes, Hornets and ſuch like, cauſe great paine in the skin wounded by their ſtinging, by reaſon of the curſtneſſe of the venome which they ſend into the body by the wound, yet are they ſeldome deadly, but yet if they ſet upon a man by multitudes, they may come to kill him. For thus they have ſometimes been the death of horſes. Wherefore becauſe ſuch as are ſtung by theſe, by reaſon of the cruelty of pain, may think they are wounded by a more virulent and deadly creature, I thinke it not amiſſe to ſet downe what ſignes follow upon their ſtingings. Great paine preſently ariſeth, which continueth untill the ſting left in the part is taken forth, the part becomes red and ſwolne, and there riſeth a puſh or little bliſter. The cure is, forthwith to ſucke the wound very hard, and thereby to draw forth the ſtings, which if they cannot thus be gotten out, the place, if nothing hinder, is to be cut, or elſe temper aſhes with leven or oile, and ſo apply them: the part alſo may be very conveniently put into hot water, and there fomented for an houres ſpace, and at length waſhed in ſea water. Creſſes beaten and applied, aſſwage the paine and diſcuſſe the humour cauſing the tumour. Oxe dung macerated in oile and vinegar, and applyed hot, doth the ſame. There are ſome who apply to the part the ſame creatures beaten, as we formerly ſaid of Scorpions; beans chawed and laid to the part aſſwage paine. Vinegar, hony and ſalt applied exceeding hot, are good, if beſides, you dip a cloth therein, and lay it upon the place; *ſulphur vivum* tempered with ſpittle hath the ſame effect. The milkie juice of unripe figs incorporated with hony, is judged very effectuall, but it is much the better, mixed with treacle. Waſpes will not ſting nor bite ſuch as anoint their bodies with the juice of mallowes mixed with oile. They may bee quickly chaſed away with the fume of brimſtone and ſuch like things. A waſpe is ſaid, if ſhee find a viper dead, to dip her ſting in the others poyſon, and thence men learned to empoiſon the heads of their arrowes. The rough and hairy wormes, which are commonly called Bear-wormes, eſpecially thoſe which breed about a Pine tree, cauſe great itching, redneſſe & ſwelling in the part which they bite, touch or grate upon very hard. A remedy hereof is onions beaten with vinegar, and the reſt of the things formerly mentioned.

The bites of Bear-wormes.

CHAP. XXVII.

Of the bite of a Spider.

Differences of Spiders.

SPiders weave webs with various art, yet in theſe they alwaies make a lurking hole, ſo to lye in waite to catch the intrapped flyes, and ſo to prey upon them. There are many ſorts of Spiders, one is termed *Rhagium*, round and like a blacke berry, whence it taketh the name; it hath a very ſmall mouth under the midſt of the belly, and moſt ſhort feet, as if they were imperfect, her bite is as painefull as the ſting of a Scorpion. Another is called *Lupus* or the Wolfe-ſpider, becauſe ſhee doth not onely lye in waite to catch flyes, but alſo bees and waſpes, and all ſuch things as may flee into her webbe. The third is named *Myrmecion*, it is larger than an Ant, but headed like one, the bodie thereof is blacke, and hath white ſpots or ſtreakes running towards the backe. The fourth kind may bee called *Veſparium*, in other things reſembling a Waſpe, but that it wants the wings; of a rediſh colour, and living onely on herbes. The Ancients have thought their bitings to bee venemous. Now their poyſon is therefore thought to bee cold, becauſe the ſymptomes thence ariſing are winde in the belly, refrigerations of the extreme parts of the body, numneſſe in the bitten part, with ſenſe of cold and ſhaking. The wound muſt forthwith be waſhed with very hot vinegar; then muſt you lay thereto onions, and ſuch like things beaten, then procure ſweat by art, as by bathes and ſtoves, yet nothing is more effectuall than treacle and mithridate.

CHAP. XXVIII.

Of Cantharides *and* Bupreſtes.

The deſcription of *Cantharides.*

Enemies to the Bladder.

Symptomes.

A hiſtory.

The cure.

C*Antharides* ſhine as it were with a golden colour, acceptable to the eye, by reaſon of the commixture of a blewiſh or greeniſh colour therewith, yet their ſmell is ungratefull. They are hot and dry in the fourth degree, and ſo cauſticke, corroſive and venemous, not onely by reaſon of their cauſtick quality, but becauſe of a ſecret antipathy which they naturally have againſt the urenary parts; which effects they produce not onely if they bee taken by the mouth into the body, but even applyed outwardly to raiſe bliſters. Such as have taken them inwardly, have the taſt of pitch or ſome thing like *cedria,* or the roſen of Cedars, in their mouthes, it is likely that this taſt proceeds from the humours diſſolved by the putredinous heat in the ſtomack, guts & liver, and the vapours that therehence ariſe; for taken inwardly, they gnaw, exulcerate and burne all parts from the mouth even to the belly, whence enſueth a bloudy fluxe, excrements flowing out, which reſemble the waſhings of new killed fleſh. Then followes a burning feaver, *vertigo,* madneſſe, reſtleſneſſe, the braine being diſturbed by the plenty of vapours lifted up from the corroded and burnt parts and humours, which therefore when as they appeare, you may know the affect is uncurable. In the parts appointed for the receiving and conveyance of the urine they cauſe a burning inflammation, excoriation, ſtrong and continuall erection of the yard, whence enſues a bloudy and painefull ſtrangury, in ſtead of which there oft-times happens or ſucceeds an Iſchary or ſtoppage of the water, whence a gangrene and mortification of the part, and ſo in concluſion of the whole bodie beſides. When as *Cantharides* are taken inwardly, the remedie is vomiting, drinking of Cowes mike to correct the heat and dryneſſe, good alſo to mitigate the ulcers and ſtay the dyſentery; it is good alſo to inject it into the guts by glyſter. In ſtead thereof ſallade oile, or oile of ſweet almonds is convenient to retunde the acrimonie of the poyſon faſtned to the ſides of the ſtomack. The reſt and whole cure of this poyſon you may learne by the following hiſtory. A certain whore, the better to enjoy the company of a young Abbot who loved her, entertained him with a banquet, and ſprinkled divers of their cates with the powder of *Cantharides,* to incite him the more to venery. The next day, when as the Abbot caſt forth pure bloud at his fundament and yard which ſtood very ſtiffe, hee called ſome Phyſicians, who preſently by the forementioned ſymptomes, which were all very apparent in him, underſtood that he had *Cantharides* given him: wherefore they purged him upwards with vomits, and downewards by glyſters made with French barly, Rice, a decoction of mallowes, ſeeds of line and fœnugreek, oyle of lillies, goats ſuet: then preſently after they gave him a little treacle with a good quantity of conſerve of violets, which might draw the poyſon outwards, they gave him milke to drinke, and cauſed him to uſe injections into the urenary paſſage and guts made of refrigerating things, as the juice of lettuce, purſlaine, cucumbers, gourds, melons; of tough and viſcide things, that ſo they might ſticke the more eaſily and long to the ulcerated parts, as the mucilages of *pſilium,* mallowes, quince-ſeeds, ſyrupe of water-lillies, popies and violets, freſh butter, and oile of ſweet almonds, and they made him drinke onely barly water, or the common ptiſan; they let him feede on veale, kid, and porke boyled with lettuce, purſlaine, barly and violet leaves, the which by their humidity might relaxe the belly, and by their toughneſſe lenifie the roughneſſe or aſperitie; they applyed alſo refrigerating things to the loines, ſhare and *perinæum* to aſſwage the heate of the urine. At length they put him into a warme bath, and to conclude, they left nothing unattempted to draw forth or weaken the poyſon. But all their endeavours were in vaine, for the Abbot dyed, not being deſtitute of remedies conveniently preſcribed, but overcome by the contumaci-

ous

A hiſtory.

Cantharides applyed to the head, ulcerate the bladder.

A remedy againſt Leprous puſtles.

ous malignity of the poyſon. The Phyſicians pains had far better ſucceſſe in a certain Gentlewoman againſt this kinde of affect; her whole face was deformed with red, fierie and filthy puſtles, ſo that all ſhunned her company as if ſhee had beene troubled with a Leproſie, and were ready to forbid her the ſociety of men; ſhee came to Paris, and calling *Hollerius* and *Grealmus* Phyſicians, mee and *Caballus* being Surgeons, ſhee made a grievous complaint, and beſought us earneſtly for ſome remedy againſt ſo great a deformity of her face; having diligently conſidered her caſe, we pronounced her free from a Leproſie; but we judged it fit to apply to her whole face a veſicatorie of *Cantharides*, three or foure houres after the application whereof, the medicine being come to worke its effect, her bladder began to burne exceedingly, and the necke of her wombe to ſwell, with gripings, continuall vomiting, making of water and ſcowring, a troubleſome agitation of the body and members, a burning and abſolutely fiery feaver. I forthwith called the Phyſicians, it was decreed that ſhe ſhould drink wine plentifully, and that it ſhould bee injected by the fundament into the guts, and by the urenary paſſage into the bladder and the neck of the womb, and that ſhe ſhould keep her ſelfe, untill the paine were mitigated, in a warme bath made of the decoction of Line-ſeeds, the roots and leaves of mallowes, marſh-mallowes, violets, henbane, purſlaine and lettuce; and her loynes and genitals ſhould be anointed with *unguentum roſatum & populeon* ſtirred and incorporated with oxycrate. By theſe meanes, all the ſymptomes were mitigated. Her face in the interim roſe all in a bliſter, and much purulent matter came out thereof, and ſo the deformity, wherewith ſhee was formerly troubled, vaniſhed away for ever, ſo that within a while after ſhee was married, and had many children, and is yet living in perfect health.

The reaſon of the name.

Bupreſtes alſo are of the kinde of *Cantharides*, being like unto them in ſhape and faculty. If an Oxe or Sheepe or any other creature ſhall in feeding devoure one of them, hee will preſently ſwell up like a Tunne; whence alſo they take their name: if a man take them inwardly, hee ſhall endure the like ſymptomes as in taking *Cantharides*, and over and beſides both his ſtomacke and his whole belly ſhall be wonderfully puffed up, as if he had a Dropſie. It is probable that this inflation like a tympany happenneth by humours diffuſed and reſolved into vapours by the fiery acrimony of the venome: They are to bee cured after the ſame manner as ſuch as have drunke *Cantharides*. Laſtly, as in all other poyſons which are taken into the body, ſo alſo here, if the poyſon taken by the mouth bee thought as yet to bee in the ſtomacke, you muſt then procure vomit. If it bee gotten into the guts, then muſt it be drawn away by glyſters; if diffuſed over all the body, then muſt you make uſe of ſuch things as may drive the poyſon forth from the center to the circumference, ſuch as are bathes and ſtoves.

Chap. XXIX.

Of Horſe-Leaches.

What horſe-leaches moſt virulent.

Divers remedies according to the diverſity of the parts.

Horſe-Leaches are alſo venemous, eſpecially ſuch as live in muddy ſtinking ditches, for theſe are leſſe hurtfull which reſide in clear & pure waters. Wherefore, before they are to bee uſed in caſes of Phyſick, they muſt be kept for ſome dayes ſpace in cleane water, that ſo they may purge themſelves; otherwiſe they may chance to leave ulcers hard to cure in the places whereto they ſhall be applyed, and the rather, if they bee violently plucked off, becauſe they by that meanes leave their teeth faſtned in the part. Now hee which by chance hath ſwallowed a Horſe-leach, muſt bee asked in what part hee feeleth her, that is, the ſenſe of her ſucking. For if ſhee ſticke in the top of the Throate or Gullet, or in the middeſt thereof, the part ſhall bee often waſhed with muſtard diſſolved in vinegar. If ſhee bee neare the orifice of the ventricle, it is fit that the patient by little and little ſwallow downe oyle with a little vinegar. But if ſhee faſten to the ſtomacke, or the bottome of the ventricle, the patient by the plucking of the part ſhall perceive a certaine ſenſe of ſucking, the patient will ſpit bloud, and will for feare become melancholicke. To force her thence, hee ſhall drinke warme water with oyle; but if ſhee cannot ſo bee looſed, then ſhall you mixe Aloes therewith, or ſome thing endued with the like bitterneſſe, for ſhee will by that meanes leave her hold, and ſo bee caſt forth by vomit. You may perceive this by ſuch as are applyed to the skinne, on the externall parts, for by the aſperſion of bitter things, whether they bee full or empty, they will forſake their hold. Then ſhall the patient take aſtringent things, which may ſtoppe the bloud flowing forth of the bitten part, ſuch is conſerve of Roſes, with *terra ſigillata*, bole armenicke, and other more aſtringent things, if need ſo require. For if they ſhall adhere to ſome greater branch of ſome veine or artery, it will bee more difficult to ſtop the flowing bloud.

But for that not the earth onely, but the ſea alſo produceth venemous creatures, wee will in like ſort treat of them, as wee have already done of the other, beginning with the Lampron.

CHAP. XXX.

Of the Lampron.

The deſcription of the Lampron

THE Lampron, called in Latine *Murana*, is a ſea fiſh ſomething in ſhape reſembling a Lamprey, but ſhee is bigger and thicker, and hath a larger mouth, with teeth long, ſharpe and bending inwards, ſhe is of a duſkie colour, diſtinguiſhed with whitiſh ſpots, and of ſome two cubits length; the Ancients had them in great eſteem, becauſe they yeeld good nouriſhment, and may be kept long alive, in pooles or ponds, and ſo taken as the owners pleaſe to ſerve their table, as it is ſufficiently knowne by the hiſtorie of the Roman *Craſſus*. Shee by her biting induceth the ſame ſymptomes as the viper, and it may bee helped by the ſame meanes. Verily the Lampron hath ſuch familiarity with the Viper, that leaving her naturall element, the ſea, ſhe leapeth a ſhoare, and ſeeketh out the Viper in her den to joyne with her in copulation, as it is written by *AElian* and *Nicander*.

The naturall friendſhip of the Lampron and Viper.

CHAP. XXXI.

Of the Draco-marinus *or ſea-Dragon.*

THE ſea-Dragon called by the French *Viva*, for his vivacity (and by the Engliſh a Viver, or as ſome ſay a Qua-viver) becauſe being taken in fiſhing and drawne out of the ſea, ſhee is ſaid long to ſurvive. Her pricks are poyſonous, but chiefly thoſe that are at the edges of her gils. Which is the reaſon that Cookes cut off their heads before they ſerve them up to the table; and at Roven the fiſhermen lay them not upon their ſtalles to ſell before they have cut off their heads. The wounded part of ſuch as are hurt, paines them much, with inflammation, a feaver, ſowning, gangrene and deadly mortification, unleſſe it be quickly withſtood. Not very long agoe the wife of *Monſieur Fromaget*, Secretary of the requeſts, was wounded with a prick of this fiſh in her middle finger, there followed a ſwelling and redneſſe of the part, without much paine; but perceiving the ſwelling to encreaſe, being made more wary by the miſchance of her neighbour the wife of *Monſieur Bargelonne* Lievtenant particulier in the Chaſtelet of Paris, who died not long before by the like accident being neglected, ſent for mee; I underſtanding the cauſe of her diſeaſe, laid to her pained finger and her whole hand, beſides a pultis made of a great Onion roaſted under the coales, leaven and a little treacle. The next day I wiſhed her to dip her whole hand into warme water, ſo to draw forth the poyſon, then I divided the skin about it with much ſcarification, but onely ſuperficiarily; to the gaſhes I applyed Leaches, which by ſucking drawing a ſuffici-

Symptomes.

A hiſtory.

Cure. ſufficient quantity of bloud, I put thereto treacle diſſolved in *aqua vitæ*. The next day the ſwelling was aſſwaged, and the paine eaſed, and within a few daies ſhee was perfectly well. *Dioſcorides* writes that this fiſh divided in the midſt and applyed to the wound, will cure it.

CHAP. XXXII.

Of the Paſtinaca narina, *or Sting-Ray, which ſome call the Pierce-claw.*

The ſymptoms. SUch as are ſtung by a Sting-Ray (as *Aëtius* hath written) the place of the wound doth manifeſtly appeare; there enſues thereon laſting paine and the numneſſe of the whole body. And ſeeing that it hath a ſharpe and firme ſting, whereby the nerves by the deepneſſe of the ſtroake may be wounded, it ſo happens that ſome die forthwith, their whole bodies ſuffering convulſions. Moreover it wil kil even the very trees into whoſe roots it is faſtned. Yet *Pliny* affirmes that it is good againſt the paine of the teeth, *Lib. 9 cap. 48.* if the gums bee ſcarified therewith, yea, and it being made into powder with white hellebore, or of it ſelfe, will cauſe teeth to fall out without any pain, or any violence offered to them. This fiſh is good meat, the head and taile excepted; ſome of them have two ſtings, otherſome but one; theſe ſtings are ſharpe like a Saw with the teeth turned towards their heads. The virulency of her ſting. *Oppianus* writes, that their ſtings are more poyſonous than the Perſians arrowes, for the force of the poyſon remaineth, the fiſh being dead, which will kill not onely living creatures, but plants alſo. Fiſhermen, when they catch this fiſh, preſently ſpoile him of his ſting, leſt they ſhould bee hurt therewith. But if by chance they bee hurt therewith, then take they forth his Liver and lay it to the wound; furthermore the fiſh being burnt and made into powder, is the true Antidote of his wound. The Sting-Ray lives in muddy places neare the ſhoare, upon the fiſhes that hee hunteth and catcheth with his ſting, having the teeth thereof turned towards his head for the ſame purpoſe. Hee is not unlike a Ray, and I have here given you his figure.

Chap. XXXIII.

Of the Lepus marinus, *or Sea-hare.*

Plinv cals the Sea-hare, a maſſe or deformed peece of fleſh. *Galen* ſaith that it is like a Snaile taken forth of the ſhell. It is exceeding poyſonous in the judgement of the Antients; wherefore it is not amiſſe to ſet downe the deſcription of it, leſt wee might eate it at unawares, too earneſtly view it, or ſmell thereto, as alſo that we may uſe it againſt the poyſon thereof; it is an inhabitant not only of the Sea, but alſo of Lakes of Sea-water, eſpecially ſuch as are muddy; it is of the ſame colour as the hair of the land-hare is, it hath a hole in the head, out of which hee putteth a certaine peece of fleſh, and plucks it backe againe when as he is ſeene. *Paulus, Aëtius, Pliny, Galen* and *Nicander*, are of one opinion, and agree in this, that if a woman big with child do too earneſtly look upon one, ſhe will vomit & preſently after abort. They which have drunk this poyſon, ſaith *Dioſcorides*, are troubled with paine in the belly, and their urine is ſtopped. If they doe make water, then is it bloody; they run downe with ſtinking ſweat, which ſmels of fiſh; a cholericke vomiting ſometimes mixed with blood enſues thereon.

The deſcription of the Sea-hare.

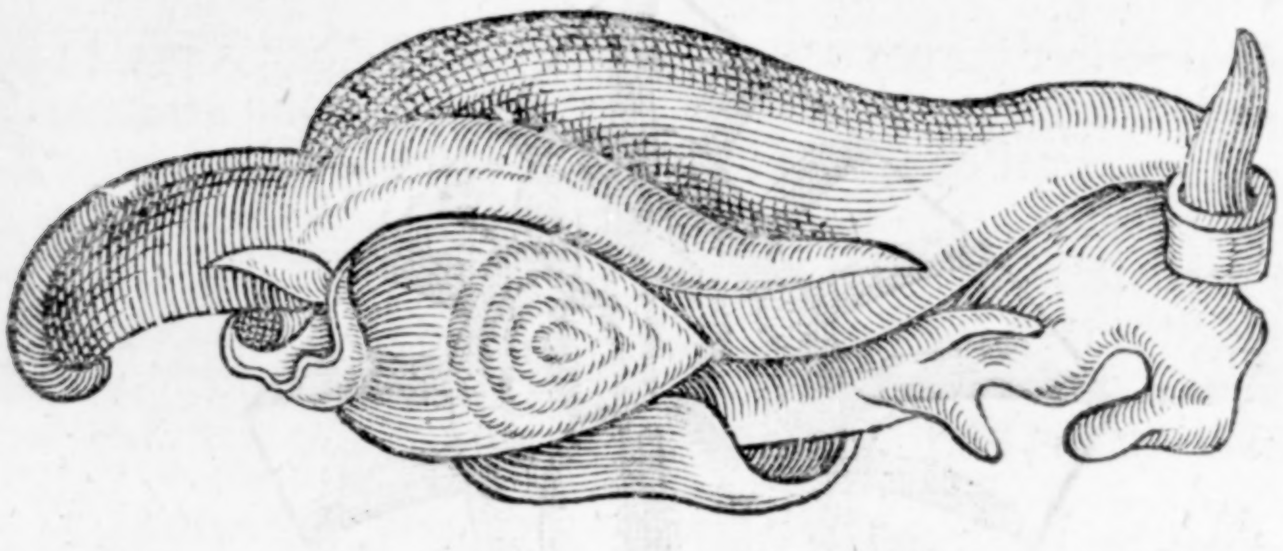
The earneſt beholding of a Sea-hare will cauſe abortion.

Aëtius writes that all their bodies turne yellow, their faces ſwell, and their feete, but chiefly their genitall member, which is the cauſe they cannot make water freely. *Galen* writes that it is the property of the Sea-hare to exulcerate the Lungs. Their Antidote is Aſſes milke, Muskedine, or honyed Wine continually drunken, or a decoction of the roots and leaves of Mallowes. It is good for the falling away of the haire. I have here given you the figure thereof out of *Rondeletius* his book of fiſhes.

The ſymptoms.

The Antidote.

The figure of a Sea-Hare.



Chap. XXXIV.

Of the Poyſon of Cats.

NOt onely the braine of a Cat, being eaten, is poyſonous and deadly to man, but alſo their haire, their breath, yea and their very preſence to ſome prove deadly. For although any hair devoured unawares, may be enough to choake one, by ſtopping the inſtruments of reſpiration, yet the haires of cat by a certaine occult propertie, are judged moſt dangerous in this caſe: beſides alſo, their breath is infected with a certain hurtfull malignitie. For *Mathiolus* ſaith that he knew ſome, who being ſo delighted with Cats, that they could never go to bed without them, have by ſo often drawing in the aire with their breath, fallen into a conſumption of the Lungs, which occaſioned their death. Moreover, it is manifeſt that the very ſight of their eies is hurtfull, which appeares by this, that ſome but ſeeing or hearing them, preſently fall downe in a ſowne; yet I would not judge that to happen by the malicious virulency of the Cat, but alſo by the peculiar nature of the party, and a quality generated with him, and ſent from heaven. When as, ſaith *Mathiolus*, a certaine Germaine in winter time, came with us into a ſtove to ſupper, where as were divers of our acquaintance; a certaine woman, knowing this mans nature, leſt that hee ſhould ſee her kitling which ſhee kept, and ſo ſhould goe away in a chafe, ſhe ſhut her up in a cupboard in the ſame chamber. But for all that hee did not ſee her, neither heard her cry, yet within a little ſpace, when hee had drawne in the aire, infected with the breath of the Cat, that quality of temperament, contrary, or enemy to Cats, being provoked, he began to ſweat, to looke pale, and to cry out (all of us admiring it) *Here lies a Cat in ſome corner or other*; neither could he be quiet untill the Cat was taken away. But ſuch as have eaten the braines of a Cat are taken with often Vertigoes, and now and then become fooliſh and mad: they are helped by procuring vomit, and taking the Antidote againſt this poyſon, that is, halfe a Scruple of Muske, diſſolved and drunke in wine. There bee ſome who preſcribe the confection *Diamoſchum* to bee taken every morning, foure houres before meat. By this you may gather that it is not ſo fabulous that the common ſort report, that Cats will kill or harme children; for lying to their mouthes with the weight of their whole bodies, they hinder the paſſage forth of the fuliginous vapours, and the motion of the Cheſt, and infect and ſtifle the ſpirits of tender infants, by the peſtiferous aire and exhalation which they ſend forth.

A Cats haire moſt ſubject to choake.

The breath of a Cat moſt hurtfull to the lungs.

A hiſtory.

A wonderfull antipathy betweene a man and a Cat.

The Antidote againſt the brains of a Cat.

Cats dangerous for children.

Chap.

CHAP. XXXV.

Of certaine poyſonous Plants.

Apium riſus.

HAving deſcribed the poyſons that come from living creatures, I come to ſpeake of ſuch as are from Plants, beginning with the Sardonian herb, which is alſo called *Apium riſus*: this is a kinde of *Ranunculus* or Crow-foote: (and, as it is thought, the round leaved water Crow-foote, called Marſh-crow-foote or ſpeare-wort) it taketh away the underſtanding of ſuch as eate thereof, and by a certaine diſtention of the nerves, contracts the cheekes, ſo that it makes them looke as if they laughed; from this affect came that proverbiall ſpeech of the Sardonian laughter, taken in evill part. His Bezoar, as one may terme it, is the juice of Balme.

His Antidote.

Napellus, or Monks-hood.

The juice, fruit, and ſubſtance of *Napellus*, taken inwardly, killeth a man the ſame day, or at the furtheſt in three dayes: yea and ſuch as eſcape the deadly force thereof by the ſpeedy and convenient uſe of Antidotes, fall into a hecticke feaver, or conſumption, or become ſubject to the falling ſickneſſe, as *Avicen* affirmeth. And hence it is that barbarous people poyſon their arrowes therewith. For the lippes are forthwith inflamed, and the tongue ſo ſwells, that by reaſon thereof it cannot bee conteined in the mouth, but hangs out with great horrour; their eyes are enflamed, and ſtand forth of their head, and they are troubled with a *Vertigo* and ſowning, they become ſo weake that they cannot ſtirre their legges, they are ſwollen and puffed in their bodies, the violence of the poyſon is ſo great. The Antidote thereof is a certaine little creature like a * Mouſe, which is bred, and lives on the root of *Napellus*, being dryed and drunke in pouder, to the weight of two drammes. In want hereof, you may uſe the ſeed of Raddiſh or Turneps to drinke, and anoint the body alſo with the oile of Scorpions.

Dorycinum and *Solanum manicum*, or deadly Night-ſhade.

Dorycinum and *Solanum Manicum*, or deadly night-ſhade, are not much different in their mortall ſymptomes or effects. *Dorycinum* being drunke, reſembleth milk in taſt, it cauſeth continuall hicketting, it troubleth the tongue with the weight of the humour, it cauſeth blood to bee caſt forth of the mouth, and certaine mucous matter out of the belly, like that which commeth away in the bloody fluxe. A remedy hereto are all ſhell Fiſhes, as well crude as roaſted, alſo ſea-lobſters and crabbes, and the broth or liquor wherein they are boyled, being drunke. Now the root of *Solanum manicum* drunke in the weight of one dram in wine, cauſeth vaine and not unpleaſing imaginations, but double this quantity cauſeth a diſtraction or alienation of the minde for three dayes; but foure times ſo much, kills. The remedies are the ſame as theſe preſcribed againſt *Dorycinum*.

The ſymptoms.

Henbane.

Henbane drunken, or otherwiſe taken inwardly by the mouth, cauſeth an alienation of the minde like drunkenneſs; this alſo is accompanied with an agitation of the body, and exolution of the ſpirits like ſowning. But amongſt others, this is a notable ſymptome, that the patients ſo dote, that they thinke themſelves to be whipped: whence their voice becomes ſo various, that ſomtimes they bray like an aſſe or mule, neigh like a horſe, as *Avicen* writes. The Antidote is piſtick nuts eaten in great plenty, treacle alſo and mithridate diſſolved in ſacke, alſo wormewood, rue and milke.

The Antidote.

Muſhromes.

Of Muſhromes, ſome are deadly and hurtfull of their owne kinde and nature, as thoſe, which broken, preſently become of divers colours, and forthwith putrefie: (ſuch as *Avicen* ſaith thoſe are which be found of a grayiſh or blewiſh colour) others though not hurtfull in qualitie, yet eaten in greater meaſure than is fitting, become deadly; for ſeeing by nature they are very cold and moiſt, and conſequently abound with no ſmall viſcoſity, as the excrementitious phlegme of the earth or trees whereon they grow, they ſuffocate and extinguiſh the heat of the body, as overcome by their quantity, and ſtrangle as if one were hanged, and laſtly kill. Verily I cannot chuſe, but pittying Gourmondizers, who though they know that Muſhromes are

---

* Our Author is deceived by the *Arabians*, who (it may bee) miſtook the greeke word, μυῖα, and inſtead thereof reade, μῦν; for a Flye, a Mouſe; for there is no Mouſe to bee found, but whole ſwarmes of Flies, which feede thereon: you may finde the deſcription of an Antidote made with them in *Lobels Stirp. Adverſ. pag.* 302.

Their Antidote

In 5. *epidemi.*

the ſeminary and gate of death, yet doe they with a great deale of doo, moſt greedily devoure them; I ſay, pitying them, I will ſhew them, and teach them the art, how they may feed upon this ſo much deſired diſh, without the endangering of their health. Know therfore that Muſhromes may be eaten without danger, if that they be firſt boyled with wild peares: but if you have no wilde peares, you may ſupply that defect with others which are the moſt harſh, either newly gathered, or dryed in the ſun. The leaves, as alſo the bark of the ſame Tree, are good, eſpecially of the wild; for peares are their Antidote: yet *Conciliator* gives another, to wit, Garlick eaten crude, whereto in like ſort vineger may bee fitly added, ſo to cut and attenuate the tough, viſcous and groſſe humors, heaped up, and in danger to ſtrangle one by the too plentifull eating of Muſhromes, as it is delivered by *Galen*.

Colchicum or meadow-ſaffron

The Antidote.

Ephemerum, which ſome call *Colchicum* or *Bulbus ſylveſtris*, that is, medow ſaffron, being taken inwardly, cauſeth an itching over all the bodie, no otherwiſe than thoſe that are netled, or rubbed with the juice of a Squill. Inwardly they feele gnawings, their ſtomacke is troubled with a great heavineſſe, and the diſeaſe encreaſing, there are ſtreakes of blood mixed with the excrements. The Antidote thereof is womans milke, Aſſes or Cowes milk drunken warme, and in a large quantity.

Mandrage.

The cure.

Mandrage taken in great quantity, either the root or fruit cauſeth great ſleepineſſe, ſadneſſe, reſolution and languiſhing of the body, ſo that after many ſcritches and gripings, the patient falls aſleep in the ſame poſture as hee was in, juſt as if hee were in a Lethargie. Wherefore in times paſt they gave Mandrage to ſuch as were to bee diſmembred. The apples, when as they are ripe, and their ſeeds taken forth, may be ſafely eaten, for being green and with their ſeeds in them, are deadly. For there ariſeth an intolerable heate, which burnes the whole ſurface of the bodie, the tongue and mouth waxe dry, by reaſon whereof they gape continually, ſo to take in the cold aire; in which caſe unleſſe they be preſently helped, they die with convulſions. But they may be eaſily helped, if they ſhall preſently drinke ſuch things as are convenient therefore. Amongſt which, in *Conciliators* opinion, excell radiſh ſeeds eaten with ſalt and bread for the ſpace of three dayes. Sneeſing ſhall be procured, if the former remedy do not quickly refreſh them, and a decoction of Corlander or Penny-royall in faire water ſhall be given them to drinke warme.

Opium. Why not uſed in poyſonings.

The ungratefull taſte of the juice of blacke poppy, which is termed *Opium*, as alſo of Mandrage, eaſily hinders them from being put into meate or drinke, but that they may be diſcerned, and chiefly for that neither of them can kill, unleſſe they be taken in a good quantity. But becauſe there is danger, leſt they bee given in greater quantity than is fitting by the ignorance of Phyſitians, or Apothecaries, you may by theſe ſignes finde the errour.

The ſymptoms.

There enſues heavie ſleepe, with a vehement itching, ſo that the patient oft-times is forced thereby to caſt off his dull ſleepe wherein hee lay, yet keepes his eye-lids ſhut, being unable to open them. But by this agitation there flowes out ſweat, which ſmels of *Opium*, the bodie waxeth pale, the lippes burne, the Jaw-bone is relaxed, they breath little and ſeldome. When as their eyes waxe livid, unleſſe they bee drawne aſide, and that they are depreſſed in their orbe, we muſt know that death is at hand. The remedy againſt this is two drammes of the pouder of *Caſtoreum* given in wine.

Hemlocke.

The ſymptoms.

The Antidote.

In lib. 6. *dioſc.*

Hemlocke drunken, cauſeth *Vertigo's*, troubleth the minde, ſo that the patients may bee taken for mad men; it darkeneth the ſight, cauſeth hicketting, and benums the extreme parts, & laſtly ſtrangles with convulſions, by ſupreſſing or ſtopping the breath of the Arterie. Wherefore at the firſt, as in other poyſons, you muſt endevour to expell it by vomit; then inject glyſters, to expell that is got into the guts; then uſe wine without mixture, which is very powerfull in this caſe. *Peter Aponenſis* thinks the Bezoar or Antidote thereof to bee a potion of two drams of Treacle, with a decoction of *Dictamnus* or Gentian in wine. He which further deſires to enform himſelfe of the effects of Hemlock, let him read *Mathiolus* his commentary upon *Dioſcorides*, where as he treats of the ſame ſubject.

Aconitum.

Aconitum called ſo of *Aconis* a towne of the *Periendines*, where as it plentifully growes. According to *Mathiolus*, it kils Wolves, Foxes, Dogges, Cats, Swine, Panthers,

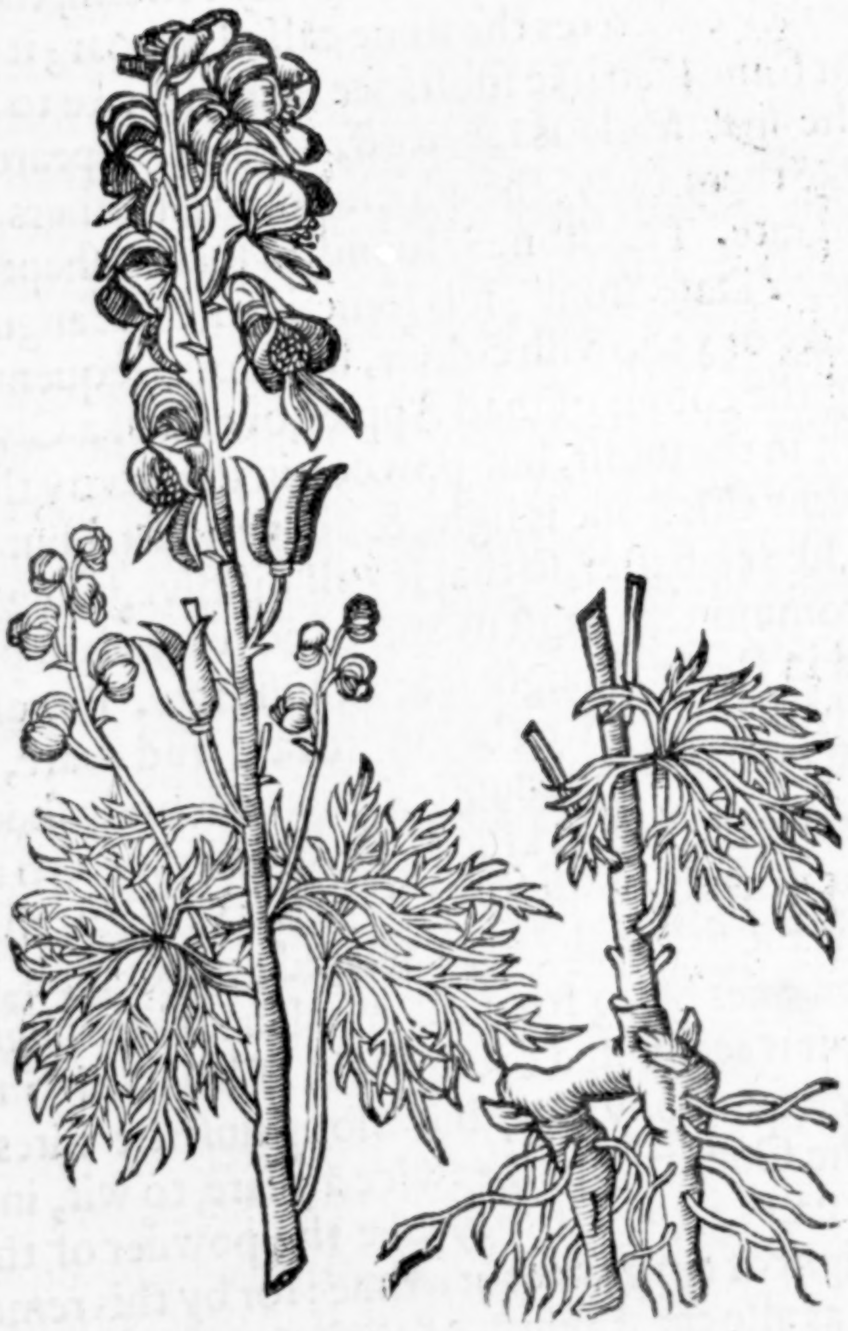
thers, Leopards, and all wilde beaſts, mixed with fleſh, and ſo devoured by them, but it kills mice by onely ſmelling thereto. Scorpions, if touched by the roote of Aconite, grow numme and torpid, and ſo die thereof; arrowes or darts dipped therein, make uncurable wounds. Thoſe who have drunke Aconite, their tongue forthwith waxeth ſweet with a certaine aſtriction, which within a while after turneth to bitterneſſe; it cauſeth a *Vertigo*, and ſhedding of teares, and a heavineſſe or ſtraitneſſe of the cheſt and parts about the heart; it makes them breake wind downewards, and makes all the body to tremble. *Pliny* attributes ſo great celerity and violence to this poyſon, that if the genitalls of female creatures bee touched therewith, it will kill them the ſame day; there is no preſenter remedy than ſpeedy vomiting after the poiſon is taken. But *Conciliator* thinks *Ariſtolochia* to be the Antidote thereof. Yet ſome have made it uſefull for man by experimenting it againſt the ſtinging of Scorpions, being given warme in wine. For it is of ſuch a nature, that it killeth the party unleſſe it finde ſomething in him to kill; for then it ſtrives therewith as if it had found an adverſary. But this fight is onely when as it finds poyſon in the body; and this is marvellous, that both the poiſons being of their own nature deadly, ſhould dye together, that man may by that meanes live. There are divers ſorts thereof, one whereof hath a flower like an helmet, as if it were armed to mans deſtruction; but the other here delineated hath leaves like to ſowes-bread, or a cucumber, and a root like the taile of a ſcorpion.

Lib.27.cap.2.

Aconite good againſt the poyſon of Scorpions.

The differences

The figure of a certaine kind of Aconite.



Trees alſo are not without poyſon, as the Yew and Walnut tree may witneſſe: Cattell, if they feede on the leaves of Yew, are killed therewith. * But men, if they ſleepe under it or ſit under the ſhadow thereof, are hurt therewith, and oft-times dye thereof. But if they eat it, they are taken with a bloudy fluxe, and a coldneſſe over all their bodyes, and a kinde of ſtrangling or ſtoppage of their breath. All which things the Yew cauſeth not ſo much by an elementary and cold quality, as by a certaine occult malignity, whereby it corrupteth the humours, and ſhaveth

The Yew.

* This is true in ſome countries, as in Provence, Italy, Greece, &c. but it is not ſo here with us in England, as both Lobell & daily exerience can teſtifie.

The Antidote.

The Wall nut tree.

the guts. The ſame things are good againſt this, as we have ſet downe againſt Hemlock; *Nicander* affirmes, that good wine being drunken is a remedy thereto. There is alſo malignity in a Wall-nut tree, which **Grevinus** affirmes that he found by experience, whileſt hee unawares ſate under one & ſlept there in the midſt of Summer. For waking, he had a ſenſe of cold over all his body, a heavineſſe of his head, and paine that laſted ſixe dayes. The remedies are the ſame as againſt the Yew.

Chap. XXXVI.

Of Bezoar, and Bezoarticke medicines.

What is poiſon.

A ſigne of true Bezoar.

The uſe of Bezoar.

FOR that we have made mention of Bezoar, in treating of the remedies of poyſons, I judge I ſhall not doe amiſſe, if I ſhall explaine, what the word meanes, and the reaſon thereof. Poyſon abſolutely taken is that which kils by a certaine ſpecifick antipathy contrary to our nature. So an Antidote or Counter-poyſon is by the Arabians in their mother tongue termed Bedezahar, as the preſervers of life. This word is unknowne to the Greekes and Latines, and in uſe onely with the Arabians and Perſians, becauſe the thing it ſelfe firſt came from them, as it is plainely ſhewed by *Garcias ab horto*, Phyſician to the Vice-Roy of the Indies, in his hiſtory of the Spices and Simples of the Eaſt-Indies. In Perſia (ſaith hee) and a certaine part of India is a certaine kinde of Goate called Pazain (wherefore in proper ſpeaking, the ſtone ſhould bee termed Pazar, of the word Pazain, that ſignifies a Goate; but wee corruptly terme it Bezar or Bezoar) the colour of this beaſt is commonly reddiſh, the height thereof indifferent, in whoſe ſtomack concretes the ſtone called Bezoar; it growes by little and little about a ſtraw or ſome ſuch like ſubſtance in ſcailes like to the ſcailes of an onion, ſo that when as the firſt ſcaile is taken off, the next appeares more ſmooth and ſhining as you ſtill take them away, the which amongſt others is the ſigne of good Bezoar and not adulterate. This ſtone is found in ſundry ſhapes, but commonly it reſembles an Acorne or Date-ſtone; it is ſometimes of a ſanguine colour, and otherwhiles of a hony-like or yellowiſh colour, but moſt frequently of a blackiſh or darke greene, reſembling the colour of mad Apples, or elſe of a Civet Cat. This ſtone hath no heart nor kernell in the midſt, but powder in the cavity thereof, which is alſo of the ſame faculty. Now this ſtone is light, & not very hard, but ſo that it may eaſily be ſcraped, or raſped like alabaſter, ſo that it will diſſolve, being long macerated in water; at firſt it was common amongſt us, and of no very great price, becauſe our people who trafficked in Perſia, bought it at an eaſie rate. But after that the faculties thereof were found out, it began to bee more rare and deare, and it was prohibited by an Edict from the King of the countrey, that no body ſhould ſell a Goate to the ſtranger Merchants, unleſſe he firſt killed him, and tooke forth the ſtone, & brought it to the King. Of the notes by which this ſtone is tryed, (for there are many counterfeits brought hither) the firſt is already declared; the other is, it may bee blowne up by the breath, like an oxes hide; for if the wind breake through, and doe not ſtay in the denſity thereof, it is accounted counterfeit. They uſe it, induced thereto by our example, not onely againſt poyſons, but alſo againſt the bites of venemous beaſts. The richer ſort of the Countrey purge twice a yeare, to wit, in March and September; and then, five daies together they take the powder of this ſtone macerated in Roſe-water, the weight of ten graines at a time: for by this remedy they thinke their youth is preſerved, as alſo the ſtrength of their members. There be ſome who take the weight of thirty graines; yet the more wary exceed not twelve grains. The ſame author addeth that he uſeth it with very good ſucceſſe in inveterate melancholy diſeaſes, as the itch, ſcab, tetters & leproſie; therefore by the ſame reaſon it may well be given againſt a quartaine feaver. Beſides, hee affirmeth for certaine that the powder conteined in the midſt of the ſtone, put upon the bites of venemous beaſts, preſently freeth the patient from the danger of the poyſon, as alſo applied to peſtilent Carbuncles when they are opened, it drawes forth the venome. But becauſe the ſmall pocks and meazles are familiar in the Indies, and oft-times dangerous, it is there given with good ſucceſſe, two graines each day in Roſe-water. *Mathiolus* ſubſcribeth to this opinion of *Garcias*, witneſſing that hee hath found it by frequent experience, that this ſtone by much exceeds not only other ſimple medicines of this kind, but alſo ſuch as are termed *theriacalia*, and what other Antidotes ſoever. Hereto alſo conſents *Abdalanarach*; Wee (ſaith he) have ſeene the ſtone which they call Bezahar, with the ſonnes of *Almirama* the obſerver of the Law of God; with which ſtone hee bought a ſtately and almoſt princely houſe at Corduba.

Lib. 5. in Dioſ. cap. 73.

Some yeares agoe a certaine Gentleman, who had one of theſe ſtones which hee brought out of Spaine, bragged before King *Charles* then being at Clermont in Auverne, of the moſt certaine efficacie of this ſtone againſt all manner of poyſons. Then the King asked of mee, whether there were any Antidote which was equally and in like maner prevalent againſt all poiſons? I anſwered, that nature could not admit it; for neither have all poyſons the like effects, neither doe they ariſe from one cauſe; for ſome worke from an occult and ſpecifick property of their whole nature, others from ſome elementary quality which is predominant. Wherefore each muſt be withſtood with its proper and contrary Antidote, as to the hot, that which is cold, and to that which aſſailes by an occult proprietie of forme, another which by the ſame force may oppugne it, and that it was an eaſie matter to make triall hereof on ſuch as were condemned to bee hanged. The motion pleaſed the King; there was a Cooke brought by the Jailor who was to have been hanged within a while after for ſtealing two ſilver diſhes out of his maſters houſe. Yet the King deſired firſt to know of him, whether hee would take the poiſon on this condition, that if the Antidote which was predicated to have ſingular power againſt all manner of poiſons, which ſhould bee preſently given him after the poiſon, ſhould free him from death, that then he ſhould have his life ſaved. The Cooke anſwered chearfully, that he was willing to undergo the hazzard, yea, and greater matters, not only for to ſave his life, but to ſhun the infamy of the death he was like to be adjudged to. Therefore he then had poyſon given him by the Apothecarie that then waited, and preſently after the poyſon, ſome of the Bezahar brought from Spain, which being taken down, within a while after hee began to vomit, and to avoid much by ſtoole with grievous torments, and to cry out that his inward parts were burnt with fire. Wherefore, being thirſty, and deſiring water, they gave it him; an houre after, with the good leave of the Jaylor, I was admitted to him; I find him on the ground going like a beaſt upon hands and feet, with his tongue thruſt forth of his mouth, his eyes fierie, vomiting, with ſtore of cold ſweats, and laſtly, the bloud flowing forth by his eares, noſe, mouth, fundament and yard. I gave him eight ounces of oile to drinke, but it did him no good, for it came too late. Wherefore at length hee died with great torment and exclamation, the ſeventh houre from the time that hee tooke the poiſon being ſcarcely paſſed. I opened his body in the preſence of the Jailor and foure others, and I found the botome of his ſtomacke blacke and dry, as if it had beene burnt with a Cautery; whereby I underſtood he had ſublimate given him; whoſe force the Spaniſh Bezahar could not repreſſe, wherefore the King commanded to burne it.

A hiſtory.

No one thing can be an Antidote againſt all Poyſon.

The cauſtick force of ſublimate.

Chap. XXXVII.

Of Minerall Poyſons.

Minerals or mettals are either ſo taken forth of the bowels of the earth, or elſe from fornaces. Of theſe many are poiſonous, as arſenicke, ſublimate, plaiſter, ceruſſe, lytharge, verdegreace, orpiment, filings of Iron, braſſe, the load-ſtone, lime, and the like. Such as have taken ſublimate, the tongue and jawes become ſtraightned and rough, as if they drunke the juice of unripe ſervices: you cannot amend this aſperity with lenitive gargariſmes but with much labour and time; for as ſoone as it deſcends into the ſtomack, it ſticketh to it. Therefore preſently after it frets and exulcerates; it cauſeth unquenchable

The ſymptomes of ſuch as have taken ſublimate.

able thirſt, and unexplicable torments; the tongue is ſwolne, the heart faints, the urine is ſuppreſt, the cheſt can ſcarce performe the office of breathing, the belly is griped, and ſo great paines happen to the other extreme parts, that unleſſe they bee helped, the patient will die; for preſently will grow upon them, unleſſe it be ſpeedily hindred, the devouring and fierie furie of the poyſon, rending or eating into the guts and ſtomacke, as if they were ſeared with an hot iron, and bloud floweth forth of the ears, noſe, mouth, urenarie paſſage and fundament, and then their caſe is deſperate. Theſe and who elſe ſoever ſhall take any corroding poyſon, ſhall be cured with the ſame remedies, as thoſe that have taken ***Cantharides***.

Verdegreace.

Verdegreace ſo ſtops the inſtruments of reſpiration, that it ſtrangles ſuch as have taken it. The cure is performed by the ſame remedies as helpe thoſe that have taken Arſenick.

Litharge.

Litharge cauſeth a heavineſſe in the ſtomack, ſuppreſſeth the urine, makes the body ſwelled and livide. Wee remedy this, by giving a vomit preſently, then after it pidgeons dung mixed in ſtrong wine, and ſo drunken. ***Peter Aponenſis*** wiſheth to give oile of ſweet almonds and figs. Alſo it is good to give relaxing and humecting glyſters, and to anoint the belly with freſh butter, or oile of lillies.

The ſcailes of braſſe.

The ſcailes of braſſe drunke by troubling the ſtomacke, cauſe a caſting and ſcouring. The remedie is, if the patient forthwith vomit, if he enter into a bath made of the decoction of ſnailes, if he annoint his belly and breaſt with butter and oile of lillies, and inject laxative and humecting glyſters.

The Loadſtone.

The Load-ſtone makes them mad that take it inwardly. The Antidote thereof is the powder of gold and an emerald drunk in ſtrong wine, and glyſters of milke and oile of ſweet almonds.

Filings of Lead & ſcails of Iron.

The filings of lead, and the ſcailes or refuſe of iron, cauſe great torment to ſuch as take them downe. The which we helpe with much milke and freſh butter diſſolved therein, or with oile of ſweet almonds drawne without fire, with relaxing and humecting glyſters uſed untill the paine be perfectly aſwaged.

Arſnick, Roſeaker or Ratſbane.

Riſagallum, Roſeaker or Ratſ-bane, becauſe it is of a moſt hot and dry nature, induces thirſt and heat over all the body, and ſo great colliquation of all the humours, that although the patients by medicines ſpeedily given eſcape death, yet can they not during the reſidue of their lives, uſe their members as they formerly did, being deſtitute of their ſtrength, by reaſon of the great dryneſſe and contraction of the joynts. The Antidote thereof is oyle of pine kernels ſpeedily given, and that to the quantity of halfe a pint; then procure vomit, then give much milke to drink, and glyſters of the ſame, and let them ſup up fat broths.

Unquenched Lime and Orpiment.

Unquencht Lime and ***Auripigmentum***, or Orpiment drunke, gnaw the ſtomacke and guts with great tormenting paine, and cauſe unquenchable thirſt, an aſperity of the jawes and throat, difficulty of breathing, ſtoppage of the urine, and a bloudy flux. They may bee helped by all fat, humecting, and relaxing things which retund the acrimonie, by lenitive potions, and ſuch things as lubricate the belly; as alſo by creames, and the mucilages of ſome ſeeds, as with a decoction of the ſeeds of Line, mallowes, marſh-mallowes and other ſuch things ſet downe at large in the cure of *Cantharides*.

Aqua fortis.

Theſe exceeding acride and ſtrong waters wherewith Gold-ſmithes and Chymiſts ſeparate gold from ſilver, being taken into the body, are hard to cure, becauſe they are forthwith diffuſed over all the body, firſt burning the throat and ſtomacke. Yet it may be helped by the meanes preſcribed againſt unquenched Lime and Orpiment.

Ceruſſe.

Ceruſſe cauſeth hicketting and a cough, makes the tongue dry, & the extreme parts of the body numbe with cold, the eyes heavie to ſleepe. The patients very often in the midſt of the day ſee ſome vain phantaſie or apparition, which in deed is nothing; they make a blacke and oft-times bloudy water, they die ſtrangled unleſſe they bee helped. The Antidote, in the opinion of ***Aëtius*** and ***Avicen***, is ſcammonie drunk in new wine, or hony and wine, and other diuretick things, and ſuch things as procure vomit, and purge by ſtoole.

Plaiſter.

Plaiſter, becauſe it concreteth and becommeth ſtony in the ſtomacke, cauſeth ſtrangula-

Chap. XXXVIII.

Of Quick-ſilver.

Quick-ſilver is ſo called becauſe it reſembleth ſilver in the colour, and is in perpetuall motion, as if it had a ſpirit or living ſoule. There is a great controverſie amongſt authors concerning it. For moſt of them affirme it hot, amongſt whom is *Galen*, *Halyabas*, *Rhaſes*, *Ariſtotle*, *Conſtantine*, *Iſack*, *Platearius*, *Nicholas Maſſa*: they maintain their opinion by an argument drawn from things helping and hurting; beſides from this, that it is of ſuch ſubtle parts, that it penetrates, diſſolves, and performeth all the actions of heate upon denſe and hard mettals; to wit, it attenuateth, incideth, dryeth, cauſeth ſalivation by the mouth, purgeth by the ſtoole, moveth urine and ſweat over all the body, neither doth it ſtirre up the thinner humours onely, but in like ſort the groſſe, tough and viſcous, as thoſe which have the *Lues Venerea* find by experience, uſing it either in ointments or plaſters.

The reaſon why it is ſo called.

Lib. 4. ſimpl. in 2. practic. cap. 148. 3. *ad Alman.* 4. *Meteor.*

Others affirme it very cold and moyſt, for that put into emplaſters and ſo applyed, it aſſwageth paine by ſtupefaction, hindring the acrimony of puſtles and cholerick inflammations. But by its humidity it ſofteneth ſcirrhous tumours, diſſolveth and diſſipateth knots and *tophous* knobs; beſides, it cauſeth the breath of ſuch as are anointed therewith to ſtinke, by no other reaſon, than that it putrefies the obvious humours by its great humidity. *Avicens* experiment confirmes this opinion, who affirmeth, that the bloud of an Ape that drunke Quickſilver, was found concrete about the heart, the carcaſſe being opened. *Mathiolus*, moved by theſe reaſons, writes that Quickſilver killeth men by the exceſſive cold and humide quality, if taken in any large quantity, becauſe it congeales the bloud and vitall ſpirits, and at length the very ſubſtance of the heart, as may bee underſtood by the hiſtory of a cetaine Apothecary, ſet downe by *Conciliator*; who, for to quench his feaveriſh heat, in ſtead of water, drunke off a glaſſe of Quickſilver, for that came firſt to his hands; hee dyed within a few houres after, but firſt hee evacuated a good quantity of the Quickſilver by ſtoole, the reſidue was found in his ſtomack being opened, and that to the weight of one pound; beſides, the bloud was found concrete about his heart. Others uſe another argument to prove it cold, and that is drawne from the compoſition thereof, becauſe it conſiſts of lead and other cold mettals. But this argument is very weak. For unquencht Lime is made of flints and ſtony matter, which is cold, yet neverthe-leſſe it exceeds in heat. *Paracelſus* affirmeth that quickſilver is hot in the interior ſubſtance, but cold in the exterior, that is, cold as it comes forth of the mine. But that coldneſſe to bee loſt as it is prepared by art, and heat onely to appeare and bee left therein, ſo that it may ſerve in ſtead of a tincture in the tranſmutation of mettals. And verily it is taken for a rule amongſt Chymiſts, that all metals are outwardly cold, by reaſon of the watery ſubſtance that is predominant in them, but that inwardly they are very hot, which then appeares when as the coldneſſe together with the moyſture is ſegregated, for by calcination they become cauſtick. Moreover many account quickſilver poyſon, yet experience denyes it. For *Marianus Sanctus Baralitanus* tels that hee ſaw a woman, who for certaine cauſes and affects, would at ſeverall times drink one pound and an halfe of quickſilver, which came from her againe by ſtoole without any harme. Moreover he affirmeth that hee hath knowne ſundry who in a deſperate Cholick (which they commonly call *miſerere mei*) have beene freed from imminent death, by drinking three pounds of quickſilver with water only. For by the weight it opens and unfolds the twined or bound up gut, and thruſts forth the hard and ſtopping excrements; he addeth that others have found this medicine

In l. 6. Dioſ. c. 28.

A hiſtorie.

Lib. 4. de nat. rerum.

Tract. de caſu & offen.

dicine effectuall againſt the cholick, drunke in the quantity of three ounces. *Antonius Muſa* writes, that hee uſually giveth quickſilver to children ready to dye of the wormes. *Avicen* confirmeth this, averring that many have drunke quickſilver without any harme, wherefore hee mixeth it in his ointments againſt ſcaules and ſcabs in children; whence came that common medicine amongſt the countrey people to kill lice by anointing the head with quickſilver mixed with butter or *axungia*. *Mathiolus* affirmeth that many think it the laſt and chiefeſt remedy to give to women in travaile that cannot bee delivered. I proteſt, to ſatisfie my ſelfe concerning this matter, I gave to a whelpe a pound of quickſilver, which being drunke downe, it voyded without any harme by the belly. Whereby you may underſtand that it is wholly without any venemous quality. Verily it is the onely and true Antidote of the *Lues Venerea*, and alſo a very fit medicine for maligne ulcers, as that which more powerfully impugnes their malignity than any other medicines that worke onely by their firſt qualities. Beſides, againſt that contumacious ſcabbe, which is vulgarly called *Malum ſancti manis*, there is not any more ſpeedy or certaine remedy. Moreover *Guido* writes, that if a plate of lead bee beſmeared or rubbed therewith, and then for ſome ſpace laid upon an ulcer, and conveniently faſtned, that it will ſoften the callous hardneſſe of the lips thereof, and bring it to cicatrization, which thing I my ſelfe have oftimes found true by experience.

Quickſilver good for women in travaile.

For the diſeaſe called *Malum ſancti manis*.

Certainely before *Guido*, *Galen* much commended quickſilver againſt maligne ulcers & cancers. Neither doth *Galen* affirm that lead is poyſonous (which many affirm poyſonous, becauſe it conſiſts of much quickſilver) but hee onely ſaith thus much, that water too long kept in leaden pipes & ciſternes, by reaſon of the droſſineſſe that it uſeth to gather in lead, cauſeth bloudy fluxes, which alſo is familiar to braſſe and copper. Otherwiſe many could not without danger beare in their bodies leaden bullets during the ſpace of ſo many yeares, as uſually they doe. It is declared by *Theodoricke Herey* in the following hiſtories, how powerfull quickſilver is to reſolve and aſſwage paines and inflammations. Not long ſince, (ſaith hee) a certaine Doctor of Phyſick his boy was troubled with *parotides*, with great ſwelling, heat, pain & beating; to him, by the common conſent of the Phyſicians there preſent, I applyed an anodine medicine, whoſe force was ſo great, that the tumor manifeſtly ſubſided at the firſt dreſſing, and the paine was much aſſwaged. At the ſecond dreſſing all the ſymptomes were more mitigated. At the third dreſſing, I wondring at the ſo great effects of an Anodine Cataplaſme, obſerved that there was quickſilver mixed therewith, and this happened through the negligence of the Apothecarie, who mixed the ſimple Anodine medicine preſcribed by us, in a mortar wherein but a while before he had mixed an oyntment whereinto quickſilver entred, whoſe reliques, and ſome part thereof yet remained therein. This which once by chance ſucceeded well, I afterwards wittingly and willingly uſed to a certaine Gentlewoman troubled with the like diſeaſe, poſſeſſing all the region behind the eares, much of the throate, and a great part of the cheeke, when as nature helped by common remedies, could not evacuate neither by reſolution nor ſuppuration, the conteined matter greatly vexing her with paine and pulſation. I to the medicine formerly uſed, by the conſent of the Phyſicians, put ſome quickſilver, ſo within a few dayes, the tumour was digeſted and reſolved. But ſome will ſay, it reſolves the ſtrength of the nerves and limbs, as you may ſee by ſuch as have beene anoynted therewith for the *Lues venerea*, who tremble in all their limbs during the reſt of their lives. This is true, if any uſe it too intemperately without meaſure, and a diſeaſe that may require ſo great a remedy; for thus we ſee that Gilders, Plumbers and ſuch as digge in mines, by the continuall aſcent of the vapours of quickſilver to the braine, the fountaine of the nerves, by reſolving the ſpirits, and diſſipating the radicall and ſubſtantificke moyſture, maketh them ſubject to the trembling of their joints. Verily if it bee killed and incorporate with hogs greace, and a liſt beſmeared therewith, which may encompaſſe the body like a girdle, it will drive away lice, fleas and *cimices*; and anoynted about the navell, it kils the wormes in the guts. There are two ſorts of quickſilver, the one naturall, the other artificiall. The naturall is found running or flowing in the veins and bowels of the earth, and amongſt metals, and in the fornaces of ſilver mines. The Artificiall

ficiall

---

ficiall is made of *minium* (as it is in *Vitruvius*) and of the powder of Ivory. Alſo it is probable that by art it may bee extracted out of all metals, but chiefly out of Lead and *Cinnabaris*. You may eaſily diſtinguiſh theſe kindes by the dull and blackiſh colour, tough and groſſe ſubſtance, which as it runs, leaves an impreſſion like melted greace, being as it were the excrement of lead. The beſt quickſilver of all is pure, cleare, thin and very white: it may bee cleanſed with the droſſe of Lead, and becomes more thin, being boyled in ſharpe vinegar, with ſage, roſemary, time, lavander. Or elſe give it by a pound at a time to a whelpe, to drinke downe, and being caſt forth by it, boyle it againe in vinegar, for thus it hath wondrous faculties, and fitly given produceth marvellous effects; nothing is more contrary thereto than fire. For quickſilver, though of its owne nature ponderous, flyeth upwards by the force of the fire, and forſaketh gold by that meanes, than which nothing is more friendly to it.

How to purifie it.

CHAP. XXXIX.

Of the Unicornes Horne.

THere are very many at this day who thinke themſelves excellently well armed againſt poyſon and all contagion, if they be provided with ſome powder of Unicornes horne, or ſome infuſion made therewith. Therefore I have thought it good to examine more diligently how much truth this inveterate, and grounded opinion hath. The better to performe this taske, I will propound three heads, whereto I will direct my whole diſcourſe. The firſt ſhall be of the ſignification of this word Unicorn. The ſecond, whether there be any ſuch thing really and truely ſo called, or whether it bee not rather imaginary; like as the *Chymera* and *Tragelaphus*? The third, whether that which is ſayd to be the horne of ſuch a beaſt, hath any force or faculty againſt poyſons? For the firſt, that is, the name, it is ſomewhat more obſcure what the word (*being Licorne*) in French may ſignifie, than what the Latine or Greek word is. For the French name is further from the word and ſignification; but it is ſo clear and manifeſt, that this word *Unicornis* amongſt the Latines ſignifieth a beaſt having but one horn, as it is vulgarly known, the ſame thing is meant by the Greek word *Monoceros*. But now for the ſecond, I thinke that beaſt that is vulgarly called & taken for an Unicorn, is rather a thing imaginary than really in the world. I am chiefly enduced to beleeve thus, by theſe conjectures. Becauſe of thoſe who have travelled over the world, there is not one that profeſſeth that ever he did ſee that creature. Certainly the Romans conquering the world, & being moſt diligent ſearchers after all things which were rare and ſo excellent, if any where in any corner of the world, this beaſt could have been found, they would have found it out, and engraven it upon their coynes, or Armes, as they did Crocodiles, Elephants, Eagles, Panthers, Lyons, Tygers, and other creatures unknowne to theſe countryes. For theſe that have written of the Unicorn, either that they have heard, or that hath been delivered by tradition, or what they in their owne mindes and fancies have conceived, you ſhall ſcarce finde two that agree together, either in the deſcription of the body, or in the nature and condition of her. *Pliny* writes, that Unicornes are for the faſhion of their bodies like to an horſe; that is, as *Cardane* interprets it, of the bigneſſe of a horſe, with the head of an Hart, the feet of an Elephant, the taile of a Boare, with one black horne in the midſt of his forehead, of the length of two cubits. *Munſter*, who (as *Mathiolus* jeſts) never ſaw Unicornes beſides painted ones, doth on the contrary affirme them not to be of the bigneſſe of an horſe, but of an hind calfe of three moneths old, not with feet like an Elephant, but cleft like thoſe of goats, with an horne not only of two, but oft times of three cubits long, of a weazell colour, with a necke not very long, nor very hairy, but having few and ſhort haires hanging to the one ſide of the necke, the legs are leane and ſmall, the buttocks high, but very hairy. *Cardane* diſſenting from both theſe, writes, that hee hath an horne in the midſt of his forehead, but that it is onely the length of three fingers,

What the name imports.

That there is no ſuch beaſt as an Unicorne.

Lib.8.cap.21.

Munſters opinion concerning Unicornes.

Tom. 1. lib. 5. Cap. 5. coſmogr.

fingers. *Andrew Thevet* mentions an Unicorne ſeene by a certaine Turkiſh Sangjach, which was of the bigneſſe of a Bull of five or ſixe moneths old, and had one horne, but that not in the midſt of the forehead, but upon the top of the crowne of the head; he was legg'd and footed like an Aſſe, but longer haired, and had eares not much unlike the Rangifer, a beaſt not unknowne in the ſubpolare or northern countries.

Vartomans opinion of the nature of the Unicorne.

What the ordinary Unicorns hornes are.

The Unicornes horne is not effectuall againſt poyſon.

Lib. de ponder. cap. 19. Hornes and bones not effectuall unleſſe to dry.

Thus various therefore is the report concerning the ſhape of this Beaſt. Neither is there leſſe difference concerning her nature and conditions. For *Pliny* writes that the Unicorne is a moſt fierce beaſt, and hath a great bellowing voice, and that ſhee cannot therefore be taken alive. *Cardane* renders a reaſon of this fierceneſſe, Becauſe (ſaith he) it inhabits the deſarts of *Aethiopia*, a region ſqualide, and filthy, abounding with toads and ſuch like venemous creatures. Others on the contrary affirme her to bee of a moſt milde, amiable, and gentle nature of all others, unleſſe one purpoſely offend her, or uſe her too harſhly; for ſeeing ſhee feeds not by ſtooping her head to the ground, becauſe ſhee is hindered therefrom by the length of her horne, ſhe muſt neceſſarily feed upon the fruit that hangeth upon trees; out of cratches or mans hand ſhe fearleſly and harmeleſly takes all manner of fruits, herbs, ſheaves of corn, apples, peares, oranges and pulſe. And herein they have proceeded ſo farre, that they feign they will love Virgins, entiſed by their beauty, ſo that ſtayed in the contemplation of them, and allured by their entiſements, they by this meanes are often taken by hunters. In this opinion is *Lewes Vartoman*, who denies that Unicornes are wild or fierce; for he ſaith that he ſaw two, which were ſent out of *Aethiopia* to the Sultan, who kept them ſhut up in Pennes, in *Mecha*, a city of *Arabia fœlix*, renowned by the Sepulcher of *Mahomet*. *Thevet* travailing thither, tels that he diligently enquired of the inhabitants, what their opinion was of ſuch a beaſt, yet could he never heare any tidings thereof. Whence it is eaſie to diſcerne, that ſuch beaſts have neither beene in our, nor in *Vartomans* times. The ſo great variety of diſſenting opinions, eaſily induceth me to beleeve that this word, Unicorne, is not the proper name of any beaſt in the world, and that it is a thing onely feigned by Painters, and Writers of naturall things, to delight the readers and beholders. For as there is but one right way, but many by-waies and windings, ſo the ſpeech of truth is but one, and that alwaies ſimple and like it ſelfe; but that of a lye is divers, and which may eaſily refell it ſelfe, by the repugnancie and incongruity of opinions, if one ſhould ſay nothing. What therefore (will ſome ſay) of what creatures are theſe hornes, which we ſee wholly different from others, if they be not of Unicorns? *Thevet* thinks them nothing elſe than Elephants bones turned and made into the faſhion that wee ſee them; for thus in the Eaſtern countreies, ſome crafty merchants and cunning companions turne, hollow, and being ſoftened, draw to what length they pleaſe the teeth of the fiſh Roharde, which lives in the Red and Æthiopian Sea, and being ſo handled, they ſell them for Unicornes horne. Verily that which is termed Unicornes horne being burnt, ſends forth a ſmell like to Ivory. Now *Cardanus* affirmes that the teeth and bones of Elephants made ſoft by art, may bee drawne forth, and brought into what forme you pleaſe, like as Oxe bones are. For what is there in the world which the thirſting deſire of gold will not make men to adulterate and counterfeit? But it is time that we come to the third ſcope. Grant there be Unicornes, muſt it therefore follow that their hornes muſt be of ſuch efficacy againſt poyſons? If we judge by events, and the experience of things, I can proteſt thus much, that I have often made tryall thereof, yet could I never find any good ſucceſſe in the uſe thereof againſt poiſons, in ſuch as I have had in cure. If the matter muſt bee tryed by witneſſes and authorities, a great part of the Phyſitians of better note have long ſince bid it adieu, and have detracted from the divine and admirable vertues for which it formerly was ſo much deſired. And this they have done, moved thereto by many juſt, but two eſpeciall reaſons. The firſt is of *Rondeletius*, who in this caſe affirmes that horns are endued with no taſte nor ſmell; and therefore have no effect in phyſicke, unleſſe it bee to dry. Neither (ſaith hee) am I ignorant that ſuch as have them, much predicate their worth, ſo to make the greater benefit and gaine by them, as of the ſhavings or ſcrapings of Unicornes horne, which they ſell for the weight in gold, as that which is ſingular good againſt poyſons and wormes, which things I thinke Harts-horne and Ivory doe no leſſe effectually performe; which is the cauſe why for the ſame diſeaſe, and with the like ſucceſſe, I preſcribe Ivory to ſuch as are poor, and Unicornes horn to the rich, as that they ſo much deſire. This is the opinion of *Rondeletius*, who without any difference was wont for Unicornes horne to preſcribe not onely Hartſ-horn or Ivory, but alſo the bones of Horſes and Dogges, and the ſtones of Myrabalanes. Another reaſon is, that whatſoever reſiſts poyſon is cordiall, that is, fit to ſtrengthen the heart, which is chiefly aſſailed by poyſons; but nothing is convenient to ſtrengthen the heart, unleſſe it bee by laudible blood or ſpirit, which two are onely familiar to the heart, as being the work-houſe of the arterious blood and vitall ſpirits. For all things are preſerved by their like, as they are deſtroyed by their contraries; for all things that generate, generate things like themſelves. But Unicornes horne, as it conteines no ſmell, ſo neither hath it any aëry parts, but is wholly earthy and dry; neither can it bee converted into blood by the digeſtive faculty, for as it is without juice, ſo is it without fleſh. For as it cannot bee turned into *Chylus*, ſo neither is it fit to become *Chymus* (that is) juice or blood. Therefore it is joyned to the heart by no ſimilitude nor familiarity. Furthermore, there is not a word in *Hippocrates* and *Galen* concerning the Unicornes horne, who notwithſtanding have in ſo many places commended Harts-horne. Therefore D. *Chapelaine*, the chiefe Phyſitian of King *Charles* the ninth, often uſed to ſay, that hee would very willingly take away that cuſtome of dipping a piece of Unicorns horn in the Kings cup, but that he knew that opinion to be ſo deeply ingrafted in the minds of men, that he feared, that it would ſcarce be impugned by reaſon. Beſides (he ſaid) if ſuch a ſuperſtitious medicine do no good, ſo certainely it doth no harme, unleſſe it be to their eſtates that buy it with gold, or elſe by accident, becauſe Princes, whilſt they rely more than is fitting upon the magnified vertues of this horne, neglect to arme themſelves againſt poyſons by other more convenient meanes, ſo that Death oft-times takes them at unawares. When as upon a time I enquired of *Lewes Duret* the Kings Phyſitian and Profeſſor (by reaſon of the great opinion that all learned men juſtly had of his learning and judgement) what he thought of this horne. He anſwered, that he attributed no faculties thereto: for the confirmation whereof he rendred the ſecond reaſon I have formerly given, but more largely and elegantly; neither feared he to affirme it aloud, & in plain words to his auditory of learned men, comming from all parts to hear him. But if at any time (orecome by the fault of the times & place) he preſcrib'd this horn, that he did it for no other entent, than to help faintings or ſownings that happen by the abundance of ſerous humors, floating in the orifice of the ventricle, which makes men ill diſpoſed, becauſe this mixed with other things endued with the like faculty, hath power to drinke up the wateriſh humidity by its earthy drineſſe. But ſome will reply, that neither the Lemnian, nor Armenian earth, have any juice in them, neither any ſmell, nor aëry ſpirit. It is granted, neither truely are ſuch things truely and properly called cordiall, but onely by event and accident, for that by the excellent aſtrictive faculty they have, and ſtopping the paſſages of the veſſels, they hinder the poyſon from entring into the heart. This is my opinion of Unicornes horne, which if any doe not approve of, hee ſhall doe mee a favour, if for the publike good, hee ſhall freely oppoſe his; but in the interim take this in good part which I have done.

In what caſes good.

The End of the One and Twentieth Booke.

OF THE PLAGUE.

THE TWENTIE SECOND BOOKE.

Chap. I.

The deſcription of the Plague.

THE Plague is a cruell and contagious diſeaſe, which every where, like a common diſeaſe, invading Man and Beaſt, kils very many; being attended, and as it were aſſociated with a continuall Feaver, Botches, Carbuncles, Spots, Nauſeouſneſſe, Vomitings, and other ſuch maligne accidents. This diſeaſe is not ſo pernitious or hurtfull, by any elementary qualitie, as from a certain poyſonous & venenate malignity, the force wherof exceeds the condition of common putrefaction. Yet I will not deny but that it is more hurtfull in certain bodies, times and regions, as alſo many other diſeaſes, of which *Hippocrates* makes mention. But from hence we can only collect, that the force and malignity of the plague, may be encreaſed, or diminiſhed, according to the condition of the Elementary qualities concurring with it, but not the whole nature and eſſence thereof to depend thereon.

What the plague is.

Sect. 3. aphor.

This peſtiferous poyſon principally aſſailes the Vitall ſpirit, the Store-houſe and originall whereof is the Heart, ſo that if the Vitall Spirit prove ſtronger, it drives it far from the Heart; but if weaker, it being overcome and weakened by the hoſtile aſſault, flies backe into the fortreſſe of the Heart, by the like contagion infecting the heart, and ſo the whole Body, being ſpred into it by the paſſages of the Arteries.

How it comes to kill.

Hence it is, peſtilent Feavers are ſometime ſimple and ſolitary, other-whiles aſſociated with a troope of other affects, as Botches, Carbuncles, Blaines, and Spots, of one or more colours.

It is probable ſuch affects have their originall from the expulſive Faculty, whether ſtrong or weake, provoked by the malignity of the raging matter: yet aſſuredly divers ſymptomes and changes ariſe, according to the conſtitution of the body of the Patient, and condition of the humor in which the virulency of the plague is chiefly inherent, and laſtly, in the nature of the efficient cauſe.

The originall Bubo's, Carbuncles, &c. in the plague.

I thought good, by this deſcription, to expreſſe the nature of the plague, at this my firſt entrance into this matter, for we can ſcarce comprehend it in a proper definition. For although the force thereof be definite and certaine in nature, yet it is not altogether certaine and manifeſt in mens minds, becauſe it never happens after one ſort: ſo that in ſo great variety, it is very difficult to ſet down any thing generall and certaine.

Chap. II.

Of the Divine cauſes of an extraordinary Plague.

Amos 3.
Acts 17

IT is a confirmed, conſtant, and received opinion in all Ages amongſt Chriſtians, that the plague and other diſeaſes, which violently aſſaile the life of man, are often ſent by the juſt anger of God puniſhing our offences. The Prophet *Amos* hath long ſince taught it, ſaying, *Shall there be affliction, ſhall there be evill in a City, and the Lord hath not done it?* On which truely we ought daily to meditate, and that for two cauſes: The firſt is, that wee alwaies beare this in minde, that wee enjoy health, live, move, and have our beings from God, and that it deſcends from that Father of Light: and for this cauſe we are alwaies bound to give him great and exceeding thanks. The other is, that knowing the calamities, by ſending whereof the Divine anger proceeds to revenge, wee may at length repent, and leaving the way of wickedneſſe, walke in the pathes of godlineſſe. For thus we ſhall learne to ſee in God, our ſelves, the Heaven and Earth, the true knowledge of the cauſes of the plague, and by a certaine Divine Philoſophy teach, God to bee the beginning and cauſe of the ſecond cauſes, which cannot well without the firſt cauſe goe about nor attempt, much leſſe performe any thing. For from hence they borrow their force, order, and conſtancy of order; ſo that they ſerve as Inſtruments for God, who rules and governes us, and the whole World, to performe all his workes, by that conſtant courſe of order, which hee hath appointed unchangeable from the beginning. Wherefore all the cauſe of a plague is not to bee attributed to theſe neere and inferiour cauſes or beginnings, as the Epicures and Lucianiſts commonly doe, who attributing too much, yea all things to nature, have left nothing to Gods providence. On the contrary, wee ought to thinke, and beleeve in all our things, That even as God by his omnipotent Power hath created all things of nothing, ſo he by his eternall Wiſedome preſerves and governes the ſame, leads and enclines them as he pleaſeth, yea verily at his pleaſure changeth their order, and the whole courſe of Nature.

The ſecond cauſes have their power from God as the firſt cauſe.

This cauſe of an extraordinary Plague, as wee confeſſe and acknowledge, ſo here we will not proſecute it any further, but thinke fit to leave it to Divines, becauſe it exceeds the bounds of Nature, in which I will now contain my ſelfe. Wherefore let us come to the naturall cauſes of the plague.

Chap. III.

Of the Naturall Cauſes of the Plague, and chiefly of the Seminary of the Plague by the corruption of the Aire.

The generall cauſes of the plague.

Lib. 6. de loc. affectis.

THE generall and naturall cauſes of the Plague are abſolutely two, that is, the infection of corrupt Aire, and a preparation and fitneſſe of corrupt humours to take that infection; for it is noted before out of the doctrine of *Galen*, that our humours may bee corrupted, and degenerate into ſuch an alienation which may equall the malignity of Poyſon.

How the ſeaſons of the yeere may be ſaid to want their ſeaſonableneſſe.

The Aire is corrupted, when the foure ſeaſons of the yeere have not their ſeaſonableneſſe, or degenerate from themſelves, either by alteration, or by alienation: as if the conſtitution of the whole yeere bee moiſt and rainy by reaſon of groſſe and blacke Cloudes; if the Winter bee gentle and warme without any Northerly wind, which is cold and dry, and by that meanes contrary to putrefaction; if the ſpring which ſhould be temperate, ſhall be faulty in any exceſſe of diſtemper; if the Autumn ſhall be ominous by Fires in the Aire, with ſtars ſhooting, and as it were falling down, or terrible comets, never ſeen without ſome diſaſter; if the ſummer be hot, cloudy and moiſt, and without winds, and the clouds flie from the South into the North. Theſe and ſuch like unnaturall conſtitutions of the ſeaſons of the yeere, were never better, or more excellently handled by any, than by *Hippocrates* in his bookes *Epidemion*. Therefore the Aire from hence drawes the ſeeds of corruption and the Peſtilence, which at the length, the like exceſſe of qualities being brought in, it ſends into the humours of our bodies, chiefly ſuch as are thinne and ſerous. Although the peſtilence doth not alwaies neceſſarily ariſe from hence, but ſome whiles ſome other kinde of cruell and infectious diſeaſe.

How the aire may be corrupted.

But neither is the aire onely corrupted by theſe ſuperiour cauſes, but alſo by putride and filthy ſtinking vapours ſpred abroad through the Aire encompaſſing us, from the Bodies and Carkaſſes of things not buried, gapings and hollowneſſes of the earth, or ſinkes and ſuch like places being opened: for the ſea often overflowing the land in ſome places, & leaving in the mud or hollowneſſes of the earth (cauſed by earth-quakes) the huge bodies of monſtrous Fiſhes, which it hides in its waters, hath given both the occaſion and matter of a plague. For thus in our time, a Whale caſt upon the Tuſcan ſhore, preſently cauſed a plague over all that country.

Lib. 8. hiſt. anim.

But as fiſhes infect and breed a plague in the aire, ſo the aire being corrupted often cauſeth a peſtilence in the ſea among fiſhes, eſpecially when they either ſwim on the top of the Water, or are infected by the peſtilent vapours of the Earth lying under them, & riſing into the aire through the body of the water, the latter whereof *Ariſtotle* ſaith, hapneth but ſeldome. But it often chanceth, that the plague raging in any countrey, many fiſhes are caſt upon all the coaſt, and may bee ſeene lying on great heaps. But ſulphureous vapours, or ſuch as partake of any other maligne quality, ſent forth from places under the ground, by gapings and gulfs opened by earthquakes, not only corrupt the aire, but alſo infect and taint the Seeds, Plants, and all the fruits which we eat, and ſo transferre the peſtilent corruption into us, and thoſe beaſts on which we feed, together with our nouriſhment. The truth whereof *Empedocles* made manifeſt, who by ſhutting up a great Gulf of the earth, opened in a valley between two mountaines, freed all Sicily from a plague cauſed from thence.

If winds riſing ſuddenly ſhall drive ſuch filthy exhalations from thoſe regions in which they were peſtiferous, into other places, they alſo will carrie the Plague with them thither.

If it be thus, ſome will ſay, it ſhould ſeeme that whereſoever ſtinking and putride exhalations ariſe, as about ſtanding Pooles, Sinkes and Shambles, there ſhould the Plague reigne, and ſtraight ſuffocate with its noyſome poyſon the people which worke in ſuch places: but experience findes this falſe.

Peſtiferous putrefaction is far different from ordinary putrefaction.

We doe anſwer, that the putrefaction of the plague is farre different, and of another kinde than this common, as that which partakes of a certaine ſecret malignity, and wholly contrary to our lives, and of which wee cannot eaſily give a plaine and manifeſt reaſon. Yet that vulgar putrefaction whereſoever it bee, doth eaſily and quickly entertaine and welcome the peſtiferous contagion, as often as, and whenſoever it comes, as joyned to it by a certaine familiarity, and at length, it ſelfe degenerating into a peſtiferous malignity, certainly no otherwiſe than thoſe diſeaſes which ariſe in the plague time, the putride diſeaſes in our bodies, which at the firſt wanted virulency and contagion, as Ulcers, putride Feavers, and other ſuch diſeaſes, raiſed by the peculiar default of the humours, eaſily degenerate into peſtilence, preſently receiving the tainture of the plague, to which they had before a certain preparation. Wherefore in time of the plague, I would adviſe all Men to ſhunne ſuch exceeding ſtinking places, as they would the plague it ſelfe: that there may be no preparation in our bodies, or humours to catch that infection (without which, as *Galen* teacheth, the Agent hath no power over the Subject, for otherwiſe in a plague time, the ſickeneſſe would equally ſeaze upon all) ſo that the impreſſion of the peſtiferous quality may preſently follow that diſpoſition.

In a peſtilent conſtitution of the aire, all diſeaſes become peſtilent.

Lib. 1. de differ. feb.

How the aire may be ſaid to putrefie.

But when we ſay the aire is peſtilent, we do not underſtand that ſincere, elementary, and ſimple as it is of its own nature, for ſuch is not ſubject to putrefaction, but that which is polluted with ill vapoures riſing from the earth, ſtanding waters, vaults, or ſea, and degenerates, and is changed from its native purity & ſimplicity. But certainly amongſt all the conſtitutions of the Aire, fit to receive a peſtilent corruption, there is none more fit than a hot, moyſt and ſtill ſeaſon: For the exceſſe of ſuch qualities eaſily cauſeth putrefaction. Wherefore the South wind reigning, which is hot and moyſt, and principally in places neare the Sea, there fleſh cannot long be kept, but it preſently is tainted and corrupted.

A Southerly conſtitution of the aire is the fuell of the Plague.

Further, wee muſt know, that the peſtilent malignity which riſeth from the carcaſſes or bodies of men, is more eaſily communicated to men; that which riſeth from oxen, to oxen; and that which comes from ſheepe, to ſheep, by a certaine ſympathy and familiarity of Nature: no otherwiſe than the Plague which ſhall ſeaze upon ſome one in a Family, doth preſently ſpread more quickly amongſt the reſt of that Family, by reaſon of the ſimilitude of temper, than amongſt others of another Family, diſagreeing in their whole temper. Therefore the Aire thus altered and eſtranged from its goodneſſe of nature, neceſſarily drawn in by inſpiration and tranſpiration, brings in the ſeeds of the Plague, and ſo conſequently the Plague it ſelfe, into bodyes prepared and made ready to receive it.

CHAP. IIII.

Of the preparation of humours to putrefaction, and admiſsion of peſtiferous impreſsions.

HAving ſhewed the cauſes from which the Aire doth putrefie, become corrupt, and is made partaker of a peſtilent and poyſonous conſtitution, wee muſt now declare what things may cauſe the humours to putrefie, and make them ſo apt to receive and retaine the peſtilent Aire and venenate quality.

Three cauſes of the putrefaction of humours.

Humours putrefie either from fulneſſe, which breeds obſtruction, or by diſtemperate exceſſe, or laſtly, by admixture of corrupt matter & evill juice, which ill feeding doth ſpecially cauſe to abound in the body: For the Plague often followes the drinking of dead and muſtie Wines, muddy and ſtanding waters, which receive the ſinks and filth of a City; and fruits and pulſe eaten without diſcretion in ſcarcity of other Corn, as Peaſe, Beans, Lentils, Vetches, Acorns, the roots of Fern, & Graſs made into Bread. For ſuch meats obſtruct, heap up ill humours in the body, & weaken the ſtrength of the faculties, from whence proceeds a putrefaction of humours, and in that putrefaction a preparation and diſpoſition to receive, conceive and bring forth the Seeds of the Plague: which the filthy ſcabs, maligne ſores, rebellious ulcers, and putrid feavers, being all forerunners of greater putrefaction and corruption, doe teſtifie. Vehement paſſions of the minde, as anger, ſorrow, griefe, vexation and feare, helpe forward this corruption of humours, all which hinder natures diligence and care of concoction: For as in the dog-dayes, the Lees of wine ſubſiding to the bottome, are by the ſtrength and efficacy of heat drawne up to the top, and mixed with the whole ſubſtance of the wine, as it were by a certaine ebullition, or working: So melancholy humours, being the Dregs or Lees of the bloud, ſtirred up by the paſſions of the mind, defile or taint all the bloud with their feculent impurity.

Paſſions of the mind helpe forward the putrefaction of the humours.

We found that ſome years agone by experience, at the battell of St. *Dennis*. For all wounds, by what weapon ſoever they were made, degenerated into great and filthy putrefactions & corruptions, with feavers of the like nature, & were commonly determined by death, what medicines, & how diligently ſoever they were applyed; which cauſed many to have a falſe ſuſpicion that the weapons on both ſides were poiſoned. But there were manifeſt ſignes of corruption and putrefaction in the bloud let the ſame day that any were hurt, and in the principall parts diſſected afterwards, that it was from no other cauſe, than an evill conſtitution of the Aire, and the minds of the Souldiers perverted by hate, anger and feare.

Chap. V.

What ſignes in the Aire and Earth prognoſticate a Plague.

WEE may know a Plague to bee at hand and hang over us, if at any time the Aire, and ſeaſons of the yeare ſwarve from their naturall conſtitution, after thoſe wayes I have mentioned before; if frequent and long continuing Meteors or ſulphureous Thunders infect the Aire; if fruits, ſeeds and pulſe be worme-eaten; If Birds forſake their neſts, egges or Young, without any manifeſt cauſe; if we perceive women commonly to abort, by continuall breathing in the vaporous Aire, being corrupted and hurtfull both to the Embrion and originall of life, and by which it being ſuffocated, is preſently caſt forth and expelled. Yet notwithſtanding, thoſe airy impreſſions doe not ſolely corrupt the Aire, but there may be alſo others rayſed by the Sunne from the filthy exhalations, and poyſonous vapours of the earth and waters, or of dead carcaſſes, which by their unnaturall mixture, eaſily corrupt the Aire, ſubject to alteration, as which is thin and moyſt, from whence divers Epidemiall diſeaſes, and ſuch as every-where ſeaze upon the common ſort, according to the ſeverall kinds of corruptions, ſuch as that famous Catarrhe with difficulty of breathing, which in the yeare 1510. went almoſt over the World, and raged over all the Cities and Townes of France, with great heavineſſe of the head (whereupon the French named it *Cuculla*) with a ſtraitneſſe of the heart and lungs, and a Cough, a continuall Feaver, and ſometimes raving.

Why Abortions are frequent in a peſtilent ſeaſon.

A Catarrhe with difficulty of breathing killing many.

This, although it ſeazed upon many more than it killed, yet becauſe they commonly dyed who were either let bloud, or purged, it ſhewed it ſelfe peſtilent by that violent and peculiar and unheard of kinde of malignity.

Such alſo was the Engliſh Sweating-ſickneſſe, or Sweating-feaver, which unuſuall, with a great deale of terrour invaded all the lower parts of Germany, and the Low Countryes from the yeare 1525. unto the yeare 1530. and that chiefly in Autumne.

The engliſh ſweating ſickneſſe.

As ſoone as this peſtilent diſeaſe entred into any City, ſuddenly two or three hundred fell ſick on one day, then it departing thence to ſome other place. The people ſtrucken with it languiſhing, fell down in a ſwoune, and lying in their beds, ſweat continually, having a feaver, a frequent, quick, and unequall pulſe; neither did they leave ſweating till the diſeaſe left them, which was in one or two dayes at the moſt: yet freed of it, they languiſhed long after, they all had a beating, or palpitation of the heart, which held ſome for two or three yeeres, and others all their life after.

At the firſt beginning it killed many, before the force of it was knowne: but afterwards very few, when it was found out by practice and uſe, that thoſe who furthered and continued their ſweats, and ſtrengthened themſelves with Cordials, were all reſtored. But at certaine times many other popular diſeaſes ſprung up, as putrid feavers, fluxes, bloudy-fluxes, catarrhes, coughes, phrenzies, ſquinances, pleuriſies, inflammations of the lungs, inflammations of the eyes, apoplexies, lithargies, ſmall pocks and meazels, ſcabs, carbuncles, and maligne puſtles. Wherefore the plague is not alwayes, nor every-where of one and the ſame kind, but of divers; which is the cauſe that divers names are impoſed upon it, according to the variety of the effects it brings, and ſymptomes which accompany it, and kinds of putrefaction, and hidden qualities of the Aire.

The Plague is not the definite name of one diſeaſe.

They affirme, when the Plague is at hand, that Muſhromes grow in greater abundance out of the earth, and upon the ſurface thereof many kindes of poyſonous *inſects* creepe in great numbers, as Spiders, Caterpillers, Butter-flyes, Graſſe-hoppers, Beetles, Hornets, Waſpes, Flyes, Scorpions, Snailes, Locuſts, Toads, Wormes, and ſuch things as are the off-ſpring of putrefaction. And alſo wilde beaſts tyred with the vaporous malignity of their Dennes and Caves in the earth, forſake them; and Moles, Toads, Vipers, Snakes, Lizzards, Aſpes and Crocodiles are ſeene to flee away,

What ſignes in the earth foretell a Plague.

away, and remove their habitations in great troopes. For theſe, as alſo ſome other creatures, have a manifeſt power by the gift of God, and the inſtinct of Nature, to preſage changes of weather, as raines, ſhowers, and faire weather; and ſeaſons of the yeare, as the Spring, Summer, Autumne, Winter, which they teſtifie by their ſinging, chirping, crying, flying, playing, and beating their wings, and ſuch like ſignes: ſo alſo they have a perception of a Plague at hand. And moreover, the carcaſſes of ſome of them which tooke leſſe heed of themſelves, ſuffocated by the peſtiferous poyſon of the ill Aire contained in the earth, may bee every where found, not onely in their dens, but alſo in the plaine fields.

How peſtilent vapours may kill plants and trees.

Theſe vapours corrupted not by a ſimple putrefaction, but an occult malignity, are drawne out of the bowels of the earth into the Aire, by the force of the Sun and Starres, and thence condenſed into clouds, which by their falling upon corne, trees and graſſe, infect and corrupt all things which the earth produceth, and alſo kils thoſe creatures which feed upon them; yet brute beaſts ſooner than men, as which ſtoope and hold their heads downe towards the ground (the maintainer and breeder of this poyſon) that they may get their food from thence. Therefore at ſuch times, skilfull husbandmen, taught by long experience, never drive their Cattell or Sheep to paſture, before that the Sun, by the force of his beames, hath waſted and diſſipated into Aire this peſtiferous dew hanging and abiding upon boughes and leaves of trees, herbs, corne and fruits.

But on the contrary, that peſtilence which proceeds from ſome maligne quality from above, by reaſon of evill and certaine conjunction of the Stars, is more hurtfull to men and birds, as thoſe who are neerer to heaven.

Chap. VI.

By uſing what cautions in Aire and Diet, one may prevent the Plague.

Change of places the ſureſt prevention of the Plague.

HAving declared the ſignes fore-ſhewing a Peſtilence: now wee muſt ſhew by what meanes we may ſhun the imminent danger thereof, and defend our ſelves from it. No prevention ſeemed more certaine to the Ancients, than moſt ſpeedily to remove into places farre diſtant from the infected place, and to be moſt ſlow in their returne thither againe. But thoſe, who by reaſon of their buſineſſe or employments, cannot change their habitation, muſt principally have care of two things: The firſt is, that they ſtrengthen their bodies, and the principall parts thereof againſt the daily imminent invaſions of the poyſon, or the peſtiferous and venenate Aire. The other, that they abate the force of it, that it may not imprint its virulency in the body; which may be done by correcting the exceſſe of the quality inclining towards it, by the oppoſition of its contrary. For if it bee hotter than is meet, it muſt bee tempered with cooling things; if too cold, with heating things: yet this will not ſuffice. For wee ought beſides, to amend & purge the corruptions of the venenate malignity diffuſed through it, by ſmels and perfumes reſiſting the poyſon thereof. The body will be ſtrengthened and more powerfully reſiſt the infected Aire, if it want excrementitious humours, which may be procured by purging and bleeding, and for the reſt a convenient diet appointed, as ſhunning much variety of meats, and hot and moyſt things, and all ſuch which are eaſily corrupted in the ſtomacke, and cauſe obſtructions, ſuch as thoſe things which be made by Comfit-makers; we muſt ſhun ſatiety and drunkenneſſe, for both of them weaken the powers, which are preſerved by the moderate uſe of meats of good juice.

Two things of chiefe account for prevention.

Diet for prevention of the Plague.

Let moderate exerciſes in a cleare Aire, and free from any venemous tainture, precede your meales.

Let the belly have due evacuation either by Nature or Art.

Let the heart, the ſeat of life, and the reſt of the bowels be ſtrengthened with Cordials and Antidotes applyed and taken (as wee ſhall hereafter ſhew) in the forme of epithemes, ointments, emplaſters, waters, pills, powders, tablets, opiates, fumigations, and ſuch like.

Make

Make choice of a pure Aire & free from all pollution, & far remote from ſtinking places, for ſuch is moſt fit to preſerve life, to recreate and repaire the ſpirits; whereas on the contrary, a cloudy or miſtie Aire, and ſuch as is infected with groſſe and ſtinking vapours, duls the ſpirits, dejects the appetite, makes the body faint and ill coloured, oppreſſeth the heart, and is the breeder of many diſeaſes.

Diſcommodities of a cloudy or foggy aire.

The Northern wind is healthfull, becauſe it is cold and dry. But on the contrary, the Southerne wind, becauſe it is hot and moyſt, weakens the body by ſloth or dulneſſe, opens the pores, and makes them pervious to the peſtiferous malignity. The Westerne winde is alſo unwholeſome, becauſe it comes neere to the nature of the Southerne: wherefore the windowes muſt bee ſhut up on that ſide of the houſe on which they blow, but opened on the North and Eaſt ſide, unleſs it happen the Plague come from thence.

Why the South wind is peſtilent.

Kindle a cleare fire in all the lodging Chambers of the houſe, and perfume the whole houſe with Aromatick things, as Frankinſence, Myrrhe, Benzoine, *Ladanum*, *Styrax*, Roſes, Myrtle-leaves, Lavender, Roſemary, Sage, Savory, wilde Time, Marjerome, Broome, Pine-apples, pieces of Firre, Juniper berries, Cloves, Perfumes: and let your cloathes be aired in the ſame.

The efficacy of fire againſt the Plague.

There be ſome, who think it a great preſervative againſt the peſtilent Aire, to keep a Goat in their houſes, becauſe the capacity of the houſes, filled with the ſtrong ſent which the Goat ſends forth, prohibits the entrance of the venemous Aire: which ſame reaſon hath place alſo in ſweet ſmels; and beſides, it argues, that ſuch as are hungry are apter to take the Plague, than thoſe who have eaten moderately: for the body is not onely ſtrengthened with meat, but all the paſſages thereof are filled by the vapours diffuſed from thence, by which otherwiſe the infected Aire would finde a more eaſie entrance to the heart.

Moderate repletion good for prevention.

Yet the common ſort of People yeeld another reaſon for the Goat, which is, that one ill ſent drives away another, as one wedge drives forth another; which calleth to my mind that which is recorded by *Alexander Benedictus*, that there was a Scythian Phyſician, which cauſed a Plague, ariſing from the infection of the Aire, to ceaſe, by cauſing all the dogs, cats, & ſuch like beaſts which were in the City, to be killed, and caſt their carcaſſes up & down the ſtreets, that ſo by the comming of this new putride vapour as a ſtranger, the former peſtiferous infection, as an old gueſt, was put out of its Lodging, & ſo the Plague ceaſed. For poyſons have not onely an antipathy with their Antidotes, but alſo with ſome other poyſons.

A ſtrange art to drive away the Plague.

The antipathy of poyſons with poyſons.

Whilſt the Plague is hot, it is not good to ſtirre out of doore before the riſing of the Sunne: wherefore wee muſt have patience, untill hee have cleanſed the Aire with the comfortable light of his Beames, and diſperſed all the foggy and nocturnall pollutions, which commonly hang in the Aire in dirty, and eſpecially in low places and Vallies.

All publike and great meetings and aſſemblies muſt be ſhunned.

If the Plague begin in Summer, and ſeeme principally to rage, being helped forward by the ſummers heat, it is the beſt to performe a journey begun, or undertaken for performance of neceſſary affaires, rather upon the night time, than on the day, becauſe the infection takes force, ſtrength and ſubtlety of ſubſtance, by which it may more eaſily permeate and enter in, by the heat of the Sun; but by night mens bodies are more ſtrong, and all things are more groſſe and denſe. But you muſt obſerve a cleane contrary courſe if the malignity ſeeme to borrow ſtrength, and celerity from coldneſſe. But you muſt alwayes eſchew the beames of the Moone, but eſpecially at the full: For then our bodies are more languid and weake, and fuller of excrementitious humours. Even as trees which for that cauſe muſt be cut down in their ſeaſon of the Moone, that is, in the decreaſe thereof.

Whether in the plague time one muſt travell by night or by day.

Why the Moon is to be ſhunned.

After a little gentle walking in your Chamber, you muſt preſently uſe ſome means that the principall parts may be ſtrengthened by ſuſcitating the heat & ſpirits, & that the paſſages to them may be filled, that ſo the way may bee ſhut up from the infection comming from without. Such as by the uſe of garlick have not their heads troubled, nor their inward parts inflamed, as Countrey people, and ſuch as are uſed to it, to ſuch there can can bee no more certaine preſervative and antidote againſt the peſtiferous

Garlick good againſt the Plague.

ſtiferous fogs or miſts, and the nocturnall obſcurity, than to take it in the morning with a draught of good wine; for it being abundantly diffuſed preſently over all the body, fils up the paſſages thereof, and ſtrengtheneth it in a moment.

What water to be made choice o' in the Plague time.

For water, if the Plague proceed from the tainture of the Aire, wee muſt wholly ſhun and avoyd raine-water, becauſe it cannot but bee infected by the contagion of the Aire. Wherefore the water of Springs, and of the deepeſt Wells are thought beſt. But if the malignity proceed from the vapours contained in the earth, you muſt make choice of Raine-water. Yet it is more ſafe to digeſt every ſort of water by boiling it, and to preferre that water before other, which is pure and cleare to the ſight, and without either taſt or ſmell, and which beſides ſuddenly takes the extremeſt mutation of heat and cold.

Chap. VII.

Of the Cordiall Remedies by which we may preſerve our bodies in feare of the Plague, and cure thoſe already infected therewith.

SUch as cannot eat without much labour, exerciſe and hunger, and who are no lovers of Break-faſts, having evacuated their excrements, before they goe from home muſt ſtrengthen the heart with ſome Antidote againſt the virulency of the infection. Amongſt which *Aqua Theriacalis*, or Treacle-water, two ounces, with the like quantity of Sacke, is much commended being drunke, and rubbing the noſtrils, mouth and eares with the ſame; for the Treacle-water ſtrengthens the heart, expels poyſon, and is not onely good for a preſervative, but alſo to cure the diſeaſe it ſelfe: For by ſweat it drives forth the poyſon contained within. It ſhould be made in *June*, at which time all ſimple medicines, by the vitall heat of the Sun, are in their greateſt efficacie.

Aqua theriacalis good againſt the Plague both inwardly taken & outwardly applyed.

The compoſition thereof.

The compoſition whereof is thus: Take the roots of Gentian, *Cyperus*, Tormentill, Diptam, or *Fraxinella*, Elecampaine, of each one ounce; the leaves of Muller, *Carduus Benedictus*, Divels-bit, Burnet, Scabious, Sheepes Sorrell, of each halfe a handfull; of the tops of Rue a little quantity; Mirtle Berries one ounce; of red Roſe leaves, the flowers of Bugloſſe, Borage, and St. Johns wurt, of each one ounce: let them be all cleanſed, dryed and macerated for the ſpace of twenty foure hours in one pound of white wine or Malmeſey, and of Roſe-water or Sorrell water; then let them bee put in a veſſell of glaſſe, and adde thereto of Treacle and Mithridate, of each foure ounces: then diſtill them in *Balneo Mariæ*, and let the diſtilled water bee received in a glaſſe Viall, and let there be added thereto of Saffron two drams, of bole Armenick, *Terra Sigillata*, yellow Sanders, ſhavings of Ivory and Harts-horne, of each halfe an ounce, then let the glaſſe be well ſtopped, and ſet in the Sun for the ſpace of eight or ten daies. Let the preſcribed quantity be taken every morning ſo oft as ſhall be needfull. It may bee given without hurt to ſucking children, and to women great with child. But that it may be the more pleaſant, it muſt bee ſtrained through an Hippocras bag, adding thereto ſome ſuger and cinamon.

Some thinke themſelves ſufficiently defended with a root of Elecampaine, Zedoarie, or Angelica, rowled in their mouth, or chawed betweene their teeth.

Others drinke every morning one dram of the root of Gentian bruſed, being macerated for the ſpace of one night in two ounces of white-wine.

Others take Worme-wood wine.

Others ſup up in a rere egge one dram of *Terra Sigillata*, or of Hartſ-horne, with a little Saffron, and drinke two ounces of wine after it.

There be ſome that doe infuſe bole Armenicke, the roots of Gentian, Tormentill, Diptam, the Berries of Juniper, Cloves, Mace, Cinamon, Saffron, and ſuch like, in *aqua vitæ* and ſtrong white wine, and ſo diſtill it in *Balneo Maria*.

A Cordiall water.

This Cordiall water that followeth is of great vertue. Take of the roots of the long and round *Ariſtolochia*, Tormentill, Diptam, of each three drams, of Zedoarie two drams, *Lignum Aloes*, yellow Saunders, of each one dram, of the leaves of Scordium,

dium, St. Johns wurt, Sorrell, Rue, Sage, of each halfe an ounce, of Bay and Juniper berries, of each three drams, Citron ſeeds one dram, Cloves, Mace, Nutmegs, of each two drams, of Maſtick, *Olibanum*, bole Armenick, *Terra Sigillata*, ſhavings of Hartſhorne and Ivory, of each one ounce, of Saffron on ſcruple, of the conſerves of Roſes, Bugloſſe flowers, water-lillies, and old Treacle, of each one ounce, of Camphire halfe a dram, of *aqua vitæ* halfe a pint, of white wine two pints and a half, make thereof a diſtillation in *Balneo Mariæ*. The uſe of this diſtilled water is even as Treacle water is.

A Cordiall electuary.

The Electuary following is very effectuall. Take of the beſt Treacle three ounces, Juniper berries and Carduus ſeeds of each one dram and a halfe, of bole Armenicke prepared halfe an ounce, of the powder of the Electuarie *de Gemmis* and *Diamargariton frigidum*, the powder of Hartſ-horne, and red Corall, of each one dram: mixe them with the ſyrupe of the rindes and juice of Pome-citrons as much as ſhall ſuffice, and make thereof a liquid Electuary in the forme of an Opiate, let them take every morning the quantity of a Filberd, drinking after it two drams of the water of Scabious, Cherryes, *Carduus Benedictus*, and of ſome ſuch like cordiall things, or of ſtrong wine.

An opiate.

The following Opiate is alſo very profitable, which alſo may be made into Tablets. Take of the roots of Angelica, Gentian, Zedoarie, Elecampaine, of each two drams; of Cytron and Sorrell ſeeds, of each halfe a dramme; of the dryed rindes of Cytrons, Cinnamon, Bay and Juniper berries, and Saffron, of each one ſcruple; of conſerve of Roſes and Bugloſſe, of each one ounce; and fine hard Sugar as much as is ſufficient: make thereof Tablets of the weight of halfe a dram, let him take one of them two houres before meate: or make thereof an Opiate with equall parts of conſerves of Bugloſſe and *Mel Anthoſatum*, and ſo adding all the reſt dry and in powder. Or take of the roots of Valerian, Tormentill, Diptam, of the leaves of Rue, of each halfe an ounce; of Saffron, Mace, Nutmegs, of each halfe a dram; of bole Armenick prepared halfe an ounce; of conſerve of Roſes and ſyrupe of Lemons as much as will bee ſufficient to make thereof an Opiate liquid enough. Or take of the roots of both the *Ariſtolochia's*, of Gentian, Tormentill, Diptam, of each one dram and an halfe; of Ginger three drams; of the leaves of Rue, Sage, Mints and Pennyroyall, of each two drams; of Bay and Juniper berries, Cytron ſeeds, of each foure ſcruples; of Mace, Nutmegs, Cloves, Cinnamon, of each two drams; of *Lignum aloes*, and yellow Saunders, of each one dram; of Male Frankincenſe, *i. Olibanum*, Maſticke, ſhavings of Hartſ-horne and Ivory, of each two ſcruples; of Saffron halfe a dram; of bole Armenicke, *Terra Sigillata*, red Corall, Pearle, of each one dram; of conſerves of Roſes, Bugloſſe flowers, water-lillyes and old Treacle, of each one ounce; of loafe ſugar one pound and a quarter: a little before the end of the making it up, adde two drams of *Confectio Alkermes*, and of Camphire diſſolved in Roſe-water one ſcruple: make thereof an Opiate according to Art, the doſe thereof is from halfe a dram to halfe a ſcruple.

Another.

Another.

Treacle and Mithridate faithfully compounded, excell all Cordiall medicines, adding for every halfe ounce of each of them, one ounce and a halfe of conſerves of Roſes, or of Bugloſſe, or of Violets, and three drams of bole Armenicke prepared: Of theſe being mixed with ſtirring, and incorporated together, make a conſerve: It muſt be taken in the morning the quantity of a Filberd: You muſt chooſe that Treacle that is not leſſe than foure years old, nor above twelve: that which is ſome-what new, is judged to be moſt meet for cholerick perſons, but that which is old for flegmatick and old men. For at the beginning the ſtrength of the *Opium* that enters into the compoſition thereof, remaines in its full vertue for a yeare: but afterwards the more years old it waxeth, the ſtrength thereof is more aboliſhed, ſo that at length the whole compoſition becommeth very hot.

The confection of *Alkermes* is very effectuall both for a preſervative againſt this diſeaſe, and alſo for the cure.

The quantity of a Filberd of Rubarbe, with one Clove chawed or rowled in the mouth, is ſuppoſed to repell the comming of the peſtilent Aire: as alſo this compoſition following.

Take

A confection to be taken in the morning againſt the peſtilent Aire.

Take of preſerved Citron and Orange pils, of each one dram; of conſerve of Roſes, and of the roots of Bugloſſe, of each three drammes; of Citron ſeeds halfe an ounce; of Anniſe ſeeds and Fennell ſeeds, of each one dram; of Angelica roots four ſcruples; ſugar of Roſes as much as ſufficeth: Make a Confection, and cover it with leaves of Gold, and take a little of it out of a ſpoone before you goe abroad every morning.

A March-pane.

Or take of Pine-Apple kernels, and Fiſtick nuts, infuſed for the ſpace of ſixe hours in the water of Scabious and Roſes, of each two ounces; of Almonds blanched in the fore-named waters halfe a pound: of preſerved Citron and Orange pils, of each one dram and a halfe: of Angelica roots foure ſcruples: make them according to art, unto the forme of March-pane, or of any other ſuch like confection: and hold a little piece thereof often in your mouth.

The Tablets following are moſt effectuall in ſuch a caſe. Take of the roots of Diptam, Tormentill, Valerian, Elecampaine, Eringoes, of each halfe a dram; of bole Armenick, *Terra Sigillata*, of each one ſcruple; of Camphire, Cinnamon, Sorrell ſeeds, and Zedoarie, of each one ſcruple; of the *Species* of the Electuarie *Diamargariton Frigidum*, two ſcruples; of conſerve of Roſes, Bugloſſe, preſerved Citron pils, Mithridate, Treacle, of each one dram; of fine ſugar diſſolved in Scabious and Carduus water, as much as ſhall ſuffice: Make thereof Tablets of the weight of a dram or half a dram: take them in the morning before you eat.

Pils of *Ruffus*.

The pils of *Ruffus* are accounted moſt effectuall preſervatives, ſo that *Ruffus* himſelfe ſaith, that he never knew any to be infected that uſed them: the compoſition of them is thus.

Take of the beſt Aloes halfe a dram; of Gumme *Ammoniacum* two drammes; of Myrrhe two drams and an halfe; of Maſticke two drams; of Saffron ſeven graines: Put them all together, and incorporate them with the juice of Citrons, or the ſyrupe of Lemons, and make thereof a maſſe, and let it bee kept in leather: Let the patient take the weight of half a dram every morning two or three hours before meat, & let him drinke the water of Sorrell after it, which through its tartneſſe, and the thinneſſe of its parts, doth infringe the force and power of the malignity or putrefaction: For experience hath taught us, that Sorrell being eaten or chawed in the mouth, doth make the pricking of Scorpions unhurtfull. And for thoſe ingredients which do enter into the compoſition of thoſe pils, Aloes doth cleanſe and purge, Myrrhe reſiſts putrefaction, Maſtick ſtrengthens, Saffron exhilerates and makes lively the ſpirits that governe the body, eſpecially the vitall and animall.

Other pils.

Thoſe pils that follow are alſo much approved. Take of Aloes one ounce; of Myrrhe halfe an ounce, of Saffron one ſcruple, of Agarick in Trochiſces, two drams, of Rubarbe in powder one dram, of Cinnamon two ſcruples, of Maſticke one dram and a half, of Citron ſeeds twelve grains: Powder them all as is requiſite; and make thereof a maſſe with the ſyrupe of Maiden-haire: Let it be uſed as afore-ſaid.

If the maſſe begin to waxe hard, the pils that muſt preſently be taken, muſt be mollified with the ſyrupe of Lemons.

Other pils.

Take of waſhed Aloes two ounces, of Saffron one dram, of Myrrhe half an ounce, of *Ammoniacum* diſſolved in white wine, one ounce, of hony of Roſes, Zedoarie, red Saunders, of each one dram, of bole Armenick prepared two drams, of red Coral half an ounce, of Camphire halfe a ſcruple: make thereof pils according to Art. But thoſe that are ſubject or apt to the hæmorrhoids ought not at all, or very ſeldome to uſe thoſe kindes of pils that doe receive much Aloes.

They ſay that King *Mithridates* affirmed by his own writing, that whoſoever took the quantity of an haſell Nut of the preſervative following, and dranke a little wine after it, ſhould be free from poyſon that day. Take two Wall-nuts, thoſe that be very dry, two figs, twenty leaves of Rue, and three grains of ſalt: beat them, and incorporate them together, and let them be uſed as is aforeſaid.

This remedy is alſo ſaid to be profitable for thoſe that are bitten or ſtung by ſome venemous beaſt, and for this onely, becauſe it hath Rue, in the compoſition thereof. But you muſt forbid women that are with child the uſe of this medicine, for Rue is hot and dry in the third degree, and therefore it is ſaid to purge the womb, and provoke the flowers, whereby the nouriſhment is drawne away from the child. Of ſuch variety of medicines, every one may make choice of that that is moſt agreeable to his taſte, and as much thereof as ſhall be ſufficient.

CHAP. VIII.

Of locall medicines to be applied outwardly.

Of what nature the medicines outwardly uſed ought to be.

THoſe medicines that have proper and excellent vertues againſt the peſtilence, are not to bee neglected to bee applied outwardly, or carried in the hand. And ſuch are all aromaticall, aſtringent, or ſpirituous things, which therfore are endued with vertue to repell the venemous and peſtiferous aire from comming and entring into the body, and to ſtrengthen the heart and the braine. Of this kind are Rue, Balm, Roſemary, *Scordium*, Sage, Worme-wood, Cloves, Nutmegs, Saffron, the roots of Angelica, and Lovage, and ſuch like, which muſt bee macerated one night in ſharpe Vinegar and *Aqua vitæ*, and then tyed in a knot as bigge as an egge: or rather let it be carried in a ſponge, made wet or ſoaked in the ſaid infuſion. For there is nothing that doth ſooner and better hold the ſpirituous vertue and ſtrength of aromaticke things, than a ſponge. Wherefore it is of principall uſe either to keep or hold ſweet things to the noſe, or to apply Epithemes and Fomentations to the heart.

Thoſe ſweet things ought to be hot or cold, as the ſeaſon of the yeere, and kinde of the peſtilence is. As for example, in the Summer you ought to infuſe and macerate Cinamon and Cloves beaten together, with a little Saffron in equall parts, of Vinegar of Roſes, and Roſe water, into which you muſt dippe a ſponge, which rowled in a faire linnen cloath, you may carry in your hand, and often ſmell to.

Take of Wormewood halfe a handfull, ten Cloves, of the roots of Gentian and Angelica, of each two drammes, of Vinegar and Roſe water, of each two ounces, of Treacle and Mithridate, of each one dramme, beat and mixe them all well together, and let a ſponge be dipped therein, and uſed as above-ſaid. They may alſo bee encloſed in boxes made of ſweet wood, as of Juniper, Cedar, or Cypreſſe, and ſo carried for the ſame purpoſe.

Pomanders.

But there is nothing more eaſie to be carried than Pomanders: the form of which is thus. Take of yellow Saunders, Mace, Citron pills, Roſe and Mirtle leaves, of each two drammes, of Benzoin, Ladanum, Storax, of each halfe a dramme, of Cinamon, and Saffron, of each two Scruples, of Camphire and Amber Greece, of each one ſcruple, of Muſke, three graines. Make thereof a Pomander, with Roſe water, with the infuſion of Tragacanth. Or take red Roſe leaves, the flowers of Water-lillies, and Violets, of each one ounce, of the three Saunders, Coriander ſeeds, Citron pills, of each halfe an ounce, of Camphire, one dramme, let them all bee made into pouder, and with Water of Roſes and Tragacanth make a pomander.

In the winter it is to be made thus: take of Storax, Benzoin, of each one dram and a half; of Musk, half a Scruple; of Cloves, Lavander, and *Cyperus*, of each two drams; of the root of Orris, *i.* Flower-de-Luce, and *Calamus aromaticus*, of each two drams and a half; of Amber Greece, three drams; of gum Tragacanth diſſolved in Roſe water & *Aqua vitæ*, as much as ſhall ſuffice: make thereof a Pomander.

Sweet pouders.

And for the ſame purpoſe you may alſo uſe to carry about with you ſweet pouders, made of Amber Greece, Storax, Orris, Nutmegs, Cinamon, Mace, Cloves, Saffron, Benzoine, Muske, Camphire, Roſes, Violets, *Juncus odoratus*, Marjoram, & ſuch like, of which being mixed together, Pouders may be compounded & made.

Take of the rootes of Orris two drams, of *Cyperus*, *Calamus Aromaticus*, red Roſes, of each halfe an ounce, of Cloves halfe a dramme, of Storax one dramme, of Muske eight graines: mixe them, and make a pouder for a bagge: or take the rootes of Orris two ounces, red Roſe leaves, white Saunders, Storax, of each one ounce, of *Cyperus* one dram, of *Calamus Aromaticus*, one ounce, of Marjoram, halfe an ounce, of Cloves, three drammes, of Lavander, halfe a dramme, of Coriander ſeedes two drammes, of good Muske, halfe a ſcruple, of Ladanum and Benzoin, of each a dram, of Nutmegs and Cinamon, of each two drammes: Make thereof a fine pouder, and ſew it in a bag.

Bagges.

It will be very convenient alſo to apply to the region of the heart, a bagge filled with yellow Saunders, Mace, Cloves, Cinnamon, Saffron, and Treacle ſhaken together, and incorporated, and ſprinckled over with ſtrong vinegar and Roſe water in Summer, and with ſtrong wine and Muskedine in the Winter.

Theſe ſweet Aromaticke things that are ſo full of ſpirits, ſmelling ſweetly and ſtrongly, have admirable vertues to ſtrengthen the principall parts of the body, and to ſtirre up the expulſive faculty to expell the poyſon.

Unſavory things to bee eſchewed.

Contrarie-wiſe, thoſe that are ſtinking and unſavory, procure a deſire to vomit, and diſſolution of the powers, by which it is manifeſt how fooliſh and abſurd their perſwaſion is, that counſaile ſuch as are in a peſtilent conſtitution of the aire, to receive and take in the ſtinking and unſavoury vapours of ſinkes and privies, and that eſpecially in the morning.

But it will not ſuffice to carry thoſe preſervatives alone, without the uſe of any other thing, but it will be alſo very profitable to waſh all the whole body in Vinegar of the decoction of Juniper & Bay berries, the roots of Gentian, Marigolds, S. Johns Wort, and ſuch like, with Treacle or Mithridate alſo diſſolved in it. For vinegar is an enemy to all poyſons in general, whether they be hot or cold: for it reſiſteth & hindereth putrefaction, becauſe it is cold & dry: therfore in this, inanimate bodies, as fleſh, Herbes, fruits, and many other ſuch like things, may be kept a long time without putrefaction. Neither is it to be feared, that it ſhould obſtruct the pores, by reaſon of its coldneſſe, if the body be bathed in it: for it is of ſubtle parts, and the ſpices boyled in it, have vertue to open.

Whoſoever accounteth it hurtfull to waſh his whole body therewith, let him waſh onely his arme-holes, the region of his heart, his temples, groines, parts of generation, as having great and marvellous ſympathy with the principall and noble parts.

An unguent.

If any miſlike bathing, let him annoint himſelf with the following unguent. Take oyle of Roſes, four ounces; oyle of Spike, two ounces; of the pouder of Cinamon and Cloves, of each one ounce and a halfe; of Benzoin, halfe an ounce; of Muske, ſixe graines; of Treacle, halfe a dramme; of Venice Turpentine, one dramme and a halfe; of Waxe, as much as ſhall ſuffice: make thereof a ſoft unguent.

You may alſo drop a few drops of oile of Maſtick, of Sage, or of Cloves, and ſuch like, into the eares, with a little Civet or Muske.

CHAP. IX.

Of other things to be obſerved for prevention, in feare of the Plague.

Why venery is to be ſhunned.

VENERY is chiefly to be eſchewed, for by it the powers are debilitated, the ſpirits diſſipated, and the breathing places of the body diminiſhed, and laſtly, all the ſtrength of nature weakened. A ſedentary life is to be ſhunned, as alſo exceſſe in diet, for hence proceeds obſtruction, the corruption of the juices, and preparation of the body to putrefaction and the peſtilence.

Running ulcers good in time of peſtilence.

Women muſt be very carefull that they have their courſes duely, for ſtopping beſides the cuſtome, they eaſily acquire corruption, and draw by contagion the reſt of the humours into their ſociety. Such as have fiſtulous, or otherwiſe old ulcers, muſt not heale them up in a peſtilent ſeaſon, for it is then more convenient rather to make new ones, and theſe in convenient and declining places; that as by theſe channels, the ſinke of the humors of the body may be emptied.

Places to be ſhunned in time of plague.

The Hæmorrhoids, bleedings, & other the like accuſtomed evacuations, muſt not be ſtopped, unleſſe they exceed meaſure. Moreover, they muſt at ſuch times take heed that they touch or handle not, any of theſe things wherein the ſeedes or fuell of the peſtilence may lye hid, ſuch as are, hempe, flaxe, quilts and coverings wherein ſuch as have had the plague, have laid; skins and all leathern things, hangings and cloaths. You muſt dwell farre from church-yards, eſpecially from thoſe wherein the corps of ſuch as have died of the plague, are not buried deep in the ground, as in the church of the *Innocents* in *Paris*, in which place by the ſame reaſon it ſundry times happens that the buried bodies are plucked up, rent and torne by dogs. Alſo let them dwell farre from places of execution, ſhambles of fleſh and fiſh, from tanne-houſes, diers, tallow-chandlers, cloth-dreſſers, farriers, skinners, and from the places wherein metals are caſt or wrought. The filth and dung, eſpecially of Swine, Privies, ſtanding and muddy waters, and laſtly all things of the like evill ſmell, muſt be farre remote from your habitation; the belly muſt not bee emptied into thoſe places, into which the excrements of ſuch as have the plague are caſt. The company of ſuch as uſually viſite thoſe ſicke of the plague, muſt be eſchewed, as of Phyſitians, Apothecaries, Surgeons, Nurſe-Keepers, Grave-makers and Bearers. For though they have not the plague, yet comming forth of a peſtilent place, they may carry with them lying hid in their garments, the ſeedes thereof. You may gather this by ſuch as have for a little while ſtayed in a perfumers ſhoppe, for the perfume diffuſed in the aire, beſtowes the ſmel upon the garments of ſuch perſons, ſo that gone from thence, ſuch as meet them, will judge them to carry perfumes with them. They ſhall alſo ſhunne long watchings, ſound ſleeping, all paſſions of the minde, eſpecially anger, hunger, thirſt, journying in the ſun, for that hath oft-times occaſioned a diary feaver, which hath not ſeldome beene ſeene to turne into a peſtilent one, for by dilating the pores of the skinne, they have given entrance to the peſtilent aire, which by that meanes hath eaſily taken hold of the humour diſpoſed to putrefaction.

What company to be avoided.

You muſt doe nothing in a peſtilent ſeaſon whereby you may grow too hot.

CHAP. X.

Of the office of Magiſtrates in the time of the Plague.

MAgiſtrates ought to have a ſpeciall care that no filth be heaped up, either in private or publike places: let all things bee kept neat in every houſe, and let all the ſtreets be kept cleane, the dung and filth bee carried forth of the city, as alſo the dead carcaſſes of killed dogs and cats, for becauſe they oft-times licke and devoure the excrements of ſuch as have the Sickneſſe, therefore they may by their familiar entry into ſound houſes, there propagate the plague. Wherfore they muſt either be driven forth of the city, or killed, and ſo be carryed forth and buried deepe in the ground. Wells, ſprings, and rivers themſelves, muſt bee freed and cleanſed from all impurity. Care muſt bee had that muſty corne, tainted fleſh, nor ſtinking fiſh be not ſet to ſale. Publike bathes and hot-houſes muſt bee prohibited, for that in theſe, mens bodies are weakened, and made more yeelding and pervious to the peſtiferous aire. They ſhall commit the cure of ſuch as have the plague, to learned, skilfull and honeſt Phyſitians, Apothecaries, and Surgeons.

Why dogs and cats muſt be killed in a plague time.

Why Bathes and hot-houſes are not then to be allowed.

Such as are knowne to have the plague, ſhall bee ſeparated from ſuch as are free therefrom, and bee ſent to ſuch fit places as ſhall bee provided for them; for this is better and more humanely done, than to ſhut up every man in his owne houſe. They ſhall provide and foreſee that the houſhold ſtuffe of ſuch as have the plague bee not ſet to ſale. They ſhall ſet ſignes and noted markes upon the houſes ſeazed upon by this diſeaſe, leſt they ſhould unawares run into danger. Wherefore to the ſame purpoſe they ſhall procure that the Surgeons & others that viſite the ſicke of the plague may be known by ſome conſpicuous marke, that ſuch as paſſe by them may be admoniſhed of the danger; they ſhall alſo take care that the bodies of the dead be buried as ſpeedily as may be. For they ſooner & more grievouſly putrefie in a ſhort time, than the bodies of others of what death ſoever they die. Wherfore, neither birds nor ravenous beaſts dare once touch their bodies, though unburied, for by taſting them they ſhould quickly come to their deaths. The keepers of the gates of the city ſhall be admoniſhed, that they take ſpeciall care that ſuch as are infected, or come from a viſited place, doe not enter into the city, for from one, the evill may come to ſpread it ſelfe further, for one ſparke may ſet a whole city on fire, and one ſcabby ſheepe infect a whole flock. And becauſe there is nothing which may more perfectly purge

Such as dye of the plague doe quickly putrefie.

the aire, and cleanſe it from all manner of noyſomneſſe and infection, than fire, they ſhall command that there be kindled, and perpetually kept burning fires, made with odoriferous and ſtrong ſmelling things, as Juniper, Turpentine, Broome, and the like.

Lib. 2. de occult nat. mirac.

In ſtead hereof *Levinus* tells that the ſouldiers of the Garriſon of *Torney* uſed in a Plague time to diſcharge their Cannons laded onely with Powder, turning their mouths upon the city, and that morning and evening, that by the vehemency of the moved aire, the peſtiferous fogges might bee chaſed away, and by the heate of the burned powder, the venenate and noyſome quality of the aire might bee amended. Laſtly, I judge it fit to admoniſh Magiſtrates that they have their eies and mindes attentive upon a murderous and impious kinde of bearers and nurſe-keepers, which allured with a deſire of gain (which whileſt the plague reignes, they get abundantly) anoint the walls, doores, threſholds, knockers of gates and lockes with the filth and ointments taken from ſuch as have the plague, that the plague within a while after ſeazing upon theſe alſo, the maſters of them flying away, and the family diſperſed, they may there reigne alone, and freely and without puniſhment carry thence what they pleaſe, oft-times ſtrangling ſuch as lye ready to dy, leſt recovering, they might be their accuſers. This I remember happened at *Lyons*, *Anno Dom.* 1565.

The villany of ſome baſe people.

CHAP. XI.

What caution muſt bee uſed in chuſing Phyſitians, Apothecaries and Surgeons, who may have care of ſuch as are taken with the Plague.

IT is the part of Magiſtrates in the ſo great neceſſity of the afflicted common-wealth, to appoint learned, skilfull, and honeſt Phyſitians, Surgeons, and Apothecaries, and ſuch as have more regard to the law of God than to gaine, to have the care & cure of ſuch as are viſited. But principally let them not take Surgeons and Apothecaries called by proclamation with ſound of trumpet, that if they will take this charge, they ſhall become free without examination or reward. But let them rather be allured by gifts and honeſt rewards, not only then when as neceſſity urgeth, but alſo after the plague is over. For ſuch ſervant Surgeons and Apothecaries as are called by proclamation, ſo to gaine freedome, are moſt commonly unskilfull and unexperienced Dunces, who, conſcious of their owne ignorance, and fearing to undergoe the examination of the Maſters of their Companies, refuſe no hazzard, however dangerous, with deſire to obtaine their freedome.

It is farre worſe and more dangerous to fall into the hands of ſuch, than into the hands of theeves and murderers, for theſe, by providence or ſtrength, wee may chance to eſcape; but wee ſeeke for and embrace the other, and having found them, lay our throats bare unto them, ſo by their unskilfulneſſe to be butchered. Certainly by the fault of the times, and the neglect of Magiſtrates, it is almoſt come to this paſſe, that if any honeſt and learned Phyſitians and Surgeons ſhall undertake this cure, they are commonly forced thereto by the Magiſtrate for feare of baniſhment or fining. Therefore becauſe they doe it againſt their wills, they ſhew themſelves leſſe vigilant, cheerefull and painefull about the ſicke. They come unwillingly and compelled hereto, becauſe by the memory of the forepaſt time, they ſufficiently know, how ſordide and baſely Magiſtrates, when the plague hath beene overpaſt, have bin in paying the promiſed reward to men of their condition, who have ſtoutly run into danger; for thence it happens that during the reſt of their lives they may ſit idle at home, for that they are infamous and feared by the people onely for this, that a while agone they viſited ſuch as had the plague. Therefore I would have Magiſtrates prudent, faithfull, and free in chooſing honeſt, learned and skilfull men, who may undergoe this ſo difficult and dangerous a charge.

CHAP. XII.

How ſuch as undertake the cure of the Plague ought to arme themſelves.

First they muſt thinke and hold for certaine, that they are not called to this office by men, but by God, ſo directing the counſels and actions of men as he thinketh fit. Therefore they ſhall confidently enter into the cure thereof, for that our lot, life and death are in the hands of the Lord: but notwithſtanding they ought not to neglect remedies, which are given to men for prevention, leſt by neglecting the gifts of God, they may ſeem to neglect him alſo that is the giver of ſo many good and excellent benefits. Therefore firſt let them by purging and bleeding evacuate the humours ſubject to putrefaction, and to conceive the ſeeds of the peſtilence. Let them make two fontanella's by application of Cauteries to bee as rivelets to evacuate the excrementitious humours which are daily by little and little heaped up in us; let one of them bee in the right arme a little below the muſcle *Epomis*, the other the ſpace of three fingers under the knee on the inſide of the left legge. This is found by experience a very certaine meanes of prevention. Let them waſh their whole bodies with the following lotion. ℞. *aquæ roſ. aceti roſati, aut ſambucini, vini albi aut malvatici, an.* ℔. vi. *rad. enulæ camp. angelicæ, gentian. biſtortæ, Zedoar. an.* ℥iii. *baccar. juniperi, & hederæ, an.* ℥ii. *ſalviæ, roriſmar. abſinth. rutæ, an.* m.i. *corticis citri,* ℥ß. *theriacæ & mithridat. an* ℥i. *conquaſſanda conquaſſent. bulliant lento igni, & ſerventur ad uſum ante commemoratum.* The Epithemes, unguents and bags formerly deſcribed ſhall be applyed to the region of the heart. I have read it noted by *John Baptiſt Theodoſius*, that amongſt other things, Arſenick may be profitably applyed to the region of the heart, that ſo it may by little and little accuſtome it ſelfe to poyſons, that afterwards it may bee leſſe harmed by their incurſion, firſt making their aſſault upon it.

Our lots are in the hands of the Lord.

Where to make iſſues in the time of the Plague.

Cap 8.

Epiſt. 2.

Let their garments be made of Chamelet, Dutch ſarge, Satin, Taffaty, or the like. Or elſe if they cannot of theſe, let them be of ſome other handſome ſtuffe, but not of cloth, frieze or the like, that may take the venenate Aire, and carry it with them to the infection of the ſound. They ſhall oft-times change their clothes, ſhirts and other linnen, and perfume them with aromaticke things; let them warily approach to the ſicke, more warily ſpeake unto him, with their faces looking away from him, rather than towards him, ſo that they may not receive the breath of his mouth, neither the vapour nor ſmell of any of his excrements.

What to weare.

How to viſite your patients.

When as I upon a time being called to viſit one that lay ſicke of the plague, came too neare and heedleſly to him, and preſently by ſudden caſting off the cloathes, laid him bare, that ſo I might the better view a *Bubo* that hee had in his right groine, and two Carbuncles that were on his belly, then preſently a thick, filthy and putride vapour ariſing from the broken abſceſſe of the Carbuncle, as out of a raked puddle, aſcended by my noſtrils to my braine, whereupon I fainted and fell down ſenſeleſſe upon the ground; raiſed up a little after, all things ſeemed to me to run round; and I was ready to fall againe, but that I ſtayed my ſelfe by taking hold of the bed poſte. But one thing comforted mee, that there appeared no ſignes that my heart was affected, either by paine or panting, or the ſtrong and contumacious failing of my powers. An argument that the animall ſpirits were only diſſipated by a venenate vapour, and that the ſubſtance of the heart was no way wronged, was a ſneeſing which tooke me ſo violently, that I ſneeſed ten times, and then fell a bleeding at the noſe; which excretion, I beleeve freed me from all the impreſſion of the malignity. Let others warned by this mine example, learne to be wiſer and more wary in this caſe, leſt they come to a worſe miſhap than befell mee.

A hiſtory.

CHAP. XIII.

Of the ſignes of ſuch as are infected with the Plague.

Whence certain ſignes of the Plague may be taken.

WEE muſt not ſtay ſo long before wee pronounce one to have the Plague, untill there be paine and a tumour under his arme-holes, or in his groine, or ſpots (vulgarly called Tokens) appeare over all the body, or carbuncles ariſe: for many dye through the venenate malignity, before theſe ſignes appeare. Wherefore the chiefeſt and trueſt ſignes of this diſeaſe are to be taken from the heart, being the manſion of life, which chiefly and firſt of all is wont to be aſſailed by the force of the poiſon. Therfore they that are infected with the Peſtilence, are vexed with often ſwounings and fainting; their pulſe is feebler and ſlower than others, but ſometimes more frequent, but that is ſpecially in the night ſeaſon; they feele prickings over all their body, as if it were the pricking of needles; but their noſtrils doe itch eſpecially by occaſion of the maligne vapours riſing upwards from the lower and inner, into the upper parts, their breaſt burneth, their heart beateth with paine under the left dug, difficulty of taking breath, Ptiſſicke, Cough, paine of the heart, and ſuch an elation or puffing up of the *Hypocondria* or ſides of the Belly, diſtended with the abundance of vapours raiſed by the force of the feaveriſh heat, that the Patient will in a manner ſeeme to have the Timpany. They are moleſted with a deſire to vomit, and oftentimes with much and painfull vomiting, wherein green and black matter is ſeen, & alwaies of divers colours, anſwering in proportion to the excrements of the lower parts, the ſtomack being drawn into a conſent with the heart, by reaſon of the vicinity and communion of the veſſels; oftentimes bloud alone, & that pure, is excluded & caſt up in vomiting; and it is not only caſt up by vomiting out of the ſtomack, but alſo very often out of the noſtrils, fundament, and in women out of the wombe; the inward parts are often burned, and the outward parts are ſtiffe with cold, the whole heat of the Patient being drawn violently inward, after the manner of a Cupping-glaſſe, by the ſtrong burning of the inner parts; then the eye-lids waxe blew, as it were through ſome contuſion, all the whole face hath a horrid aſpect, and as it were the colour of lead, the eies are burning red, & as it were, ſwoln or puffed up with Bloud, or any other humour, ſhed teares; and to conclude, the whole habit of the body is ſomewhat changed and turned yellow.

The cauſe of vomiting in ſuch as have the Plague.

Their looks are ſuddenly changed.

Many have a burning feaver, which doth ſhew it ſelfe by the Patients ulcerated jawes, unquenchable thirſt, dryneſs and blackneſs of the tongue, and it cauſeth ſuch a phrenſie by inflaming the braine, that the patients running naked out of their beds, ſeeke to throw themſelves out of windowes into the pits and rivers that are at hand. In ſome the joynts of the body are ſo weakned, that they cannot goe nor ſtand, from the beginning they are as it were buried in a long ſwoune and deepe ſleep, by reaſon that the feaver ſendeth up to the braine the groſſe vapours from the crude and cold humours, as it were from greene Wood newly kindled to make a fire.

Why ſome that are taken with the plague are ſleepy.

Such ſleeping doth hold him eſpecially while the matter of the ſore or Carbuncle is drawne together, and beginneth to come to ſuppuration. Oftentimes when they are awaked out of ſleepe, there doe ſpots and markes appeare diſperſed over the skin, with a ſtinking ſweat. But if thoſe vapours be ſharpe that are ſtirred up unto the head, in ſtead of ſleepe they cauſe great waking, and alwayes there is much diverſitie of accidents in the urine of thoſe that are infected with the Plague, by reaſon of the divers temperature and condition of bodies: neither is the urine at all times, and in all men of the ſame conſiſtence and colour: For ſometimes they are like unto the urine of thoſe that are ſound and in health, that is to ſay, laudable in colour and ſubſtance, becauſe that when the heart is affected by the venemous Aire, that entreth in unto it, the ſpirits are more greatly grieved and moleſted than the humours: but thoſe, *i.* the ſpirits, are infected and corrupted when theſe do begin to corrupt.

Why their urines are like thoſe that are ſound.

But Urines onely ſhew the diſpoſitions of the humours or parts in which they are made, collected together, and through which they paſſe.

This reaſon ſeemeth truer to me than theirs which ſay, that nature terrefied with the malignity of the poyſon avoyds contention, and doth not reſiſt or labour to digeſt the matter that cauſeth the diſeaſe.

Many have their appetites ſo overthrowne, that they can abſtaine from meat for the ſpace of three dayes together.

And to conclude, the variety of accidents is almoſt infinite, which appear & ſpring up in this kinde of diſeaſe, by reaſon of the diverſity of the poyſon, and condition of the bodies and grieved parts: but they doe not all appeare in each man, but ſome in one, and ſome in another.

CHAP. XIIII.

What ſignes in the Plague are mortall.

IT is a moſt deadly ſigne in the Peſtilence, to have a continuall and burning Feaver, to have the tongue dry, rough, and black, to breathe with difficulty, and to draw in a great quantity of breath, but breathe out little; to talke idely; to have phrenſie and madneſſe together, with unquenchable thirſt and great watching; to have Covulſions, the Hicket, heart-beating, and to ſwoune very often and vehemently; further, toſſing and turning in the bed, with a loathing of meats, and daily vomits of a greene, blacke and bloudy colour; and the face pale, blacke, of a horrid and cruell aſpect, bedewed with a cold ſweat, are very mortall ſignes.

There are ſome which at the very beginning have ulcerous and painefull wearineſſe, pricking under the skin, with great torment of paine; the eyes looke cruelly and ſtaringly, the voyce waxeth hoarſe, the tongue rough and ſtutting, and the underſtanding decaying, the Patient uttereth and talketh of frivolous things. Truely thoſe are very dangerouſly ſicke, no otherwiſe than thoſe whoſe urine is pale, black, and troubled like unto the urine of carriage beaſts, or Lye, with divers coloured clouds or contents, as blew, greene, black, fatty and oylie, as alſo reſembling in ſhew a Spiders Web, with a round body ſwimming on the top.

An ulcerous & painefull wearineſſe from the beginning ſheweth the Plague to be deadly.

If the fleſh of the carbuncle be dry and blacke, as it were ſeared with a hot iron, if the fleſh about it be blacke and blew, if the matter doe flow back, and turne in, if they have a laske with greatly ſtinking, liquid, thin, clammy, blacke, greene or blewiſh ordure; if they avoyd wormes by reaſon of the great corruption of the humours, and yet for all this the patient is never the better; if the eies waxe often dim, if the noſtrils bee contracted or drawne together, if they have a grievous crampe, the mouth bee drawne aſide, the muſcles of the face being drawn or contracted equally or unequally; if the nailes be blacke; if they be often troubled with the Hicket, or have a Convulſion and reſolution over all the body, then you may certainly prognoſticate that death is at hand, and you may uſe Cordiall medicines onely, but it is too late to purge or let bloud.

CHAP. XV.

Signes of the Plague comming by contagion of the Aire without any fault of the humours.

YOU ſhall underſtand that the Peſtilence proceeds from the corruption of the aire, if it be very contagious, and diſperſe it ſelfe into ſundry places in a moment. If it kill quickly and many, ſo that whileſt ſundry perſons goe about their uſuall buſineſſe, walke in the places of common reſort and through the ſtreets, they ſuddenly fall downe and dye, no ſigne of the diſeaſe or harme appearing, nor any paine oppreſſing them; for the malignity of the corrupt Aire is quick and very ſpeedy in infecting our ſpirits, overthrowing the ſtrength of the heart and killing the patient. The patients are not troubled with great agitation, becauſe the ſpirits diſſipated by the rapid malignity of the poyſon, cannot endure that labour; beſides they are taken with frequent ſwouning, few of them have Bubo's, few have Blains come forth; and by the ſame reaſon their urines are like to thoſe of ſound men.

Why they have no ſores.

CHAP. XVI.

Signes of the Plague drawne into the body by the fault and putrefaction of humours.

Formerly we have reckoned up the cauſes of the corruption of humours from plenitude, obſtruction, diſtemper, and the ill juice of meats. Now muſt wee deliver the ſignes of each corrupt humour which reignes in us, that it may be reduced to ſoundneſſe and perfection of nature by the oppoſition of its contrary, or elſe bee evacuated by phyſick. Therefore if the body be more yellow than uſuall, it is a ſigne of choler offending in quantity and quality. If more black, then of melancholy; if more pale, then of phlegme; if more red, with the veines ſwolne up and full, then of bloud. Alſo the colour of the riſing blaines, tumours and ſpots, expreſſe the colour of the predominant humour, as alſo the excrements caſt forth by vomit, ſtoole and otherwiſe; the heavineſſe and cheerfulneſſe of the affected body; the manner of the preſent feaver; the time of the year, age, region, diet. Such things as have a cutting, penetrating, attenuating, and cleanſing faculty, take away obſtruction. By meanes of obſtruction feavers oft-times accompany the Plague, and theſe not onely continuall, but alſo intermitting, like tertians or quartaines. Therefore that Plague that is fixed in the infection or corruption of a cholericke humour, ſhewes it ſelfe by the forementioned ſignes of predominating choler, to wit, the heate of the skin, blaines and excrements, as alſo in the quickneſſe of killing, and vehemency of the ſymptomes, bitterneſſe of the mouth, a painefull and continuall endeavour of going to ſtool, by reaſon of the acrimony of choler ſtimulating and raking the guts in the paſſage forth. That which reſides in the corrupt ſubſtance of groſſe humours, as of bloud, ſheweth it ſelfe by many and plentifull ſweats, by a ſcowring, by which are avoyded many and various humours; and ofttimes alſo bloudy matter that proceeds from corrupt phlegme, it invades with more ſound ſleep, & a cauſeleſs wearineſs of all the members; when they are awakened out of their ſleepe, they are not ſeldome troubled with a trembling over all their joints, the entrance and way of the ſpirits into the members being obſtructed by the groſſeneſſe of the humours. That which is ſeated in the corruption of a melancholy humour, is accompanied with heavineſſe and paine of the head, much penſiveneſſe, a deep and ſmall pulſe. But the moſt certaine ſigne of the Plague reſiding in the corruption of the humours, is to bee taken from the urine. For the ſignes of the vitiated humours cannot but ſhew themſelves in the urines: therefore troubled urines, and ſuch as are like thoſe of carriage beaſts, as alſo blacke and greene, give certaine notice thereof. But ſome are much troubled with thirſt, others not at all, becauſe choler or Phlegme ſometimes onely putrefie in the ſtomacke or orifice of the ventricle, ſometimes beſides they will weaken the governement of the naturall faculties of the part, as of the appetite. But if the feaver happen by the default and infection both of the Aire and Humours, then will there bee a great confuſion of the forementioned ſignes and ſymptomes.

Signes of choler.

When the urine is to be looked upon.

Why ſome are much troubled with thirſt, others not at all.

CHAP. XVII.

Of the Prognoſtication that is to be inſtituted in the Plague.

YOU may well fore-tell the future motions and events of diſeaſes, when you throughly know the nature of the diſeaſe, and accidents thereof, and the condition, function, and excellency of the body and grieved parts: Although that this may bee ſpoken in generall, That there is no certaine prediction in piſtilent diſeaſes, either to health or death, for they have very unconſtant motions, ſometimes ſwift and quick, ſometimes ſlow, and ſometimes choaking or ſuffocating in a moment, while one breathes in the venemous Aire, as hee is going about any of his neceſſary affaires, having puſtles riſing in the skin with ſharpe pain, and as though the whole body were pricked all over with needles, or the ſtings of Bees. Which I have ſeene with mine eyes in the Plague that was at Lyons when *Charles* the French King lay there. It many times commeth to paſs that the accidents that were very vehement and raging a little before, are ſuddenly aſſwaged, and the patients doe thinke themſelves better, or almoſt perfectly ſound. Which happened to *Mary* one of the Queene-Mother her Mayds, in that notable peſtilent conſtitution of the Aire, that yeare when *Charles* the French King lay at the Caſtle of Roſſilion: For when ſhe was infected, a great tumour or *Bubo* aroſe in her groine, and ſuddenly it went in againe, ſo that the third day of her ſickneſſe, ſhe ſaid ſhe was without any griefe or diſeaſe at all, but that ſhee was ſomewhat troubled with a difficulty of making water; and I think it was becauſe the bladder was enflamed by the refluxe of the matter; but ſhee was ſound in mind and body, and walked up and downe the Chamber on the ſame day that ſhe died. The ſtrangeneſſe of which thing made the King ſo fearfull, that he haſted to depart thence.

No certain prediction in the Plague.

A hiſtory.

Although this diſeaſe doth ſpare no man, of what age, temperature, complexion, diet and condition ſoever, yet it aſſaulteth young men that are cholericke and ſanguine, more often than old men that are cold and dry, in whom the moyſture that is the nouriſher of putrefaction by reaſon of their age is conſumed, and the wayes, paſſages and pores of the skin, whereby the venemous Aire ſhould enter and pierce in, are more ſtrait and narrow. And moreover, becauſe old men doe alwayes ſtay at home, but young men for their neceſſary buſineſſe, and alſo for their delight and pleaſure, are alwayes abroad in the day time, in the Aire, where-hence the pollution of the peſtilence commeth more often.

Why young men ſooner take the Plague than old.

That peſtilence that comes by the corruption of the humours, is not ſo contagious as that which commeth by the default of the Aire. But thoſe that are phlegmatick and melancholy, are moſt commonly grieved with that kinde of peſtilence, becauſe in them the humours are more clammy and groſſe, and their bodies more cold and leſſe perſpirable, for which cauſes the humours ſooner and more ſpeedily putrefie.

What Plague moſt contagious.

Men that are of an ill juice are alſo moſt apt to this kinde of peſtilence, for in the naughty quality of the juice there is a great preparation of the humours unto putrefaction: You may know it by this, that when the peſtilence raigneth, there are no other diſeaſes among the common people, which have their original of any ill juice, but they all degenerate into the Plague. Therefore when they begin to appeare and wander up and downe, it is a token that the peſtilence will ſhortly ceaſe, or is almoſt at an end.

But here alſo I would have you to underſtand thoſe to bee of an ill juice, which have no pores in their skin, by which, as it were by rivers, the evill juice which is contrary to nature, may be evacuated and purged. And I have noted and obſerved, that thoſe are leſſe in danger of the Peſtilence which have cancerous ulcers and ſtinking ſores in their noſes, and ſuch as infected with the French Pocks, have by reaſon thereof, tumours and rotten ulcers, or have the Kings evill running upon them, the Leproſie or the Scab: and to conclude, all thoſe that have fiſtulous and running ulcers in their bodies.

Who leaſt ſubject to take the Plague.

I thinke thoſe that have quartaine Feavers are the better priviledged for the ſame, becauſe that by the Fit cauſing ſweat, that commeth every fourth day, they avoyd much of the evill juice that was engendered.

This is more like to bee true, than to thinke that the poyſon that commeth from without, may be driven away by that which lurketh within.

Who ſubject thereto.

Contrariwiſe, women that are great with child, as I have noted, becauſe they have much ill juice, being prohibited from their accuſtomed evacuations, are very apt to take this diſeaſe, and do ſeldome recover after they are infected.

Signes that the diſeaſe is incurable.

Blacke or blew impoſtumes, and ſpots and puſtles of the ſame colour, diſperſed over the skin, argue that the diſeaſe is altogether incurable and mortall.

A good ſigne.

When the ſwelling or ſore goeth or commeth before the feaver, it is a good ſigne, for it declareth that the malignity is very weak and feeble, and that nature hath overcome it, which of it ſelfe is able to drive ſo great portion thereof from the inner parts. But if the ſore or tumour come after the feaver, it is a mortall and deadly ſigne, for it is certaine that it commeth of the venemous matter not tranſlated, but diſperſed, not by the victory of nature, but through the multitude of the matter, with the weight whereof nature is overcome.

A deadly ſigne.

When the Moone decreaſeth, thoſe that are infected with the Peſtilence are in great doubt and danger of death, becauſe then the humours that were collected and gathered together before the full of the Moone, through delay and abundance, do ſwell the more, and the faculties by which the body is governed, become more weake and feeble, becauſe of the imbecility of the native heate, which before was nouriſhed and augmented by the light, and ſo conſequently by the heat of the full Moon: For as it is noted by *Ariſtotle*, the wainings of the Moone are more cold and weak: and thence it is that women have their menſtruall fluxes chiefly or moſt commonly at that time.

In what aire moſt contagious.

In a groſſe and cloudy Aire the peſtilent infection is leſs vehement and contagious than in a thin and ſubtle Aire; whether that thinneſſe of the Aire proceed from the heat of the Sun, or from the North wind & cold. Therfore at *Paris*, where naturally, and alſo through the abundance of filth that is about the Citie, the Aire is darke and groſſe, the peſtilent infection is leſſe fierce and contagious than it is in *Province*, for the ſubtlety of the Aire ſtimulates or helps forward the Plague.

But this diſeaſe is mortall and pernicious whereſoever it bee, becauſe it ſuddenly aſſaulteth the heart, which is the Manſion, or as it were the fortreſſe or caſtle of life: but commonly not before the ſignes and tokens of it appeare on the body: and yet you ſhall ſcarce find any man that thinketh of calling the Phyſitian to helpe to preſerve him from ſo great danger before the ſignes thereof be evident to bee ſeene and felt: but then the heart is aſſaulted. And when the heart is ſo aſſaulted, what hope of life is there, or health to be looked for? Therefore becauſe medicines come ofttimes too late, and this malady is as it were a ſudden and winged meſſenger of our death, it commeth to paſſe that ſo many dye thereof. And moreover, becauſe at the firſt ſuſpicion of this ſo dire and cruell a diſeaſe, the imagination and minde (whoſe force in the diverſly ſtirring up of the humours is great and almoſt incredible) is ſo troubled with feare of imminent death, and diſpaire of health, that together with the perturbed humours, all the ſtrength and power of nature falleth and ſinketh downe.

What effects feare and confidence produce in the Plague.

This you may perceive and know, by reaſon that the keepers of ſuch as are ſicke, and the bearers which are not fearefull, but very confident, although they doe all the baſeſt offices which may be for the ſick, are commonly not infected, and ſeldome dye thereof if infected.

CHAP.

Chap. XVIII.

How a peſtilent feaver comes to be bred in us.

THe Plague oft-times findeth fuel in our bodies, and oft-times allurements, to wit, the putrefaction of humours, or aptneſſe to putrefie: but it never thence hath its firſt originall, for that comes alwaies from the defiled aire; therefore a peſtilent feaver is thus bred in us: The peſtilent Aire drawne by inſpiration into the lungs, and by tranſpiration into the utmoſt mouthes of the veines and arteries ſpread over the skin, the bloud or elſe the humours already putrefying or apt to putrefie therein, are infected and turned into a certaine kind of malignity reſembling the nature of the agent. Theſe humours, like unquencht lime when it is firſt ſprinkled with water, ſend forth a putride vapour, which carryed to the principall parts and heart eſpecially, infecteth the ſpirituous bloud boyling in the ventricles thereof, and therewith alſo the vitall ſpirits; and hence proceeds a certaine feaveriſh heat. This heat diffuſed over the body by the arteries, together with a maligne quality, taints all, even the ſolid parts of the bones with the peſtiferous venome, and beſides, cauſeth divers ſymptomes, according to the nature thereof, and the condition of the body and humours wherein it is. Then is the conflict of the malignity aſſailing, & nature defending, manifeſt, in which if nature prevaile, it, uſing the help of the expulſive faculty, will ſend & drive it far from the noble parts, either by ſweats, vomits, bleeding, evacuation by ſtoole or urine, buboes, carbuncles, puſtles, ſpots, and other ſuch kinds of breakings out over the skin. But on the contrary, if the malignity prevaile, and nature be too weake, and yeeld, and that firſt he be troubled with often panting or palpitation of the heart, then preſently after with frequent faintings, the patient then at length will dye. For this is a great ſigne of the Plague or a peſtilent Feaver, if preſently at the firſt, with no labour, nor any evacuation worth the ſpeaking of, their ſtrength faile them, and they become exceeding faint. You may find the other ſignes mentioned in our preceding diſcourſe.

The originall of the Plague alwaies from the Aire.

Signes that nature is orecome.

Chap. XIX.

Into what place the Patient ought to betake himſelfe ſo ſoone as he finds himſelfe infected.

WEE have ſaid that the perpetuall and firſt originall of the peſtilence commeth of the Aire, therefore ſo ſoone as one is blaſted with the peſtiferous Aire, after he hath taken ſome preſervative againſt the malignity thereof, hee muſt withdraw himſelfe into ſome wholeſome Aire, that is, cleane and pure from any venemous infection or contagion, for there is great hope of health by the alteration of the Aire; for we doe moſt frequently and abundantly draw in the Aire of all things, ſo that we cannot want it for a minute of time: therefore of the Aire that is drawne in, dependeth the correction, amendment, or increaſe of the Poyſon or malignity that is received, as the Aire is pure, ſincere or corrupted.

Change of the Aire conduceth to the cure of the Plague.

There bee ſome that doe think it good to ſhut the patient in a cloſe Chamber, ſhutting the windowes to prohibite the entrance of the Aire as much as they are able: But I thinke it more convenient that thoſe windowes ſhould bee open from whence that wind bloweth that is directly contrary unto that which brought in the venemous Aire: For although there be no other cauſe, yet if the Aire bee not moved, or agitated, but ſhut up in a cloſe place, it will ſoone bee corrupted. Therefore in a cloſe and quiet place that is not ſubject to the entrance of the Aire, I would wiſh the patient to make wind, or to procure Aire with a thick and great cloth dipped or macerated in water and vinegar mixed together, and tyed to a long Staffe, that by toſſing it up and downe the cloſe chamber, the wind or aire thereof may coole and re-

Aire pent up is apt to putrefie.

create the patient. The patient muſt every day bee carried into [illegible] chamber, a the beds and the linnen cloaths muſt be changed: there muſt alwaies be a cleare a bright fire in the patients chamber, and eſpecially in the night, whereby the aire ma be made more pure, cleane, and voyd of nightly vapours, and of the filthy and peſti lent breath proceeding from the patient, or his excrements. In the meane time, le (if it be in hot weather) the patient ſhould be weakened or made more faint by rea ſon that the heat of the fire doth diſperſe and waſt his ſpirits, the Floor or ground o the chamber muſt bee ſprinkled or watered with vinegar and water, or ſtrowed wit the branches of vines made moiſt in cold water, with the leaves and flowers of Wa ter-lillyes, or Poplar, or ſuch like. In the fervent heat of ſummer hee muſt abſtaine from Fumigations that doe ſmell too ſtrongly, becauſe that by aſſaulting the head, they encreaſe the paine.

If the patient could goe to that coſt, it weregood to hang all the chamber where he lyeth, and alſo the Bed, with thicke or courſe linnen cloaths moiſtened in vinegar and water of Roſes. Thoſe linnen cloaths ought not to be very white, but ſomewhat browne, becauſe much and great whiteneſſe doth diſperſe the ſight, and by waſting the ſpirits, doth encreaſe the paine of the head: for which cauſe alſo the Chamber ought not to bee very lightſome.

Contrariwiſe, on the night ſeaſon there ought to bee fires and perfumes made, which by their moderate light, may moderately call forth the ſpirits.

The materials for ſweet fires.

Sweet fires may be made of little pieces of the wood of Juniper, Broom, Aſh, Tamarisk, of the rinde of Oranges, Lemmons, Cloves, Benzoin, gum Arabick, Orris roots, Mirrhe, groſſely beaten together, and layd on the burning coals put into a chafing diſh. Truely the breath or ſmoake of the wood or berries of Juniper, is thought to drive ſerpents a great way from the place where it is burnt. The vertue of the Aſh-tree againſt venome is ſo great, as *Pliny* teſtifieth, that a ſerpent will not come under the ſhadow thereof, no not in the morning nor evening, when the ſhaddow of any thing is moſt great and long, but ſhe will runne from it. I my ſelfe have proved that if a circle or compaſſe bee made with the boughes of an Aſh-tree, and a fire made in the midſt thereof, and a ſerpent put within the compaſſe of the boughs, that the ſerpent will rather runne into the fire than through the Aſh boughes.

Lib. 16. cap 13.

There is alſo another meanes to correct the Aire. You may ſprinkle vinegar of the decoction of Rue, Sage, Roſemary, Bay berries, Juniper berries, *Cyperus* nuts, & ſuch like, on ſtones or bricks made red hot, and put in a pot or pan, that all the whole chamber where the patient lyeth may be perfumed with the vapour thereof.

Perfumes.

Alſo fumigations may bee made of ſome matter that is more groſſe and clammy, that by the force of the fire the fume may continue the longer, as of *Ladanum*, Myrrhe, Maſticke, Roſine, Turpentine, Storax, *Olibanum*, Benzoin, Bay berries, Juniper berries, Cloves, Sage, Roſemary, and Marjoram, ſtamped together, and ſuch like.

Sweet candles.

Thoſe that are rich and wealthy may have Candles and Fumes made of waxe, or Tallow mixed with ſome ſweet things.

A ſponge macerated in Vinegar of Roſes, and Water of the ſame, and a little of the decoction of Cloves, and of Camphire added thereto, ought alwaies to be ready at the patients hand, that by often ſmelling unto it, the animall ſpirits may be recreated and ſtrengthened.

A ſweet water to ſmell to.

The water following is very effectuall for this matter. Take of Orris, foure ounces; of Zedoarie, Spikenard, of each ſixe drammes; of Storax, Benzoin, Cinamon, Nutmegs, Cloves, of each one ounce and a halfe; of old Treacle, halfe an ounce: bruiſe them into a groſſe pouder, and macerate them for the ſpace of twelve houres in foure pound of white and ſtrong wine, then diſtill them in a Limbeck of glaſſe on hot aſhes, and in the diſtilled liquor wet a ſponge, and then let it be tyed in a linnen cloath, or cloſed in a boxe, and ſo often put unto the noſtrills. Or take of the vinegar and water of roſes, of each foure ounces; of Camphire, ſixe graines; of Treacle, half a dram: let them be diſſolved together, and put into a viall of glaſſe, which the patient may often put unto his noſe.

A *Nodula* to ſmell to.

This *Nodula* following is more meet for this matter. Take of Roſe leaves, two pugils; of Orris halfe an ounce; of *Calamus Aromaticus*, Cynamon, Cloves, of each two drammes; of Storax and Benzoin, of each one dramme and a halfe; of *Cyperus*, halfe a dramme: beat them into a groſſe pouder, make thereof a *Nodula* betweene two pieces of Cambricke or Lawne of the bigneſſe of an hand-ball, then let it bee moiſtened in eight ounces of Roſe water, and two ounces of Roſe vinegar, and let the patient ſmell unto it often. Theſe things muſt be varied according to the time: For in the Summer you muſt uſe neither Muske nor Civet, nor ſuch like hot things: and moreover women that are ſubject to fits of the Mother, and thoſe that have Feavers or the head-ach, ought not to uſe thoſe things that are ſo ſtrong ſmelling & hot, but you muſt make choice of things more gentle: Therefore things that are made with a little Camphire and Cloves bruiſed and macerated together in Roſe water & vinegar of Roſes, ſhall be ſufficient.

Chap. XX.

What Diet ought to be obſerved, and firſt of the choice of Meat.

The order of diet in a peſtilent diſeaſe ought to bee cooling and drying; not ſlender, but ſomewhat full. Becauſe by this kinde of diſeaſe there commeth waſting of the ſpirits, and exolution of the faculties, which inferreth often ſwouning, therefore that loſſe muſt be repaired as ſoone as may be with more quantity of meates that are of eaſie concoction and digeſtion. Therfore I never ſaw any being infected with the peſtilence that kept a ſlender diet, that recovered his health, but died; and few that had a good ſtomacke, and fed well, dyed.

Why ſuch as have the plague may feed more fully.

Sweet, groſſe, moiſt and clammy meates, and thoſe which are altogether, and exquiſitely of ſubtle parts, are to be avoyded; for the ſweet do eaſily take fire, and are ſoone enflamed; the moiſt will putrefie; the groſſe and clammy obſtruct, and therefore engender putrefaction; thoſe meats that are of ſubtle parts, over-much attenuate the humours, and enflame them, and doe ſtirre up hot and ſharp vapours into the braine, whereof commeth a Feaver. Therefore wee muſt eſchew Garlike, Onions, Muſtard, ſalted and ſpiced Meats, and all kind of Pulſe muſt alſo be avoided, becauſe they engender groſſe winds, which are the authors of obſtruction: but the decoction of them is not alwayes to be refuſed, becauſe it is a provoker of urine. Therefore let this bee their order of diet: let their bread bee of Wheat or Barly, well wrought, well leavened and ſalted, neither too new nor too ſtale: let them bee fed with ſuch meat as may be eaſily concocted and digeſted, & may engender much laudable juice, and very little excrementall, as are the fleſh of Wether-lambs, Kids, Leverets, Pullets, Partridges, Pigeons, Thruſhes, Larkes, Quailes, Blacke-Birds, Turtle-Doves, Moor-Hennes, Pheaſants, and ſuch like, avoyding water-Fowles. Let the Fleſh be moiſtened in Ver-juice of unripe Grapes, Vinegar, or the juice of Lemmons, Oranges, Cytrons, tart Pomegranates, Barberries, Gooſe-berries, or red Currance, or of garden, & wild ſorrell: for all theſe ſowre things are very wholeſome in this kinde of diſeaſe, for they doe ſtirre up the appetite, reſiſt the venemous quality and putrefaction of the humours, reſtraine the heat of the Feaver, and prohibit the corruption of the meates in the ſtomacke. Although that thoſe that have a more weake ſtomacke, and are endued with a more exact ſenſe, and are ſubject to the Cough and diſeaſes of the Lungs, muſt not uſe theſe, unleſſe they be mixed with Sugar and Cynamon.

Pulſe muſt be ſhunned.

The manner of diet.

If the patient at any time be fed with ſodden meats, let the brothes be made with Lettuce, Purſlaine, Succory, Borage, Sorrell, Hops, Bugloſſe, Creſſes, Burnet, Marigolds, Chervill, the cooling Seeds, french Barly and Oatmeale, with a little Saffron, for Saffron doth engender many ſpirits, and reſiſteth poyſon. To theſe opening roots may be added for to avoid obſtruction; yet much broath muſt be refuſed by reaſon of moiſture. The fruit of Capers eaten in the beginning of the Meale provoke the appetite, and prohibit obſtructions, but they ought not to bee ſeaſoned with over-much Oyle and Salt, they may alſo with good ſucceſſe bee put into Broaths.

Fiſhes are altogether to be avoyded, becauſe they ſoon corrupt in the Stomack: but if the patient be delighted with them, thoſe that live in ſtony places muſt be choſen, that is to ſay, thoſe that live in pure and ſandy water, & about rocks and ſtones, as are Trouts, Pikes, Pearches, Gudgions, and Craviſes boyled in milk, Wilks, and ſuch like. And concerning Sea-fiſh, he may be fed with Giltheads, Gurnarts, with all the kinds of Cod-fiſh, Whitings not ſeaſoned with ſalt, and Turbuts.

Egges potched and eaten with the juice of Sorrell, are very good. Likewiſe Barly water ſeaſoned with the graines of a tart Pomegranate, and if the Feaver be vehement, with the ſeeds of white Poppy. Such Barly water is eaſie to be concocted and digeſted, it cleanſeth greatly, and moiſtens and mollifieth the belly. But in ſome it procures an appetite to vomit, and paine of the head, and thoſe muſt abſtaine from it. But inſtead of barly water they may uſe pap, and bread crummed in the decoction of a Capon.

For the ſecond courſe.

For the ſecond courſe, let him have raiſons of the Sunne newly ſodden in Roſe water with Sugar, ſoure Damaske Prunes, tart Cherries, Pippins, and Katharine Peares.

In the end of the meale.

And in the latter end of the Meale, Quinces roaſted in the Embers, Marmelate of Quinces, and conſerves of Bugloſſe or of Roſes, and ſuch like, may be taken: or elſe this pouder following.

Take of Coriander ſeeds prepared, two drams; of Pearle, Roſe leaves, ſhavings of Hartſ-horne and Ivory, of each halfe a dram; of Amber two ſcruples; of Cinamon one ſcruple; of Unicornes horne, and the bone in a Stagges heart, of each half a ſcruple; of Sugar of Roſes, foure ounces: Make thereof a pouder, and uſe it after meats.

If the patient be ſomewhat weake, he muſt be fed with Gelly made of the fleſh of a Capon, and Veale ſodden together in the water of Sorrell, *Carduus benedictus*, with a little quantity of Roſe vinegar, Cynamon, Sugar, and other ſuch like, as the preſent neceſſity ſhall ſeeme to require.

In the night ſeaſon for all events and miſchances, the patient muſt have ready prepared broath of meats of good digeſtion, with a little of the juice of Citrons or Pomegranates.

A reſtaurative drinke.

This reſtaurative that followeth may ſerve for all. Take of the conſerve of Bugloſſe, Borage, Violets, Water-lillies, and Succory, of each two ounces; of the pouder of the Electuary *Diamargaritum Frigidum*, of the Trochiſces of Camphire, of each three drams: of Citron ſeeds, *Carduus* ſeeds, Sorrell ſeeds, the rootes of *Diptamnus*, Tormentill, of each two drammes; of the broath of a young Capon, made with Lettuce, Purſlaine, Bugloſſe and Borage boiled in it, ſixe pints,; put them in a Lembecke of glaſſe with the fleſh of two Pullets, of ſo many Partridges, and with fifteene leaves of pure gold: make thereof a deſtillation over a ſoft fire. Then take of the diſtilled liquor, half a pint, ſtraine it through a woollen bagge, with two ounces of white Sugar, and halfe a dram of Cynamon: let the patient uſe this when he is thirſtie. Or elſe put the fleſh of one old Capon, and of a legge of Veale, two minced Partridges, and two drammes of whole Cinamon without any liquor, in a lembecke of glaſſe, well luted and covered, and ſo let them boile in *Balneo Mariæ* unto the perfect concoction. For ſo the fleſhes will bee boiled in their owne juice, without any hurt of the fire; then let the juice bee preſſed out therehence with a preſſe: give the patient for every doſe, one ounce of the juice with ſome cordiall waters, ſome *Triſantalum*, and *Diamargaritum frigidum*.

The preſerves of ſweet fruits are to bee avoided, becauſe that ſweet things turne into choler; but the confection of tart prunes, Cherries, and ſuch like may bee fitly uſed. But becauſe there is no kinde of ſickeneſſe that ſo weakens the ſtrength, as the plague; it is alwaies neceſſary, but yet ſparingly and often, to feed the patient, ſtill having reſpect unto his cuſtome, age, the region, and the time: for through emptineſſe there is great danger, leſt that the venemous matter that is driven out to the ſuperficiall parts of the body, ſhould be called backe into the inward parts, by an hungry

gry

grie ſtomacke, an d the ſtomacke it ſelfe ſhould bee filled with cholericke, hot, thin, and ſharp excrementall humours, whereof commeth biting of the ſtomack, and gripings in the guts.

Chap. XXI.

What drinke the Patient infected ought to uſe.

IF the feaver be great and burning, the patient muſt abſtain from wine, unleſſe that he be ſubject to ſwouning: and he may drinke the *Oxymel* following in ſtead thereof.

An Oxymel.

Take of faire water, three quarts, wherein boyle foure ounces of hony untill the third part bee conſumed, ſcumming it continually; then ſtrain it, and put it into a cleane veſſell, and adde thereto four ounces of vinegar, and as much cinamon as will ſuffice to give it a taſt. Or elſe a ſugred water, as followeth. Take two quarts of faire water, of hard ſugar, ſixe ounces, of cinamon, two ounces, ſtrain it through a woollen bagge or cloth without any boiling; and when the patient will uſe it, put thereto a little of the juice of Citrons. The ſyrupe of the juice of Citrons excelleth amongſt all others that are uſed againſt the peſtilence.

A Julep.

The uſe of the Julep following is alſo very wholſome. Take of the juice of Sorrell well clarified, halfe a pint, of the juice of Lettuce ſo clarified, foure ounces, of the beſt hard ſugar, one pound, boile them together to a perfection, let them bee ſtrained and clarified, adding a little before the end a little vinegar, let it be uſed betweene meales with boyled water, or with equall portions of the water of Sorrell, Lettuce, Scabious and Bugloſſe: or take of this former deſcribed Julep ſtrained and clarified foure ounces, let it be mixed with one pound of the forenamed cordiall waters, and boile them together a little. And when they are taken from the fire, put thereto of yellow Sanders one dram, of beaten Cinamon halfe a dram, ſtrain it through a cloth: when it is cold let it be given the patient to drink with the juice of Citrons.

Thoſe that have accuſtomed to drink Sider, Perry, Beer or Ale, ought to uſe that drink ſtill, ſo that it be clear, tranſparent, and thin, and made of thoſe fruits that are ſomwhat tart; for troubled & dreggiſh drink doth not only engender groſſe humors, but alſo crudities, windineſs, and obſtructions of the firſt region of the body, whereof comes a feaver.

The commodities of oxycrate.

To whom hurtfull,

Oxycrate being given in manner following, doth aſſwage the heat of the feaver, and repreſſe the putrefaction of the humours, and the fierceneſſe of the venome, and alſo expelleth the water through the veines, if ſo bee that the patients are not troubled with ſpitting of blood, cough, yexing, and altogether weake of ſtomacke: for ſuch muſt avoyd all tart things.

Take of faire water, one quart; of white or red vinegar three ounces; of fine Sugar, foure ounces; of ſyrup of Roſes, two ounces: boile them a little, and then give the patient thereof to drinke. Or take of the juice of Lemmons & Citrons, of each halfe an ounce; of juice of foure Pomegranates, two ounces; of the water of Sorrell and Roſes, of each one ounce; of faire water boyled, as much as ſhall ſuffice: make thereof a Julep, and uſe it betweene meales. Or take of Sirupe of Lemmons and of red Currance, of each one ounce; of the water of lillies, foure ounces; of faire water boyled, halfe a pinte; make thereof a Julep. Or take of the ſyrups of water Lillies, and vinegar, of each half an ounce, diſſolve it in five ounces of the water of Sorrell; of faire water one pinte: make thereof a Julep.

The drinking of cold water, to whom & when profitable.

But if the patient be young, and have a ſtrong and good ſtomacke, and cholericke by nature, I thinke it not unmeet for him to drinke a full and large draught of fountaine water cold; for that is effectuall to reſtraine and quench the heat of the Feaver, and contrariwiſe, they that drinke cold water often, and a very ſmall quantity at a time, as the Smith doth ſprinkle water on the fire at his Forge, doe encreaſe the heat

Lib. 3. cap. 7.

and burning, and thereby make it endure the longer. Therfore by the judgment of *Celſus*, when the diſeaſe is in the chiefe encreaſe, and the patient hath endured thirſt for the ſpace of three or four daies, cold water muſt be given unto him in great quantity, ſo that he may drink paſt his ſatiety, that when his belly and ſtomacke are filled beyond meaſure, and ſufficiently cooled, he may vomit.

Some doe not drinke ſo much thereof as may cauſe them to vomit, but do drinke even unto ſatiety, and ſo uſe it for a cooling medicine; but when either of theſe is done, the patient muſt bee covered with many cloaths, and ſo placed that hee may ſleepe; and for the moſt part, after long thirſt and watching, and after long fulneſſe, and long and great heat, ſound ſleep commeth, by which great ſweat is ſent out, and that is a preſent helpe.

But thirſt muſt ſometimes be quenched with little pieces of Melons, Gourds, Cucumbers, with the leaves of Lettuce, Sorrell, and Purſlaine, made moiſt or ſoked in cold water, or with a little ſquare piece of a Citron, Lemmon, or Orange macerated in Roſe water, & ſprinkled with Sugar, and ſo held in the mouth, and then changed.

But if the patient be aged, his ſtrength weak, flegmatick by nature, & given to wine, when the ſtate of the Feaver is ſomewhat paſt, and the chiefe heat beginning to aſſwage, he may drink wine very much allayed at his meat, for to reſtore his ſtrength, and to ſupply the want of the waſted ſpirits. The patient ought not by any meanes to ſuffer great thirſt, but muſt mitigate it by drinking, or elſe allay it by waſhing his mouth with oxycrate and ſuch like, and he may therein alſo waſh his hands and his face, for that doth recreate the ſtrength. If the fluxe or laſk trouble him, he may very well uſe to drinke ſteeled water, and alſo boyled milke, wherein many ſtones comming red hot out of the fire have beene many times quenched.

For dryneſſe or roughneſſe of the mouth.

For the dryneſſe and roughneſſe of the mouth, it is very good to have a cooling, moiſtening and lenifying lotion of the mucilaginous water of the infuſion of the ſeeds of Quinces, *pſilium, id eſt*, Flea-wort, adding thereto a little Camphire, with the Water of Plantain and Roſes; then cleanſe and wipe out the filth, and then moiſten the mouth, by holding therein a little oile of ſweete Almonds mixed with a little ſyrupe of Violets.

For the Ulcers thereof.

If the roughneſſe breed or degenerate into Ulcers, they muſt be touched with the water of the infuſion of ſublimate, or *Aqua fortis*.

But becauſe wee have formerly made frequent mention of drinking of water, I have here thought good to ſpeake ſomewhat of the choice and goodneſſe of waters.

The choice of waters.

The choice of waters is not to be neglected, becauſe a great part of our diet depends thereon, for beſides that we uſe it either alone, or mixed with wine for drink, we alſo knead bread, boile meat, and make broaths therewith. Many thinke that rain water which falls in ſummer, and is kept in a ciſterne well placed and made, is the wholeſomeſt of all. Then next thereto they judge that ſpring water which runnes out of the tops of mountaines, through rocks, cliffes and ſtones: in the third place they put Well water, or that which riſeth from the foots of hils. Alſo the river water is good that is taken out of the midſt of ſtreame. Lake or pond water is the worſt, eſpecially if it ſtand ſtill; for ſuch is fruitfull of and ſtored with many venemous creatures, as Snakes, Toads, and the like. That which comes by the melting of Snow and Ice is very ill, by reaſon of the too-refrigerating faculty and earthy nature. But of ſpring and well waters theſe are to be judged the beſt, which are inſipide, without ſmell, & colour; ſuch as are cleare, warmiſh in winter, and cold in ſummer, which are quickly hot and quickly cold, that is, which are moſt light, in which all manner pulſe, turneps, and the like, are eaſily and quickly boyled.

Hip. ſect. 5. aphor. 26.

Laſtly, when as ſuch as uſually drink thereof, have cleer voices and ſhrill, their cheſts ſound, and a lively and freſh colour in their faces.

CHAP. XXII.

Of Antidotes to bee uſed in the Plague.

NOw we muſt treate of the proper cure of this diſeaſe, which muſt bee uſed as ſoone as may be poſſible, becauſe this kinde of poyſon in ſwiftneſſe exceedeth the celerity of the medicine. Therefore it is better to erre in this, that you ſhould think every diſeaſe to bee peſtilent in a peſtilent ſeaſon, and to cure it as the Peſtilence: becauſe that ſo long as the Ayre is polluted with the ſeeds of the Peſtilence, the humours in the body are ſoone infected with the vicinity of ſuch an ayre, ſo that then there happeneth no diſeaſe voyd of the Peſtilence, that is to ſay, which is not peſtilent from the beginning by his owne nature, or which is not made peſtilent.

The beginning of the cure muſt be by antidotes.

Many begin the cure with bloud-letting, ſome with purging, and ſome with Antidotes. We, taking a conſideration of the ſubſtance of that part that is aſſaulted, firſt of all begin the cure with an Antidote, becauſe that by its ſpecificke property, it defends the heart from poyſon, as much as it is offended therewith. Although there are alſo other Antidotes which preſerve & keep the heart & the patient from the danger of Poyſon and the Peſtilence, not onely becauſe they doe infringe the power of the poyſon in their whole ſubſtance, but alſo becauſe they drive and expell it out of all the body by ſweat, vomiting, ſcowring, and ſuch other kinds of evacuations.

In what quantity they muſt be taken.

Why poiſonous things are put into Antidotes.

Some poyſons Antidotes to otherſome.

The Antidote muſt be given in ſuch a quantity as may bee ſufficient to overcome the poyſon; but becauſe it is not good to uſe it in greater quantitie than needeth, leſt it ſhould overthow our nature, for whoſe preſervation onely it is uſed, therefore that which cannot bee taken together and at once, muſt bee taken at ſeverall times, that ſome portion thereof may daily bee uſed ſo long, untill all the accidents, effects and impreſſions of the poyſon be paſt, and that there be nothing to be feared. Some of thoſe Antidotes conſiſt of portions of venemous things, being tempered together, and mixed in an apt proportion with other medicines, whoſe power is contrary to the venome: as Treacle, which hath for an ingredient the fleſh of Vipers, that it being therto mixed may ſerve as a guide to bring all the antidote unto the place where the venenate malignity hath made the chiefe impreſſion; becauſe by the ſimilitude of nature and ſympathy, one poyſon is ſuddenly ſnatched and carryed unto another. There are other abſolute poiſonous, which nevertheleſſe are Antidotes one unto another: as a Scorpion himſelfe cureth the prick of a Scorpion. But Treacle and Mithridate excell all other Antidotes: for by ſtrengthening the nobleſt part, and the manſion of life, they repaire and recreate the waſted Spirits, and overcome the poyſon, not onely being taken inwardly, but alſo applyed outwardly to the region of the heart, Botches and Carbuncles: for by an hidden property they draw the poyſons unto them, as Amber doth Chaffe, and digeſt it when it is drawne, and ſpoile and robbe it of all its deadly force; as it is declared at large by *Galen*, in his booke *de Theriaca ad Piſonem*, by moſt true reaſons and experiments. But you will ſay that theſe things are hot, and that the Plague is often accompanied with a burning Feaver. But thereto I anſwer, there is not ſo great danger in the Feaver as in the Peſtilence, although in the giving of Treacle, I would not altogether ſeeme to neglect the Feaver, but think it good to miniſter or apply it mixed with cordiall cooling medicines, as with the Trochiſces of Camphire, ſyrupe of Lemons, of water Lillies, the water of Sorrell, and ſuch like. And for the ſame cauſe wee ought not to chooſe old Treacle, but that which is of a middle age, as of one or two yeares old: to thoſe that are ſtong, you may give halfe a dramme, and to thoſe that are more weake, a dram.

How to walke after the taking of an Antidote.

The patient ought to walke preſently after that hee hath taken Treacle, Mithridate, or any other Antidote; but yet as moderately as hee can: not like unto many, which when they perceive themſelves to bee infected, doe not ceaſe to courſe and run up and downe, untill they have no ſtrength to ſuſtaine their bodies, for ſo they diſſolve nature, ſo that it cannot ſuffice to overcome the contagion. After moderate

rate walking, the patient muſt be put warm to bed, and covered with many clothes, & warm brick-bats or tiles applyed to the ſoles of his feet; or in ſtead thereof you may uſe ſwines bladders filled with hot water, and apply them to the groines and arme-holes, to provoke ſweate: for ſweating in this diſeaſe is a moſt excellent remedy, both for to evacuate the humours in the Feaver, and alſo to drive forth the malignity in the Peſtilence, although every ſweate brings not forth the fruit of health. For *George Agricola* ſaith, that hee ſaw a woman at *Miſnia* in Germanie, that did ſweat ſo for the ſpace of three dayes, that the bloud came forth at her head and breaſt, & yet neverthleſſe ſhee died.

A ſudorifick potion.

A ſudorifick powder.

This potion following will provoke ſweate. Take the roots of China ſhaved in thinne pieces one ounce and halfe; of *Guajacum* two ounces; of the barke of Tamariske one ounce; of Angelica roots two drams; of the ſhaving of Hatſ-horne one ounce; of Juniper berries three drams; put them into a viall of glaſſe that wil contain ſixe quarts, put thereto foure quarts of running or river water that is pure and cleare, macerate them for the ſpace of one whole night on the hot aſhes: and in the morning boile them all in *Balneo Mariæ*, untill the halfe bee conſumed, which will bee done in the ſpace of ſixe houres; then let them be ſtrained through a bagge, and then ſtrained againe, but let that be with ſixe ounces of ſugar of Roſes, and a little Treacle: let the patient take eight ounces or fewer of that liquor, and it will provoke ſweat. The powder following is alſo very profitable. Take of the leaves of *Dictamnus*, the roots of Tormentill, Betony, of each halfe an ounce, of bole Armenicke prepared one ounce, of *Terra Sigillata* three drams, of Aloes and Myrrhe, of each halfe a dram, of Saffron one dram, of Maſticke two drams: powder them all according to art, and give one dram thereof diſſolved in Roſe-water, or the water of wild ſorrell, and let the patient walke ſo ſoone as he hath taken that powder; then let him be laid in his bed to ſweat as I have ſhewed before.

A diſtilled water againſt the Plague.

Another.

What meane to be uſed in ſweating.

The water following is greatly commended againſt poyſon. Take the roots of Gentian & Cyperus, of each three drams; of *Carduus benedictus*, Burnet, of each one handfull; of Sorrell ſeeds and Divels-bit, of each two pugils; of Ivie and Juniper berries, of each halfe an ounce; of the flowers of Bugloſſe, Violets and red Roſes, of each two pugils: powder them ſomewhat groſſely, then ſoake or ſteepe them for a night in white wine and Roſe water: then adde thereto of bole Armenick one ounce, of Treacle halfe an ounce, diſtill them all in *Balneo Mariæ*, and keepe the diſtilled liquor in a vial of glaſſe wel covered or cloſe ſtopped for your uſe: let the patient take ſixe ounces thereof with Sugar and a little Cinamon & Saffron: then let him walk, and then ſweat as is aforeſaid: the Treacle and cordiall water formerly preſcribed are very profitable for this purpoſe. Alſo the water following is greatly commended. Take of Sorrell ſixe handfuls, of Rue one handfull: dry them & macerate them in vinegar for the ſpace of foure and twenty houres, adding thereto foure ounces of Treacle: make thereof a diſtillation in *Balneo Mariæ*, and let the diſtilled water bee kept for your uſe; and ſo ſoone as the patient doth thinke himſelfe to be infected, let him take foure ounces of that liquor, then let him walke and ſweate. He muſt leave ſweating when he beginneth to waxe faint and weake, or when the humour that runs downe his body begins to waxe cold, then his body muſt be wiped with warme clothes, and dryed. The patient ought not to ſweat with a full ſtomacke, for ſo the heat is called away from performing the office of concoction: alſo he muſt not ſleep when he is in his ſweat, leſt the malignity goe inwardly with the heat and ſpirits unto the principall parts; but if the patient bee much inclined to ſleep, hee muſt bee kept from it with hard rubbing, and bands tyed about the extreme parts of his body, and with much noiſe of thoſe that are about him, and let his friends comfort him with the good hope that they have of his recovery; but if all this will not keepe him from ſleepe, diſſolve *Caſtoreum* in tart Vinegar, and *Aqua vitæ*, and let it bee injected into his noſtrils: and let him bee kept continually waking the firſt day, and on the ſecond and third, even unto the fourth; that is to ſay, unto the perfect expulſion of the venome; and let him not ſleep above three or foure houres on a day and night. In the meane time let the Phyſician that ſhall bee preſent conſider all things by his ſtrength: for it is to be feared, that great watchings will diſſolve the ſtrength, and make the patient weake: you muſt not let him eate within three houres after his ſweating; in the meane ſeaſon, as his ſtrength ſhall require, let him take the rinde of a preſerved Citron, conſerve of Roſes, bread toaſted and ſteeped in wine, the meat of a preſerved Myrabolane, or ſome ſuch like thing.

CHAP. XXIII.

Of Epithemes to be uſed for the ſtrengthening of the principall parts.

THere are alſo ſome topick medicines to bee reckoned amongſt Antidotes, which muſt be outwardly applyed as ſpeedily as may be, as cordiall and hepaticke Epithemes for the ſafety of the noble parts, and ſtrengthening of the faculties, as thoſe that drive the venenate aire farre from the bowels: they may be made of cordiall things not onely hot, but alſo cold, that they may temper the heat, and more powerfully repercuſſe. They muſt be applyed warme with a ſcarlet, or a double linnen cloth, or a ſoft ſpunge dipped in them, if ſo be that a Carbuncle doe not poſſeſſe the regions of the noble parts, for it is not fit to uſe repercuſſives to a Carbuncle. You may make Epithemes after the following formes; ℞. *aquar. roſ. plantag. & ſolan. an* ℥iv. *aquæ acetoſ. vini granat. & aceti, an.* ℥iii. *ſantal. rub. & coral. rub. pulveriſ. an.* ʒiii. *theriac. vet.* ℥ß. *camph.* ℈ii. *croci* ℈i. *carioph.* ʒß. *miſce, fiat epithema.* Or elſe, R. *aqu. roſ. & plantag. an.* ℥x. *aceti roſ.* ℥iv. *carioph. ſant. rub. coral. rub. pulveriſ. pul. diamargarit. frigid. an.* ʒiß. *caphuræ & moſchi an.* ℈i. *fiat epithema.* Or, ℞. *aquar. roſar. & meliſſæ, an.* ℥iv. *aceti roſ.* ℥iii. *ſant. rub.* ʒi. *caryophyl.* ʒß. *croci.* ℈ii. *caphuræ* ℈i. *boli arm. terræ ſigil. & Zedoar. an.* ʒi. *fiat epithema.* Or elſe, ℞. *aceti roſat. & aquæ roſat. an* ℔. ß. *caphuræ* ʒß. *theriac. & mithridat. an.* ʒi. *fiat epithema.* Or elſe, *aqu. roſar. nenuph. bugloſ. acetoſæ, aceti roſar. an.* ℔. ß. *ſant. rub. roſ. rub. an.* ʒiii. *flor. nenuph. violar. caphur. an.* ʒß. *mithrid. & theriac. an.* ʒii. *terantur & miſceantur ſimul omnia.* When you intend to uſe them, take ſome portion of them in a veſſell by its ſelfe, wherewith let the affected bowell be fomented warme.

Whereof they muſt be made.

Repercuſsives not fit to be applyed to Carbuncles.

CHAP. XXIIII.

Whether purging and bloud-letting bee neceſſary in the beginning of peſtilent diſeaſes.

SO ſoon as the heart is ſtrengthened & corroberated with cordials & antidotes, we muſt come to phlebotomy & purging. As concerning bloud-letting in this caſe, there is a great controverſie among Phyſicians. Thoſe that wiſh it to be uſed, ſay or affirme that the peſtilent Feaver doth infixe it ſelfe in the bloud, and therein alſo the peſtilent malignity taketh its ſeate; and therefore it will ſoone infect the other humours, unleſſe that the bloud be evacuated, & the infection that remaineth in the bloud be thereby taken away. Contrariwiſe, thoſe that do not allow phlebotomy in this caſe, alledge, that it often commeth to paſſe that the bloud is voyd of malignity when the other humours are infected with the venemous contagion. If any man require my judgement in this doubtfull queſtion, I ſay, that the peſtilence ſometimes doth depend on the default of the aire: This default being drawne through the paſſages of the body, doth at length pierce unto the entrals, as we may underſtand by the abſceſſes which breake out one while behind the eares, ſometimes in the arme-holes, and ſometimes in the groines, as the braine, heart or liver are infected. And hereof alſo come Carbuncles, and other collections of matter, and eruptions, which are ſeene in all parts of the body, by reaſon that nature uſing the ſtrength of the expulſive faculty, doth drive forth whatſoever is noyſome or hurtfull. Therefore if the Phyſician will follow this motion of nature, he muſt neither purge nor let bloud, leſt that by a contrary motion, that is, by drawing in from without, the motion of nature which proceeds outward-

Reaſons for and againſt bloud-letting in the Plague.

The compoſing of this controverſie.

ly from within, ſhould be troubled. So wee often ſee in thoſe who are purged or let bloud for ſuch Buboes as come through unlawfull copulation, that the matter is thereby made contumacious, and by drawing it inwardly, it ſpeedily cauſeth the French Pocks.

Wherefore, when Buboes, Carbuncles and other peſtilent eruptions appeare, which come through the default of the Aire, we ought to abſtain from purging and phlebotomie; but it is ſufficient to fore-arme the heart inwardly and outwardly with Antidotes that are endued with a proper vertue of reſiſting the poyſon. For it is not to bee doubted, but that when nature is debilitated with both kindes of evacuation, aud when the ſpirits together with the bloud are exhauſted, the venemous Aire will ſoone pierce, and be received into the empty body, where it exerciſeth its tyranny to the utter deſtruction thereof.

A hiſtory.

In the yeare of our Lord God 1565. in which yeare there was great mortality throughout all France, by reaſon of the peſtilence and peſtilent diſeaſes, I earneſtly & diligently enquired of all the Phyſicians & Chirurgians of all the Cities (through which King *Charles* the ninth paſſed in his progreſſe unto Bayon) what ſucceſſe their patients had after they were letten bloud and purged, whereunto they all anſwered alike, that they had diligently obſerved, that all that were infected with the Peſtilence, and were letten bleed ſome good quantity of bloud, or had their bodies ſomewhat ſtrongly purged, thenceforwards waxed weaker and weaker, and ſo at length dyed; but others which were not let bloud nor purged, but took cordiall Antidotes inwardly, and applyed them outwardly, for the moſt part eſcaped and recovered their health: for that kind of Peſtilence tooke its originall of the primitive and ſolitary default of the Aire, and not of the corruption of the humours.

When purging and bleeding may be uſed.

The like event was noted in the hoarſeneſſe that we ſpake of before: that is to ſay, that the patients waxed worſe and worſe by purging and phlebotomie; but yet I doe not diſallow either of thoſe remedies, if there be great fulneſſe in the body, eſpecially in the beginning, and if the matter have a cruell violence, whereof may bee feared the breaking in unto ſome noble part. For wee know that it is confirmed by *Hypocrates*, that what diſeaſe ſoever is cauſed by repletion, muſt be cured by evacuation: and that in diſeaſes that are very ſharpe, if the matter do ſwell, it ought to be remedied the ſame day, for delay in ſuch diſeaſes is dangerous; but ſuch diſeaſes are not cauſed or inflicted upon mans body by reaſon or occaſion of the peſtilence, but of the diſeaſed bodies, and diſeaſes themſelves commixed together with the Peſtilence; therefore then peradventure it is lawfull to purge ſtrongly, and to let a good quantity of bloud, leſt that the peſtilent venome ſhould take hold of the matter that is prepared, and ſo infect it with a contagion, whereby the Peſtilence taketh new and farre greater ſtrength; eſpecially as *Celſus* admoniſheth us, where he ſaith; that, By how much the ſooner thoſe ſudden invaſions doe happen, by ſo much the ſooner remedies muſt be uſed, yea or rather raſhly applyed; therefore if the veines ſwell, the face waxe fiery red, if the arteries of the temples beat ſtrongly, if the patient can very hardly breathe by reaſon of a weight in his ſtomacke, if his ſpittle be bloudy, then ought he to bee let bloud without delay, for the cauſes before mentioned. It ſeems beſt to open the liver veine on the left arme, whereby the heart and the ſpleene may be better diſcharged of their abundant matter; yet bloud-letting is not good at all times, for it is not expedient when the body beginneth to waxe ſtiffe by reaſon of the comming of a Feaver; for then by drawing backe the heat and ſpirits inwardly, the outward parts being deſtitute of bloud, waxe ſtiffe and cold; therefore bloud cannot bee letten then without great loſſe of the ſtrength, and perturbation of the humours. And it is to be noted, that when thoſe plethoricke cauſes are preſent, there is one Indication of bloud-letting in a ſimple peſtilent Feaver, and another in that which hath a *Bubo, id eſt*, a Botch or a Carbuncle joined therwith. For in one or both of theſe, being joyned with a vehement & ſtrong burning Feaver, bloud muſt be letten by opening the veine that is neareſt unto the tumour or ſwelling againſt nature, keeping the ſtraightneſs of the fibres, that this being open, the bloud might be drawn more directly from the part affected; for all and every retraction of putrefied bloud unto the noble parts, is to be avoyded, becauſe it is noyſome and hurtful to nature, and

Aph. 22. ſect. 2.
Aph. 10. ſect. 4.

Cap. 7. lib 3.

Why bloud muſt be let on the left arme in the Plague.

to the patient. Therefore, for example ſake, admit the patient be plethoricke by repletion, which is called *Ad vaſa, id eſt*, unto the veſſels, and *Ad vires, id eſt*, unto the ſtrength: and therewithall he hath a tumour that is peſtilent in the parts belonging unto his head or necke, the bloud muſt bee let out of the cephalick or median veine, or out of one of their branches diſperſed in the arme on the grieved ſide. But if through occaſion of fatte, or any other ſuch like cauſe, thoſe veines doe not appeare in the arme, there bee ſome that give counſell in ſuch a caſe to open the veine that is betweene the fore-finger and the thumbe, the hand being put into warme water, whereby that veine may ſwell and be filled with bloud, gathered thither by meanes of the heate.

If the tumour be under the arme-hole, or about thoſe places, the liver veine, or the median muſt be opened which runneth alongſt the hand: if it be in the groine, the veine of the hamme, or *Saphena*, or any other veine above the foote that appeareth well, but alwaies on the grieved ſide. And phlebotomie muſt bee performed before the third day: for this diſeaſe is of the kind or nature of ſharpe diſeaſes; becauſe that within foure and twenty houres it runneth paſt helpe. In letting of bloud you muſt have conſideration of the ſtrength. You may perceive that the patient is ready to ſwoune, when that his forehead waxeth moyſt, with a ſmall ſweate ſuddenly ariſing, by the aking or paine at the ſtomacke, with an appetite to vomit, and deſire to goe to ſtoole, gaping, blackneſſe of the lippes, and ſudden alteration of the face unto paleneſſe: and laſtly moſt certainely by a ſmall and ſlow pulſe: and then you muſt lay your finger on the veine, and ſtop it untill the patient come to himſelfe againe, either by nature, or elſe reſtored by art; that is to ſay, by giving unto him bread dipped in wine, or any other ſuch like thing: then, if you have not taken bloud enough, you muſt let it goe againe, and bleed ſo much as the greatneſſe of the diſeaſe, or the ſtrength of the patient will permit or require: which being done, ſome one of the Antidotes that are preſcribed before will be very profitable to be drunk, which may repaire the ſtrength, and infringe the force of the malignity.

CHAP. XXV.

Of purging medicines in a peſtilent diſeaſe.

What purges fit in the Plague.

Pils.

IF you call to minde the proper indications, purging ſhall ſeeme neceſſary in this kinde of diſeaſe, and that muſt bee preſcribed as the preſent caſe and neceſſity requireth; rightly conſidering that the diſeaſe is ſudden, and doth require medicines that may with all ſpeede drive out of the body the hurtfull humour wherein the noyſome quality doth lurke and is hidden; which medicines are diverſe by reaſon of the diverſity of the kinde of the humour, and the condition or temperature of the patient. For this purpoſe ſixe graines of Scammonie beaten into powder, or elſe tenne graines are commonly miniſtred to the patient with one dram of Treacle. Alſo pils may be made in this forme: Take of Treacle and Mithridate, of each one dram; of *Sulphur vivum* finely powdred halfe a dram; of *Diagridium* foure graines: make thereof Pils. Or, Take three drams of Aloes; of Myrrhe and Saffron, of each one dram; of white Hellebore and Aſarabacca, of each foure ſcruples: make thereof a maſſe with old Treacle, and let the patient take foure ſcruples thereof for a doſe, three houres before meate. *Ruffus* his pils may be profitably given to thoſe that are weake. The ancient Phyſicians have greatly commended Agarick for this diſeaſe, becauſe it doth draw the noyſome humours out of all the members: and the vertues thereof are like unto thoſe of Treacle; for it is thought to ſtrengthen the heart, and to draw out the malignity by purging. To thoſe that are ſtrong the weight of two drams may be given, and to thoſe that are more weake, halfe a dram. It is better to give the infuſion in a decoction, than in ſubſtance; for being elected and prepared truly into Trochiſes, it may be called a moſt divine kinde of medicine.

Antimonium is highly prayſed by the experience of many; but becauſe I know the uſe thereof is condemned by the councell and decree of the School of Phyſicians at Paris, I will here ceaſe to ſpeake of it.

Thoſe medicines that cauſe ſweats are thought to excell all others, when the Peſtilence commeth of the venemous Ayre: among whom the efficacy of that which followeth hath beene proved, to the great good of many in that Peſtilence which was lately throughout all Germany, as *Matthias Rodler* Chancellor to Duke *George* the Count Palatine ſignified unto me by letters.

An effectuall ſudorifick and alſo purging medicine.

They doe take a bundle of Mugwort, and of the aſhes thereof after it is burnt, they make a lye with foure pints of water; then they doe ſet it over the fire, and boyle it in a veſſell of earth well leaded, untill the liquor be conſumed, the earthy dregges falling unto the bottome like unto ſalt, whereof they make Trochiſces of the weight of a crowne of gold: then they diſſolve one or two of thoſe Trochiſces, according to the ſtrength of the patient, in good Muskadine, and give it the patient to drinke, and let him walke after that hee hath drunke it for the ſpace of halfe an houre; then lay him in his bed, and there ſweat him two or three houres, and then he will vomit, and his belly will bee looſed as if hee had taken Antimony; and ſo they were all for the moſt part cured, eſpecially all thoſe that tooke that remedy betimes, and before the diſeaſe went unto their heart, as I my ſelfe have proved in ſome that were ſicke at Paris, with moſt happy ſucceſſe: Truely Mugwort is highly commended by the ancient Phyſicians, being taken and applyed inwardly or outwardly againſt the bitings of venemous creatures, ſo that it is not to be doubted but that it hath great vertue againſt the Peſtilence.

The vertues of Mugwort.

Vide Rondelet. Lib. 7. de piſ. c. 3.

I have heard it moſt certainly reported by *Gilbertus Heroaldus* Phyſician of *Mompilier*, that eight ounces of the pickle of Anchoves, drunke at one draught, is a moſt certaine and approved remedie againſt the Peſtilence, as he and many other have often found by experience. For the plague is no other thing but a very great putrefaction; for the correction and amendment whereof, there is nothing more apt or fit than this pickle or ſubſtance of the Anchoves, being melted by the ſun and force of the ſalt that is ſtrawed thereon. There be ſome which infuſe one dramme of Walewort ſeede in white wine, and affirme that it drunken will performe the like effect as Antimony. Others diſſolve a little weight of the ſeed of Rue being bruiſed in Muſkadine, with the quantity of a Beane of Treacle, and ſo drinke it. Others beate or bruiſe an handfull of the leaves or tops of Broome in halfe a pint of white wine, and ſo give it to the patient to drinke, to cauſe him to vomit, looſe his belly, and make him to ſweat. Truly thoſe that are wounded or bitte with venemous beaſts, if they bind broome above the wound, it will prohibit or hinder the venome from diſperſing it ſelfe, or going any further: therefore a drink made thereof will prohibit the venome from going any nearer the heart. Some take of the roote of Elecampaine, Gentian, Tormentill, Kermes berries and broom; of the powder of Ivory and Hartſhorne, of each halfe a dram: they doe bruiſe and beate all theſe, and infuſe them for the ſpace of foure and twenty houres in white wine and *Aqua vitæ* on the warm embers, and then ſtraine it, and give the patient three or foure ounces thereof to drinke; this provokes ſweat, and infringeth the power of the poyſon: and the potion following hath the ſame vertue.

A Potion.

Take good Muſtard half an ounce, of Treacle or Mithridate the weight of a Bean, diſſolve them in white wine, and a little *Aqua vitæ*, and let the patient drinke it, and ſweat thereon with walking. You may alſo roaſt a great Onion made hollow, and filled with halfe a dram of Treacle and Vinegar under the embers; and then ſtraine it, and mixe the juice that is preſſed out of it with the water of Sorrell, *Carduus Benedictus*, or any other cordiall thing, and with ſtrong wine, and give the patient to drinke thereof to provoke ſweat, and to repell the malignity. Or elſe take as much Garlick as the quantity of a big Nut; of Rue and Celandine, of each twenty leaves, bruiſe them all in white wine and a little *Aqua vita*; then ſtraine it, and give the patient thereof to drink. There be ſome that doe drink the juice that is preſſed out of Celandine and Mallowes, with three ounces of Vinegar, and halfe an ounce of the oyle of Wall-nuts, and then by much walking doe unburthen their ſtomack and belly upwards and downewards, and ſo are helped. When the venemous ayre hath already crept into and infected the humors, one dram of the dryed leaves of the Bay tree macerated for the ſpace of two dayes in Vinegar and drunke, is thought to bee a moſt ſoveraigne medicine to provoke ſweat, looſeneſſe of the belly, and vomiting.

Mathiolus in his Treatiſe *de Morbo Gallico* writeth, that the powder of Mercury miniſtred unto the patient with the juice of *Carduus Benedictus*, or with the electuary *de Gemmis*, will drive away the Peſtilence before it be confirmed in the body, by provoking vomit, looſeneſs of the belly & ſweat: one dram of Calchanthum or white Copperoſe diſſolved in Roſe-water, performeth the like effect in the ſame diſeaſe. Some do give the patient a little quantity of the oyle of Scorpions with white wine to expel the poyſon by vomit, & therewithall they anoint the region of the heart, the breaſt and the wreſts of the hands. I think theſe very meet to be uſed often in bodies that are ſtrong and wel exerciſed, becauſe weaker medicines do evacuate little or nothing at all, but onely move the humours, whereby commeth a Feaver. When a ſufficient quantity of the malignity is evacuated, then you muſt miniſter things that may ſtrengthen the belly and ſtomack, and withhold the agitation or working of the humours: and ſuch is the confection of Alkermes.

The effects of mercury & copperoſe againſt the Plague.

CHAP. XXVI.

Of many Symptomes which happen together with the Plague: and firſt of the paine of the head.

IF the malignity be carryed into the braine, and nature be not able to expell it, it inflames not onely it, but alſo the membranes that cover it: which inflammation doth one while hurt, trouble, or aboliſh the imagination, another while the judgement, and ſometimes the memory, according to the ſituation of the inflammation, whether it bee in the former, hinder or middle part of the head; but hereof commeth alwayes a Phrenſie, with fiery redneſſe of the eyes and face, and heavineſſe and burning of the whole head. If this will not be amended with Cliſters, and with opening the Cephalicke veine in the arme, the arteries of the temples muſt be opened, taking ſo much bloud out of them, as the greatneſſe of the Symptomes and the ſtrength of the patient ſhall require and permit. Truly the inciſion that is made in opening of an arterie will cloſe and joyne together as readily, and with as little difficulty, as the inciſion of a veine. And of ſuch an inciſion of an artery, commeth preſent helpe, by reaſon that the tenſive and ſharpe vapours do plentifully breath out together with the arterious bloud. It were alſo very good to provoke a fluxe of bloud at the noſe, if nature be apt to exonerate herſelfe that way. For, as *Hippocrates* ſaith, when the head is grieved, or generally aketh, if matter, water, or bloud flow out at the noſtrils, mouth or eares, it preſently cures the diſeaſe. Such bleeding is to be provoked by ſtrong blowing, or ſtriving to cleanſe the noſe, by ſcratching or picking of the inner ſides of the noſtrils, by pricking with an horſe haire, and long holding downe of the head.

The cauſe of phrenſie in the Plague.

The benefit of opening an artery.

Aph.10.ſect.6.

The Lord of Fontains, a Knight of the Order, when we were at Bayon, had a bleeding at the noſe, which came naturally for the ſpace of two dayes, and thereby hee was freed of a peſtilent Feaver which he had before, a great ſweat riſing therewithall, and ſhortly after his Carbuncles came to ſuppuration, and by Gods grace he recovered his health being under my cure. If the bloud doe flow out and cannot be ſtopped when it ought, the hands, armes, and legges muſt be tyed with bands, and ſponges wet in Oxycrate muſt be put under the arme-holes, cupping-glaſſes muſt be applyed unto the dugges, the region of the liver and ſpleen; and you muſt put into the noſtrils, the doune of the willow tree, or any other aſtringent medicine, incorporated with the haires pluckt from the flanke, belly or throat of a Hare, bole Armenicke, *Terra Sigillata*, the juice of Plantain and Knot-graſſe mixed together; and furthermore the patient muſt be placed or laied in a coole place. But if the pain bee nothing mitigated notwithſtanding all theſe fluxes of bloud, we muſt come to medicines that procure ſleep, whoſe formes are theſe.

A hiſtory.

To ſtay bleeding.

Take

Medicines to procure ſleep.

Take of green Lettuce one handfull, flowers of water Lillies and Violets, of each two pugils, one head of white Poppy bruiſed, of the foure cold ſeeds, of each two drams, of Liquorice and Raiſons, of each one dram: make thereof a decoction, and in the ſtraining diſſolve one ounce and an halfe of *Diacodion*: make thereof a large potion to be given when they goe to reſt. Alſo a Barly-creame may be prepared in the water of water-Lillies and of Sorrell, of each two ounces, adding thereto ſixe or eight graines of *Opium*: of the foure cold ſeeds, and of white Poppy ſeeds, of each halfe an ounce, and let the ſame be boyled in broths with Lettuce and Purſlaine; alſo the Pils *de Cynogloſſo, id eſt*, Hounds tongue may be given. Cliſters that provoke ſleep muſt be uſed, which may be thus prepared:

Take of Barly-water, halfe a pinte; oyle of Violets and water-Lillies, of each two ounces; of the water of Plantaine and Purſlaine, or rather of their juices, three ounces; of Camphire ſeven graines, and the whites of three egges: make thereof a Cliſter. The head muſt be fomented with Roſe-vinegar, the haire being firſt ſhaven away, leaving a double cloth wet therein on the ſame, and often renewed. Sheepes lungs taken warme out of the bodies, may be applyed to the head, as long as they are warme. Cupping-glaſſes with and without ſcarification, may be applyed to the neck and ſhoulder-blades. The armes and legs muſt be ſtrongly bound, being firſt wel rubbed to divert the ſharpe vapours and humours from the head. Frontals may alſo bee made on this manner. Take of the oyle of Roſes and water-Lillies, of each two ounces, of the oyle of Poppy halfe an ounce, of *Opium* one dram, of Roſe-vinegar one ounce, of Camphire halfe a dram, mixe them together. Alſo Nodules may bee made of the flowers of Poppies, Henbane, water-Lillies, Mandrakes beaten in Roſe-water with a little Vinegar, and a little Camphire, and let them be often applyed to the noſtrils: for this purpoſe Cataplaſmes alſo may be laid to the forehead. As, Take of the mucilage of the ſeeds of *Pſilium, id eſt*, Flea-wort, and Quince ſeeds extracted in Roſe-water, three ounces; of Barly-meale foure ounces; of the powder of Roſe-leaves, the flowers of water-Lillies and Violets, of each halfe an ounce; of the ſeeds of Poppies and Purſlaine of each two ounces; of the water and vinegar of Roſes, of each three ounces: make thereof a Cataplaſme, and apply it warme unto the head.

A Cataplaſme.

Or take of the juice of Lettuce, water-Lillies, Henbane, Purſlaine, of each halfa pint; of Roſe-leaves in powder, the ſeeds of Poppy, of each halfe an ounce; oyle of Roſes three ounces; of Vinegar two ounces; of Barly-meale as much as ſhall ſuffice: make thereof a Cataplaſme in the forme of a liquid Pultis. When the heate of the head is mitigated by theſe medicines, and the inflammation of the braine aſſwaged, wee muſt come unto digeſting and reſolving fomentations, which may diſperſe the matter of the vapours. But commonly in paine of the head, they doe uſe to bind the forehead and hinder part of the head very ſtrongly, which in this caſe muſt bee avoyded.

CHAP. XXVII.

Of the heat of the Kidnies.

An ointment for the reines.

THe heat of the kidnies is tempered by anointing with *unguent. refrigerans Galen.* newly made, adding therto the whites of egs wel beaten, that ſo the ointment may keep moyſt the longer; let this liniment bee renewed every quarter of an houre, wiping away the reliques of the old. Or, ℞. *aq. roſ.* ℔. ß. *ſucci plant.* ℥iv. *alb. ovorum* iv. *olei roſacei, & nenuph. an.* ℥ii. *aceti roſ.* ℥iii. *miſce ad uſum.* When you have anointed the part, lay thereon the leaves of water-Lillies or the like cold herbs, & then preſently thereupon a double linnen cloth dipped in oxycrate & wrung out againe, and often changed; the patient ſhall not lye upon a feather bed, but on a quilt ſtuffed with the chaffe of oates, or upon a matte with many doubled clothes or Chamelet ſpread thereon. To the region of the heart may in the meane time bee applyed a refrigerating and alexiteriall medicine, as this which followeth.

℞. *ung. roſat.* ℥iii. *olei nenupharini*, ℥ii. *aceti roſ. & aquæ roſar. an.* ℥i. *theriacæ*, ʒi. *croci*, ʒß. Of theſe melted and mixed together make a ſoft ointment, which ſpred upon a ſcarlet cloth may be applyed to the region of the heart. Or, ℞. *theriacæ opt.* ʒiß. *ſucci citri acidi, & limonis, an.* ℥ß. *coral. rub. & ſem. roſar. rub. an.* ʒß. *caphuræ, & croci, an.* gra. iiii. let them bee all mixed together, and make an ointment or liniment.

An ointment for the heart.

At the head of the patient as he lies in his bed, ſhall be ſet an Ewre or cocke with a baſon under it to receive the water, which by dropping may reſemble raine. Let the ſoles of the feet and palmes of the hands be gently ſcratched, and the patient lye far from noiſe, and ſo at length he may fall to ſome reſt.

The noiſe of dropping water drawes on ſleep.

CHAP. XXVIII.

Of the Eruptions and Spots, which commonly are called by the name of Purples and Tokens.

THE ſkinne, in peſtilent feavers, is marked and variegated in divers places with ſpots, like unto the bitings of Fleas or Gnats, which are not alwaies ſimple, but many times ariſe in forme like unto a graine of millet. The more ſpots appeare, the better it is for the patient: they are of divers colours according to the virulency of the malignity, and condition of the matter, as red, yellow, browne, violet, or purple, blew and blacke. And becauſe for the moſt part they are of a purple colour, therefore wee call them Purples. Others call them *Lenticulæ*, becauſe they have the colour and forme of Lentiles. They are alſo called *Papiliones* (*i*) Butterflies, becauſe they doe ſuddenly ſeaze or fall upon divers regions of the body, like unto winged Butterflyes, ſometimes the face, ſometimes the armes and legges, and ſometimes all the whole body; often times they doe not onely affect the upper part of the skin, but goe deeper into the fleſh, ſpecially when they proceed of matter that is groſſe and aduſt. They doe ſometimes appeare great and broad, affecting the whole arme, legge or face, like unto an *Eryſipelas*: to conclude, they are divers according to the variety of the humour that offends in quality or quantity.

The differences of the ſpots in the plague.

Their ſeverall names, and the reaſons of them.

If they are of a purple or black colour, with often ſwouning, and ſinke in ſuddenly without any manifeſt cauſe, they foreſhew death.

When ſignes of death.

The cauſe of the breaking out of thoſe ſpots, is the working or heat of the blood, by reaſon of the cruelty of the venome received, or admitted. They often ariſe at the beginning of a peſtilent feaver: many times before the breaking out of the Sore, or Botch, or Carbuncle, and many times after: but then they ſhew ſo great a corruption of the humours in the body, that neither the Sores, nor Carbuncles will ſuffice to receive them, and therefore they appear as forerunners of death. Sometimes they breake out alone, without a Botch or Carbuncle; which if they bee red, and have no evill ſymptomes joyned with them, they are not wont to prove deadly: they appeare, for the moſt part, on the third or fourth day of the diſeaſe, and ſometimes later, and ſometimes they appeare not before the patient be dead, becauſe the working or heat of the humours being the off-ſpring of putrefaction, is not as yet reſtrained and ceaſed.

Wherefore then principally the putride heat, which is greateſt a little before the death of the patient, drives the excremental humors, which are the matter of the ſpots unto the skin; or elſe becauſe nature in the laſt conflict hath contended with ſome greater endeavour than before (which is common to all things that are ready to dye) a little before the inſtant time of death, the peſtilent humour being preſently driven unto the skinne; and nature thus weakened by this extreme conflict, falleth downe proſtrate, and is quite overthrowne by the remnant of the matter.

Why they ſometimes appeare after the death of the patient.

CHAP.

Chap. XXIX.

Of the Cure of Eruptions and Spots.

They are to be cured by driving forth.

YOU muſt firſt of all take heed leſt you drive in the humour that is comming outwards with repercuſſives: therfore beware of cold, all purging things, Phlebotomy, and drowſie or ſound ſleeping. For all ſuch things doe draw the humours inwardly, and work contrary to nature. But it is better to provoke the motion of nature outwardly, by applying of drawing medicines outwardly and miniſtring medicines to provoke ſweat inwardly, for otherwiſe by repelling & ſtopping the matter of the eruptions, there will bee great danger leſt the heart be oppreſſed with the abundance of the venome flowing back; or elſe by turning into the belly, it inferres a mortall bloody fluxe: which diſcommodities that they may bee avoided, I have thought good to ſet downe this remedy, whoſe efficacy I have knowne and proved many times, and on divers perſons, when by reaſon of the weakneſſe of the expulſive faculty, and the thickneſſe of the skinne, the matter of the ſpots cannot breake forth, but is conſtrained to lurke under the skin, lifting it up into bunches and knobs.

The indication of curing taken from the like.

I was brought unto the invention of this remedy, by compariſon of the like. For when I underſtood that the eſſence of the French pockes (and likewiſe of the peſtilence) conſiſted in a certain hidden virulency, and venemous quality, I ſoon deſcended unto that opinion, that even as by the anointing of the body with the unguent compounded of Quick-ſilver, the groſſe and clammy humors which are fixed in the bones, and unmoveable, are diſſolved, relaxed, and drawne from the center into the ſuperficiall parts of the body, by ſtrengthening and ſtirring up the expulſive faculty, and evacuated by ſweating and fluxing at the mouth; that ſo it ſhould come to paſſe in peſtilent Feavers, that nature being ſtrengthened with the ſame kinde of unction, might unloade her ſelfe of ſome portion of the venemous and peſtilent humour, by opening the pores and paſſages, and letting it breake forth into ſpots and puſtles, and into all kind of eruptions. Therefore I have anointed many in whom nature ſeemed to make paſſage for the venemous matter very ſlowly, firſt looſing their belly with a Cliſter, and then giving them Treacle water to drinke, which might defend the vitall faculty of the heart, but yet not diſtend the ſtomack, as though they had had the French pockes, and I obtained my expected purpoſe: in ſtead of the Treacle water you may uſe the decoction of *Guajacum*, which doth heat, dry, provoke ſweat, and repell putrefaction, adding thereto alſo vinegar, that by the ſubtlety thereof, it may pierce the better, and withſtand the putrefaction. This is the deſcription of the unguent.

An ointment to draw them forth when as they appear too ſlowly.

Take of Hogs-greace, one pound, boyle it a little with the leaves of Sage, Time, Roſemary, of each halfe an handfull, ſtraine it, and in the ſtraining extinguiſh five ounces of Quick-ſilver, which hath bin firſt boyled in vinegar with the forementioned herbs; of *Sal Nitrum*, three drammes; the yelks of three egges boyled untill they be hard; of Treacle and Mithridate, of each halfe an ounce; of Venice Turpentine, oyle of Scorpions and Bayes, of each three ounces; incorporate them altogether in a morter, and make thereof an unguent, wherewith annoint the patients arme-holes and groines, avoyding the parts that belong to the head, breaſt and backbone: then let him bee laid in his bed and covered warme, and let him ſweat there for the ſpace of two houres, and then let his body bee wiped and cleanſed, and if it may be let him be laid in another bed, and there let him be refreſhed with the broth of the decoction of a Capon, rear egges, and with ſuch like meats of good juice that are eaſie to be concocted and digeſted; let him be anointed the ſecond and third day, unleſſe the ſpots appeare before.

If the patient fluxe at the mouth, it muſt not bee ſtopped: when the ſpots and puſtles doe all appeare, and the patient hath made an end of ſweating, it ſhall be convenient to uſe diureticke medicines, for by theſe the remnant of the matter of the ſpots, which happely could not all breath forth, may eaſily be purged and avoyded by urine.

If any noble or gentlemen refuſe to be anointed with this unguent, let them be encloſed in the body of a Mule or Horſe that is newly killed, and when that is cold, let them bee layed in another, untill the puſtles and eruptions doe breake forth, being drawne by that naturall heat. For ſo *Mathiolus* writeth that *Valentinus*, the ſonne of Pope *Alexander* the ſixt, was delivered from the danger of moſt deadly poyſon which he had drunke.

In proœm. lib. 6 Dioſc.

CHAP. XXX.

Of a peſtilent Bubo, *or Plague-ſore.*

What a peſtilent *Bubo* is.

A Peſtilent *Bubo* is a tumor at the beginning long and moveable, and in the ſtate, and full perfection copped, and with a ſharp head, unmoveable and fixed deepely in the glandules, or kernells; by which the braine exonerates it ſelfe of the venemous and peſtiferous matter into the kernells that are behind the eares, and in the neck: the heart, into thoſe that are in the arm-holes; and the liver, into thoſe that are in the groine; that is, when all the matter is groſſe and clammy, ſo that it cannot be drawn out by ſpots and puſtles breaking out on the skinne; and ſo the matter of a Carbuncle is ſharpe, and ſo fervent, that it maketh an *Eſchar* on the place where it is fixed. In the beginning, while the *Bubo* is breeding, it maketh the patient to feele, as it were, a cord or rope ſtretched in the place, or a hardened nerve with pricking pain: & ſhortly after the matter is raiſed up as it were into a knob, and by little and little it groweth bigger, and is enflamed, theſe accidents before mentioned accompanying it. If the tumour be red, and encreaſe by little and little, it is a good and ſalutary ſigne: but if it be livid or black, and come very ſlowly unto his juſt bigneſſe, it is a deadly ſigne: It is alſo a deadly ſigne if it encreaſe ſodainely, and come unto his juſt bigneſſe as it were with a ſwift violence, and as in a moment, have all the ſymptomes in the higheſt exceſſe, as paine, ſwelling and burning. Buboes or Sores appeare ſometimes of a naturall colour, like unto the skinne, and in all other things like unto an œdematous tumour, which notwithſtanding will ſodainely bring the patient to deſtruction, like thoſe that are livide and black, wherefore it is not good to truſt too much to thoſe kindes of tumours.

The ſignes of *Bubo*'s ſalutary and deadly.

CHAP. XXXI.

Of the cure of Buboes, *or Plague-ſores.*

The uſe of cupping glaſſes in curing a *Bubo*.

SO ſoon as the Bubo appeares, apply a Cupping-glaſſe with a great flame unto it, unleſſe it be that kinde of Bubo which will ſuddenly have all the accidents of burning and ſwelling in the higheſt nature; but firſt the skinne muſt be anointed with the oyle of lillies, that ſo it being made more looſe, the Cupping-glaſſe may draw the ſtronger and more powerfully; it ought to ſticke to the part for the ſpace of a quarter of an houre, & be renewed and applyed again every three quarters of an houre, for ſo at length the venom ſhall be the better drawn forth from any noble part that is weak, and the work of ſuppuration or reſolution, whichſoever nature hath aſſaied, will the better and ſooner bee abſolved and perfected: which may bee alſo done by the application of the following ointment.

A liniment.

Take of *Vnguentum Dialthæa* one ounce and a halfe; oile of Scorpions halfe an ounce; of Mithridate diſſolved in *Aqua vitæ*, halfe a dramme; this liniment will very well relaxe and looſen the skin, open the pores thereof, & ſpend forth portion of that matter which the Cupping-glaſſe hath drawne thither: in ſtead thereof mollifying fomentations may bee made, and other drawing and ſuppurating medicines, which ſhall be deſcribed hereafter.

A Veſicatory applied in a meet place below the Bubo profits them very much but not above; as for example. If the Bubo be in the throat, the Veſicatory muſt be applied unto the ſhoulder-blade on the ſame ſide; if it be in the arme-holes, it muſt be applied in the midſt of the arme, or of the ſhoulder-bone, on the inner ſide: if in the groin, in the midſt of the thigh on the inner ſide, that by the double paſſage that is open for to draw out the matter, the part wherein the venome is gathered together, may be the better exonerated.

Spurge, Crow-foot, Arſemart, Beare-foot, Briony, the middle barke of Travellers-joy, the rindes of Mullet, *Flammula* or upright Virgins-bower, are fit for raiſing bliſters. If you cannot come by thoſe ſimple medicines, you may apply this which followeth, which may be prepared at all times.

A compound veſicatory.

Take *Cantharides*, Pepper, *Euphorbium*, Pellitory of Spain, of each halfe a dram; of ſoure leaven, two drammes; of Muſtard one dramme, and a little Vinegar; the vinegar is added thereto to withhold or reſtraine the vehemency of the *Cantharides*; but in want of this medicine it ſhall ſuffice to drop ſcalding oyle or water, or a burning candle, or to lay a burning coale on the place: for ſo you may raiſe bliſters, which muſt preſently be cut away, and you muſt ſee that you keep the ulcers open & flowing as long as you can, by applying the leaves of red coleworts, Beetes, or Ivie dipped in warme water, and anointed with oyle or freſh butter. Some apply Cauteries, but Veſicatories work with more ſpeed: for before the Eſchar of the Cauteries will fall away, the patient may dye: therefore the ulcers that are made with Veſicatories will ſuffice to evacuate the peſtilent venome, becauſe that doth worke rather by its quality than its quantity. Let the abſceſſe bee fomented as is ſhewed before: and then let the medicine following, which hath vertue to draw, be applied.

Why veſicatories are better than cauteries in a peſtilent *Bubo*.

Strong drawing cataplaſmes.

Fill a great onion, being hollowed, with Treacle and the leaves of Rue, then roaſt it under the hot Embers, beat it with a little Leaven, and a little Swines greaſe, and ſo apply it warme unto the abſceſſe or ſore; let it be changed every ſixe houres. Or Take the roots of Marſh-mallowes and Lillies, of each halfe a pound; of Line, Fœnugreek, and Muſtard ſeeds, of each halfe an ounce; of Treacle one dramme; ten Figges, and as much Hogges greaſe as ſhall ſuffice: make thereof a cataplaſme according to Art. Or, take of Onions and Garlicke roaſted in the embers, of each three ounces: bruiſe them with one ounce of ſower leaven, adding thereto *Unguentum Baſilicon*, one ounce; Treacle one dramme; Mithridate halfe a dramme; of old Hogs greace one ounce; of *Cantharides* in pouder one ſcruple; of Pigeons dung two drams: beat them and mixe them together into the forme of a cataplaſme. Hereunto old Rennet is very profitable, for it is hot, and therfore attractive, being mixed with old Leaven and *Baſilicon*: you ought to uſe theſe untill the abſceſſe be growne unto its full ripeneſſe and bigneſſe; but if preſently after the beginning there bee great inflammation, with ſharpe paine, as it often happeneth, eſpecially when the abſceſſes be of the kinde of Carbuncles, wee muſt abſtaine from thoſe remedies that are hot and attractive, and alſo from thoſe that are very emplaſticke and clammy; becauſe they doe altogether cloſe the pores of the skin, or becauſe they reſolve the thinner part of the collected matter, which if it might remain, would bring the other ſooner to ſuppuration: or elſe becauſe they may perchance draw more quantity of the hot matter than the part can beare, whereof commeth rather corruption than maturation: and laſt of all becauſe they encreaſe the feaver and pain, which inferreth danger of a convulſion or mortall Gangrene. Therefore in ſuch a caſe it is beſt to uſe cold and temperate locall medicines, as the leaves of Henbane and Sorrell roaſted under the coales, *Galens* pultis, and ſuch like.

Againſt ſuch as cut away plague ſores.

There are many that for feare of death, have with their owne hands pulled away the *Bubo* with a paire of Smithes Pincers: others have digged the fleſh round about it, and ſo gotten it wholly out. And to conclude others have become ſo mad, that they have thruſt an hot iron into it with their owne hand, that the venome might have a paſſage forth: of all which I doe not allow one; for ſuch abſceſſes doe not come from without, as the bitings of virulent beaſts, but from within, and moreover becauſe pain is by theſe means encreaſed, and the humour is made more maligne and fierce. Therefore I think it ſufficient to uſe medicines that relaxe, open the pores of the skinne, and digeſt portion of the venome by tranſpiration, as are theſe that follow. Take the roots of Marſh-mallowes and Lillies, of each ſixe ounces; of Chamomill and Melilote flowers, of each halfe a handfull; of Linſeeds halfe an ounce; of the leaves of Rue halfe a handfull: boyle them and ſtraine them, dip ſponges in the ſtraining, and therewith let the tumour bee fomented a long time. Or, Take the crum of hot bread, and ſprinkle it with Treacle-water, or with *aqua vitæ*, and Cowes milk or Goates milke, and the yolks of three egges, put them all one ſtupes or flaxe, and apply them warme unto the place. Or, Take of ſoure Rie leaven foure ounces; of *Baſilicon* two ounces; three yolkes of egges; oyle of Lillies two ounces; Treacle one dram: let it be received on ſtupes, and applyed in like manner. Or, Take of *Diachylon* and *Baſilicon*, of each two ounces; oyle of Lillies one ounce and an halfe: let them be melted and mixed together, and let it be applyed as is aboveſaid. When you ſee, feele and know, according to reaſon, that the *Bubo* is come to perfect ſuppuration, it muſt be opened with an inciſion knife, or an actuall or potentiall Cautery, but it is beſt to be done with a potentiall Cautery, unleſſe that happely there be great inflammation, becauſe it doth draw the venome from beneath unto the ſuperficiall parts, and maketh a larger orifice for the matter that is contained therein: neither muſt it be looked for, that nature ſhould open it of her ſelfe, for then it were danger that leſt while nature doth worke ſlowly, a venemous vapour ſhould bee ſtirred up, which ſtriking the heart by the arteries, the braine by the nerves, and the liver by the veines, ſhould cauſe a new increaſe of the venemous infection. For feare whereof there be ſome that will not expect the perfect maturation and ſuppuration, but as it were in the midſt of the crudity and maturity will make an orifice for it to paſſe forth at: yet if it be done before the tumour be at his perfect maturity, paine, a Feaver, and all accidents are ſtirred up and enraged, whereof commeth a maligne ulcer that often degenerats into a Gangrene. For the moſt part about the tenth or eleventh day the work of ſuppuration ſeemeth perfected and finiſhed; but it may be ſooner or later by reaſon of the application of medicines, the condition of the matter, and ſtate of the part: when the matter commeth forth, you muſt yet uſe ſuppurative and mollifying medicines, to maturate the remains thereof; in the mean while cleanſing the ulcer by putting mundificatives into it, as we ſhall declare in the cure of Carbuncles. But if the tumour ſeeme to ſinke in or hide it ſelfe again, it muſt be revoked and procured to come forth againe, by applying of Cupping-glaſſes with ſcarification, and with ſharpe medicines, yea, and with Cauteries both actuall and potentiall.

A digeſtive fomentation.

An anodine Cataplaſme.

Why it is beſt to open a Plague-ſore with a potentiall cautery.

How to draw forth a ſore that ſeems to goe in againe.

When the Cauteries are applyed, it ſhall be very good to apply a veſicatory a little below it, that there may be ſome paſſage open for the venome while the Eſchar is in falling away. For ſo they that are troubled with the French Pocks, ſo long as they have open and flowing ulcers, ſo long are they voyd of any paine that is worth the ſpeaking of; which ulcers being cloſed and cicatrized, they doe preſently complain of great paine. If you ſuſpect that the *Bubo* is more maligne by reaſon that it is of a greene, or blacke and inflamed colour, as are thoſe that come of a melancholy humour by aduſtion, turned into a groſſe and rebellious melancholy humour, ſo that by the more copious influxe thereof into the part, there is danger of a gangrene and mortification; then the places about the abſceſſe muſt bee armed with repercuſſives, but not the abſceſſe it ſelfe: and this may be the forme of the repercuſſives: Take of the juice of houſe-leeke, Purſlaine, Sorrell, Night-ſhade, of each two ounces, of Vinegar one ounce, the whites of three egges, of oyle of Roſes and water-Lillies, of each two ounces and a halfe: ſtirre them together, and apply it about the *Bubo*, and renew it often: or boyle a Pomgranate in vinegar, beat it with *Unguentum Roſatum*, or *Populeon* newly made, and apply it as is aforeſaid. If theſe things doe not ſtop the influxe of other humours, the abſceſſe it ſelfe and the places about it muſt bee ſcarified round about, if the part will permit it; that the part exonerated of portion of the venome may not ſtand in danger of the extinction of the proper and naturall heat, by the greater quantity and malignity of the humours that flow unto it. In ſcarrifying you muſt have care of the great veſſels, for feare of an irrepugnable fluxe of bloud, which in this caſe is very hard to bee ſtayed or reſiſted; both becauſe the part it ſelfe is greatly inflamed, and the humour very fierce; for the expulſion whereof, nature, carefull for the preſervation of the part and all the body

When repercuſſives may be applyed.

Why too much bleeding is to be feared.

beſides, ſeemeth to labour and worke. But yet you muſt ſuffer ſo much of the bloud & humour to flow out as the patient is able to abide without the loſſe of his ſtrength. Moreover, you may ſpend forth the ſuperfluous portion of the malignity, with relaxing, mollifying and reſolving fomentations: as, Take the roots of Marſh-Mallowes, Lillies and Elicampaine, of each one pound, of Linſeeds and Fænugreek, of each one ounce, of Fennell-ſeeds and Aniſe-ſeeds, of each halfe an ounce, of the leaves of Rue, Sage, Roſemary, of each one handfull, of Chamomill and Melilote flowers, of each three handfuls; boyle them all together, and make thereof a decoction for a fomentation; uſe it with a ſpunge according to Art. Alſo after the aforeſaid ſcarification, wee may put Hens, or Turkies that lay egs (which therefore have their fundaments more wide and open, and for the ſame purpoſe put a little ſalt into their fundaments) upon the ſharpe top of the *Bubo*, that by ſhutting their bils at ſeverall times they may draw and ſuck the venome into their bodies, farre more ſtrongly and better than cupping-glaſſes, becauſe they are endued with a naturall property againſt poyſon, for they eat and concoct Toads, Efts, and ſuch like virulent beaſts: when one hen is killed with the poyſon that ſhe hath drawne into her body, you muſt apply another, and then the third, fourth, fift and ſixt within the ſpace of half an houre. There be ſome that will rather cut them, or elſe uſe whelps cut aſunder in the midſt, and applyed warme unto the place, that by the heate of the creature that is yet ſcarce dead, portion of the venome may be diſſipated and exhaled. But if nevertheleſſe there be any feare of a Gangrene at hand, you muſt cut the fleſh with a deeper ſcarification, not onely avoyding the greater veſſels, but alſo the nerves, for feare of convulſion: and after the ſcarification and a ſufficient flux of bloud, you muſt waſh it with *Ægyptiacum*, Treacle and Mithridate diſſolved in ſea-water, *Aqua vitæ* and Vinegar. For ſuch a lotion hath vertue to ſtay putrefaction, repell the venome, and prohibite the bloud from concretion: but if the Gangrene cannot be avoyded ſo, cauteries may be applied to the part: eſpecially actual, becauſe they do more effectually repel the force of the poiſon, & ſtrengthen the part. Preſently after the impreſſion of the hot iron, the eſchar muſt bee cut away even unto the quicke fleſh, that the venemous vapours and the humours may have a free paſſage forth, for it is not to bee looked for that they will come forth of themſelves.

Liniments to haſten the falling away of the Eſchar.

With theſe inunctions they are wont to haſten the falling away of the Eſchar. Take of the mucilage of Marſh-mallowes and Linſeeds, of each two ounces, freſh butter or Hogs-greaſe one ounce, the yolks of three egges, incorporate them together, and make thereof an ointment: butter, Swines greaſe, oyle of Roſes, with the yolks of egges, performe the ſelfe ſame thing. When the Eſchar is fallen away, we muſt uſe digeſtives. As take of the juice of Plantaine, water-Bettony, and Smallage, of each three ounces, hony of Roſes foure ounces, Venice Turpentine five ounces, Barly-flower three drams, Aloes two drams, oyle of Roſes foure ounces, Treacle halfe a dram, make a mundificative according to Art. Or, Take Venice Turpentine foure ounces, Syrupe of dryed Roſes and Wormewood, of each one ounce, of the powder of Aloes, Maſtick, Myrrhe, Barly-flower, of each one dram, of Mithridate halfe an ounce, incorporate them together.

Againſt eating ulcers.

This unguent that followeth is very meet for putrefied and corroding ulcers: Take red Orpiment one ounce, of unquenched Lime, burnt Alome, Pomgranate pills, of each ſixe drams, of *Olibanum*, Galls, of each two drams; of Waxe and Oile as much as ſhall ſuffice, make thereof an unguent. This doth mundifie ſtrongly, conſume putrefied fleſh, and dry up virulent humidities that engender Gangrenes.

The praiſe of *Ægyptiacum*.

But there is not a more excellent unguent than *Ægyptiacum* encreaſed in ſtrength, for beſides many other vertues that it hath, it doth conſume and waſte the proud fleſh, for there is neither oyle nor waxe that goeth into the compoſition thereof, with which things the vertue of ſharpe medicines convenient for ſuch ulcers, is delayed, and as it were dulled and hindered from their perfect operation ſo long as the ulcer is kept open. There have bin many that being diſeaſed with this diſeaſe, have had much matter & venemous filth come out at their abſceſſes, ſo that it ſeemed ſufficient, and they have bin thought wel recovered, yet have they dyed ſuddenly. In the mean while when theſe things are in doing, cordial medicines are not to be omitted to ſtrengthen the heart. And purgations muſt be renewed at certaine ſeaſons, that nature may be every way unloaded of the burthen of the venenate humors.

CHAP. XXXII.

Of the Nature, Cauſes and Signes of a peſtilent Carbuncle.

A Peſtilent Carbuncle is a ſmall tumour, or rather a maligne puſtle, hot and raging, conſiſting of bloud vitiated by the corruption of the proper ſubſtance. It often commeth to paſſe through the occaſion of this untameable malignity, that the Carbuncle cannot be governed or contained within the dominion of nature. In the beginning it is ſcarce ſo big as a ſeed or grain of Millet or a Peaſe, ſticking firmly unto the part and immoveable, ſo that the skinne cannot be pulled from the fleſh; but ſhortly after it encreaſeth like unto a *Bubo* unto a round and ſharpe head, with great heat, pricking paine, as if it were with needles, burning and intolerable, eſpecially a little before night, and while the meate is in concocting, more than when it is perfectly concocted. In the midſt thereof appeareth a bladder puffed up and filled with ſanious matter. If you cut this bladder, you ſhall finde the fleſh under it parched, burned and blacke, as if there had bin a burning cole layed there, whereby it ſeemeth that it took the name of Carbuncle; but the fleſh that is about the place is like a Rainebow, of divers colours, as red, darke, green, purple, livid, and black; but yet alwaies with a ſhining blackneſſe, like unto ſtone pitch, or like unto the true precious ſtone which they call a Carbuncle, whereof ſome alſo ſay it tooke the name. Some call it a Naile, becauſe it inferreth like paine as a naile driven into the fleſh. There are many Carbuncles which take their beginning with a cruſty ulcer without a puſtle, like to the burning of a hot iron: and theſe are of a blacke colour, they encreaſe quickly, according to the condition of the matter whereof they are made. All peſtilent Carbuncles have a Feaver joyned with them, and the grieved part ſeemeth to be ſo heavie, as if it were covered or preſſed with lead tyed hard with a ligature: there commeth mortall ſwounings, faintings, toſſing, turning, idle-talking, raging, gangrenes and mortifications, not onely to the part, but alſo to the whole bodie, by reaſon (as I thinke) of the oppreſſion of the ſpirits of the part, & the ſuffocation of the naturall heat, as we ſee alſo in many that have a peſtilent *Bubo*. For a *Bubo* and Carbuncle are tumours of a near affinity, ſo that the one doth ſcarce come without the other, conſiſting of one kinde of matter, unleſſe that which maketh the *Bubo* is more groſſe and clammy, and that which cauſeth the Carbuncle more ſharpe, burning and raging, by reaſon of its greater ſubtlety, ſo that it maketh an Eſchar on the place where it is, as we noted before.

What a Carbuncle is.

Whence ſo called.

Symptomes of Carbuncles.

How the matter of a *Bubo* & Carbuncle differ.

CHAP. XXXIII.

What Prognoſticks may bee made in peſtilent Buboes and Carbuncles.

SOme having the Peſtilence have but one Carbuncle, and ſome more in divers parts of their body, and in many it happeneth that they have the *Bubo* and Carbuncle before they have any Feaver; which giveth better hope of health, if there be no other maligne accident therewith: for it is a ſigne that nature is the victor, and hath gotten the upper hand, which excluded the peſtilent venome before it could come to aſſault the heart. But if a Carbuncle and *Bubo* come after the Feaver, it is mortall; for it is a token that the heart is affected, moved and incenſed with the furious rage of the venome; whereof preſently commeth a feaveriſh heat or burning, and corruption of the humours, ſent as it were from the center unto the ſuperficies of the body. It is a good ſigne when the patients minde is not troubled from the beginning untill the ſeventh day; but when the *Bubo* or Carbuncle ſinketh downe againe ſhortly after that it is riſen, it is a mortall ſigne, eſpecially if ill accidents follow it. If after they are brought to ſuppuration they preſently waxe dry without any reaſon thereof, it is an ill ſigne: Thoſe Carbuncles that are generated of bloud have a greater Eſchar than thoſe that are made

Why it is deadly to have a ſore come after the Feaver.

made of choler, becauſe that bloud is of a more groſſe conſiſtence, and therefore occupieth a greater roome in the fleſh: contrariwiſe, a cholerick humour is more ſmall in quantity and thinne, and it taketh little roome in the upper part of the fleſh onely, as you may ſee in an *Eryſipelas*. And I have ſeene Carbuncles whoſe Eſchars were as broad and as large as halfe the backe: alſo I have ſeene others, which going up by the ſhoulders to the throat, did ſo eate away the fleſh that was under them, that the rough artery or wind-pipe might be ſeen bare, when the Eſchar was fallen away: I had once a Carbuncle which was in the midſt of my belly, ſo that when the Eſchar was fallen away, I might very plainly ſee the *Piritonæum* or Rim: & the cicatrice that remaineth is as broad as my hand: but they doe not ſpread themſelves ſo far without the great danger or death of the patient. There are alſo ſome Carbuncles which beginning at the parts under the chin, diſperſe themſelves by little & little unto the pattell bones, and ſo ſtrangle the patient. So in many, the *Buboes* in the groin ariſe above a great part of the muſcles of the *Epigaſtrium*. Truly of thoſe abſceſſes that are ſo large & great in quantity, & ſo terrible to be ſeen, there is great danger of death to the patient, or at leaſt to the grieved part. For after the conſolidation, the part remaineth as if it were leprous, which aboliſheth the action of the part, as I have ſeene in many. Oftentimes alſo the corruption of the matter is ſo great, that the fleſh leaveth the bones bare: but Carbuncles often leave the joints and ligaments quite reſolved through the occaſion of the moiſture that is ſoaked & ſunk in unto them; for they often caſt out putrefied & virulent ſanious matter: whereby eating and creeping ulcers are bred, many bliſters & puſtles ariſing up in the parts round about it; which ſhortly breaking into one, make a great ulcer. Theſe come very ſeldome and ſlowly unto ſuppuration, or at leaſt to caſt out laudible matter, eſpecially if thy have their original of choler, becauſe the matter is ſooner burned with heat, than ſuppurated. Therefore then, if they can bee brought to ſuppuration by no medicines, if the tumour ſtill remaine blacke, if when they are opened nothing at all, or elſe a very little ſharpe moiſture doth come forth, they are altogether mortall: and there is ſcarce one of a thouſand who hath theſe accidents that recovereth health: diſperſed ſmall bliſters, comming of vapours ſtirred up by the matter that is under the skinne, and are there ſtayed and kept from paſſage forth, doe not neceſſarily fore-ſhew death in Carbuncles. But if the part be ſwolne or puffed up, if it be of a green or black colour, and if it feele neither pricking nor burning, it is a ſigne of a mortall Gangrene. *Buboes* or Carbuncles ſeldome or never come without a Feaver: but the Feaver is more vehement when they are in the emunctories, or nervous parts, than when they are in the fleſhy parts, yet it is leſſe, and all Symptomes are leſſe, and more tolerable in a man that is ſtrong and of a good temperature: Carbuncles not onely affect the outward, but alſo the inward parts, and oftentimes both together. If the heart be vexed in ſuch ſort with a Carbuncle that nothing thereof appeareth forth on the ſuperficiall parts, all hope of life is paſt, and thoſe dye ſuddenly, eating, drinking or walking, and not thinking any thing of death. If the Carbuncle be in the middriffe or lungs, they are ſoon ſuffocated: If it be in the braine, the patient becommeth frantick, and ſo dyeth. If it be in the parts appointed for the paſſage of the urine, they dye of the ſuppreſſion of their water, as it happened in the Queene mothers waiting maide at the Caſtle of *Roſsilion*, of whom I ſpake before. If it be in the ſtomacke, it inferreth the accidents that are ſhewed in this hiſtory following.

Huge peſtilent Abſceſſes commonly deadly.

Deadly Carbuncles.

A hiſtory.

While I was Surgeon in the Hoſpitall of Paris, a young and ſtrong Monke of the order of St. *Victor*, being overſeer of the women that kept the ſicke people of that place, fell into a continuall Feaver very ſuddenly with his tongue blacke, dry, rough, (by reaſon of the putrefied and corrupted humours, and the vapours riſing from the whole body unto that place) and hanging out like unto an hounds, with unquenchable thirſt, often ſwouning and deſire to vomit. He had convulſions over all his body through the vehemency and malignity of the diſeaſe, and ſo hee dyed the third day: wherefore thoſe that kept the ſicke people in the Hoſpitall, thought that he had been poyſoned, for the certaine knowledge whereof the Governours of the Hoſpitall commanded his body to be opened.

I therefore calling to mee a Phyſician and Surgeon, wee found in the bottome of his ſtomack a print or impreſſion, as if it had been made with an hot Iron or potentiall Cauterie, with an Eſchar or cruſt as broad as ones naile, all the reſt of his ſtomack was greatly contracted and ſhrunke up together, and as it were horny; which wee conſidering, and eſpecially the Eſchar which was deepe in the ſubſtance of the ſtomacke, we all ſaid with one voice that he was poyſoned with Sublimate or Arſenick. But behold while I was ſowing up his belly, I perceived many blacke ſpots diſperſed diverſly throughout the skin: then I asked my company what they thought of thoſe ſpots; truely (ſaid I) it ſeemeth unto me that they are like unto the purple ſpots or markes that are in the peſtilence. The Phyſician and the Chirurgion denied it, and ſaid that they were the bitings of fleas. But I perſwaded them to conſider the number of them over all the whole body, and alſo their great depth and depreſſion into the fleſh; for when we had thruſt needles deep into the fleſh in the middeſt of them, and ſo cut away the fleſh about the needle, we found the fleſh about the needle to be blacke: moreover his noſtrils, nailes and eares were livid, and all the conſtitution of his body was contrary, and far unlike to the bodies of thoſe that died of other ſickneſſes or diſeaſes. Alſo it was credibly reported unto us by thoſe that kept him, that his face was ſo altered a little before he died, that his familiar friends could hardly know him. Wee perſwaded by theſe proofes, revoked our former opinion and ſentence, and made a certificate to bee ſent unto the Governours and Maſters of the Hoſpitall, ſetting our hands and ſeales unto it, to certifie them that hee died of a peſtilent Carbuncle.

How to diſtinguiſh purple ſpots from flea-bitings.

CHAP. XXXIIII.

Of the cure of a peſtilent Carbuncle.

BY the forenamed ſignes of a peſtilent Carbuncle, and eſpecially by the bitterneſſe of the paine, malignity of the venemous matter, and by the burning Feaver that is therewithall annexed, I think it manifeſt, that very hot, emplaſtick, and drawing medicines ſhould not bee applyed to this kind of tumour; becauſe they prohibite or hinder the exhalation, or waſting forth of the venenate malignity; becauſe that by ſtopping the pores of the skinne, they increaſe and cauſe a greater heat in the part than there was before. Therefore it is better to uſe reſolving medicines, which may aſſwage heate, and reſolve the pores of the skinne. Therefore firſt the place muſt be fomented with water and oyle mixed together, wherein a little Treacle hath beene diſſolved, leaving thereon ſtupes wet therein: you may alſo uſe the decoction of Mallowes, the roots of Lillies, Linſeeds, Figges, with oile of *Hypericon*, for to make the skinne thin, and to draw forth the matter; and the day following you muſt apply the Cataplaſme following.

Why Emplaſtick, very hot, and great drawers are not good for a carbuncle.

Take the leaves of Sorrell and Henbane, roſt them under the hot aſhes; afterwards beate them with foure yolks of egges, two drams of Treacle, oyle of Lillies, three ounces, Barly-meale as much as ſhall ſuffice: make thereof a Cataplaſme in the form of a liquid pultis; this aſſwageth heat, and furthereth ſuppuration. Or, Take the roots of Marſh-mallowes and Lillies, of each foure ounces, Linſeeds halfe an ounce, boyle them, beat them, and then ſtraine them through a ſearſe, adding thereto of freſh butter one ounce and an halfe, of Mithridate one dramme, of Barly-meale as much as ſhall ſuffice: make thereof a Cataplaſme according to Art: thoſe Cataplaſmes that follow are moſt effectuall to draw the venemous matter forth, and to make a perfect ſuppuration, eſpecially when the fluxe of the matter is not ſo great, but that the part may beare it. Take the roots of white Lillies, Onions, Leaven, of each halfe an ounce; Muſtard-ſeeds, Pidgeons dung, Sope, of each one dram; ſixe ſnailes in their ſhels; of fine Sugar, Treacle and Mithridate, of each half a dram; beate them all together, and incorporate them with the yolks of egs, make therof a Cataplaſme, & apply it warm. Or, Take the yolkes of ſixe egs; of ſalt poudered one ounce; of oyle of Lillies and Treacle, of each halfe a dramme; Barly-meale as much as ſhall ſuffice: make there-

A Cataplaſme for a peſtilent Carbuncle.

Another.

Other Cataplaſmes.

The effect of Scabious againſt a peſtilent Carbuncle.

A Radiſh root drawes out the venome powerfully.

The top of a Carbuncle when, why and with what to be burned.

The falling of the Eſchar promiſeth health.

A twofold indication.

of a Cataplaſme. Take of ordinary ***Diachylon*** foure ounces; of ***Unguentum Baſilicon*** two ounces; oyle of Violets halfe an ounce: make thereof a medicine. Many ancient Profeſſors greatly commend Scabious ground or brayed betweene two ſtones, and mixed with old hogs greaſe, the yolkes of egs, and a little ſalt; for it will cauſe ſuppuration in Carbuncles: alſo an egge mixed with Barly-meale, and oyle of Violets doth mitigate paine and ſuppurate. A Radiſh root cut in ſlices, and ſo the ſlices laid one after one unto a Carbuncle or peſtilent tumour, doth mightily draw out the poyſon. The juice of Colts foote doth extinguiſh the heat of Carbuncles: the herbe called Divels-bit being bruiſed, worketh the like effect: I have often uſed the medicine following unto the heat of Carbuncles, with very good ſucceſſe; it doth alſo aſſwage paine and cauſe ſuppuration. Take of the ſoot ſcraped from a chimny foure ounces, of common ſalt two ounces, beate them into ſmall powder, adding thereto the yolkes of two egges, and ſtirre them well together untill it come to have the conſiſtence of a pultis, and let it bee applyed warme unto the Carbuncle. In the beginning the point or head of the Carbuncle muſt bee burned, if it bee blacke, by dropping thereinto ſcalding hot oyle, or ***Aqua fortis***: for by ſuch a burning the venome is ſuffocated as touched by lightening, and the paine is much leſſened, as I have proved oftentimes: neither is it to bee feared leſt that this burning ſhould bee too painfull, for it toucheth nothing but the point of the Carbuncle, which by reaſon of the Eſchar that is there, is voyd of ſenſe. After this burning, you muſt goe forward with the former deſcribed medicines, untill the Eſchar ſeemeth to ſeparate it ſelfe from the fleſh round about it, which is a token of the patients recovery, for it ſignifieth that nature is ſtrong and able to reſiſt the poyſon. After the fall of the Eſchar you muſt uſe gentle mundificatives, as thoſe which we have preſcribed in a peſtilent *Bubo*, not omitting ſometimes the uſe of ſuppurative and mollifying medicines, that while the groſſe matter is cleanſed, that which is as yet crude may bee brought to ſuppuration; for then the indication is twofold, the one to ſuppurate that which remaines as yet crude and raw in the part, and the other to cleanſe that which remaines concocted and perfectly digeſted in the ulcer.

CHAP. XXXV.

Of the itching and inflammation happening in peſtilent ulcers, and how to cicatrize them.

Why the adjacent parts are troubled with itching.

A fomentation for this itch.

Why theſe ulcers are hard to be cicatrized.

Two ſorts of Epuloticks.

THE parts adjoyning to a peſtilent ulcer oft-times are ſuperficially excoriated by reaſon of ulcerous puſtles, which here and there with burning and great itching pricke and vellicate the part. The cauſe may happen either externally or internally; internally by a thin and biting *ſanies*, which ſweating from the ulcer, moyſtens the neighbouring parts. But externally by the conſtipation of the pores of the ſkinne induced by the continuall application of medicines. To remedy this, the place muſt bee fomented with diſcuſſing and relaxing things, as *aqua fortis*, which the Gold-ſmithes have uſed for ſeparating of metalls, alome water, the water of Lime, Brine and the like. But ulcers left by Carbuncles and peſtilent *Buboes*, are difficultly cicatrized by reaſon of the corroding *ſanies*, proceeding from the cholericke, or phlegmaticke and ſalt bloud, which being in fault by the corruption of the whole ſubſtance cauſeth the abſceſſe. Beſides, ſuch ulcers are commonly round, and therefore more hard to be cicatrized, for that the quitture hath no free paſſage forth; ſo the *ſanies*, of its owne nature acride and corroding, doth by delay acquire greater acrimony and introſitie, ſo that by its burning touch diſſolving the adjacent fleſh, it hinders the conjunction and unition of the lips of the ulcer; but in the interim the lips of the ulcer become callous, which, unleſſe they be helped by cutting, or eating medicines, the ulcer cannot be healed, for that by their denſity they hinder the ſweating out of a ſufficient quantity of the dewy glew to heale up the ulcer. Now the ulcer being plained and brought equall to the other fleſh, we muſt uſe Epuloticks, that is, ſuch things as have a faculty to cicatrize ulcers by condenſing and hardening the ſurface of the fleſh, of theſe there are two kinds; for ſome without much biting bind and dry, ſuch are pomgranate pils, oake barke, *Tutia*, litharge, burnt bones, ſcailes of braſſe, galls, cypreſſe nuts, *Minium*, antimony, bole armenicke, the burnt and waſhed ſhels of oiſters, Lime nine times waſhed, and many metalline things. Others are next to theſe, by which proud fleſh is conſumed, but ſuch muſt be ſparingly uſed: of this kind is waſhed Vitrioll, burnt Alome, which excelleth other Epuloticks, by reaſon of the excellent drying and aſtringent faculty conſolidating the fleſh, which by being moiſtened by an excrementitious humour, growes lanke. For that the ſcarre which is made, is commonly unſightly in this kind of ulcers, as red, livide, blacke, ſwolne, rough, by reaſon of the great aduſtion imprinted in the part, as by a burning coale, therefore I have thought good here to ſet down ſome means by which this deformity may be corrected or amended. If the ſcarre be too big or high, it ſhall be plained by making convenient ligation and ſtrait binding to the part a plate of lead rubbed over with quickſilver; but you may whiten it by anointing it with Lime nine times waſhed (that ſo it may bee more gentle and loſe the acrimony) and incorporated with oile of Roſes. Some take two pound of Tartar or Argole, burne it, and then powder it, put it in a cloth, and ſo let it hang in a moyſt vault or cellar, and ſet a veſſell under it to receive the dropping liquor, which is good to be rubbed for a good ſpace, upon the ſcarre. The ſame faculty is thought to be in that moyſture of egs which ſweats through the ſhel, whileſt they are roſted at the coals; as alſo *unguent. citrinum*, and *Emplaſt. de ceruſſa* newly made: The three following compoſitions are much approved. ℞. *Axungiæ ſuillæ nonies lotæ in aceto acerrimo* ℥iv. *cinab. ſucci titri, & alum. uſti, an.* ℥ß. *ſulphur. vivi ignem haud experti,* ʒii. *caph.* ℈ii. *fiat pulvis*; then let them all be incorporated together, and make an ointment; it attenuates the skin and cleanſeth ſpots. ℞. *olei hyoſ. olei ſemin. cucurb. an.* ℥i. *olei tartar.* ʒß. *ceræ alb.* ʒiii. *liquefiant ſimul lento igne, deinde adde ſpermat. ceti* ʒvi. *removeantur predicta ab igne donec infrigid. poſtea adde troch. alb. Rhaſis pul.* ʒiii. *caph.* ʒi. *tandem cum mali citri ſucco omnia diligenter commiſce, fiat linimentum.* Or elſe, ℞. *rad. ſerpent.* ℥i. *bulliat in aq. com.* ℔i. *ad dimid. deinde adde ſulph. vivi ignem non experti, & alum. crudi, pulveriſ. an.* ʒiß. *colent. predict. & addatur caph.* ʒi. *ſucci hyoſcyami* ʒiß. Let this medicine be kept in a lead or glaſſe veſſel, and when you would uſe it, dip linnen clothes therein, and lay them to the part. You may alſo uſe theſe medicines againſt the redneſſe of the face, and you may fetch them off in the morning by waſhing the face with warme water and bran.

Remedies againſt the deformity of ſcarres.

Ointments to attenuate and take away ſcars.

CHAP. XXXVI.

Of ſundry kinds of Evacuations, and firſt of ſweating and vomiting.

THe peſtilent malignity is not onely evacuated and ſent forth by the eruption of puſtles and ſpots, but alſo by ſweat, vomit, bleeding at noſe, at the hæmorrhoids, by the courſes, a fluxe of the belly, and other wayes, ſo that nature by every kind of excretion may be freed from the deadly poyſon, eſpecially that which is not as yet arrived at the heart. But chiefe regard muſt be had to the inclination of nature, and wee muſt attend what way it chiefly aimes at, and what kind of excretion it affects. Yet ſuch evacuations are not alwayes criticall, but uſually ſymptomaticall, for that oft-times nature is ſo irritated by the untameable malignity of the matter, that it can no way digeſt it, but is forced by any meanes to ſend it away crude as it is. Wherefore if nature may ſeeme by the moyſtneſſe of the skin, the ſuppreſſion of urine, & other ſignes to affect a criſis and excretion by ſweat, you then ſhall procure it by the formerly mentioned meanes. It is delivered by the Ancients that all ſweats in acute diſeaſes are ſalutary, which happen upon a Criticall day, which are univerſall and hot, and ſignified before the criticall day. But in this rapid and deadly diſeaſe of the Plague, wee muſt not expect a *Criſis*, but as ſoone as wee can, and by what meanes wee may to free nature from ſo dire and potent an enemy.

Why the peſtilent malignity is not caried away by one way, but by many.

We muſt have chiefe regard to the motion of nature.

Signes of future ſweat.

A *Criſis* muſt not be expected in the Plague.

But

How to procure vomit.

But oft times the tough and groſſe excrementitious humours may bee purged by vomit, which could not be evacuated by ſtrong purges. Therefore alſo by this manner of excretion may we hope for the excluſion of the peſtilent venome, if there bee nothing which may hinder; and nature by frequent nauſeouſneſſe may ſeem to affect this way: the endeavour thereof ſhall be helped by giving ſome halfe a pint of warm water to be drunke with foure ounces of common oyle, an ounce of vinegar, and a little juice of raddiſh, after the taking of the potion it is fit to thruſt into the throate a gooſe quill dipped in the ſame oile, or elſe a branch of Roſemary, or elſe by thruſting in the fingers ſo to procure vomit; alſo a potion of eight ounces of the mucilaginous water of the decoction of Line ſeeds will procure vomit. Or elſe, ℞. *rad. raph. in taleol. ſect. vel ſem. ejus, & ſem. antriplicis, an.* ʒ iii. *bulliant in aqua com. quod ſufficit pro doſi, in colatura diſſolve oxym. & ſyr. acet. an.* ℥ß. *exhibeatur potio larga & tepida.* Or elſe, ℞. *oxym. Gal.* ℥ vi. *ol. com.* ℥ ii. *paretur potio tepid.*

Why vomit muſt not be forced.

But nature muſt not be forc't, unleſſe of its own accord it undertake this motion; for forced and violent vomiting, diſtends the nervous fibers of the ventricle, dejects the ſtrength, breaks the veſſels of the Lungs, whence proceeds a deadly ſpitting of blood. Wherefore if the ſtomack ſhall trouble it ſelfe with a vain and hurtfull deſire to vomit, it ſhall rather be ſtrengthened with bagges of roſes, worm wood and Saunders, uſing inwardly the juice of Quinces and Berberies, and brothes made for the ſame purpoſe.

Chap. XXXVII.

Of ſpitting, Salivation, Sneeſing, Belching, Hicketting, and making of Water.

The effect of ſpitting in peſtilent diſeaſes.

What long evacuations may be made by ſpitting and ſalivation, you may learne by the example of ſuch as have a pluriſie, for the matter of the pluriſie being turned into *pus*, the purulent matter ſuckt up by the rare and ſpongeous ſubſtance of the lungs, and thence drawn into the *Aſpera Arteria*, is laſtly caſt out by the mouth.

The force of ſalivation.

There is none ignorant, how much ſuch as have the *Lues venerea* are helped by ſalivation and ſpitting. But theſe ſhall be procured by Maſticatories of the roots of *Ireos*, Pellitory of Spaine, Maſtick, and the like; the mucilage of Line ſeeds held in the mouth will worke the ſame effect.

The force of ſneeſing.

That ſuch as have a moiſt braine may expell their ſuperfluous humours by ſneeſing and blowing their noſes, the braine by the ſtrength of the expulſive faculty, being ſtirred up to the excluſion of that which is harmefull, may be knowne by the example of old people and children which are daily purged by their noſes; the braine is ſtirred up to both kindes of excretion from cauſes either internall or externall: from the internall, as by a phlegmaticke and vaporous matter, which conteined in the braine, offends it; externally, as by receiving the beames of the ſunne in the noſtrils, or by tickling them with a feather, or blowing into them the powder of Hellebore, *Euphorbium*, *Pyrethrum*, Muſtard ſeed, and the like ſternutamentories. For then the braine is ſtraitened by its owne expulſive faculty, to the excretion of that which is troublous unto it. Sneeſing breaketh forth with noiſe, for that the matter paſſeth through ſtraits, to wit, by the ſtraining paſſages of the *Os cribroſum*, which is ſeated at the roots of the noſtrills. It is not fit to cauſe ſneeſing in a body very plethorick, unleſſe you have firſt premiſed generall medicines, leſt the humours ſhould bee more powerfully drawne into the braine, and ſo cauſe an Apoplexie, *Vertigo*, or the like ſymptomes.

The commodities of belching.

By belching the flatulencies conteined in the ventricle, being the off-ſpring of crudity, or flatulent meats, are expelled, theſe by their taſte and ſmell, pleaſing, ſtinking, ſweet, bitter or tart, ſhew the condition and kinde of crudity of the humours from whence they are raiſed: now vomiting freeth the ſtomack of crudities, but the diſtemper muſt be corrected by contraries, as altering things to be preſcribed by the Phyſitian.

Hicketting is a contraction and extenſion of the nervous fibers of the ſtomack, to caſt forth ſuch things as are too contumaciouſly impact in the coates thereof; yet repletion only is not the cauſe thereof, but ſometimes inanition alſo; ſo oft times a putride vapour, from ſome other place, breaking into the ſtomacke, as from a peſtilent *Bubo*, or Carbuncle; alſo all acide and acride things, becauſe they pricke, vellicate & provoke the tunicles of the ventricle, as vinegar, ſpiced things, and the like; often & contumacious hicketting after purging, a wound or vomiting, is ill; but if a convulſion preſently happen thereon, it is deadly.

Severall remedies muſt be uſed according to the variety of the cauſes: for repletion helps that hicketing that proceeds from inanition, & evacuation that which happens by repletion: that which proceeds from a putrid and venemous vapour, is helped by Treacle and Antidotes; that which is occaſioned by acide and acrid things, is cured by the uſe of groſſe, fatty, and cold things.

The whole body purged by urine.

Now the whole body is oft times purged by urine, and by this way the feavouriſh matter is chiefly and properly accuſtomed to bee evacuated: not a few, being troubled with the *Lues venerea*, when as they could not be brought to ſalivation by unction, have bin cured by the large evacuation of urine cauſed by diuretick medicines. Diureticks wherewithall you may move urine, are formerly deſcribed in treating of the ſtone. But we muſt abſtaine from more acride diureticks, eſpecially when as inflammation is in the bladder; for otherwiſe the noxious humours are ſent to the affected part, whence there is danger of a deadly Gangrene. Therefore then it is better to uſe diverſion by ſweat.

When we ought to abſtaine from diureticks.

CHAP. XXXVIII.

Of the Menſtruall and Hæmorrhoidall purgation.

How to provoke the courſes.

NOt onely reaſon, but alſo manifold experience induceth us to beleeve that women, by the benefit of their menſtruall purgation, eſcape and are freed from great, peſtilent, and abſolutely deadly diſeaſes; wherefore it muſt bee procured by remedies, both inwardly taken, and outwardly applied: theſe may be taken inwardly with good ſucceſſe, *Caſsia lignea*, Cinamon, the barke of the root of a Mulberry, Saffron, Agricke, Nutmeg, Savine, *Diagridium*, and divers others. But if the affect require more vehement medicines, the rootes of Tithymel, Antimony, *Cantharides* (taken in ſmall quantity) move the courſes moſt powerfully; frictions and ligatures made upon the thighes and legges conduce hereto, as alſo cupping in the inner and middle part of the thighs, the opening of the vein *Saphena*, leaches applyed to the orifice of the neck of the womb, peſſaries, nodula's, glyſters, baths, fomentations made of oderiferous things, which by the fragrancy of their odor, or rather by their heat, may attenuate & cut groſſe humors, open the obſtructed orifices of the veines, ſuch are the roots of Marſh-mallowes, Orris, Parſly, Fennell, Kneholne, the leaves and floures of St. Johns Wort, *Aſparagus*, Rocket, Balme, Chervile, Mugwort, Mints, Penny-royall, Savory, Roſemary, Rue, Time, Sage, Bay berries, Broome, Ginger, Cloves, Pepper, Nutmegs, and the like; the vapour of the boyling whereof, let the woman, ſitting upon a perforated ſeat, receive by a funnell into the necke of her wombe, covering herſelfe warme on all ſides, that ſo nothing may otherwiſe breath forth. Of the ſame things may bee made bathes, as well generall as particular. Alſo peſſaries are good made after this manner. ℞. *theriac. mithrid. an.* ʒ ß. *caſtor. gum. ammoniac. an.* ʒ i. *miſce cum bombace in ſucco mercurialis tincto, fiat peſſarium.* Or elſe, ℞. *rad. petroſelin. & fænug. ſub cineribus coctas, deinde contuſas cum pul. ſtaphyſag. pyreth. croco & oleo liliorum*, ſo make a peſſary in the forme of a ſuppoſitory or nodula. Or, ℞. *pulv. myrrh. & aloes, an.* ʒ i. *fol. ſabin. nigel. arthemiſ. an.* ʒ ii. *rad. Helleb. nigr.* ʒ i. *croci*, ℈ i. *cum ſucco mercur. & melle communi*: make a peſſary in Cotton. This which followes is more effectuall. ℞. *ſucci rut. abſinth. an.* ʒ ii. *myrrh. euphorb. caſtor. ſabin. diacrid. terebinth. galban. theriac. an.* ʒ i.

How aromatick things provoke the courſes.

Peſſaries to provoke the terms.

make a peſſary according to art; let a thred hang out of the one end of the peſſaries, that ſo you may eaſily draw them forth as you pleaſe.

How to ſtop the courſes flowing too immoderately.

But if this menſtruous flux once provoked, flow too immoderately, it muſt be ſtopped by uſing meats of groſſer and more viſcide juice, by opening a veine in the arm, application of cupping glaſſes under the dugs, frictions and ligations of the upper parts, as the armes, putting up of peſſaries, application of refrigerating and aſtringent plaſters, to the lower belly, ſhare and loines, laying the woman in a convenient place, and not upon a feather-bed.

This following injection ſtoppeth the blood flowing out of the wombe, ℞. *aquæ plant. & fabror. an.* ℔ i. *nucum cupreſ. gallar. immatur. an.* ʒ ii. *berber. ſumach. balauſt. vitriol. rom. alum. roch. an.* ʒ ii. *bulliant omnia ſimul, & fiat decoctio*: of this make injection into the wombe. In the performance of all theſe things, I would have the Surgeon depend upon the advice of a Phyſitian, as the occaſion and place ſhall permit.

How to provoke the hæmorrhoides.

But if nature endeavour to free it ſelfe of the peſtilent matter by the hœmorrhoides, you may provoke them by frictions and ſtrong ligatures in the lower parts, as if the thighes or legs were broken, by ventoſes applyed with great flame to the inner ſide of the thigh, by application of hot and attractive things to the fundament, ſuch as are fomentations, emplaſters, unguents, ſuch as is uſually made of an onion roſted under the embers, and incorporated with Treacle, and a little oile of Rue: after the hœmorrhoid veines, by theſe meanes, come to ſhew themſelves, they ſhal be rubbed with rough linnen cloths, or fig leaves, or a raw onion, or an oxe gall mixt with ſome pouder of *Coloquintida*: laſtly you may apply horſe-leaches, or you may open them with a Lancet, if they hang much forth of the fundament, and be ſwolne with much blood. But if they flow too immoderately, they may be ſtayed by the ſame meanes as the courſes.

Chap. XXXIX.

Of procuring evacuation by ſtoole, or a fluxe of the belly.

NAture often times, both by it ſelfe, of its owne accord, as alſo helped by laxative and purging medicines, caſts into the belly and guts, as into the ſinke of the body, the whole matter of a peſtilent diſeaſe, whence are cauſed Diarrhæa's, Lienteries, and Dyſenteries; you may diſtinguiſh theſe kindes of fluxes of the belly, by the evacuated excrements. For if they be thinne and ſincere, that is, reteine the nature of one, and that a ſimple humour, as of choler, melancholy or phlegme, and if they be caſt forth in a great quantity, without the ulceration or excoriation of the guts, vehement or fretting paine, then it is a *Diarrhæa*, which ſome alſo call *fluxus humoralis*. It is called a *Lienteria*, when as by the reſolved retentive faculty of the ſtomacke and guts cauſed by ill humours, either there collected, or flowing from ſome other place, or by a cold & moiſt diſtemper, the meat is caſt forth crude, & almoſt as it was taken. A *Dyſenteria* is when as many and different things, and oft times mixt with blood, are caſt forth with pain, gripings, and an ulcer of the guts, cauſed by acride choler, fretting inſunder the coats of the veſſels.

What a Diarrhæa is.

What a Dyſenteria is.

But if in any kinde of diſeaſe, certainely in a peſtilent one, fluxes of the belly happen immoderate in quantity, and horrible in the quality of their contents, as liquid, viſcous, frothy as from melted greace, yellow, red, purple, greene, aſh-coloured, blacke, and exceeding ſtinking. The cauſe is various, and many ſorts of ill humours, which taken hold of by the peſtilent malignity, turne into divers ſpecies, differing in their whole kinde both from their particular, as alſo from nature in generall, by reaſon of the corruption of their proper ſubſtance, whoſe inſeparable ſigne is ſtinch, which is oft times accompanied by wormes.

The cauſe of various, and ſtinking excrements in the plague.

A hiſtory.

In the campe at *Amiens* a peſtilent Dyſentery was over all the Campe, in this the ſtrongeſt Souldiers purged forth meere blood: I diſſecting ſome of their dead bodies, obſerved the mouths of the Meſaraike Veines and Arteries, opened and much ſwollen, and whereas they entered into the guts, were juſt like little Catyledones, out of which, as I preſſed them, there flowed blood. For both by the exceſſive heat of the ſummers ſunne, and the mindes of the enraged ſouldiers, great quantity of acride and cholericke humour was generated; and ſo flowed into the belly: but you ſhall know whether the greater or the leſſer guts be ulcerated, better by the mixture of the blood with the excrements, than by the ſite of the paine, therefore in the one you muſt rather worke by Glyſters, but in the other, by Medicines taken by the mouth.

Therefore if by gripings, a *teneſmus*, the murmuring and working of the guts, you ſuſpect in a peſtilent diſeaſe, that nature endeavours to disburden it ſelf by the lower parts, neither in the meane while doe it ſucceed to your deſire, then muſt it be helped forward by art, as by taking a potion of ℥ ß. of *hiera ſimplex*, and a dramme of *Diaphenicon* diſſolved in worme-wood water.

A potion.

Alſo Glyſters are good in this caſe, not onely for that they aſſwage the gripings and paines, and draw by continuation or ſucceſſion from the whole body, but alſo becauſe they free the meſaraike veines and guts from obſtruction and ſtuffing, ſo that by opening and as it were unlocking of the paſſages, nature may afterwards more freely free it ſelfe from the noxious humours. In ſuch glyſters they alſo ſometimes mixe two or three drammes of Treacle, that by one and the ſame labour they may retunde the venenate malignity of the matter.

There may alſo be made for the ſame purpoſe ſuppoſitories of boyled hony ℥ i. of *hierapicra* and common ſalt, of each ʒ ß. or that they may bee the ſtronger, of hony ℥ iii. of oxe gall ℥ i. of Scammony, *euphorbium* and *coloquintida* poudred, of each ʒ ß. The want of theſe may be ſupplied by nodula's made in this forme. ℞. *vitell. ovor.* nu. iii. *fellis bubuli, & mellis, an.* ℥ ß. *ſalis com.* ʒ ß. let them be ſtirred together, and well incorporated, and ſo parted into linnen ragges, and then bound up into nodula's, of the bigneſſe of a filberd, and ſo put up into the fundament; you may make them more acride by adding ſome powder of *Euphorbium* or *Coloquintida*.

Suppoſitories.

CHAP. XL.

Of ſtopping the fluxe of the belly.

Violent and immoderate ſcourings, for that they reſolve the faculty, and lead the patient into a conſumption and death, therefore if they ſhall appear to be ſuch, they muſt be ſtayed in time by things taken and injected by the mouth and fundament. To this purpoſe may a pudding be made of wheat flower boyled in the water of the decoction of one pomegranate, berberies, bole armenick, *terra ſigillata*, and white poppie ſeeds, of each ʒ i. The following Almond milke ſtrengthens the ſtomacke, and mitigates the acrimony of the cholericke humour, provoking the guts to excretion. Take ſweet Almonds boiled in the water of barly, wherein ſteele or Iron hath been quenched, beat them in a marble morter, and ſo with ſome of the ſame water make them into an Almond milk, wherto adding ʒ i. of *Diarhodon Abbatis* you may give it to the patient to drink.

A haſty pudding to ſtay the laske.

This following medicine I learnt of Dr. *Chappelaine* the Kings chiefe phyſitian, who received it of his father, and held it as a great ſecret, & was wont to preſcribe it with happy ſucceſſe to his patients: It is thus, ℞. *boli armen. terræ ſigil. lapid. hæmat. an.* ʒ i. *picis navalis*, ʒ i ß. *coral rub. marg. elect. corn. cervi uſt. & loti in aq. plant. an.* ℈ i. *ſacchar. roſ.* ℥ ii. *fiat pulviſc.* of this let the patient take a ſpoonefull before meat, or with the yolke of an egge.

D. Chappelaires medicine to ſtay a ſcouring.

Chriſtopher Andrew in his *æcoiätria* much commendeth dogges dung, when as the dogge hath for three dayes before bin fed onely with bones.

Quinces roſted in embers, or boyled in a pot, the conſerve of cornelian cherries, preſerved berberies and myrabalans, roſted nutmeg taken before meat, ſtrengthen the ſtomack and ſtay the laske; the patient muſt feed upon good meats, and theſe ra-

Drinke. ther roaſted than boiled. His drinke ſhall be chalibeate water of the decoction of a ſoure pomegranate beaten, or of the decoction of a quince, medlars, cervices, mulberies, bramble berries, and the like things, endued with a faculty to binde and waſte the excrementitious humidities of the body: theſe waters ſhall be mixed with ſyrupe of red currance, Julep of roſes, and the like.

Ointments. Let the region of the ſtomacke and belly be anointed with oile of maſticke, *Moſchatelinum*, myrtles and quinces. Alſo a cruſt of bread newly drawn forth of the oven and ſteeped in vinegar and roſe water, may be profitably applyed; or elſe a cataplaſme of red roſes, ſumach, berberies, myrtles, the pulpe of quinces, maſtick, bean flower, and hony of roſes made up with calibeate water.

Glyſters to ſtay a fluxe. Anodyne, abſtergent, aſtringent, conſolidating and nouriſhing glyſters ſhall bee injected. Theſe following retund the acrimony of humours, and aſſwage paine. ℞. *fol. lactuc. hyoſc. acetoſ. portul. an.* m. i. *flor. violar. & nenuph. an.* p i. *fiat decoctio ad* ℔ i. *in colatura diſſolve caſſiæ fiſtul.* ʒ vi. *olei roſat. & nenuph. an.* ℥ i ß. *fiat clyſter.* Or elſe, ℞. *roſ. rub. hord. mund. ſem. plant. an.* p i. *fiat decoctio, in colatura adde olei roſ.* ℥ ii. *vitel. ovor.* ii. *fiat clyſter.* Or, ℞. *decoctionis Capi, crur. vitellin. & capit. vervicin. una cum pelle,* ℔ ii. *in qua coquantur fol. violar. malv. mercur. plantag. an.* m i. *hord. mund.* ℥ i. *quatuor ſem. frigid. major. an.* ʒ ß. *in colaturæ* ℔ ß. *diſſolve caſſ. recenter extract.* ℥i. *ol. viol.* ℥ iv. *vitellor. ovor.* ii. *ſach. rub.* ℥ i. *fiat clyſter.* Or, ℞. *flor. chamæm. melil. aneth. an.* p i. *rad. biſmal.* ℥i. *fiat decoctio in lacte; colaturæ adde mucag. ſem, lin. fænugr. extract. in aqua malv.* ℥ ii. *ſacchar. rub.* ℥ i. *olei cham. & aneth. an.* ℥ i ß. *vitellor. ovor.* ii. *fiat clyſter.*

Such glyſters muſt be long kept that they may more readily mitigate paine. When ſhavings of the guts appeare in the ſtooles, it is an argument that there is an ulcer in the guts; therefore then wee muſt uſe detergent and conſolidating glyſters, as this which followes.

A glyſter for ulcerated guts. ℞. *hordei integr.* p ii. *roſ. rub. flor. chamæm. plantag. apii, an.* p i. *fiat decoctio, in colatura diſſolve mellis roſat. & ſyr. de abſinth. an.* ℥ i ß. *vitel. ovor.* ii. This following glyſter conſolidateth. ℞. *ſucci plantag. centinod. & portulac.* nu ℥ ii. *bol. armen. ſang. dracon. amyl. an.* ʒ i. *ſebi hircini diſſoluti,* ʒ iii. *fiat clyſter.* Alſo cowes milke boyled with plantaine and mixed with ſyrupe of roſes is an excellent medicine for the ulcerated guts.

A very aſtringent glyſter. This following glyſter bindes. ℞. *caud. equin. plant. polygon. an.* m i. *fiat decoctio in lacte uſtulato ad* quart. iii. *& in colatura adde boli arm. terræ ſigil. ſang. dracon. an.* ʒ ii. *albumina duor. ovor. fiat clyſter.* Or elſe, ℞. *ſuc. plant. arnogloſ. centinod. portulac. reſidentia facta depuratorum quantum ſufficit pro clyſtere, addendo pul. boli armeni, terræ ſigil. ſang. dracon. an.* ʒ i. *ol. myrthin. & roſat. an.* ℥ ii. *fiat clyſter.*

If pure blood flow forth of the guts, I could wiſh you to uſe ſtronger aſtrictives. To which purpoſe I much commend a decoction of pomegranate pills, of cypreſſe nuts, red roſe leaves, ſumach, alome, and vitrioll made with ſmithes water, and ſo made into glyſters, without any oyle. It will bee good with the ſame decoction to foment the fundament, *perinæum*, and the whole belly.

Aſtringent glyſters ought not to bee uſed before that the noxious humours bee drawne away and purged by purging medicines, otherwiſe by the ſtoppage hereof, the body may chance to be oppreſſed.

A nouriſhing glyſter. If the patient bee ſo weake that hee cannot take or ſwallow any thing by mouth, nutritive glyſters ſhall be given him. ℞. *decoctionis capi pinguis, & cruris vitulini, coct. cum acetoſa, bugloſſo, boragine, pimpinella, lactuca,* ℥ x. *vel* xii. *in quibus diſſolve vitellos ovorum,* num iii. *ſacchari roſati, & aquæ vitæ, an.* ℥ i. *butyri recentis non ſaliti,* ʒ ii. *fiat clyſter.*

Chap.

CHAP. XLI.

Of evacuation by inſenſible tranſpiration.

THe peſtilent malignity as it is oft times drawne by the pores, by tranſpiration into the body, ſo oft times it is ſent forth inviſibly the ſame way againe. For our native heat that is never idle in us, diſperſeth the noxious humours attenuated into vapours and aire through the unperceivable breathing places of the skin. An argument hereof is, we ſee that the tumours and abſceſſes againſt nature, even when they are come to ſuppuration, are oft times reſolved and diſcuſſed by the onely efficacy of nature, and heate, without any helpe of art. Therefore there is no doubt, but that nature being prevalent, may free it ſelf from the peſtilent malignity by Tranſpiration, ſome Abſceſſe, *Bubo* or Carbuncle being come forth, and ſome matter collected in ſome certaine part of the body. For when as nature and the native heat are powerfull and ſtrong, nothing is impoſſible to it, eſpecially when as the paſſages are alſo in like manner free and open.

Tumours are oft-times diſcuſſed by the force of nature after they are ſuppurated.

CHAP. XLII.

How to cure Infants and Children taken with the Plague.

IF that it happen that ſucking or weaned children be infected with the peſtilence, they muſt bee cured after another order than is yet deſcribed. The Nurſe of the ſucking childe muſt governe her ſelfe ſo in dyet and the uſe of medicines, as if ſhe were infected with the peſtilence her ſelf: Her dyet conſiſteth in the uſe of the ſix things not naturall. Therefore let it be moderate, for the fruit or profit of that moderation in dyet cannot chuſe but come unto the Nurſes milke, and ſo unto the infant who liveth onely by the milke. And the infant it ſelfe muſt keep the ſame diet as neere as he can in ſleep, waking, and expulſion, or avoyding of ſuperfluous humours and excrements of the body. Let the Nurſe bee fed with thoſe things that mitigate the violence of the feaveriſh heat: as cooling brothes, cooling herbs, and meats of a moderate temperature: ſhee muſt wholy abſtaine from wine, and anoint her nipples, as often as ſhee giveth the infant ſucke, with water, or juice of ſorrell tempered with ſugar of roſes. But the infants heart muſt bee fortified againſt the violence of the encreaſing venome, by giving it one ſcruple of treacle in the Nurſes milke, the broth of a pullet, or ſome other cordiall water. It is alſo very neceſſary to anoint the region of the heart, the emunctories, and both the wreſts with the ſame medicine: neither were it unprofitable to ſmell often unto Treacle diſſolved in roſe water, vinegar of roſes and a little *aqua vitæ*, that ſo nature may bee ſtrengthened againſt the malignity of the venome. When the children are weaned, and ſomewhat well growne, they may take medicines by the mouth, for when they are able to concoct and turne into bloud meats that are more groſſe and firm than milk, they may eaſily actuate a gentle medicine. Therefore a potion muſt be prepared for them of twelve graines of treacle, diſſolved with a little of the ſyrupe of ſuccory in ſome cordiall water, or the broth of a capon: unleſſe that any had rather give it with conſerve of roſes, in forme of a bole: but treacle muſt bee given to children in very ſmall quantity, for if it be taken in any large quantity, there is great danger leſt that by inflaming the humours, it inferre a feaver. Furthermore, broth may be prepared to be taken often, made of a capon ſeaſoned with ſorrell, lettuce, purſlaine and cooling ſeeds, adding thereto bole armenick and *terra ſigillata*, of each one ounce, being tyed in a rag, and ſometimes preſſed out from the decoction. For bole armenicke, whether it be by its marvellous faculty of drying, or by ſome hidden property, hath this vertue, that being drunken (according as *Galen* witneſſeth) it cureth thoſe that are infected with the peſtilence, if ſo be that they may bee cured by phyſick: ſo that thoſe that cannot be cured with bole armenick, cannot bee preſerved

The nurſe muſt be dieted when as the child is ſick.

Medicines may be given to ſuch as are weaned.

Lib.9.ſimp.ca.7.

The benefit of ſweate.

ſerved by any other medicines. But becauſe the bodies of children are warme, moiſt and vaporous, they are eaſily delivered of ſome portion of the venenate matter through the pores of the skin by provoking ſweat, with a decoction of parſly ſeeds, prunes, figs, and the roots of ſorrell, with a little of the powder of Harts horne, or Ivory. But that the ſweat may be more abundant and copious, apply ſpunges dipped & preſſed out in the hot decoction of ſage, roſemary, lavender, bayes, chamomil, melilote and mallowes, or elſe ſwines bladders halfe filled with the ſame decoction, to the arme-holes, and to the groines. In the time that they ſweat, let their faces be fanned to coole them. Alſo let a nodule of Treacle, diſſolved in vinegar and water of Roſes, bee appled to the noſtrils; but alwaies uſe a moderation in ſweating, becauſe that children are of a ſubſtance that is eaſie to be diſſipated and reſolved: ſo that oftentimes although they do not ſweat, yet they feel the commodities of ſweating, the matter of the venome being diſſipated by the force of the heat through the pores of the skin. But in the ſweating while the face is fanned, and ſweet & cordiall things applyed to the noſtrils, nature muſt bee recreated and ſtrengthened, which otherwiſe would be debilitated through ſweating, that it may bee better able to expell the venome. After that the ſweat is wiped away, it is very profitable to take a potion of conſerve of Roſes, with the powder of Harts horne or of Ivorie diſſolved in the waters of Bugloſſe and Sorrel, the better to coole and defend the heart. If there appeare any tumour under the arme-holes or in the groine, let it bee brought to maturation with a mollifying, relaxing, drawing, and then with a ſuppurative fomentation, or Cataplaſme; alwaies uſing and handling it as gently as you may, conſidering the tender age of the infant. If you have need to purge the patient, the purgation following may be preſcribed with great profit. Take of Rubarbe in powder one dram, infuſe it in the water of *Carduus Benedictus*, with one ſcruple of Cinamon, in the ſtraining diſſolve two drams of *Diacatholicon*, of ſyrupe of Roſes laxative three drams; make thereof a ſmall potion. This is the cure of the Peſtilence and of the peſtilent Feaver, as far as I could learn from the moſt learned Phyſicians, and have obſerved my ſelfe by manifold experience by the grace and permiſſion of God: of whom alone, as the Author of all good things that mortall men injoy, the true and certaine preſervatives againſt the peſtilence are to be deſired and hoped for.

The forme of a purge to be given to a child.

The End of the Twentie ſecond Booke.

OF THE MEANES AND MANNER TO REPAIRE OR SUPPLY THE NATURALL or accidentall defects or wants *in mans body.*

The Twentie Third Booke.

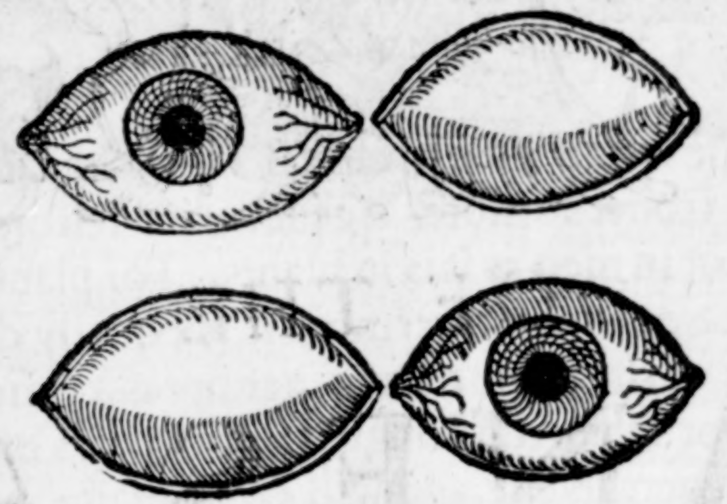
Chap. I.

How the loſſe of the naturall or true eye may bee covered, hidden or ſhadowed.

The fourth duty of a Surgeon.

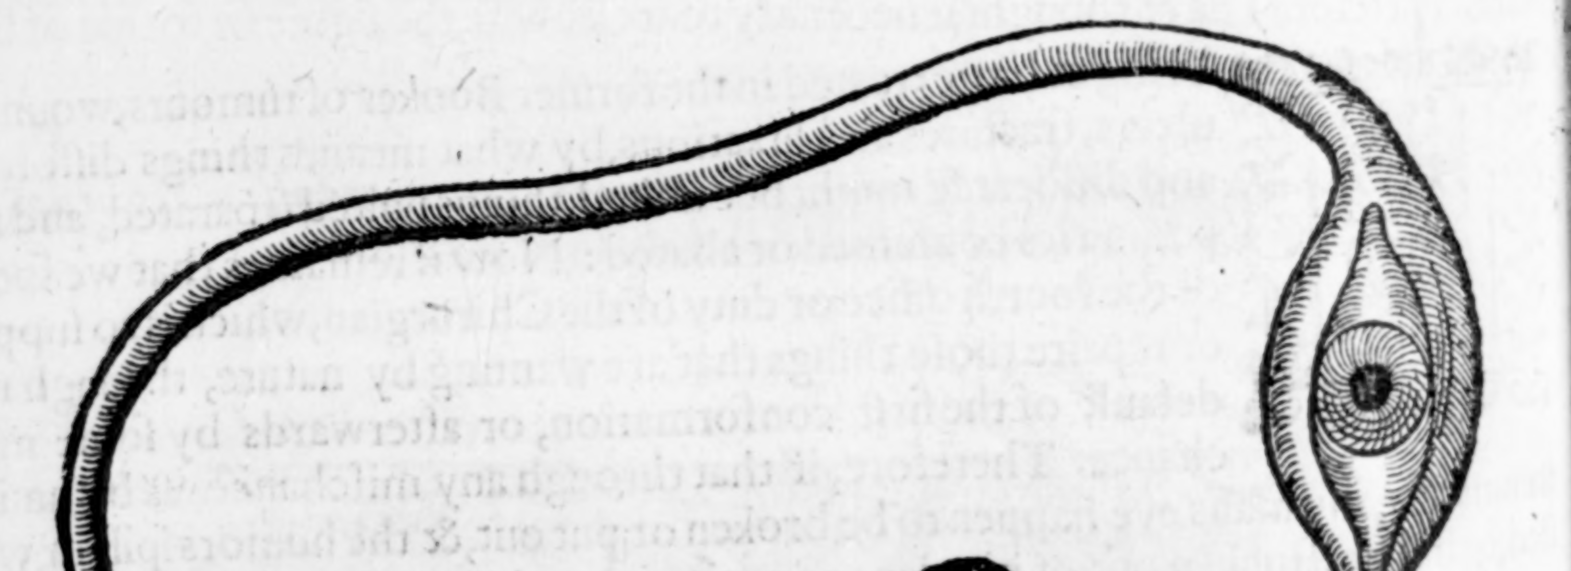
HAving at large treated in the former Bookes of tumours, wounds, ulcers, fractures and luxations, by what meanes things diſſolved and diſlocated might bee united, things united ſeparated, and ſuperſluities conſumed or abated: Now it remaines that we ſpeak of the fourth office or duty of the Chirurgian, which is to ſupply or repaire thoſe things that are wanting by nature, through the default of the firſt conformation, or afterwards by ſome miſchance. Therefore, if that through any miſchance, as by an inflammation, any mans eye happen to be broken or put out, & the humors ſpilt or waſted, or if it be ſtrucken out of his place or cavity wherein it was naturally placed, by any violent ſtroak, or if it waſte or conſume by reaſon of a conſumption of the proper ſubſtance, then there is no hope to reſtore the ſight or function of the eye, yet you may cover the deformity of the eye ſo loſt (which is all you can doe in ſuch a caſe) by this meanes: If that when you have perfectly cured and healed the ulcer, you may put another eye artificially made of gold or ſilver, counterfeited and enamelled, ſo that it may ſeem to have the brightneſſe, or gemmie decencie of the naturall eye, into the place of the eye that is ſo loſt.

The formes of eyes artificially made of gold or ſilver, poliſhed and enameled, ſhewing both the inner and outer ſide.



But if the patient be unwilling, or by reaſon of ſome other meanes cannot weare this eye ſo prepared, in his head, you may make another on this wiſe. You muſt have a ſtring or wiar, of iron bowed or crooked, like unto womens eare-wiars, made to bind the head harder or looſer as it pleaſeth the patient, from the lower part of the head behinde above the eare, unto the greater corner of the eye, this rod or wiar muſt be covered with ſilke, and it muſt alſo be ſomewhat broad at both the ends, leſt that the ſharpeneſſe thereof ſhould pierce or pricke any part that it commeth unto. But that end wherewith the empty hollowneſſe muſt be covered, ought to bee broader than the other, and covered with a thin piece of leather, that thereon the colours of the eye that is loſt may be ſhadowed or counterfeited. Here followeth the figure or portraiture of ſuch a ſtring or wiar.

The forme of an iron wiar wherewith the deformity of an eye that is loſt may bee ſhadowed or covered.



CHAP. II.

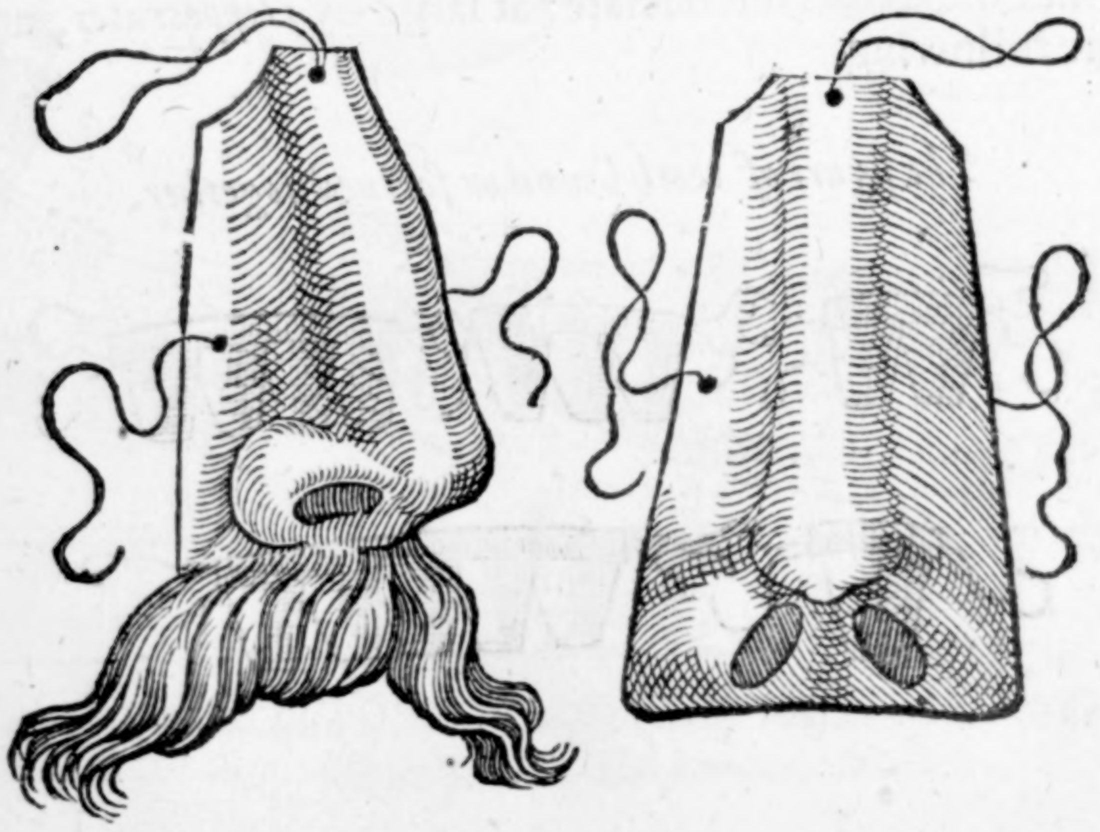
By what meanes a part of the noſe that is cut off, may be reſtored; or how in ſtead of the noſe that is cut off, another counterfeit noſe may be faſtened or placed in the ſtead.

WHen the whole noſe is cut off from the face, or portion of the noſtrils from the noſe, it cannot bee reſtored or joyned againe: for it is not in men as it is in plants. For plants have a weake and feeble heate, and furthermore it is equally diſperſed into all the ſubſtance of the plant or tree, neither is it eaſie to be conſumed or waſted, for when the boughes or branches of trees are broken, torne, or cut away, they live neverthe leſſe, and will grow againe when they are ſet or grafted; neither is there any ſeate for the heart rightly prepared in them from whence the heat muſt neceſſarily run, and diſperſe it ſelfe continually into all the parts thereof. But contrariwiſe, the ſeparated parts of more perfect living creatures, as of men, are incontinently deprived of life, becauſe they have their nouriſhment, life, ſenſe, and whole ſuſtentation not of themſelves, by faculties flowing or comming unto them from ſome other parts, neither are they governed by their own heat as plants, but by a borrowed heat, ſo that above or beſide the naturall faculty of the liver, another vitall faculty commeth unto it from the heart.

Why the parts of plants being cut off, may grow againe, but thoſe of man cannot.

Wherefore in ſtead of the noſe cut away or conſumed, it is requiſite to ſubſtitute another made by Art, becauſe that nature cannot ſupply that defect: this noſe ſo artificially made, muſt be of gold, ſilver, paper or linnen clothes glewed together, it muſt bee ſo coloured, counterfeited and made both of faſhion, figure and bigneſſe, that it may as aptly as is poſſible, reſemble the natural noſe: it muſt be bound or ſtayed with little threeds or laces unto the hinder part of the head or the hatte. Alſo if there be any portion of the upper lip cut off with the noſe, you may ſhadow it with annexing ſome ſuch thing that is wanting unto the noſe, and cover it with the haire on his upper lippe, that he may not want any thing that may adorne or beautifie the face. Therefore I have thought it neceſſary to ſet downe the figure or forme of both theſe kindes.

The forme of a noſe artificially made, both alone by it ſelfe, and alſo with the upper lip, covered as it were with the haire of the beard.



There was a Surgeon of Italy of late yeares which would reſtore or repaire the portion of the noſe that was cut away after this manner. Hee firſt ſcarified the callous edges of the maimed noſe round about, as is uſually done in the cure of hare-

A ſtange cure for a cut off noſe

lips: then he made a gaſh or cavity in the muſcle of the arme, which is called *Biceps*, as large as the greatneſſe of the portion of the noſe which was cut away did require: And into that gaſh or cavity ſo made, he would put that part of the noſe ſo wounded, & bind the patients head to his arm as if it were to a poaſt, ſo faſt that it might remain firme, ſtable and immoveable, and not leane or bow any way, and about forty dayes after, or at that time when he judged the fleſh of the noſe was perfectly agglutinated with the fleſh of the arm, he cut out as much of the fleſh of the arme, cleaving faſt unto the noſe, as was ſufficient to ſupply the defect of that which was loſt, & then he would make it even, & bring it, as by licking, to the faſhion & forme of a noſe, as near as art would permit, & in the mean while he did feed his patient with ponadoes, gellies, & all ſuch things as were eaſie to be ſwallowed & digeſted. And he did this work of curing the place where the fleſh was ſo cut out, only with certain balmes & agglutinative liquors. A younger brother of the family of St. *Thoan*, being weary of a ſilver noſe, which being artificially made, he had worn in the place of his noſe that was cut off, went to this Chirurgian into Italy, & by the means of the fore-named practice he recovered a noſe of fleſh againe, to the great admiration of all thoſe that knew him before. This thing truly is poſſible to be done, but it is very difficult both to the patient ſuffering, and alſo to the Chirurgian working. For that the fleſh that is taken out of the arme, is not of the like temperature as the fleſh of the noſe is, alſo the holes of the reſtored noſe cannot be made as they were before.

A hiſtory.

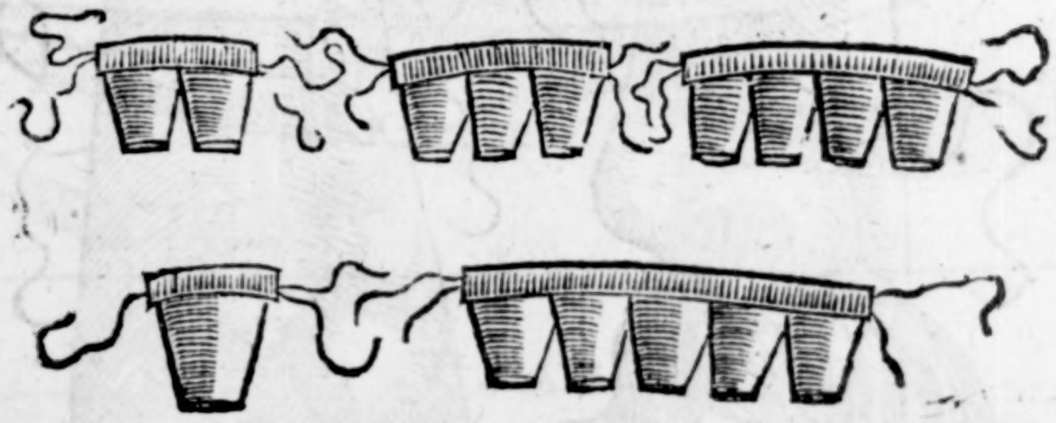
Chap. III.

Of the Placing of teeth artificially made in ſtead of thoſe that are loſt or wanting.

IT oftentimes happeneth that the fore teeth are moved, broken or ſtricken out of their places by ſome violent blow, which cauſeth deformity of the mouth, and hinders plain pronunciation. Therfore when the jaw is reſtored (if it were luxated or fractured) and the gums brought unto their former hardneſſe, other teeth artificially made of bone or Ivory may bee put in the place of thoſe that are wanting, and they muſt bee joyned one faſt unto another, and alſo ſo faſtened unto the naturall teeth adjoyning, that are whole; and this muſt chiefly bee done with a thread of gold or ſilver, or for want of either, with a common thread of ſilke or flaxe, as it is declared at large by *Hippocrates*, and alſo deſcribed in this figure following.

Sect. 2. lib. de art. ſent. 25.

The figure of teeth bound or faſtned together.



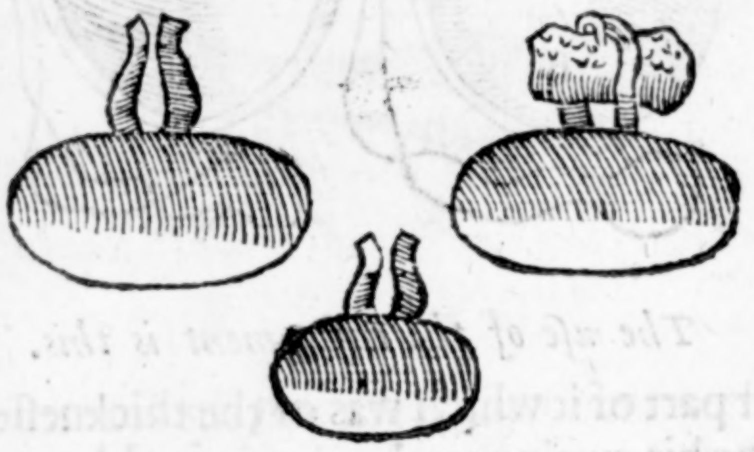
CHAP. IIII.

Of filling the hollowneſſe of the Pallat.

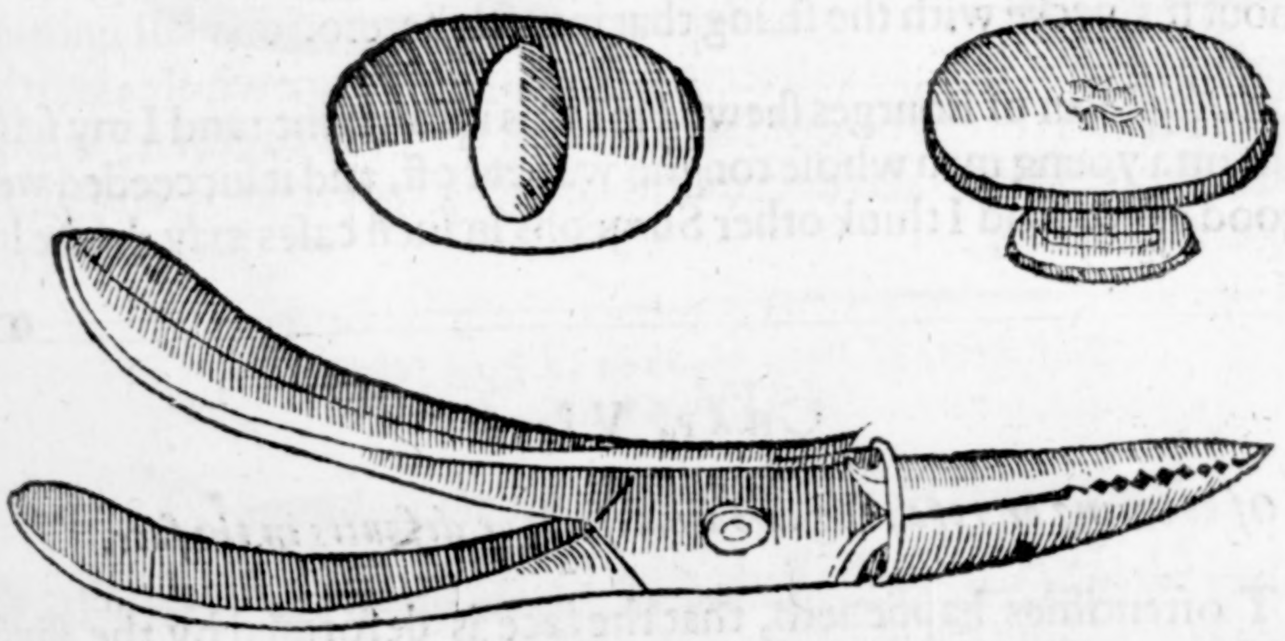
MAny times it happeneth that a portion or part of the bone of the pallat, being broken with the ſhot of a gun, or corroded by the virulency of the *Lues venerea*, falls away, which makes the patients to whom this happeneth, that they cannot pronounce their words diſtinctly, but obſcurely and ſnuffling: therefore I have thought it a thing worthy the labour to ſhew the meanes how it may be helped by art. It muſt be done by filling the cavity of the pallat with a plate of gold or ſilver a little bigger than the cavity its ſelfe is. But it muſt bee as thick as a French Crowne, and made like unto a diſh in figure, and on the upper ſide, which ſhall be towards the braine, a little ſpunge muſt bee faſtened, which, when it is moiſtened with the moyſture diſtilling from the brain, will become more ſwolne and puffed up, ſo that it will fill the concavity of the pallat, that the artificiall pallat cannot fall down, but ſtand faſt and firme, as if it ſtood of it ſelfe. This is the true figure of thoſe inſtruments, whoſe certain uſe I have obſerved not by once or twice, but by manifold triall in the battels fought beyond the Alpes.

The cauſes and hurt that enſues of the loſt pallate

The figure of plates to fill or ſupply the defects of the Pallat.



The figure of another plate for the Pallat, on whoſe upper ſide there is a button which may be turned when it is put into the place, with a ſmall Ravens bill, like this whoſe figure is here expreſſed.



CHAP. V.

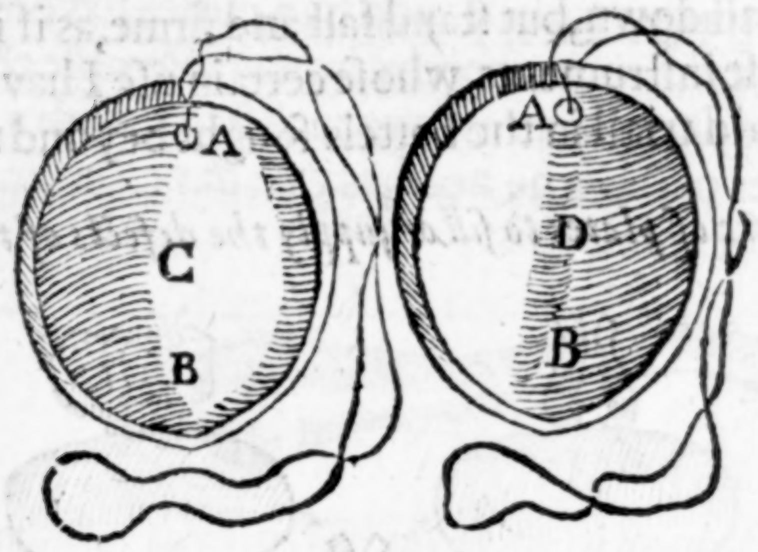
How to helpe ſuch as cannot ſpeake by reaſon of the loſſe of ſome part of the tongue.

CHance gave place and authority to this remedy, as to many other in our art. A certaine man dwelling in a village named *Tvoy le Chaſteau*, being ſome twenty foure miles from *Bourges*, had a great piece of his tongue cut off, by which occaſion hee remained dumbe ſome three yeares. It happened

A remedy found out by accident. A hiſtory.

on a time that as hee was in the fields with reapers, hee drinking in a woodden diſh, was tickled by ſome of the ſtanders by, not enduring the tickling, hee ſuddenly broke out into articulate and intelligible words. He himſelfe wondring thereat, and delighted with the novelty of the thing, as a miracle, put the ſame diſh to his mouth juſt in the ſame manner as before, and then he ſpake ſo plainly and articulately, that he might be underſtood by them all. Wherefore a long time following he alwaies carried this diſh in his boſome, to utter his mind, untill at length neceſſity, the miſtris of arts and giver of wit, inducing him, hee cauſed a woodden inſtrument to be neatly cut and made for him, like this which is here delineated, which hee alwaies carryed hanging at his neck, as the onely interpreter of his mind, and the key of his ſpeech.

An inſtrument made to ſupply the defect of the ſpeech when the tongue is cut off.



The uſe of the Inſtrument is this.

A. ſheweth the upper part of it which was of the thickneſſe of a nine-pence, which he did ſo hold betweene his cutting teeth, that it could not come out of his mouth, nor bee ſeene. B. ſheweth the lower part, as thick as a ſixe-pence, which he did put hard to the reſt of his tongue, cloſe to the membranous ligament which is under the tongue. That place which is depreſt and ſomewhat hollowed, marked with the letter C. is the inner part of the inſtrument. D. ſheweth the outſide of the ſame. Hee hanged it about his necke with the ſtring that is tyed thereto.

Textor the Phyſician of Bourges ſhewed me this inſtrument: and I my ſelfe made tryall thereof on a young man whoſe tongne was cut off, and it ſucceeded well, and took very good effect. And I think other Surgeons in ſuch caſes may do the like.

CHAP. VI.

Of covering or repairing certain defects or defaults in the face.

IT oftentimes happeneth, that the face is deformed by the ſudden flaſhing of Gunpowder, or by a peſtilent Carbuncle, ſo that one cannot behold it without great horrour. Such perſons muſt be ſo trimmed and ordered, that they may come in ſeemely manner into the company of others. The lips if they bee either cut off with a ſword, or deformed with the eroſion or eating of a peſtilent Carbuncle or ulcerated *Cancer*, ſo that the teeth may be ſeene to lye bare with great deformity. If the loſſe or conſumption of the lip bee not very great, it may be repaired by that way which we have preſcribed in the cure of hare-lips, or of an ulcerated *Cancer*. But if it be great, then muſt there be a lip of gold made for it, ſo ſhadowed and counterfeited, that it may not be much unlike in colour to the naturall lip, and it muſt be faſtened and tyed to the hat or cap that the patient weareth on his head, that ſo it may remaine ſtable and firme.

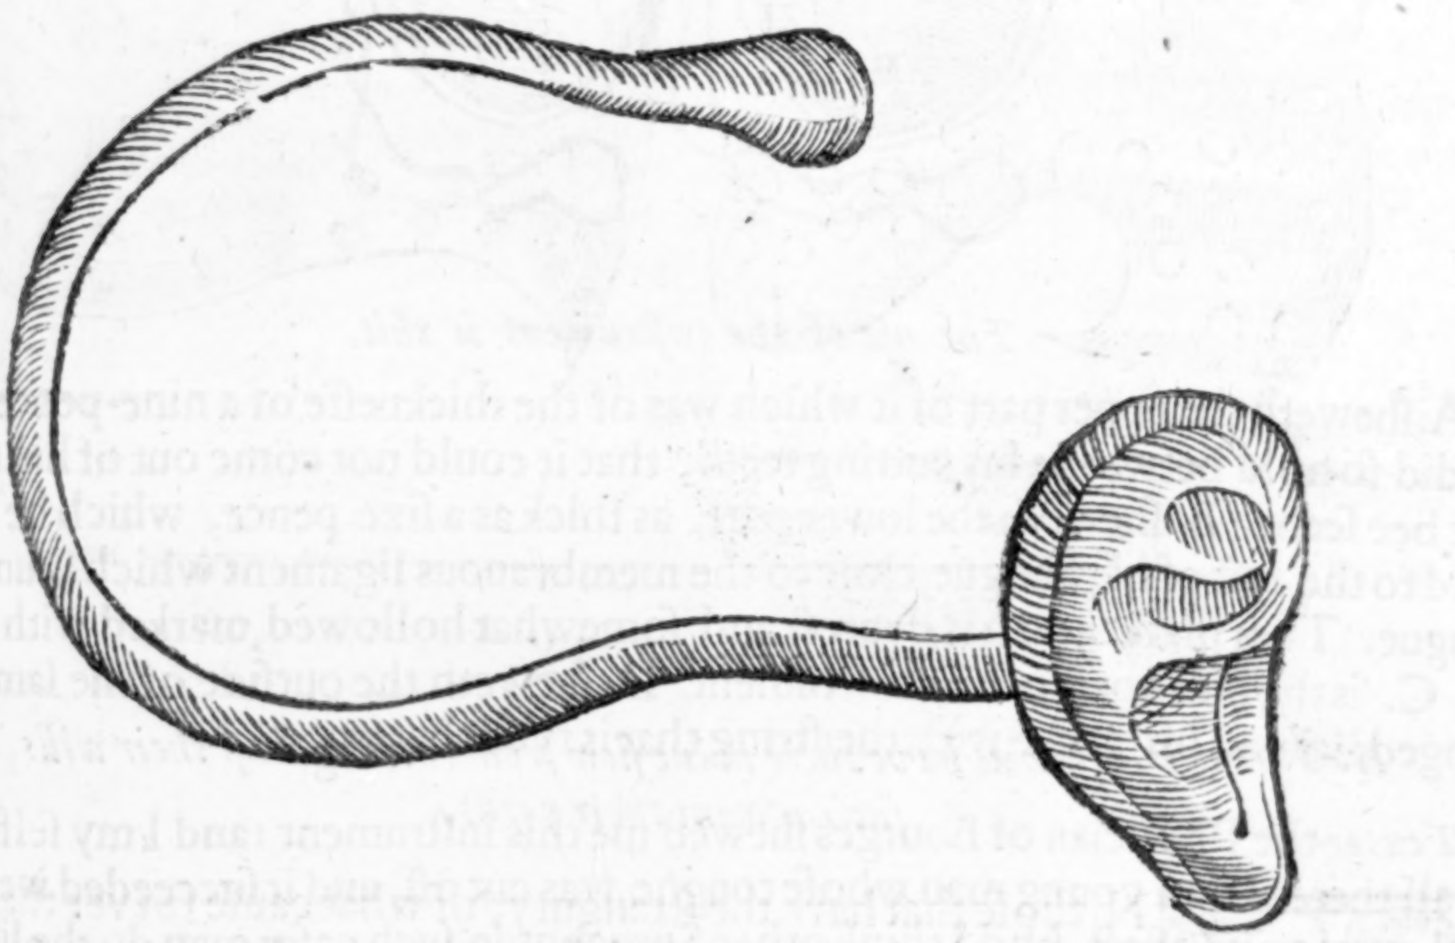
CHAP.

CHAP. VII.

Of the defects of the eares.

SUch as want their eares, either naturally or by misfortune, as through a wound, carbuncle, cancer, or the biting of wild beaſts: if ſo be that the eare be not wholly wanting, waſted, conſumed, or torne away, but that ſome portion thereof doth yet remaine, then muſt it not bee neglected, but muſt have many holes made therein with a bodkin, and after that the holes are cicatrized, let ſome convenient thing, made like unto the piece of the eare that is loſt, bee tyed or faſtned unto it by theſe holes.

But if the eare bee wholly wanting, another muſt bee made of paper artificially glewed together, or elſe of leather, and ſo faſtened with laces, from the toppe or hinder part of the head, that it may ſtand in the appointed place, and ſo the haire muſt be permitted to grow long, or elſe ſome cap worne under the hat which may hide or cover the deformity, unleſſe you had rather have it to bee ſhadowed and counterfeited by ſome Painter, that thereby it may reſemble the colour of a naturall eare, and ſo retein it in the place where it ought to ſtand, with a rod or wiar comming from the toppe or hinder part of the head, as wee have ſpoken before in the loſſe of the eye; and the forme thereof is this.



CHAP. VIII.

Of amending the deformity of ſuch as are crooke-backt.

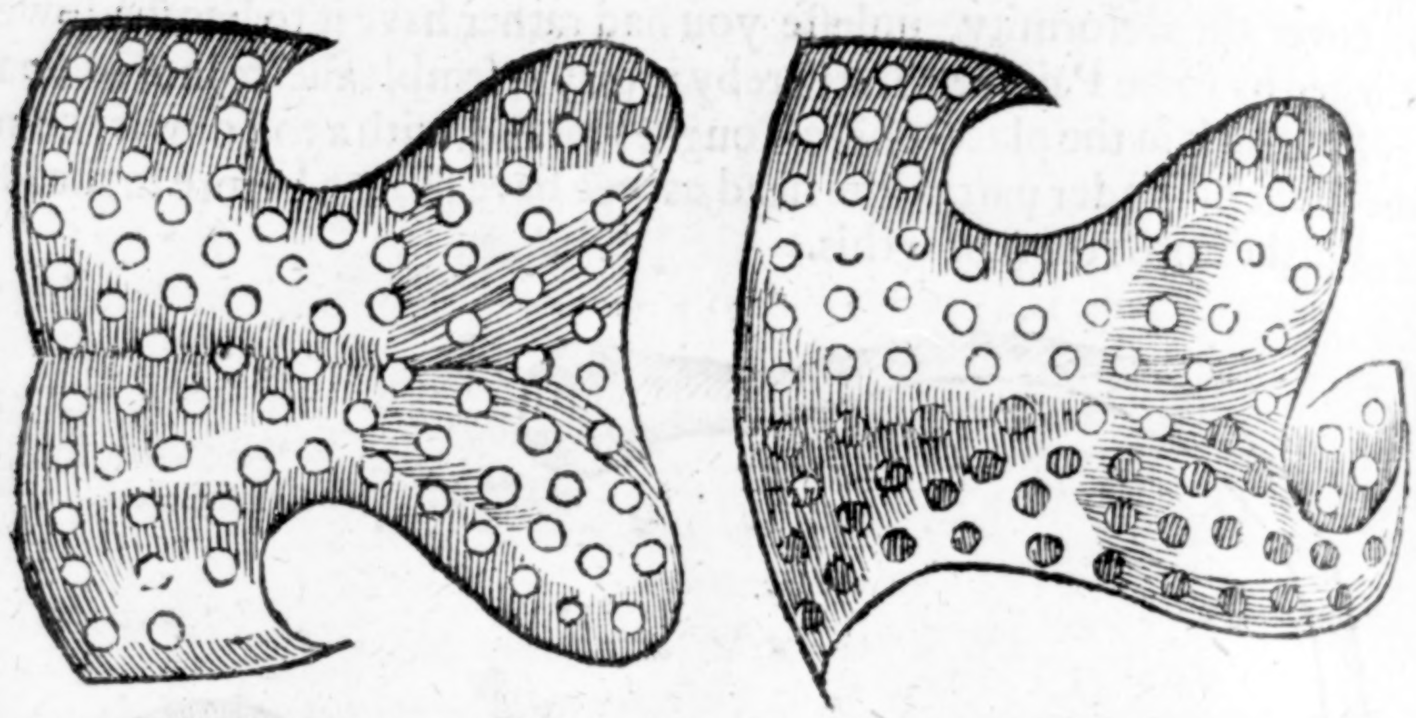
THe bodies of many, eſpecially young maids or girles (by reaſon that they are more moiſt and tender than the bodies of boyes) are made crooked in proceſſe of time, eſpecially by the wrenching aſide and crookedneſſe of the backe-bone. It hath many cauſes, that is to ſay, in the firſt conformation in the wombe, and afterwards by misfortune, as a fall, bruiſe, or any ſuch like accident, but eſpecially by the unhandſome and undecent ſituation of their bodies, when they are young and tender, either in carrying, ſitting or ſtanding (and eſpecially when they are taught to goe too ſoone) ſaluting, ſewing, writing, or in doing any ſuch like thing.

Cauſes of crookedneſſe.

In the meane while, that I may not omit the occaſion of crookedneſſe, that happens ſeldome to the country people, but is much incident to the inhabitants of great townes and cities, which is by reaſon of the ſtraitneſſe and narrowneſſe of the garments that are worne by them, which is occaſioned by the folly of mothers, who while they covet to have their young daughters bodies ſo ſmall in the middle as may be poſſible, plucke and draw their bones awry, and make them crooked. For the ligaments of the back-bone being very tender, ſoft and moiſt at that age, cannot ſtay it ſtrait, and ſtrongly, but being pliant, eaſily permits the ſpondels to ſlippe awry inwards, outwards, or ſidewiſe, as they are thruſt or forced.

The remedy for this deformity is to have breaſt-plates of iron, full of holes all over them, wherby they may be lighter to wear; and they muſt be ſo lined with bombaſt, that they may hurt no place of the body. Every three moneths new plates muſt be made for thoſe that are not yet arrived at their full growth, for otherwiſe by the daily afflux of more matter, they would become worſe. But theſe plates will do them ſmall good that are already at their full growth.

The forme of an iron Breaſt-plate, to amend the crookedneſſe of the Body.



Chap. IX.

How to relieve ſuch as have their urine flow from them againſt their wills, and ſuch as want their yards.

An inſtrument for ſuch as cannot hold their water.

IN thoſe that have the ſtrangury, of what cauſe ſoever that malady commeth, the urine paſſeth from them by drops, againſt their wils and conſent. This accident is very grievous and troubleſome, eſpecially to men that travaile: and for their ſakes onely I have invented the inſtrument here beneath deſcribed. It is made like unto a cloſe breech or hoſe, it muſt be of latin, & to contein ſome four ounces; it muſt be put into the patients hoſe, between his thighs, unto which it muſt be tied with a point by the ring. Into the open and hollow mouth of this inſtrument, which is noted with the letter C. the patient muſt put his yard, & into this concavity or hollowneſſe goeth a ſtay ſomewhat deep, it is marked with the letter B. and made or placed there, both to hold or beare the end of the yard, and alſo by his cloſe joint that it muſt have unto the veſſell, to ſtay the urine from going backe againe, when it is once in. But the letters A. and D. doe ſignifie all the inſtrument; that the former part, and this the hinder part thereof. Now this is the ſhape thereof.

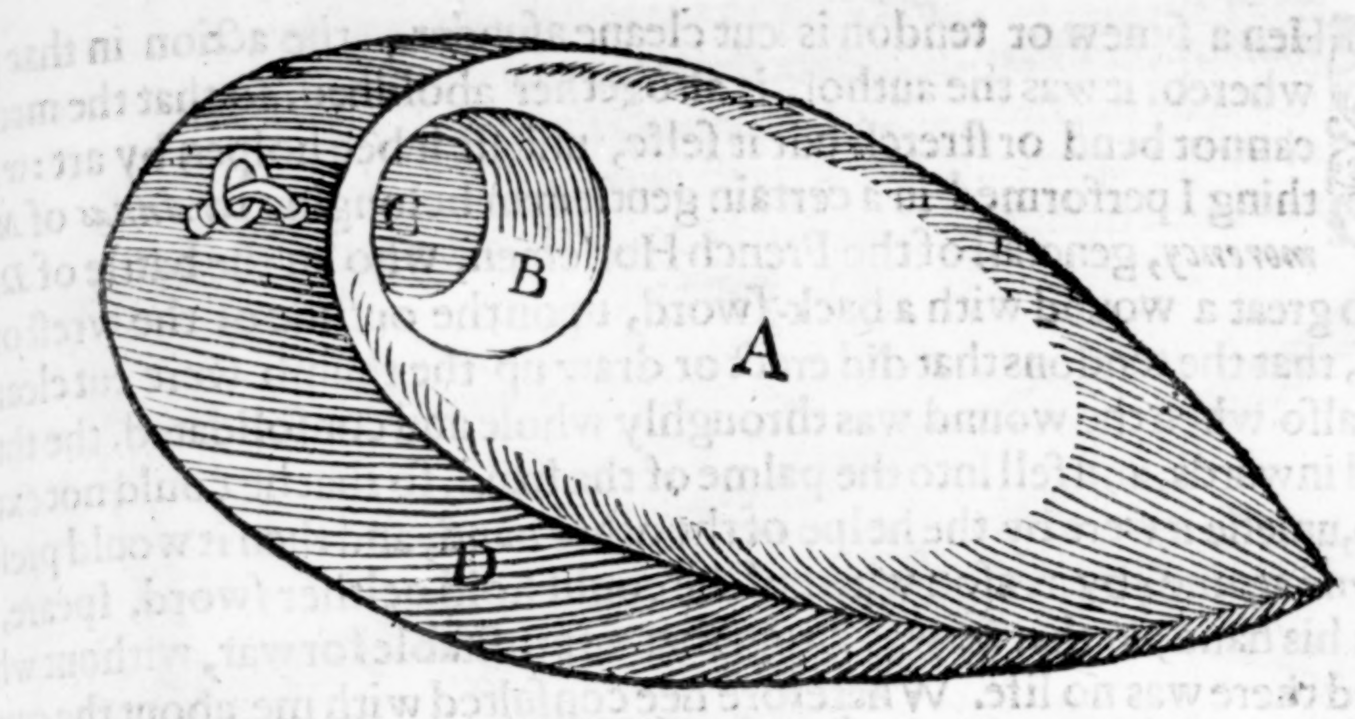
The

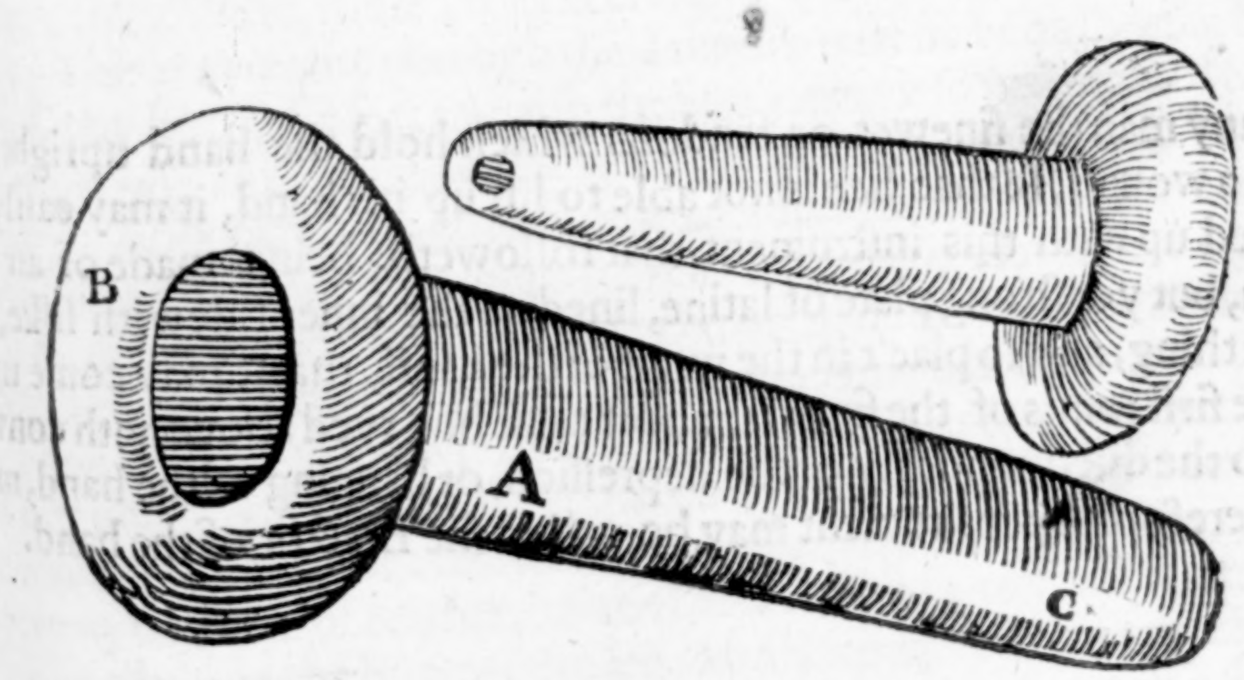
The figure of an inſtrument, which you may call A Baſon, or receptacle for the Urine.



Thoſe that have their yards cut off cloſe to their bellies, are greatly troubled in making of urine, ſo that they are conſtrained to ſit downe like women, for their eaſe. I have deviſed this pipe or conduit, having an hole through it as big as ones finger, which may be made of wood, or rather of latin.

A. and C. doe ſhew the bigneſſe and length of the pipe. B. ſheweth the brink on the broader end. D. ſheweth the outſide of the brinke. This Inſtrument muſt be aplied to the lower part of *os pectinis*: on the upper end it is compaſſed with a brink for the paſſage of the urine, for thereby it will receive the urine the better, and carry it from the patient, as he ſtandeth upright.

The deſcription of a pipe, or conduit, ſerving inſtead of the yard in making of water, which therefore wee may call an artificiall Yard.

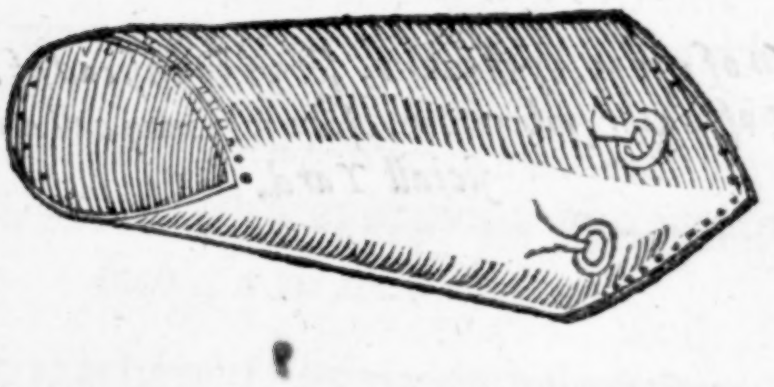


CHAP. X.

By what meanes the periſhed function or action of a thumbe or finger may be corrected and amended.

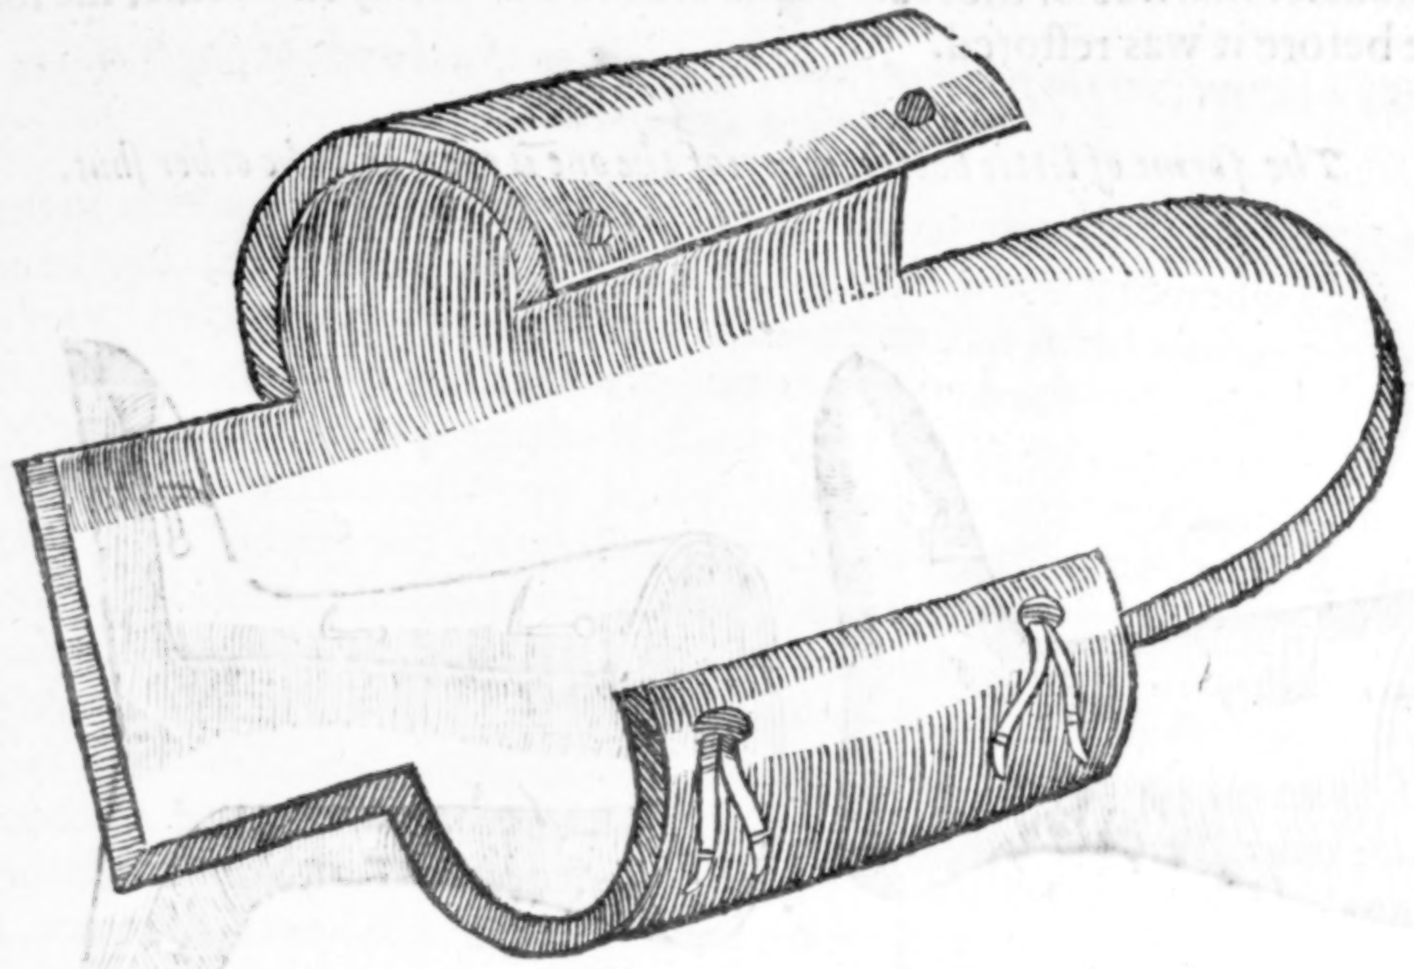
A hiſtory. WHen a ſynew or tendon is cut cleane aſunder, the action in that part, whereof it was the author, is altogether aboliſhed, ſo that the member cannot bend or ſtretch out it ſelfe, unleſſe it bee holpen by art: which thing I performed in a certain gentleman belonging to *Annas* of *Montmorency*, generall of the French Horſemen, who in the battle of *Dreux* received ſo great a wound with a back-ſword, upon the outſide of the wreſt of the right hand, that the tendons that did erect or draw up the thumb were cut clean inſunder, & alſo when the wound was throughly whole and conſolidated, the thumb was bowed inwards, and fell into the palme of the hand, ſo that he could not extend or lift it up, unleſſe it were by the helpe of the other hand, and then it would preſently fall downe againe; by reaſon whereof he could hold neither ſword, ſpeare, nor Javeline in his hand, ſo that he was altogether unprofitable for war, without which he ſuppoſed there was no life. Wherefore hee conſulted with me about the cutting away of his thumbe, which did hinder his griping, which I refuſed to doe, and told him that I conceived a meanes how it might bee remedied without cutting away. Therefore I cauſed a caſe to bee made for it of Latine, whereinto I put the thumbe: this caſe was ſo artificially faſtened by two ſtrings that were put into two Rings, made in it above the joint of the hand, that the thumbe ſtood upright, and ſtraight out, by reaſon whereof he was able afterwards to handle any kinde of weapon.

The forme of a thumbe or finger-ſtall of iron or latine, to lift up or erect the thumbe, or any other finger that cannot be erected of it ſelfe.



If that in any man the ſinewes or tendons which hold the hand upright, be cut aſunder with a wound, ſo that hee is not able to lift up his hand, it may eaſily bee erected or lifted up with this inſtrument that followeth, being made of an equall, ſtreight, thin, but yet ſtrong plate of latine, lined on the inner ſide with ſilke, or any ſuch like ſoft thing, and ſo plac't in the wreſt of the hand, that it may come unto the palme, or the firſt joints of the fingers, and it muſt bee tyed above with convenient ſtayes, and ſo the diſcommodity of the depreſſion, or hanging of the hand, may bee avoyded; therefore this inſtrument may be called the Erector of the hand.

The Erector of the Hand.



CHAP. XI.

Of helping thoſe that are Vari *or* Valgi, *that is, crooke-legged or crooke-footed, inwards or outwards.*

What *varus* is.

THoſe are ſaid to bee Varous, whoſe feet or legs are bowed or crooked inwards. This default is either from the firſt conformation in the wombe, through the default in the mother, who hath her legs in like manner crooked; or becauſe that in the time when ſhe is great with child, ſhe commonly ſits with her legs a croſſe: or elſe after the child is born, & that, either becauſe his legs be not well ſwathed, when he is laid into the cradle, or elſe becauſe they bee not well placed in carrying the infant, or if he be not wel looked unto by the nurſe when he learneth to goe, for the bones of infants are very tender, and almoſt as flexible as Waxe.

What *valgus* is.

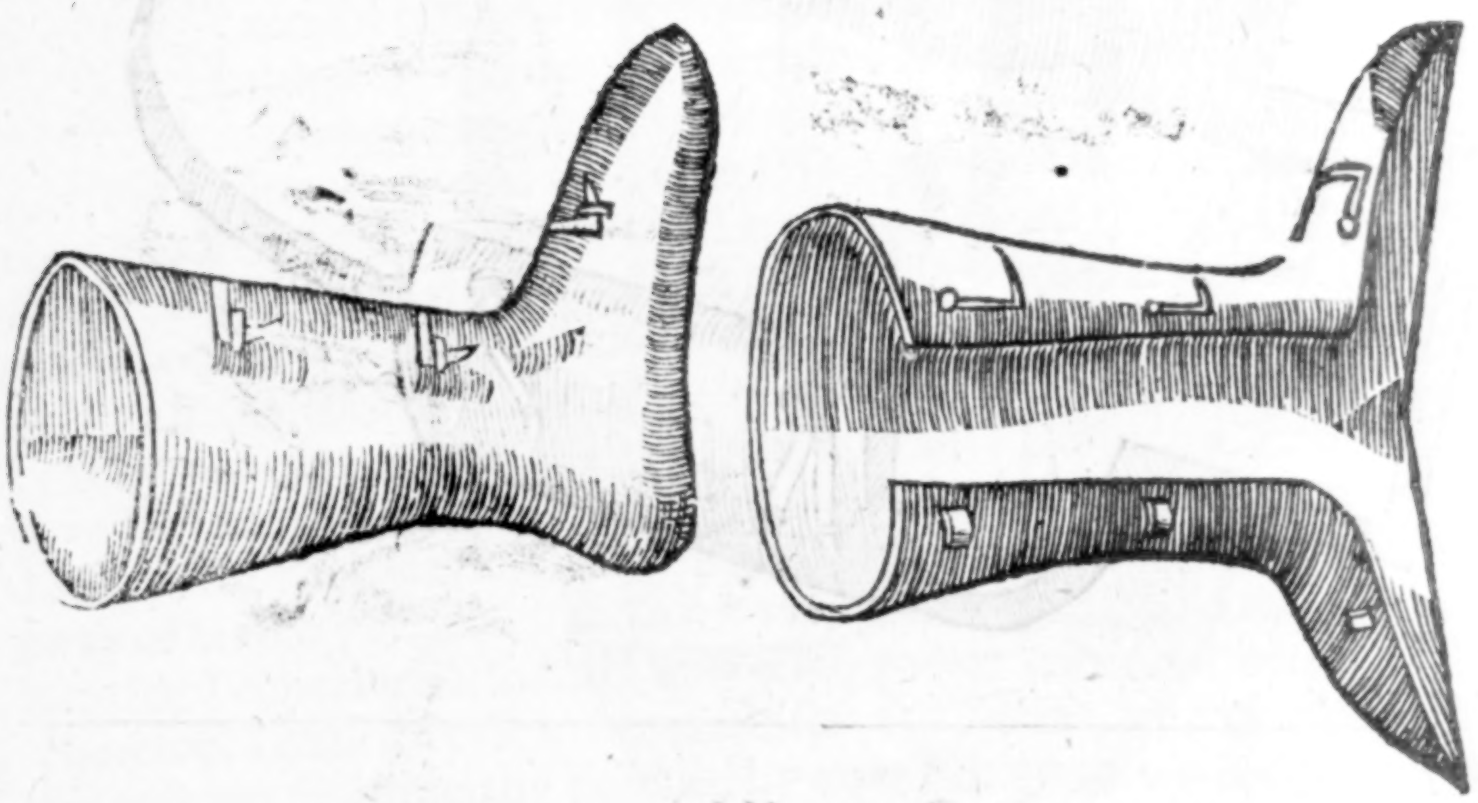
But contrariwiſe, thoſe are called *valgi*, whoſe legs are crooked or bowed outwards. This may come through the default of the firſt conformation, aſwell as the other, for by both, the feet and alſo the knees may bee made crooked; which thing, whoſoever will amend, muſt reſtore the bones into their proper and naturall place, ſo that in thoſe that are varous hee muſt thruſt the bones outwards, as though hee would make them valgous, and in thoſe that are valgous, hee muſt thruſt the bones inwards, as though hee would make them varous: neither is it ſufficient to thruſt them ſo, but they ought alſo to be retained there in their places after they are ſo thruſt, for otherwiſe they being not well eſtabliſhed, would ſlip back againe.

They muſt bee ſtayed in their places by applying of collers and bolſters on that ſide whereunto the bones doe leane and incline themſelves; for the ſame purpoſe boots may be made of leather, of the thickneſſe of a teſtone, having a ſlit in the former part all along the bone of the leg, and alſo under the ſole of the foot, that being drawne together on both ſides, they may be the better fitted, and ſit the cloſer to the leg. And let this medicine following be applyed all about the leg. ℞. *thuris, maſtich. aloës, boli armeni, an.* ℥i. *aluminis roch. reſinæ pini ſiccæ, ſubtiliſſime pulveriſ. an.* ʒiii. *farinæ volat.* ℥iß. *album. ovor. q. ſ.* make thereof a medicine. You may alſo adde a little turpentine, leſt it ſhould dry ſooner, or more vehemently than is neceſſary. But you muſt beware, and take great heed leſt that ſuch as were of late varous or valgous ſhould attempt or ſtraine themſelves to goe before that their joynts be confirmed, for ſo the bones that were lately ſet in their places, may ſlip aſide againe. And moreover

A plaſter to hold faſt reſtored bones.

over, untill they are able to goe without danger, let them weare high ſhooes tyed cloſe to their feet, that the bones may be ſtayed the better and more firmely in their places, but let that ſide of the ſoale of the ſhooe be underlayed whither the foote did incline before it was reſtored.

The forme of little bootes, whereof the one is open and the other ſhut.



CHAP. XII.

By what meanes armes, legs, and hands may be made by art, and placed in ſtead of the naturall armes, legs, or hands that are cut off and loſt.

Neceſſity oftentimes conſtraines us to find out the meanes whereby we may help and imitate nature, and ſupply the defect of members that are periſhed and loſt. And hereof it commeth that we may performe the functions of going, ſtanding and handling with armes and hands made by art, and undergoe our neceſſary flexions and extenſions with both of them. I have gotten the formes of all thoſe members made ſo by art, and the proper names of all the engines and inſtruments wherby thoſe artificially made are called, to my great coſt and charges, of a moſt ingenious, & excellent Smith dwelling at Paris, who is called of thoſe that know him, and alſo, of ſtrangers, by no other name than the little *Loraine*, and here I have cauſed them to bee portrayed or ſet downe, that thoſe that ſtand in neede of ſuch things, after the example of them, may cauſe ſome Smith, or ſuch like workman to ſerve them in the like caſe. They are not onely profitable for the neceſſity of the body, but alſo for the decency and comelineſſe thereof. And here followeth their formes.

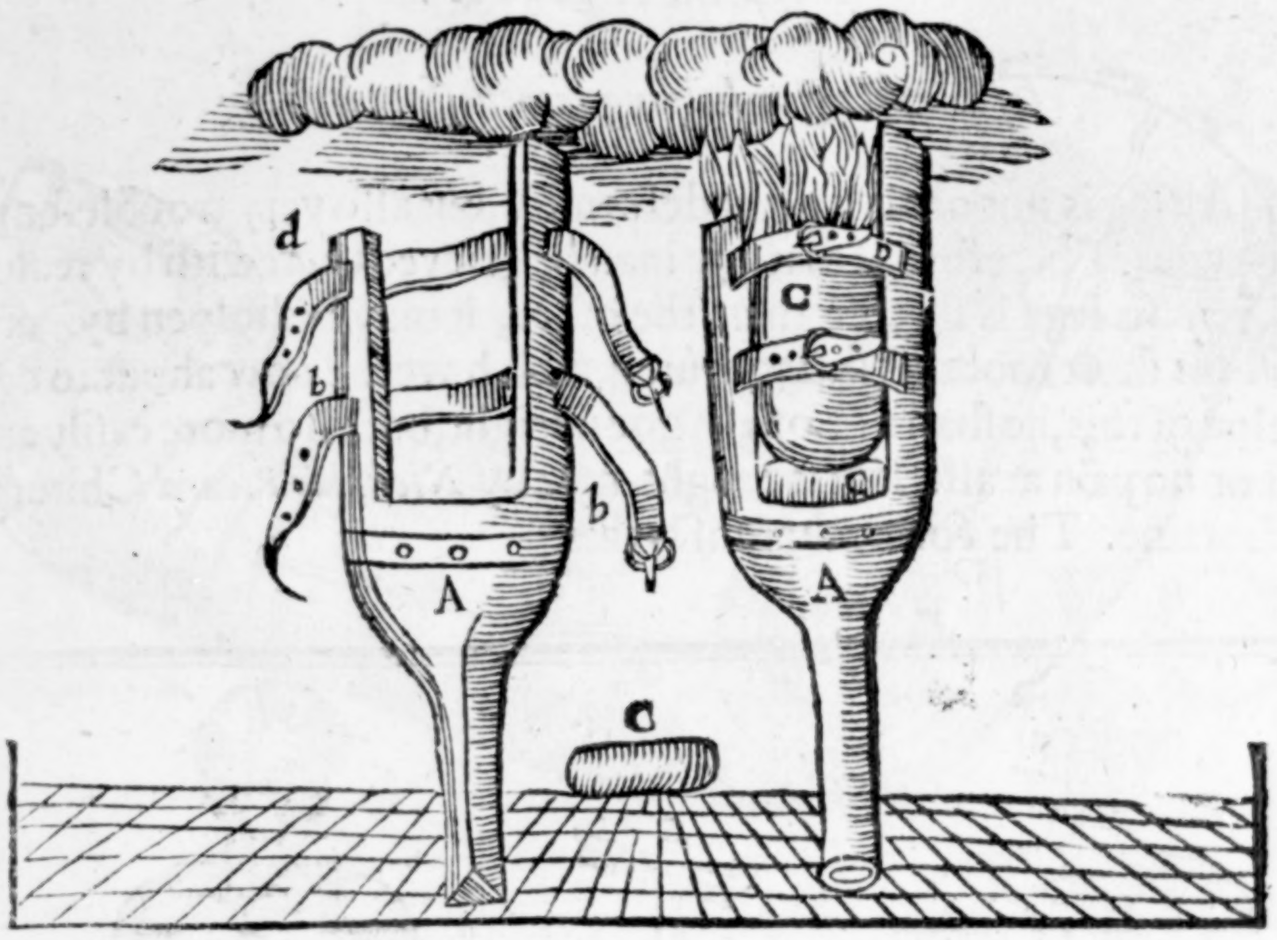
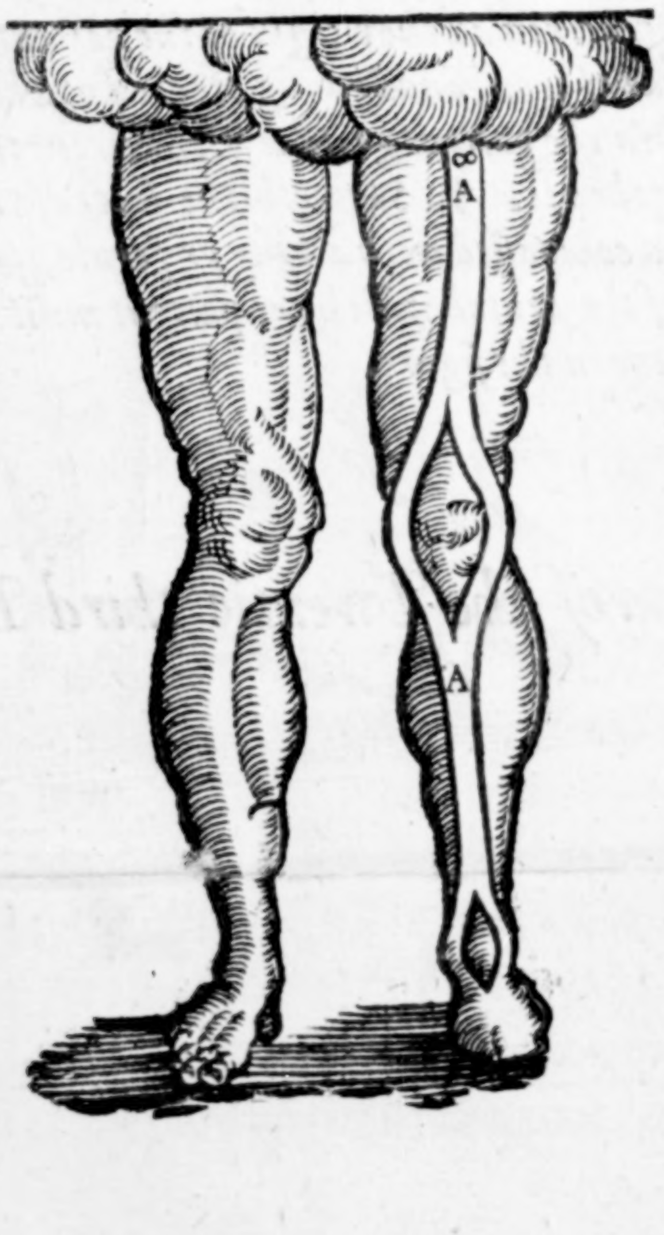
The forme of a woodden Leg made for poore men.



A. *Sheweth the ſtump or ſtock of the woodden leg.* BB. *Sheweth the two ſtayes which muſt bee on both ſides of the leg, the ſhorter of them muſt bee on the inner ſide.* CC. *Sheweth the pillow or bolſter whereon the knee muſt reſt in the bottome between the two ſtayes, that ſo it may reſt the ſofter.* DD. *Sheweth the thongs or girths with their round buckles, put through the two ſtayes on either ſide to ſtay the knee in his place firm and immoveable, that it ſlip not aſide.* E. *Sheweth the thigh it ſelfe, that you may know after what faſhion it muſt ſtand.*

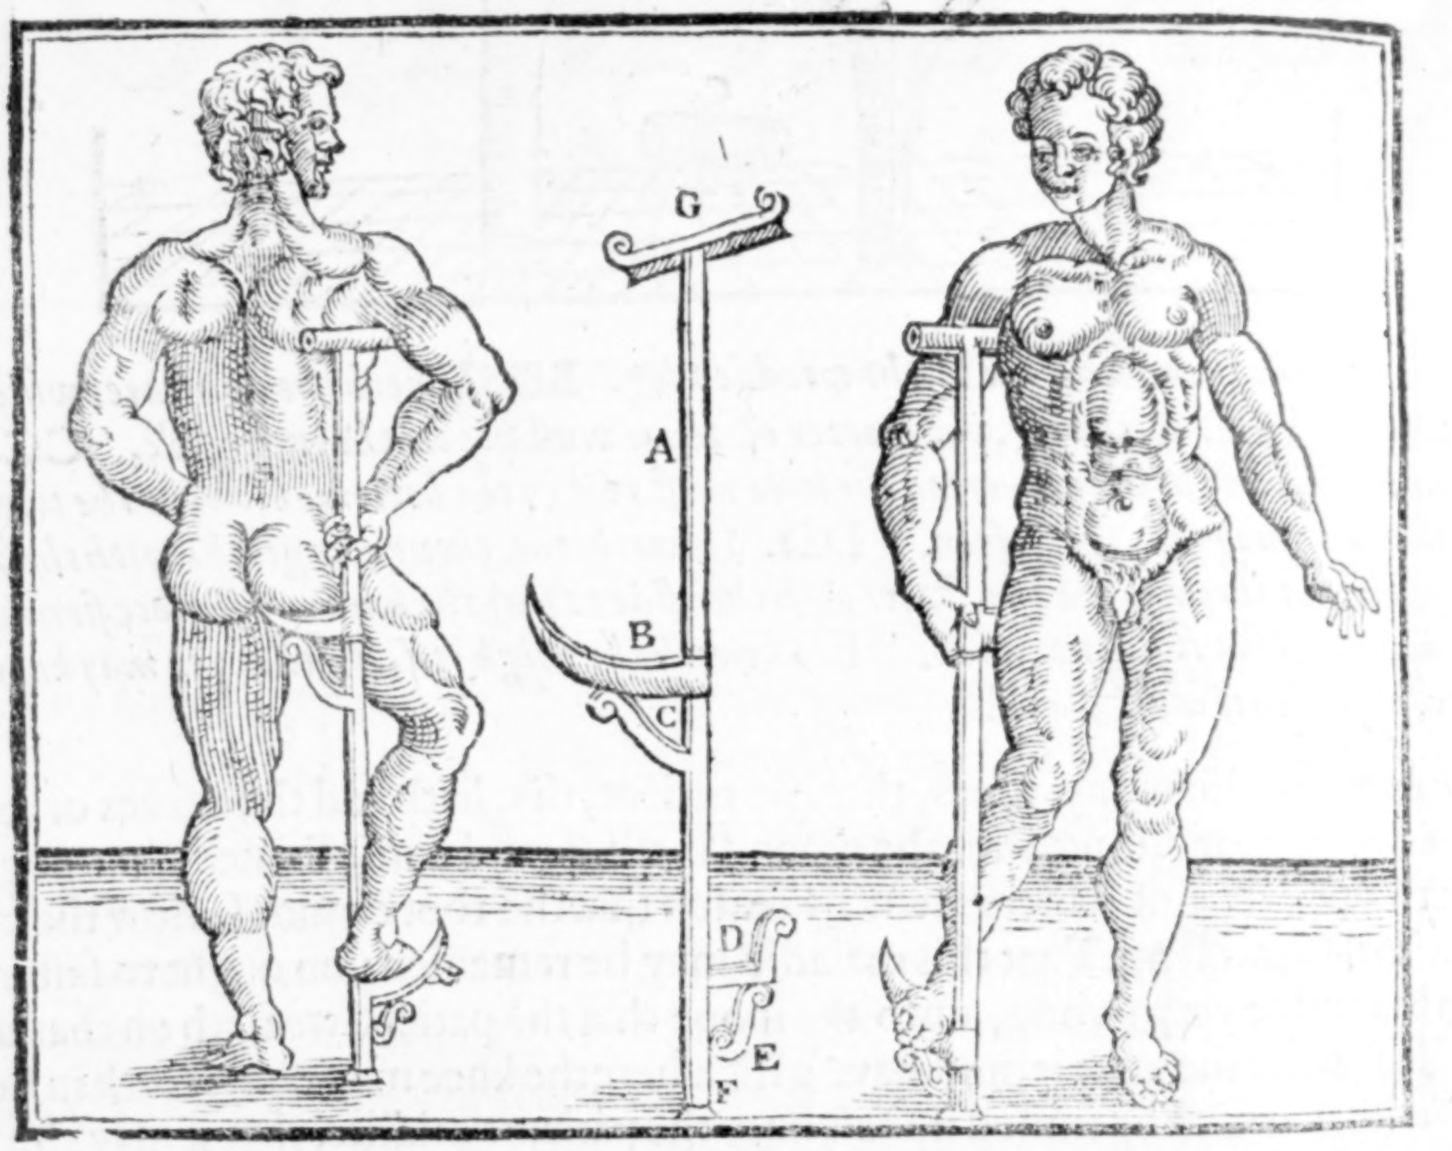
It happens alſo many times, that the patient, that hath had the nerves or tendons of his leg wounded, long after the wound is whole and conſolidated, cannot goe but with very great paine and torment, by reaſon that the foot cannot follow the muſcle, that ſhould draw it up. That this maladie, may be remedied you ought to faſten a linnen band made very ſtrong, unto the ſhooe that the patient weareth on that his pained foot, and at the knee it muſt have a ſlit where the knee may come forth in bowing of the leg, & it muſt be truſſed up faſt unto the patients middle, that it may the better lift up and erect the foot in going. This band is marked in the figure following with the letters A A.



CHAP. XIII.

Of amending or helping lameneſſe or halting.

HAlting is not onely a great deformity, but alſo very troubleſome and grievous. Therefore if that any man be grieved therewith by reaſon that one of his legs is ſhorter than the other, it may be holpen by putting under his ſhort foot this ſitting crutch, which we are now about to deſcribe. For by the helpe of this, he ſhall not onely goe upright, but alſo more eaſily and with little labour or no pain at all. It was taught mee by *Nicholas Picard* Chirurgian to the Duke of Loraine. The forme thereof is this.



A. *Sheweth the ſtaffe or ſtilt of this crutch, which muſt bee made of wood.* B. *Sheweth the ſeat of iron whereon the thigh reſteth, juſt under the buttocke.* C. *Sheweth a prop which ſtayeth up the ſeat whereon all the weight of the patients body reſteth.* D. *Sheweth the ſtirrop, being made of iron, and bowing crooked upwards, that the foot may ſtand firm, and not ſlip off it when the patient goeth.* E. *Sheweth the prop that ſtayeth or holdeth up the ſtirrop to ſtrengthen it.* F. *Sheweth the foote of the ſtilt or crutch made of iron with many pikes, and compaſſed with a ring or ferule, ſo to keepe it from ſlipping.* G. *The croſſe or head of the crutch which the patient muſt put under his arme-hole to leane upon, as it is to be ſeene in the figure.*

OF THE GENERATION OF MAN.

The Twenty Fourth Book.

The Preface.

GOD, the Creator and maker of all things, immediately after the Creation of the world, of his unſpeakable counſell and ineſtimable wiſedome not onely diſtinguiſhed mankinde, but all other living creatures alſo, into a double ſex, to wit, of male and female; that ſo they being moved and enticed by the allurements of luſt, might deſire copulation, thence to have procreation. For this bountifull Lord hath appointed it as a ſolace unto every living creature againſt the moſt certaine & fatall neceſsity of death: that for as much as each particular living creature cannot continue for ever, yet they may endure by their ſpecies or kinde by propagation and ſucceſsion of creatures, which is by procreation, ſo long as the world endureth. In this conjunction or copulation, repleniſhed with ſuch delectable pleaſure, which God hath chiefly eſtabliſhed by the law of Matrimony, the male and female yeeld forth their ſeeds, which preſently mixed and conjoyned, are received and kept in the females wombe. For, the ſeed is a certaine ſpumous or foamie humour repleniſhed with vitall ſpirit, by the benefit whereof, as it were by a certain ebullition or fermentation it is puffed up and ſwolne bigger, and both the ſeedes being ſeparated from the more pure bloud of both the parents, are the materiall and formall beginning of the iſſue, for the ſeede of the male being caſt and received into the wombe, is accounted the principall and efficient cauſe, but the ſeede of the female is reputed the ſubjacent matter, or the matter whereon it worketh. Good and laudable ſeede ought to bee white, ſhining, clammy, knotty, ſmelling like unto the elder or palme, delectable to bees, and ſinking downe to the bottome of water being put into it, for that which ſwimmeth on the water is eſteemed unfruitfull; for a great portion commeth from the brain, yet ſome thereof falles from the whole body, & from all the parts both firme and ſoft thereof. For unleſſe it come from the whole body, & every part therof, all & every part of the iſſue cannot be formed thereby: becauſe like

The diſtinction of male and female.

The cauſe of this diſtinction.

What ſeed is.

The conditions of good ſeed.

Seed falleth from all the parts of the body.

Wherefore many diſeaſes are hereditary.

How ſeed is to be underſtood to fall from the whole body.

like things are engendered of their like: and therefore it commeth that the child reſembleth the parents, not onely in ſtature and favour, but alſo in the conformation and proportion of his lims and members, and complexion and temperature of his inward parts, ſo that diſeaſes are oft times hereditary, the weakeneſs of this or that entrall being tranſlated from the parent to the childe. There are ſome which ſuppoſe this falling of the ſeed from the whole body not to be underſtood according to the weight and matter, as if it were a certaine portion of all the blood ſeparated from the reſt; but according to the power and forme, that is to ſay the animall, naturall, and vitall ſpirits, being the framers of formation and life, and alſo the formative faculty to fall down from all the parts into the ſeed, that is wrought or perfected by the Teſticles, for proofe and confirmation whereof, they alledge that many perfect, ſound, abſolute, and well proportioned children, are borne of lame and decrepit parents.

Chap. I.

Why the generative parts are endued with great pleaſure.

What moveth a man to copulation.

Why the genitalls are endued with a whayiſh moiſture.

A Certaine great pleaſure accompanieth the function of the parts appointed for generation, and before it, in living creatures that are of a luſty age, when matter aboundeth in thoſe parts, there goeth a certaine fervent or furious deſire: the cauſes thereof are many, of which the chiefeſt is, That the kind may be preſerved and kept for ever, by the propagation and ſubſtitution of other living creatures of the ſame kinde. For brute beaſts which want reaſon, and therefore cannot bee ſolicitous for the preſervation of their kinde, never come to carnall copulation, unleſſe they be moved thereunto by a certaine vehement provocation of unbridled luſt, and as it were by the ſtimulation of venery. But man, that is endued with reaſon, being a divine and moſt noble creature, would never yeeld nor make his minde ſubject to a thing ſo abject and filthy as is carnall copulation, but that the venereous ticklings, raiſed in thoſe parts, relaxe the ſeverity of his mind, or reaſon admoniſh him that the memory of his name ought not to end with his life, but to be preſerved unto all generations, as farre as may be poſſible, by the propagation of his ſeed or iſſue. Therefore by reaſon of this profit or commodity, nature hath endued the genitall parts with a far more exact or exquiſite ſenſe than the other parts, by ſending the great ſinewes unto them, and moreover ſhe hath cauſed them to be bedewed or moiſtened with a certain whayiſh humour, not much unlike the ſeed ſent from the glandules or kernells called *proſtatæ*, ſituated in men at the beginning of the necke of the bladder, but in women at the bottome of the wombe: this moiſture hath a certaine ſharpeneſſe or biting, for that kinde of humour of all others can chiefly provoke thoſe parts to their function or office, and yeeld them a delectable pleaſure, while they are in the execution of the ſame. For even ſo whayiſh and ſharpe humours, when they are gathered together under the ſkinne, if they waxe warme, tickle with a certaine pleaſant itching, and by their motion inferre delight: but the nature of the genitall parts or members is not ſtirred up or provoked to the expulſion of the ſeed with theſe provocations of the humours, abounding either in quantity or quality onely, but a certaine great and hot ſpirit or breath conteined in thoſe parts, doth begin to dilate it ſelfe more and more, which cauſeth a certaine incredible exceſſe of pleaſure or voluptuouſneſſe, wherewith the genitalls being replete, are ſpread forth or diſtended every way unto their full greatneſſe. The yard is given to men whereby they may caſt out their ſeed directly or ſtraightly into the womans wombe, and the necke of the wombe to women, whereby they may receive that ſeed ſo caſt forth, by the open or wide mouth of the ſame necke, and alſo that they may caſt forth their owne ſeed, ſent through the ſpermaticke veſſels unto their teſticles; theſe ſpermaticke veſſels, that is to ſay, the veine lying above, and the artery lying below, do make many flexions or windings, yet one as many as the other, like unto the tendrills of vines diverſly platted or folded together, and in theſe folds or bendings the blood and ſpirit which are carryed unto the teſticles, are concocted a longer time, and ſo converted into a white ſeminall ſubſtance. The lower of theſe flexions or bowings doe end in the ſtones or teſticles. But the teſticles, for as much as they are looſe, thin, and ſpongeous or hollow, receiving the humour which was begun to be concocted in the forenamed veſſels, concoct it again themſelves: but the teſticles of men concoct the more perfectly for the procreation of the iſſue; & the teſticles of women more imperfectly, becauſe they are more cold, leſſe, weake and feeble, but the ſeed becommeth white by the contact or touch of the teſticles, becauſe the ſubſtance of them is white. The male is ſuch as engendereth in another, and the female in her ſelfe, by the ſpermaticke veſſels which are implanted in the inner capacity of the womb. But out of all doubt unleſſe nature had prepared ſo many allurements, baits, and provocations of pleaſure, there is ſcarce any man ſo hot or delighted in venereous acts, which conſidering and marking the place appointed for humane conception, the loathſomneſſe of the filth which daily falleth downe unto it, and wherewithall it is humected and moiſtened, and the vicinity and neereneſſe of the great gut under it, and of the bladder above it, but would ſhun the embraces of women. Nor would any woman deſire the company of man, which once premeditates or forethinkes with her ſelfe on the labour that ſhee ſhall ſuſtaine in bearing the burthen of her childe nine moneths, and of the almoſt deadly paines that ſhe ſhall ſuffer in her delivery.

The cauſe of the foldings of the ſpermaticke veſſels.

Womens teſticles more imperfect.

Why many men and women abhorre venereous copulation.

Men that uſe too frequent copulation, oftentimes in ſtead of ſeed caſt forth a crude and bloody humor, and ſometimes alſo meere blood it ſelfe; and oft times they can hardly make water but with great pain, by reaſon that the clammy and oily moiſture, which nature hath placed in the glandules called *proſtatæ*, to make the paſſage of the urine ſlippery, & to defend it againſt the ſharpeneſſe of the urine that paſſeth through it, is waſted, ſo that afterward they ſhal ſtand in need of the help of a Surgion to cauſe them to make water with eaſe & without pain, by injecting a little oile out of a ſiringe into the conduit of the yard. For generation it is fit the man caſt forth his ſeed into the wombe with a certaine impetuoſity, his yard being ſtiffe and diſtended, and the woman to receive the ſame without delay into her wombe, being wide open, leſt that through delay the ſeed waxe cold, and ſo become unfruitfull by reaſon that the ſpirits are diſſipated and conſumed. The yard is diſtended or made ſtiffe, when the nervous, ſpongeous, and hollow ſubſtance thereof is replete and puffed up with a flatulent ſpirit. The womb allures or drawes the maſculine ſeed into it ſelfe by the mouth thereof, and it receives the womans ſeed by the hornes from the ſpermatick veſſels, which come from the womans teſticles into the hollowneſſe or concavity of the womb, that ſo it may be tempered by conjunction, commiſtion & confuſion with the mans ſeed, and ſo reduced or brought unto a certaine equality: for generation or conception cannot follow without the concourſe of two ſeeds, well and perfectly wrought in the very ſame moment of time, nor without a laudible diſpoſition of the wombe both in temperature and complexion: if in this mixture of ſeeds the mans ſeed in quality and quantity exceed the womans, it will be a man child, if not, a woman childe, although that in either of the kindes there is both the mans and womans ſeed, as you may ſee by the daily experience of thoſe men who by their firſt wives have had boyes onely, and by their ſecond wives had girles onely: the like you may ſee in certaine women, who by their firſt husbands have had males onely, and by their ſecond husbands females onely. Moreover, one and the ſame man is not alwaies like affected to get a man or a woman childe, for by reaſon of his age, temperature and diet, hee doth ſometimes yeeld forth ſeed endued with a maſculine vertue, and ſometimes with a feminine or weake vertue, ſo that it is no marvaile if men get ſometimes men, and ſometimes women children.

Why the ſtrangury enſueth immoderate copulation.

What things neceſſary unto generation.

Why a male, & why a female is engendered.

CHAP. II.

Of what quality the ſeed is, whereof the male, and whereof the female is engendered.

Why men children are ſooner formed in the wombe than women.

The ſeed is that in power from whence each thing commeth or floweth.

Why the children are moſt commonly like unto their fathers.

When children ſhould be begotten.

Why often times the child reſembleth the Grand father.

Why ſometime thoſe that are diſeaſed do get ſound children.

MAle children are engendered of a more hot and dry ſeed, and women of a more cold and moiſt: for there is much leſſe ſtrength in cold than in heat, and likewiſe in moiſture than in dryneſſe; and that is the cauſe why it will be longer before a girle is formed in the womb than a boy. In the ſeed lyeth both the procreative and the formative power: as for example; In the power of the Melon ſeed are ſituate the ſtalkes, branches, leaves, flowers, fruite, the forme, colour, ſmell, taſte, ſeed and all. The like reaſon is of other ſeeds; ſo Apple grafts engrafted in the ſtock of a Peare tree, beare Apples; and we doe alwaies finde and ſee by experience, that the tree (by vertue of grafting) that is grafted, doth convert it ſelfe into the nature of the Sions wherewith it is grafted. But although the childe that is borne doth reſemble or is very like unto the father or the mother, as his or her ſeed exceedeth in the mixture, yet for the moſt part it happeneth that the children are more like unto the father than the mother, becauſe that in the time of copulation, the minde of the woman is more fixed on her husband, than the minde of the husband on, or towards his wife: for in the time of copulation or conception, the formes, or the likeneſſes of thoſe things that are conceived or kept in minde, are tranſported and impreſſed in the childe or iſſue; for ſo they affirme that there was a certain Queene of the Æthiopians who brought forth a white child, the reaſon was (as ſhe confeſſed) that at the time of copulation with her King, ſhe thought on a marvellous white thing, with a very ſtrong imagination. Therefore *Heſiod* advertiſeth all married people not to give them ſelves to carnall copulation when they return from burialls, but when they come from feaſts and plaies, leſt that their ſad, heavie, and penſive cogitations, ſhould bee ſo transfuſed and engrafted in the iſſue, that they ſhould contaminate or infect the pleaſant joyfulneſſe of his life, with ſad, penſive and paſſionate thoughts. Sometimes it happeneth, although very ſeldome, the childe is neither like the father nor the mother, but in favour reſembleth his Grandfather, or any other of his kindred, by reaſon that in the inward parts of the parents, the engrafted power and nature of the grandfather lieth hidden: which when it hath lurked there long, not working any effect, at length breakes forth by means of ſome hidden occaſion: wherein nature reſembleth the Painter, making the lively portraiture of a thing, which as far as the ſubject matter will permit, doth forme the iſſue like unto the parents in every habit; ſo that often times the diſeaſes of the parents are transferred or participated unto the children, as it were by a certaine hereditary title: for thoſe that are crooke-backt get crooke-backt children, thoſe that are lame, lame; thoſe that are leprous, leprous; thoſe that have the ſtone, children having the ſtone; thoſe that have the ptiſicke, children having the ptiſick; and thoſe that have the gout, children having the gout: for the ſeed followes the power, nature, temperature, and complexion of him that engendereth it. Therefore of thoſe that are in health and ſound, healthy and ſound; and of thoſe that are weake and diſeaſed, weake and diſeaſed children are begotten, unleſſe happely the ſeed of one of the parents that is ſound doth correct or amend the diſeaſed impreſſion of the other that is diſeaſed, or elſe the temperate and ſound wombe as it were by the gentle and pleaſant breath thereof.

CHAP.

Chap. III.

What is the cauſe why the Females of all brute beaſts, being great with young, doe neither deſire, nor admit the males, untill they have brought forth their Young.

Why the ſenſe of venereous acts is given to brute beaſts.

THe cauſe hereof is, that, foraſmuch as they are moved by ſenſe only, they apply themſelves unto the thing that is preſent, very little, or nothing at all perceiving things that are paſt, and to come. Therfore after they have conceived, they are unmindfull of the pleaſure that is paſt, and doe abhor copulation: for the ſenſe or feeling of luſt is given unto them by nature, onely for the preſervation of their kinde, and not for voluptuouſneſſe, or delectation. But the males raging, ſwelling, and as it were ſtimulated by the provocations of the heat, or fervency of their luſt, do then runne unto them, follow and deſire copulation, becauſe a certaine ſtrong odour or ſmell commeth into the aire from their ſecret or genitall parts, which pierceth into their noſtrills, and unto their braine, and ſo inferreth an imagination, deſire, and heat. Contrariwiſe, the ſenſe and feeling of venereous actions ſeemeth to be given by nature to women, not onely for the propagation of iſſue and for the conſervation of mankinde, but alſo to mitigate and aſſwage the miſeries of mans life, as it were by the entiſements of that pleaſure: alſo the great ſtore of hot blood that is about the heart, wherewith men abound, maketh greatly to this purpoſe, which by impulſion of imagination, which ruleth the humours, being driven by the proper paſſages, downe from the heart and entralls into the genitall parts, doth ſtirre up in them a new luſt.

Why of brute beaſts, the males raging with luſt, follow after the females.

Wherefore a woman when ſhe is with childe, deſireth copulation.

The males of brute beaſts, being provoked or moved by the ſtimulations of luſt, rage, and are almoſt burſt with a *Tentigo* or extenſion of the genitall parts, and ſometimes waxe mad, but after that they have ſatisfied their luſt with the female of their kinde, they preſently become gentle, and leave off ſuch fierceneſſe.

Chap. IIII.

What things are to be obſerved, as neceſſary unto generation in the time of copulation.

How women may be moved to venery and conception.

WHen the husband commeth into his wives chamber hee muſt entertaine her with all kinde of dalliance, wanton behaviour, and allurements to venery: but if he perceive her to be ſlow, and more cold, he muſt cheriſh, embrace, and tickle her, and ſhall not abruptly, the nerves being ſuddenly diſtended, breake into the field of nature, but rather ſhall creepe in by little and little, intermixing more wanton kiſſes with wanton words and ſpeeches, handling her ſecret parts and dugs, that ſhe may take fire and bee enflamed to venery, for ſo at length the wombe will ſtrive and waxe fervent with a deſire of caſting forth its owne ſeed, and receiving the mans ſeed to bee mixed together therewith. But if all theſe things will not ſuffice to enflame the woman, for women for the moſt part are more ſlow and ſlack unto the expulſion or yeelding forth of their ſeed, it ſhall be neceſſary firſt to foment her ſecret parts with the decoction of hot herbes made with Muſcadine, or boiled in any other good wine, and to put a little muske or civet into the neck or mouth of the wombe: and when ſhee ſhall perceive the efflux of her ſeed to approach, by reaſon of the tickling pleaſure, ſhee muſt advertiſe her husband thereof, that at the very inſtant time or moment, hee may alſo yeeld forth his ſeed, that by the concourſe or meeting of the ſeeds, conception may be made, and ſo at length a child formed and borne. And that it may have the better ſucceſſe, the husband muſt not preſently ſeparate himſelfe from his wives embraces, leſt the aire ſtrike into the open wombe, and

The meeting of the ſeeds moſt neceſſary for generation.

and ſo corrupt the ſeeds before they are perfectly mixed together. When the man departs, let the woman lye ſtill in quiet, laying her legges or her thighes acroſſe, one upon another, and raiſing them up a little, leſt that by motion or downeward ſituation, the ſeed ſhould be ſhed or ſpilt: which is the cauſe why ſhe ought at that time not to talk, eſpecially chiding, nor to cough, nor ſneeſe, but give herſelfe to reſt and quietneſſe, if it be poſſible.

CHAP. V.

By what ſignes it may bee knowne whether the woman have conceived or not.

If the ſeed in the time of copulation, or preſently after be not ſpilt, if in the meeting of the ſeedes the whole body doe ſomewhat ſhake, that is to ſay, the wombe drawing it ſelfe together for the compreſſion & entertainment therof, if a little feeling of pain doth runne up and downe the lower belly and about the navell, if ſhee be ſleepy, if ſhe loath the embracings of a man, and if her face bee pale, it is a token that ſhe hath conceived.

Spots or ſpecks in the faces of thoſe that are with childe.

In ſome, after conception ſpots or freckles ariſe in their face, their eyes are depreſſed and ſunke in, the white of their eyes waxeth pale, they waxe giddy in the head, by reaſon that the vapours are raiſed up from the menſtruall blood that is ſtopped, ſadneſſe & heavineſſe grieve their mindes, with loathing and waywardneſſe, by reaſon that the ſpirits are covered with the ſmoaky darkeneſſe of the vapoures: paines in the teeth and gummes, and ſwouning often times commeth, the appetite is depraved or overthrown, with aptneſſe to vomit, and longing, whereby it happeneth that they loath meats of good juice, and long for and deſire illaudable meates, and thoſe that are contrary to nature, as coales, dirt, aſhes, ſtinking ſalt-fiſh, ſowre, auſtere and tart fruits, pepper, vinegar, and ſuch like acride things, and other, altogether contrary to nature and uſe, by reaſon of the condition of the ſuppreſſed humour abounding & falling into the orifice of the ſtomack. This appetite ſo depraved or overthrown, endureth in ſome untill the time of childe-birth; in others it commeth in the third moneth after their conception, when haires do grow on the childe, and laſtly it leaveth them a little before the fourth moneth, becauſe that the child, being now greater and ſtronger, conſumes a great part of the excrementall and ſuperfluous humour. The ſuppreſſed or ſtopped tearms in women that are great with childe, are divided into three parts: the more pure portion maketh the nutriment for the childe, the ſecond aſcendeth by little and little into the dugs, and the impureſt of all remaineth in the womb about the infant, and maketh the ſecundine or after-birth, wherein the infant lieth as in a ſoft bed. Thoſe women are great with child whoſe urine is more ſharpe, fervent, and ſomewhat bloody, the bladder not only waxing warme by the compreſſion of the wombe, fervent by reaſon of the blood conteined in it, but alſo the thinner portion of the ſame blood being expreſſed, and ſweating out into the bladder. A ſwelling and hardneſſe of the dugs, and veines that are under the dugs in the breaſtes and about them, and milke comming out when they are preſſed, with a certaine ſtirring motion in the belly, are certaine infallible ſignes of greatneſſe with childe. Neither in this greatneſſe of childe bearing, the veines of the dugges onely, but of all the whole body, appeare full and ſwelled up, eſpecially the veines of the thighes and legges, ſo that by their manifold folding and knitting together, they do appeare varicous, whereof commeth ſluggiſhneſſe of the whole body, heavineſſe & impotency or difficulty of going, eſpecially when the time of deliverance is at hand. Laſtly, if you would know whether the woman have conceived or not, give unto her when ſhe goeth to ſleepe, ſome meed or honyed water to drink, and if ſhe have a griping in her guts or belly, ſhe hath conceived, if not, ſhe hath not conceived.

Why many women being great with childe refuſe laudable meates, and deſire thoſe that are illaudable & contrary to nature.

The ſuppreſſed tearmes divided into three parts.

Hip. 1. de morb. mul.

Aph. 41. ſect. 5.

CHAP. VI.

That the wombe, ſo ſoone as it hath received the ſeede, is preſently contracted or drawne together.

After that the ſeeds of the male and female have both met, and are mixed together in the capacity of the wombe, then the orifice thereof doth draw it ſelfe cloſe together, leſt the ſeedes ſhould fall out. There the females ſeede goeth and turneth into nutriment and the encreaſe of the males ſeede, becauſe all things are nouriſhed and doe encreaſe by thoſe things that are moſt familiar and like unto them. But the ſimilitude and familiarity of ſeede with ſeede is farre greater than with bloud, ſo that when they are perfectly mixed and coagulated, and ſo waxe warme by the ſtraight and narrow incloſure of the wombe, a certaine thinne skinne doth grow about it, like unto that that will bee over unſcimmed milke.

Why the female ſeede is nutriment for the male ſeed.

Moreover, this concretion or congealing of the ſeede, is like unto an egge layed before the time that it ſhould: that is to ſay, whoſe membrane or tunicle that compaſſeth it about, hath not as yet encreaſed or growne into a ſhelly hardneſſe about it; in folding-wiſe are ſeene many ſmall threads dividing themſelves, over-ſpread with a certaine clammy, whitiſh or red ſubſtance, as it were with blacke bloud. In the middeſt under it appeareth the navell, from whence that ſmall skinne is produced. But a man may underſtand many things that appertaine unto the conception of mankinde by the obſervation of twenty egges, ſetting them to bee hatched under an Henne, and taking one every day and breaking it, and diligently conſidering it; for in ſo doing, on the twentieth day you ſhall finde the Chicke perfectly formed with the navell. That little skin that ſo compaſſeth the infant in the wombe is called the ſecundine or *Chorion*, but commonly the after-birth.

A compendious way to underſtand humane conception.

This little skinne is perfectly made within ſixe dayes, according to the judgment of *Hippocrates*, as profitable and neceſſary not onely to containe the ſeeds ſo mixed together, but alſo to ſucke nutriment through the orifices of the veſſels ending in the wombe. Thoſe orifices the Greekes doe call *Cotyledones*, and the Latines *Acetabula*, for they are as it were hollowed eminences, like unto thoſe, which may bee ſeene in the feete or ſnout of a Cuttle fiſh many times in a double order, both for the working and holding of their meate. Thoſe eminences called *Acetabula* doe not ſo greatly appeare in women as in many brute beaſts. Therefore by theſe the ſecundine cleaveth on every ſide unto the wombe, for the conſervation, nutrition, and encreaſe of the conceived ſeede.

Lib. de nat. puer.

What the Cotyledones are.

CHAP. VII.

Of the generation of the navell.

After the woman hath conceived, to every one of the aforeſaid eminencies groweth preſently another veſſell, that is to ſay, a veine to the veine, and an artery to the artery: theſe ſoft and yet thin veſſels, are framed with a little thin membrane, which being ſpread under, ſticketh to them, for to them it is in ſtead of a membrane, and a ligament and a tunicle or a defence, and it is doubled with the others, and made of the veine and artery of the navell, to compaſſe the navell. Theſe new ſmall veſſels of the infant, with their orifices, doe anſwer directly one to one to the cotyledones or eminences of the womb, they are very ſwall and little, as it were the hairy fibres that grow upon roots that are in the earth, and when they have continued ſo a longer time, they are combined together, that of two they are made one veſſell; until that by continuall connexion, all thoſe veſſels go and degenerate into two other great veſſels, called the umbi-

The veine never joyneth it ſelfe with the artery.

licall veſſels, or the veſſels of the navell, becauſe they do make the navell, and do enter into the childs body by the hole of the navell. Here *Galen* doth admire the ſingular providence of God and Nature, becauſe that in ſuch a multitude of veſſels, and in ſo long a paſſage or length that they go or are produced, the vein doth never confound it ſelfe nor ſtick to the artery, nor the artery to the veine, but every veſſell joyneth it ſelfe to the veſſell of its owne kinde. But the umbilicall veine or navell veine, entering into the body of the child, doth joyne it ſelf preſently to the hollow part of the liver, but the artery is divided into two, which joine themſelves to the two iliack arteries along the ſides of the bladder, & are preſently covered with the *peritonæum*, & by the benefit thereof are annexed unto the parts which it goes unto. Thoſe ſmall veines and arteries are as it were the rootes of the child, but the veine and artery of the navell are as it were the body of the tree, to bring down the nutriment to nouriſh the child. For firſt we live in the wombe the life of a plant, and then next the life of a ſenſitive creature; and as the firſt tunicle of the child is called *Chorion* or *Allantoides*, ſo the other is called *Amnios* or *Agnina*, which doth compaſſe the ſeed or child about on every ſide. Theſe membranes are moſt thin, yea for their thinneſſe like unto the ſpiders web, woven one upon another, and alſo connexed in many places by the extremities of certaine ſmall and hairy ſubſtances, which at length by the adjunction of their like do get ſtrength; wherby you may underſtand, what is the cauſe why by divers and violent motions of the mother in going and dancing or leaping, and alſo of the infant in the wombe, thoſe membranes are not almoſt broken. For they are ſo conjoyned by the knots of thoſe hairie ſubſtances, that betweene them nothing, neither the urine nor the ſweate can come, as you may plainely and evidently perceive in the diſſection of a womans body that is great with child, not depending on any other mans opinion, be it never ſo old or inveterate: yet the ſtrength of thoſe membranes is not ſo great but that they may bee ſoone broken in the birth by the kicking of the child.

Hippocrates calleth all the membranes that compaſſe the infant in the wombe, according to the judgement of *Galen* in his booke *de uſu partium*, by the name of the ſecundines.

Chap. VIII.

Of the umbilicall veſſels, or the veſſels belonging to the navell.

An old opinion confuted.

Many of the ancient Writers have written that there are five veſſels found in the navell. But yet in many, nay all the bodies I ſought in for them, I could never finde but three, that is to ſay, one veine, which is very large, ſo that in the paſſage thereof it will receive the tagge of a poynt, and two arteries, but not ſo large, but much narrower, becauſe the childe wanteth or ſtandeth in need of much more bloud for his conformation and the nutriment or increaſe of his parts, than of vitall ſpirit.

To what uſe the knots of the childs navell in the wombe ſerveth.

Theſe veſſels making the body of the navell, which, as it is thought, is formed within nine or tenne dayes, by their doubling and folding, make knots like unto the knots of a Franciſcan Friers girdle, that ſtaying the running bloud in thoſe their knotty windings, they might more perfectly concoct the ſame: as may be ſeene in the ejaculatory ſpermatick veſſels, for which uſe alſo the length of the navell is halfe an ell, ſo that in many infants that are ſomewhat growne, is is found three or foure times doubled about their neck or thigh.

The child in the wombe taketh his nutriment by his navell, not by his mouth.

How the child breatheth.

As long as the childe is in his mothers wombe, hee taketh his nutriment onely by the navell, and not by his mouth, neither doth hee enjoy the uſe of eyes, eares, noſtrils or fundament, neither needeth hee the functions of the heart. For ſpirituous bloud goeth unto it by the arteries of the navell, and into the iliack arteries, and from the iliack arteries unto all the other arteries of the whole body, for by the motion of theſe onely the infant doth breathe. Therefore it is not to bee ſuppoſed that aire is carryed or drawne in by the lungs unto the heart, in the body of the childe, but contrariwiſe from the heart to the lungs. For neither the heart doth performe the generation or working of bloud, or of the vitall ſpirits. For the iſſue or infant is contented

tented with them as they are made and wrought by his mother. Which, untill it hath obtained a full, perfect and whole deſcription of his parts and members, cannot be called a child, but rather an embrion, or an imperfect ſubſtance.

CHAP. IX.

Of the ebullition or ſwelling of the ſeed in the wombe, and of the concretion of the bubbles or bladders, or the three principall entralls.

IN the ſixe firſt dayes of conception the new veſſels are thought to bee made and brought forth of the eminences or cotylidons of the mothers veſſels, and diſperſed into all the whole ſeede, as they were fibres or hairy ſtrings. Thoſe as they pierce the wombe, ſo do they equally and in like manner penetrate the tunicle *Chorion.* And it is carried this way, being a paſſage not only neceſſary for the nutriment and conformation of the parts, but alſo into the veines diverſly woven and diſperſed into the skin *Chorion.* For thereby it commeth to paſſe that the ſeed it ſelfe boileth, and as it were fermenteth or ſwelleth, not onely through occaſion of the place, but alſo of the bloud and vitall ſpirits that flow unto it, and then it riſeth into the bubbles or bladders, like unto the bubbles which are occaſioned by the raine falling into a river or channell full of water. Theſe three bubbles or bladders, are certain rude or new formes or concretions of the three principall entrals, that is to ſay, of the liver, heart and braine. All this former time it is called ſeed, and by no other name; but when thoſe bubbles ariſe, it is called an embrion, or the rude forme of a body untill the perfect conformation of all the members: on the fourth day after that the veine of the navell is formed, it ſucketh groſſer bloud, that is, of a more fuller nutriment out of the Cotylidons. And this bloud, becauſe it is more groſſe, eaſily congeales & curdles in that place, where it ought to prepare the liver fully & abſolutely made. For then it is of a notable great bigneſſe above all the other parts, & therfore it is called *parenchyma*, becauſe it is but only a certain congealing or concretion of bloud brought together thither or in that place. From the gibbous part thereof ſpringeth the greater part or trunke of the hollow veine, called commonly *vena cava*, which doth diſperſe his ſmall branches, which are like unto haires, into alſo the ſubſtance thereof: and then it is divided into two branches, whereof the one goeth upwards, the other downwards unto all the particular parts of the body.

The three bladders.

When the ſeede is called an embrion.

Why the liver is called *Parenchyma.*

In the meane ſeaſon the Arteries of the navell ſuck ſpirituous bloud out of the eminences or Cotylidons of the mothers arteries, whereof, that is to ſay, of the more fervent and ſpirituous bloud, the heart is formed in the ſecond bladder or bubble, being endued with a more fleſhy, ſound and thicke ſubſtance, as it behooveth that veſſell to bee, which is the fountaine from whence the heate floweth, and hath a continuall motion.

In this the vertue formative hath made two hollow places, one on the right ſide, another on the left. In the right, the root of the hollow veine is infixed or ingraffed, carrying thither neceſſary nutriment for the heart; in the left is formed the ſtamp or roote of an artery, which preſently doth divide it ſelfe into two branches, the greater whereof goeth upwards to the upper parts, and the wider unto the lower parts, carrying unto all the parts of the body life and vitall heat.

CHAP. X.

Of the third bubble or bladder, wherein the head and the braine is formed.

Why the greater portion of ſeed goeth into generation of the head and braine.

THe farre greater portion of the ſeede goeth into this third bubble, that is to ſay, yeelding matter for the conformation of the braine and all the head. For a greater quantity of ſeede ought to goe unto the conformation of the head and braine, becauſe theſe parts are not ſanguine or bloudy as the heart and liver, but in a manner without bloud; bonie, marrow, cartilaginous, nervous and membranous, whoſe parts, as the veines, arteries, nerves, ligaments, panicles, and ſkinne, are called ſpermaticke parts, becauſe they obtaine their firſt conformation almoſt of ſeede onely: although that afterwards they are nouriſhed with bloud, as the other fleſhy and muſculous parts are. But yet the bloud when it is come unto thoſe parts, degenerateth and turneth into a thing ſomewhat ſpermatick, by vertue of the aſſimulative faculty of thoſe parts. All the other parts of the head, forme and faſhion themſelves unto the forme of the braine when it is formed, and thoſe parts which are ſituated and placed about it for defence eſpecially, are hardened into bones.

Why the head is placed on the top of the body.

The head as the ſeate of the ſenſes, and manſion of the minde and reaſon, is ſituated in the higheſt place, that from thence, as it were from a lofty tower or turret, it might rule and governe all the other members and their functions and actions, that are under it, for there the ſoule or life which is the rectreſſe or governeſſe is ſituated; and from thence it floweth and is diſperſed into all the whole body. Nature hath framed theſe three principall entrals as proppes and ſuſtentations for the weight of all the reſt of the body: for which matter alſo ſhee hath framed the bones.

The firſt bones that appeare to bee formed, or are ſuppoſed to be conformed, are the bones called *oſſa Ilium*, connexed or united by ſpondils that are betweene them: then all the other members are framed & proportioned by their concavities & hollowneſſes, which generally are ſeaven, that is to ſay, two of the eares, two of the noſe, one of the mouth, and in the parts beneath the head, one of the fundament, and another of the yard or conduit of the bladder; and furthermore in women, one of the necke of the wombe, without the which they can never bee made mothers or beare children.

When all theſe are finiſhed, nature, that ſhee might poliſh her excellent worke in all ſorts, hath covered all the body and every member thereof with ſkinne. Into this excellent work or *Microcoſmos* ſo perfected, God, the author of nature and all things, infuſeth or ingrafteth a ſoule or life: which St. *Auguſtine* proveth by this ſentence of *Moſes*: If any man ſmite a woman with child, ſo that thereby ſhe be delivered before her naturall time, and the child bee dead, being firſt formed in the wombe, let him die the death: but if the child hath not as yet obtained the full proportion and conformation of his body and members, let him recompence it with mony. Therefore it is not to bee thought that the life is derived, propagated or taken from *Adam* or our parents, as it were an hæreditary thing diſtributed unto all mankinde by their parents; but we muſt believe it to be immediately created of God, even at the very inſtant time when the child is abſolutely perfected in the lineaments of his body, and ſo given unto it by him.

Exod. 20. *qu.* 52.

The *mola* in the wombe liveth not as the child.

So therefore the rude lumpes of fleſh called *molæ* that engender in womens wombes, and monſters of the like breeding and confuſed bigneſſe, although by reaſon of a certaine quaking and ſhivering motion, they ſeeme to have life, yet they cannot bee ſuppoſed to bee endued with a life or a reaſonable ſoule: but they have their motion, nutriment and increaſe wholly of the naturall and infixed faculty of the wombe, and of the generative or procreative ſpirit that is engraffed naturally in the ſeed.

But even as the infant in the wombe obtaineth not perfect conformation before the thirtieth day, ſo likewiſe it doth not move before the ſixtieth day: at which

time it is moſt commonly not perceived by women, by reaſon of the ſmallneſſe of the motion. But now let us ſpeake briefly of the life or ſoule, wherein conſiſteth the principall originall of every function in the body, and likewiſe of generation.

Chap. XI.

Of the life or ſoule.

THE ſoule entreth into the body, ſo ſoone as it hath obtained a perfect and abſolute diſtinction and conformation of the members in the wombe: which in male children, by reaſon of the more ſtrong and forming heate which is engraffed in them, is about the fortieth day, and in females about the forty fifth day, in ſome ſooner, and in ſome later, by reaſon of the efficacy of the matter working, and plyantneſſe or obedience of the matter whereon it worketh. Neither doth the life or ſoule being thus inſpired into the body preſently execute or performe all his functions, becauſe the inſtuments that are placed about it cannot obtaine a firme and hard conſiſtence neceſſary for the lively, but eſpecially for the more divine miniſteries of the life or ſoule, but in a long proceſſe of age or time.

The life goeth not into the maſſe of ſeed that doth engender the child, before the body of the child and each part thereof hath his perfect proportion and forme.

Why the life or ſoule doth not preſently execute all his offices.

Thoſe inſtruments of the ſoule are vitiated either in the firſt conformation, as when the forme or faſhion of the head is ſharpe upwards or piramydall, as was the head of *Therſites*, that lived in the time of the Trojan warre, and of *Triboulet* and *Tonin*, that lived in later yeares; or alſo by ſome caſualty, as by the violent handling of the mydwife, who by compreſſion, by reaſon that the ſcull is then tender and ſoft, hath cauſed the capacity of the ventricles that be under the braine to be too narrow for them: or by a fall, ſtroake, diſorder in diet, as by drunkenneſſe, or a feaver, which inferreth a lithargie, exceſſive ſleepineſſe, or a phrenſie.

Preſently after the ſoule is entred the body, God endueth it with divers and ſundry gifts: hereof it commeth that ſome are endued with wiſedome by the ſpirit; others with knowledge by the ſame ſpirit; others with the gift of healing by the ſame ſpirit; others with power, dominion and rule; others with propheſie; others with diverſities of tongues; and to others other endowments, as it hath pleaſed the divine providence and bounty of God to beſtow upon them, againſt which no man ought to contend or ſpeake. For it is not meet that the thing formed ſhould ſay unto him that formed it, why haſt thou made mee on this faſhion? hath not the Potter power to make of the ſame lumpe of clay one veſſell to honour and another to diſhonour? it is not my purpoſe, neither belongeth it unto mee or any other humane creature to ſearch out the reaſon of thoſe things, but onely to admire them with all humility: But yet I dare affirme this one thing, that a noble and excellent ſoule neglecteth elementary and tranſitory things, and is raviſhed and moved with the contemplation of celeſtiall, which it cannot freely enjoy before it bee ſeparated from this earthly encloſure or priſon of the body, and be reſtored unto its originall.

1 *Cor.c.12.*

Therefore the ſoule is the inward *Entelechia* or perfection, or the primative cauſe of all motions and functions both naturall and animall, and the true forme of man. The Ancients have endeavoured to expreſſe the obſcure ſenſe thereof by many deſcriptions. For they have called it a celeſtiall ſpirit, and a ſuperiour, incorporeall, inviſible, an immortall eſſence, which is to bee comprehended of its ſelfe alone, that is, of the minde or underſtanding. Others have not doubted but that wee have our ſoules inſpired by the univerſall divine minde, which as they are alive, ſo they doe beſtow life on the bodies unto whom they are annexed or united. And although this life bee diſperſed into all the whole body, and into every portion of the ſame, yet is it voyd of all corporall weight or mixtion, and it is wholly and alone in every ſeverall part, being ſimple and indiviſible, without all compoſition or mixture, yet endued with many vertues and faculties, which it doth utter in divers

What the ſoule or life is.

The life is in all the whole body, and in every portion thereof.

The life or ſoule is ſimple and indiviſible.

parts of the body: For it feeleth, imagineth, judgeth, remembreth, underſtandeth, and ruleth all our deſires, pleaſures and animall motions; it ſeeth, heareth, ſmelleth, taſteth, toucheth: and it hath divers names of theſe ſo many and ſo great functions which it performeth in divers parts of the body. It is called the ſoule or life, becauſe it maketh the body live, which of it ſelfe is dead. It is called the ſpirit or breath, becauſe it inſpireth our bodies. It is called reaſon, becauſe it diſcerneth truth from falſhood, as it were by a certaine divine rule. It is termed the minde, becauſe it is mindfull of things paſt, in recalling and remembring them: and it is called the vigour or courage, becauſe it giveth vigour and courage to the ſluggiſh weight or maſſe of the body. And laſtly it is called the ſenſe & underſtanding, becauſe it comprehendeth things that are ſenſible and intelligible. Becauſe it is incorporeall it cannot occupie a place by corporeall extenſion, although notwithſtanding it filleth the whole body. It is ſimple, becauſe it is but one in eſſence, not encreaſed nor diminiſhed: for it is no leſſe in a Dwarfe than in a Gyant, and it is like perfect and great in an infant as in a man, according to its owne nature.

Divers names, and the reaſon of divers names that are given to humane formes.

Three kinds of living bodies.

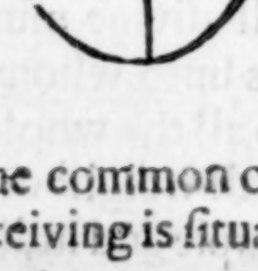
The ſuperiour ſoule containeth in it ſelfe all the powers of the inferiour.

But there are three kindes of bodies informed by a ſoule whereby they live: the firſt being the moſt imperfect, is of plants, the ſecond of brute beaſts, and the third of men. The plants live by a vegitative, beaſts by a ſenſitive, and men by an intellective ſoule. And as the ſenſitive ſoule of brute beaſts is endued with all the vertues of the vegetative, ſo the humane intellective comprehendeth the vertues of all the inferior, not ſeparated by any diviſion, but by being indiviſibly united with reaſon and underſtanding, into one humane forme and ſoule whereon they depend. But becauſe we have ſayd a little before, that divers functions of the life are reſident, and appeare in divers parts of the body, here in this place, omitting all others, wee will proſecute thoſe only which are accounted the principall.

What the common ſenſe is.

The function of the common ſenſe is double.

The principall functions of a humane ſoule, according to the opinion of many, are foure in number, proceeding from ſo many faculties, and conſequently from one ſoule; they are theſe: The common Senſe, Imagination, Reaſoning, and Memory. And they thinke that the common or interior ſenſe doth receive the formes and images of ſenſible things, being carryed by the ſpirit through the paſſage of the nerves, as an inſtrument of the externall ſenſes, as it were a meſſenger to goe between them; and it ſerves not onely to receive them, but alſo to know, perceive and diſcerne them. For the eye, wherein the externall ſenſe of ſeeing conſiſteth, doth not know white or blacke. Therefore it cannot diſcerne the differences of colours, as neither the tongue taſtes, nor the noſe ſavours, nor the eares ſounds, nor laſtly, the hands their touching quality: yea, the eye doth not of it ſelfe perceive that it ſeeth, nor the noſe that it ſmelleth, nor the eares that they heare, nor the tongue that it taſteth, nor the hands that they touch. For all theſe things are the offices and functions of the common ſenſe; for this ſenſe knoweth that the eye hath ſeene ſome thing, either white, blacke, red, a man, horſe, ſheepe, or ſome ſuch like materiall thing, yea, even when the ſight is gone and paſt; and ſo likewiſe the noſe to have ſmelled this or that ſavour, the eare to have heard this or that ſound, the tongue to have taſted this or that taſt, and the hand to have touched this or that thing, bee they never ſo diverſe. For all the externall ſenſes, and all the functions thereof do end and are referred to the common ſenſe, as it were the lines of a circle from the circumference into the centre, as it is expreſſed in this figure.



For what cauſe the internall ſenſe is called the common ſenſe.

For which cauſe it is called the common or principll ſenſe, for that therein the primitive power of feeling or perceiving is ſituated, for it uſeth the miniſtery or ſervice of the externall ſenſes to know many and divers things, whoſe differences it doth diſcerne and judge, but ſimple things, that are of themſelves, and without any compoſition and connexion, which may conſtitute any thing true or falſe, or any argumentation, belongeth onely to the minde, underſtanding or reaſon. For this was the counſell of nature, that the externall ſenſes ſhould receive the formes of things ſuperficially, lightly and gently onely, like as a glaſſe, not to any other end but that they ſhould preſently ſend them unto the common ſenſe, as it were unto their center and prince, which he (that is to ſay the common ſenſe) at length delivereth to be collected unto the underſtanding or reaſoning faculty of the ſoule, which *Avicen* and *Averrois* have ſuppoſed to be ſituated in the former part of the braine.

The common ſenſe underſtandeth or knoweth thoſe things that are ſimple onely.

Next unto the common ſenſe followeth the phantaſie or imagination, ſo called, becauſe of it ariſe the formes and Ideas that are conceived in the minde, called of the Geekes *Phantaſmata*. This doth never reſt but in thoſe that ſleepe: neither alwaies in them, for oft-times in them it cauſeth dreames, and cauſeth them to ſuppoſe they ſee and perceive ſuch things as were never perceived by the ſenſes, nor which the nature of things, nor the order of the world will permit. The power of this faculty of the minde is ſo great in us, that often it bringeth the whole body in ſubjection unto it.

What Imagination is.

For it is recorded in hiſtory, that *Alexander* the Great ſitting at Table, and hearing *Timotheus* the Muſician ſing a martiall Sonnet unto his Citherne, that hee preſently leaped from the table, and called for armes; but when againe the Muſician mollifyed his tune, hee returned to the Table and ſate downe as before. The power of Imagination cauſed by muſicall harmony, was ſo great, that it ſubjected to it the courage of the Worlds conquerour, by whoſe various motion, it would now as it were cauſe him to runne headlong to armes, and then pacifie and quiet him, and ſo cauſe him to returne to his chaire and banquetting againe. And there was one whoſoever it was, who ſome few yeares agone, ſeeing the Turke dance on a rope on high, with both his feet faſtened in a baſon, turned his eyes from ſo dangerous a ſight or ſpectacle, although hee came to the place of purpoſe to ſee it, and was ſtricken with ſuch feare, that his body ſhooke and heart quaked, for feare leſt that by ſudden falling downe headlong hee ſhould breake his necke. Many looking downe from an high and lofty place, are ſo ſtricken with feare, that ſuddenly they fall downe headlong, being ſo overcome and bound with the imagination of the danger, that their owne ſtrength is not able to ſuſtaine them. Therefore it manifeſtly appeareth that God hath dealt moſt graciouſly and lovingly with us, who unto this power of imagination, hath joyned another, that is, the faculty or power of reaſon and underſtanding; which diſcerning falſe dangers and perils from true, doth ſuſtain and hold up a man that he may not be overthrowne by them.

After this appeareth and approacheth to performe his function, the faculty of Reaſon, being the Prince of all the principall faculties of the ſoule; which bringeth together, compoſeth, joyneth and reduceth all the ſimple and divided formes or images of things into one heape, that by dividing, collecting and reaſoning it might diſcerne and try truth from falſhood.

What Reaſon is.

This faculty of Underſtanding or Reaſon is ſubject to no faculty or inſtrument of the body, but is free, and penetrateth into every ſecret, intricate and hidden thing, with an incredible celerity: by which a man ſeeth what will follow, perceiveth the originalls and cauſes of things, is not ignorant of the proceedings of things, he compareth things that are paſt with thoſe that are preſent and to come, decreeing what to follow, and what to avoyde. This bridleth and with-holdeth the furious motions of the minde, bridleth the overhaſty motions of the tongue, and admoniſheth the ſpeaker that before the words paſſe out of his mouth, hee ought with diligence and diſcretion to ponder and conſider the thing whereof hee is about to ſpeake.

The functions of Reaſon.

After Reaſon and Judgement followeth Memory, which keeping and conſerving all formes and images that it receiveth of the ſenſes, and which Reaſon ſhall appoint, and as a faithfull keeper and conſerver, receiveth all things, and imprinteth and ſealeth them as well by their owne vertue and power, as by the impulſion and adherence of thoſe things in the body of the braine, without any impreſſion of the

What Memory is.

matter; that when occaſion ſerveth, we may bring them forth therehence as out of a treaſurie or ſtore-houſe. For otherwiſe, to what purpoſe were it to reade, heare and note ſo many things, unleſſe wee were able to keepe and retaine them in minde by the care and cuſtody of the Memory or Braine? Therefore aſſuredly God hath given us this one onely remedy and preſervative againſt the oblivion and ignorance of things, which although of it ſelfe and of its owne nature it bee of greater efficacie, yet by daily and often meditation it is trimmed and made more exquiſite and perfect. And hence it was that the Ancients termed wiſedome the daughter of memory and experience. Many have ſuppoſed that the manſion or ſeate of the Memory, is in the hinder part, or in the ventricle of the *Cerebellum*, by reaſon that it is apt to receive the formes of things, becauſe of the engrafted dryneſſe and hardneſſe thereof.

Wiſdome the daughter of memory and experience.

Chap. XII.

Of the naturall excrements in generall, and eſpecially of thoſe that the childe or infant being in the wombe excludeth.

What an excrement is.

Before I declare what excrements the infant excludeth in the wombe and by what paſſages, I thinke it good to ſpeak of the excrements which all men doe naturally voyde. All that is called an excrement which nature is accuſtomed to ſeparate and caſt out from the laudible and nouriſhing juice. There are many kinds of thoſe excrements.

The excrement of the firſt concoction.

The firſt is of the firſt concoction, which is performed in the ſtomacke, which being driven downe into the inteſtines or guts, is voyded by the fundament.

The excrement of the ſecond concoction is triple.

The ſecond commeth from the liver, and it uſually is three-fold, or of three kinds; one cholericke, whereof a great portion is ſent into the bladder of the gall, that by ſweating out there-hence, it might ſtirre up the expulſive faculty of the guts to expell and exclude the excrements. The other is like unto whay, which goeth with the bloud into the veines, and is as it were a vehicle thereto to bring it unto all the parts of the body, and into every Capillar veine for to nouriſh the whole body; and after it hath performed that function, it is partly expelled by ſweate, and partly ſent into the bladder, and ſo excluded with the urine. The third is the melancholicke excrement, which being drawn by the milt, the purer and thinner part thereof goeth into the nouriſhment of the milt, and after the remnant is partly purged out downewards by the hæmorrhoidall veines, and partly ſent to the orifice of the ſtomacke, to inſtimulate and provoke the appetite. The laſt commeth of the laſt concoction, which is abſolved in the habit of the body, and breatheth out, partly by inſenſible tranſpiration, is partly conſumed by ſweating, and partly floweth out by the evident and manifeſt paſſages that are proper to every part: as it happeneth in the braine before all other parts; for it doth unloade it ſelfe of this kinde of excrement by the paſſages of the noſe, mouth, eares, eyes, pallat bone and ſutures of the ſcull.

The excrement of the third concoction is triple.

Therefore if any of thoſe excrements bee ſtayed altogether, or any longer than it is meete they ſhould, the default is to bee amended by diet and medicine. Furthermore, there are other ſorts of excrements not naturall, of whom wee have entreated at large in our booke of the peſtilence.

The uſe of the navell ſtring.

When the infant is in the mothers wombe, untill hee is fully and abſolutely formed in all the liniments of his body, hee ſends forth his urine by the paſſage of the navell or *urachus*. But a little before the time of childe-birth, the *urachus* is cloſed, and then the man childe voydeth his urine by the conduit of the yard, and the woman childe by the necke of the wombe. This urine is gathered together and contained in the coate *Chorion* or *Allantoides*, together with the other excrements, that is to ſay, ſweat, & ſuch whayiſh ſuperfluities of the menſtruall matter, for the more eaſie bearing up of the floting or ſwimming childe. But in the time of child-birth, when the infant by kicking breaketh the membranes, thoſe humours runne out, which when the mydwifes perceive, they take it as a certaine ſigne that the childe is at hand.

For

For if the infant come forth together with thoſe waters, the birth is like to be more eaſie, and with the better ſucceſſe; for the necke of the wombe and all the genitalls are ſo by their moiſture relaxed and made ſlippery, that by the endeavour and ſtirring of the infant the birth will be the more eaſie, and with the better ſucceſſe: contrariwiſe, if the infant bee not excluded before all theſe humours bee wholly flowed out and gone, but remaineth as it were in a dry place, preſently through drineſſe the necke of the wombe and all the genitalls will be contracted and drawne together, ſo that the birth of the childe will bee very difficult and hard, unleſſe the necke of the wombe, to amend that default, be anointed with oile, or ſome other relaxing liquor. Moreover, when the childe is in the wombe, he voideth no excrements by the fundament, unleſſe it be when at the time of the birth, the proper membranes and receptacles are burſt by the ſtriving of the infant, for hee doth not take his meat at the mouth, wherefore the ſtomacke is idle then, and doth not execute the office of turning the meats into *Chylus*, nor of any other concoction; wherefore nothing can goe downe from it into the guts. Neither have I ſeldome ſeene infants borne without any hole in their fundament, ſo that I have beene conſtrained with a knife to cut in ſunder the membrane or tunicle that grew over and ſtopped it. And how can ſuch excrements be engendered, when the childe being in the wombe, is nouriſhed with the more laudable portion of the menſtruall blood? therefore the iſſue or child is wont to yeeld or avoyd two kindes or ſorts of excrements, ſo long as he is in the womb, that is to ſay, ſweat and urine, in both which he ſwimmes; but they are ſeparated by themſelves, by a certaine tunicle called *Allantoides*, as it may be ſeene in kids, dogges, ſheepe, and other brute beaſts; for as much as in mankinde the tunicle *Chorion* and *Allantoides* or *Farciminalis* be all one membrane. If the woman be great of a man childe, ſhe is more merry, ſtrong, and better coloured, all the time of her child bearing, but if of a woman childe, ſhe is ill coloured becauſe that women are not ſo hot as men.

Children born without a paſſage in their fundament.

Aph. 42. *ſect.* 5.

The males begin to ſtirre within three moneths and an halfe, but females after: if a woman conceive a male child, ſhe hath all her right parts ſtronger to every work: wherefore they do begin to ſet forwards their right foot firſt in going, & when they ariſe they leane on the right arme, the right dug will ſooner ſwell and waxe hard; the male children ſtirre more in the right ſide than in the left, and the female children rather in the left than in the right ſide.

Aph. 47. *ſect.* 5.

CHAP. XIII.

With what travell the Childe is brought into the world, and of the cauſe of this labour and travell.

When the naturall prefixed and preſcribed time of child-birth is come, the childe being then growne greater, requires a greater quantity of food: which when he cannot receive in ſufficient meaſure by his navell, with great labour and ſtriving hee endeavoureth to get forth: therefore then hee is moved with a ſtronger violence, and doth breake the membranes wherein he is contained. Then the wombe, becauſe it is not able to endure ſuch violent motions, nor to ſuſtaine or hold up the childe any longer, by reaſon that the conceptacles of the membranes are broken aſunder, is relaxed. And then the childe purſuing the aire which hee feeleth to enter in at the mouth of the wombe, which then is very wide and gaping, is carried with his head downewards, and ſo commeth into the world, with great pain both unto it ſelfe, and alſo unto his mother, by reaſon of the tenderneſs of his body, & alſo by reaſon of the extenſion of the nervous necke of his mothers wombe, and ſeparation of the bone called *Os Ilium* from the bone called *Os ſacrum*. For unleſſe thoſe bones were drawne in ſunder, how could not onely twinnes that cleave faſt together, but alſo one childe alone, come forth at ſo narrow a paſſage as the necke of the wombe is? Not onely reaſon, but alſo experience confirmeth it; for I have opened the bodies of women preſently after they have

Why the infant is borne ſometimes with his head forwards.

In the time of childe birth the bones of *Ilium* and *Os ſacrum* are drawne & extended one from another.

have died of travell in childe-birth, in whom I have found the bones of *Ilium* to bee drawne the breadth of ones finger from *Os ſacrum*: and moreover, in many unto whom I have been called being in great extremity of difficult and hard travell, I have not onely heard, but alſo felt the bones to crackle and make a noiſe, when I laid my hand upon the coccyx or rumpe, by the violence of the diſtention. Alſo honeſt matrons have declared unto me that they themſelves, a few daies before the birth, have felt and heard the noiſe of thoſe bones ſeparating themſelves one from another with great paine. Alſo a long time after the birth, many doe feele great paine and ache about the region of the coccix and *Os ſacrum*, ſo that when nature is not able to repaire the diſſolved continuity of the bones of *Ilium*, they are conſtrained to halt all the dayes of their life after. But the bones of the ſhare called *Oſſa pubis*, I have never ſeene to be ſeparated, as many do alſo affirme. It is reported that in *Italy* they break the coccyx or rumpe in all maidens, that when they come to bee married they may beare children with the leſſer travaile in childe-birth; but this is a forged tale, for that bone being broken, is naturally and of its owne accord repaired, and joyned together again with a *Callus*, whereby the birth of the childe will be more difficult and hard.

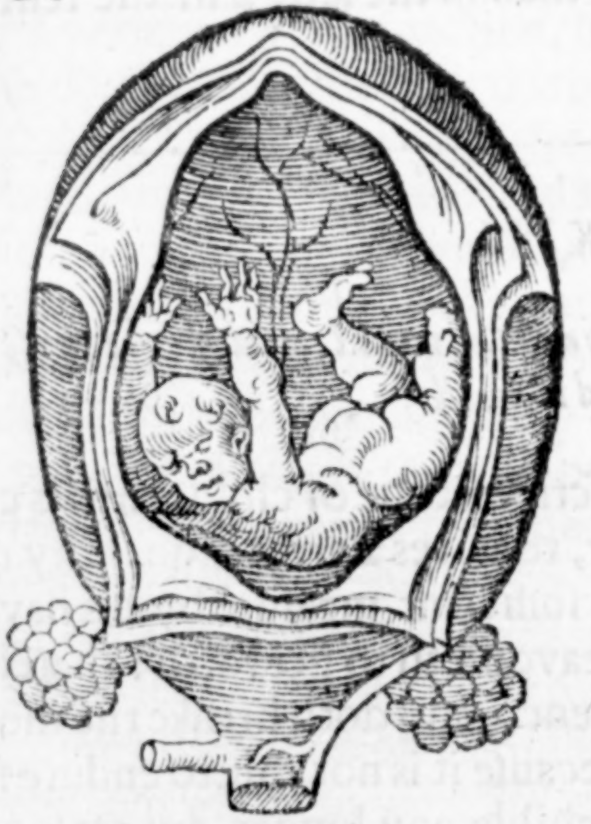
An Italian fable.

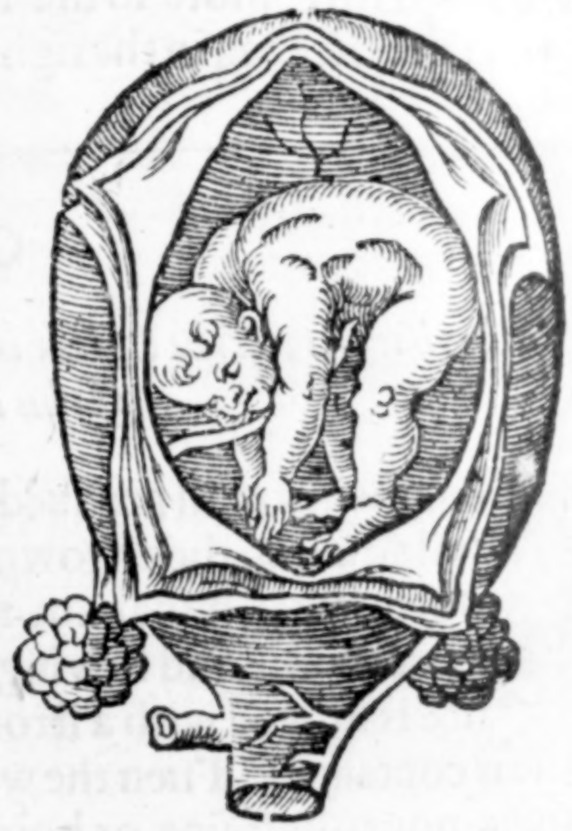
CHAP. XIV.

Of the ſituation of the infant in the wombe.

The ſituation of the infant in the wombe is divers.

REASON cannot ſhew the certain ſituation of the infant in the wombe, for I have found it altogether uncertaine, variable and divers both in living and dead women: in the dead by opening their bodies preſently after they were dead, and in the living by helping them by the induſtry of my hand, when they have beene in danger of periſhing by travell of child-birth: for by putting my hand into the womb, I have felt the infant comming forth, ſometimes with his feet forwards, ſometimes with his hands, and ſometimes with his hands and feet turned backwards, and ſometimes forwards, as the figure following plainely deſcribeth.

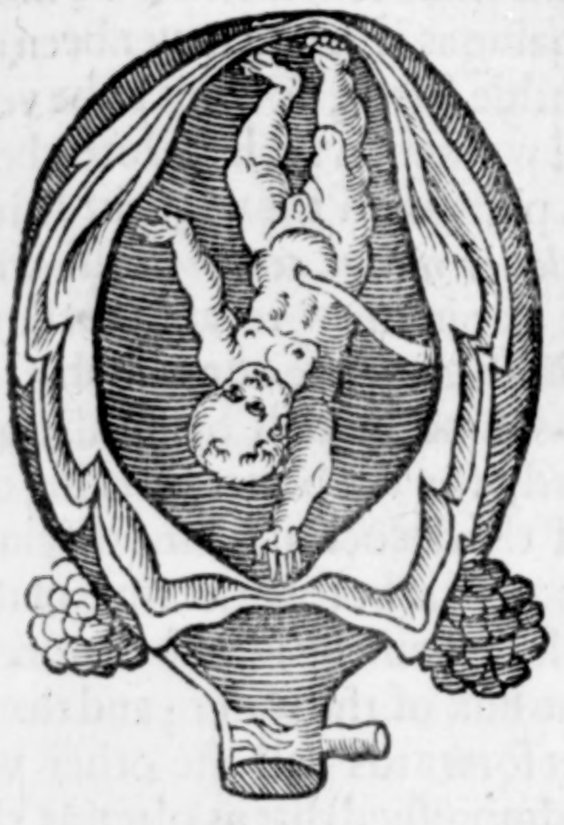


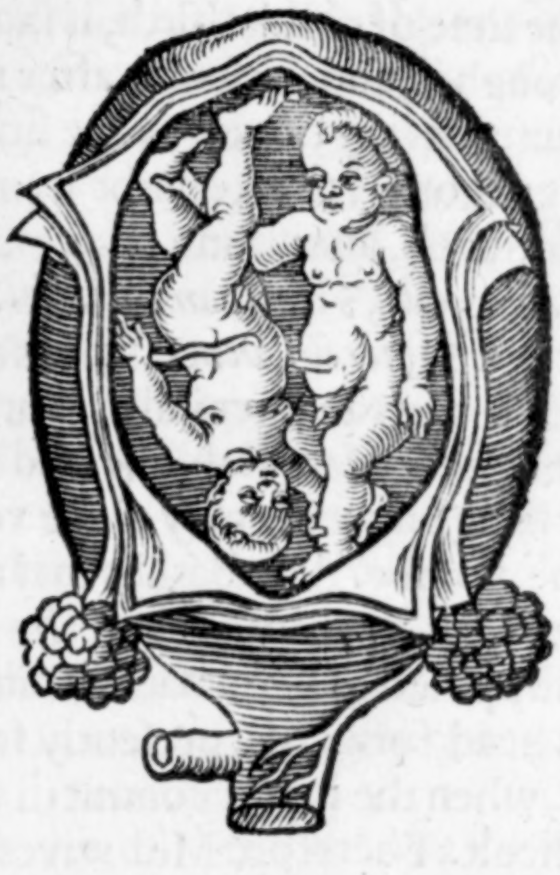


I have often found them comming forth with their knees forwards, and ſometimes with one of the feet, and ſometimes with their belly forwards, their hands and feet being lifted upwards, as the former figure ſheweth at large.

Sometimes I have found the infant comming with his feet downwards ſtriding awide, and ſometimes headlong, ſtretching one of his armes downward out at length, and that was an Hermaphrodite, as the figure following plainly declareth.

One time I obſerved in the birth of twinnes, that the one came with his head forwards, and the other with his feet, according as here I have thought good to deſcribe them.





In the bodies of women that died in travaile of childe I have ſometimes found children no bigger than if they had beene but foure moneths in the wombe, ſituated in a round compaſſe like a hoope, with their head bowed downe to the knees, with both their hands under the knees, and their heeles cloſe to their buttockes. And moreover, I proteſt before God that I found a childe being yet alive in the body of his mother (whom I opened ſo ſoone as ſhee was dead) lying all along ſtretched out, with his face upwards, and the palmes of his hands joyned together, as if he were at prayer.

CHAP. XV.

Which is the legitimate and naturall, and which the illegitimate or unnaturall time of childe birth.

Mankinde hath no certain time of bringing forth young.

TO all living creatures, except man, the time of conception and bringing forth their young is certaine and definite; but the iſſue of man commeth into the world, ſometimes in the ſeventh, ſometimes in the eighth, and ſometimes, which is moſt frequent, in the ninth moneth, ſometimes in the tenth moneth, yea ſometimes in the beginning of the eleventh moneth. *Maſſurius* reports that *Lucius Papyrius* the Pretor, the ſecond heire commencing a ſuit, gave the poſſeſſion of the goods away from him, ſeeing the mother of the childe affirmed that ſhe went thirteen moneths therewith, being there is no certaine definite time of child-birth. The child that is borne in the ſixt moneth cannot be long lived, becauſe that at that time all his body or members are not perfectly finiſhed or abſolutely formed. In the ſeventh moneth it is proved by reaſon and experience that the infant may be long lived. But in the eight moneth it is ſeldome or never long lived: the reaſon thereof is, as the Aſtronomers ſuppoſe, becauſe that at that time Saturne ruleth, whoſe coldneſſe and dryneſſe is contrary to the originall of life: but yet the phiſicall reaſon is more true; for the phyſitians ſay that the childe in the wombe doth often times in the ſeaventh moneth ſtrive to bee ſet at liberty from the incloſure of the wombe, and therefore it contendeth and laboureth greatlie, and ſo with labouring

Why the child is ſcarce alive in the eight moneth.

ring and ſtriving it becommeth weak, that all the time of the eight moneth it cannot recover his ſtrength again, whereby it may renew his accuſtomed uſe of ſtriving, and that ſome by ſuch labouring and ſtriving, hurt themſelves, and ſo dye. Yet ſome ſtrong and luſty women are thought to bring forth their children, being lively and ſtrong, on the eight moneth, as *Ariſtotle* teſtifieth of the *Aegyptians*, the Poets of the inhabitants of the Iſle of *Naxus*, and many of the Spaniards. Furthermore, I cannot ſufficiently marvaile, that the wombe, which all the time of childe-bearing is ſo cloſed together, that one can ſcarce put a probe into it, unleſſe it be happely by reaſon of ſuperfœtation, or when it is open for a ſhort time to purge it ſelfe, that preſently before the time of childe-birth, it ſhould gape and waxe ſo wide, that the infant may paſſe through it, and preſently after it to cloſe againe as if it had never been opened. But becauſe that the travell of the firſt time of childe-birth, is wont to be very difficult and grievous, I thinke it not unmeet that all women, a little before the time of their firſt travell, anoint and relaxe their privie parts with the unguent here deſcribed. ℞. *ſper. ceti*, ℥ ii. *ol. amygd. dul.* ℥ iv. *ceræ alb. & medul. cervin.* ℥ iii. *axung. anſ. & gallin. an.* ℥ i. *tereb. venet.* ℥ ii. make thereof an ointment to anoint the thighes, ſhare, privie parts and genitalls. Furthermore, it ſhall not bee unprofitable, to make a truſſe or girdle of moſt thinne and gentle dog-skinne, which being alſo anointed with the ſame unguent, may ſerve very neceſſarily for the better carrying of the infant in the wombe. Alſo bathes that are made of the decoction of mollifying herbs, are alſo very profitable to relaxe the privie parts a little before the time of the birth.

Lib. 4. de hiſt. anim. cap. 7.

The naturall & eaſie child birth

That is ſuppoſed to bee a naturall and eaſie birth, when the infant commeth forth with his head forwards, preſently following the flux of the water; and that is more difficult, when the infant commeth with his feet forwards: all the other wayes are moſt difficult. Therefore Mid-wives are to be admoniſhed that as often as they ſhall perceive the infant to be comming forth none of thoſe waies, but either with his belly or his backe forwards, as it were double, or elſe with his hands and feet together, or with his head forwards, and one of his hands ſtretched out, that they ſhould turne it, and draw it out by the feet; for the doing whereof, if they be not ſufficient, let them crave the aſſiſtance and helpe of ſome expert Chirurgian.

CHAP. XVI.

Signes of the birth at hand.

THere will bee great paine under the navell, and at the groines, and ſpreading therehence towards the *Vertebræ* of the loines, and then eſpecially when they are drawne backe from the *Os ſacrum*, the bones *Ilia* and the *Coccix* are thruſt outward, the genitalls ſwell with paine, and a certaine feaver-like ſhaking invades the body, the face waxeth red by reaſon of the endeavour of nature, armed unto the expulſion of the infant. And when theſe ſignes appeare let all things bee prepared ready to the childe-birth. Therefore firſt of all let the woman that is in travell be placed in her bed conveniently, neither with her face upwards, nor ſitting, but with her backe upwards and ſomewhat high, that ſhe may breath at more liberty, and have the more power or ſtrength to labour. Therefore ſhe ought to have her legs wide one from another, and crooked, or her heeles ſomewhat bowed up towards her buttocks, ſo that ſhe may lean on a ſtaffe that muſt be placed overthwart the bed. There are ſome that do travell in a ſtoole or chair made for the purpoſe: others ſtanding upright on their feet, and leaning on the poaſt or piller of the bed. But you muſt take diligent heed that you doe not exhort or perſwade the woman in travell to ſtrive or labour to expell the birth before the forenamed ſignes thereof doe manifeſtly ſhew that it is at hand. For by ſuch labour or pains ſhe might be wearied or ſo weakened, that when ſhee ſhould ſtrive or labour, ſhe ſhall have no power or ſtrength ſo to doe. If all theſe things doe fall out well in the childe-birth, the buſineſſe is to be committed to nature and to the Mid-wife. And the woman with child muſt onely bee admoniſhed that when ſhee feeleth very ſtrong paine, that ſhee preſently

How the woman that travelleth in childbirth muſt bee placed in her bed.

preſently therewith ſtrive with moſt ſtrong expreſſion, ſhutting her mouth and noſe if ſhee pleaſe, and at the ſame time let the mydwife with her hands force the infant from above downewards. But if the birth bee more difficult and painefull, by reaſon that the waters wherein the infant lay are flowed out long before, and the womb be dry, this ointment following is to be prepared. ℞. *butyri recentis ſine ſale in aqua artemeſiæ loti* ℥ii. *mucaginis ficuum, ſemin. lini & altheæ cum aqua ſabinæ extractæ, an.* ℥ß, *olei liliorum* ℥i. Make thereof an ointment, wherewith let the mydwife often anoynt the ſecret parts. Alſo this powder following may bee prepared. ℞. *Cinamom. cort. caſsiæ fiſtul. dictamni an.* ʒi ß *ſacch. albi ad pondus omnium*: make thereof a moſt ſubtle and fine powder. Let the woman that is in extremity by reaſon of difficult and painefull travell in child-birth, take halfe an ounce thereof at a time, with the decoction of linſeede, or in white wine, for it will cauſe more ſpeedy and eaſie deliverance of the childe.

An unction to ſupply the defect of the waters that are flowed out too long before the birth.

A powder to cauſe ſpeedy deliverance in child-birth.

Moreover, let the mydwife anoynt her hands with this ointment following as often as ſhee putteth them into the necke of the wombe, and therewith alſo anoint the parts about it. ℞. *olei ex ſeminibus lini* ℥i.ß. *olei de caſtoreo* ʒß. *galliæ moſchatæ* ʒiii. *ladani* ʒi. make thereof a liniment. Moreover, you may provoke ſneeſing, by putting a little pepper or white hellebore in powder into the noſtrils. Linſeed beaten, and given in a potion, with the water of Mugwort and Savine, is ſuppoſed to cauſe ſpeedy deliverance. Alſo the medicine following is commended for the ſame purpoſe. ℞. *corticis caſsiæ fiſtul. conquaſſatæ* ℥ii. *cicer. rub.* m. ß. *bulliant cum vino albo & aqua ſufficienti, ſub finem addendo ſabinæ,* ʒii. *in colatura pro doſi adde cinamomi* ʒß. *croci gr.* vi. make thereof a potion, which being taken, let ſneeſing bee provoked, as it is above-ſaid, and let her ſhut or cloſe her mouth and noſtrils.

Aph. 35. *&* 45. *ſect.* 5.

A potion cauſing ſpeedy deliverance.

Many times it happeneth that the infant commeth into the world out of the wombe, having his head covered or wrapped about with portion of the ſecundine or tunicle wherein it is encloſed, eſpecially when by the much, ſtrong, and happy ſtriving of the mother, he commeth forth together with the water wherein it lyeth in the wombe, and then the mydwives propheſie or foretell that the childe ſhall be happy, becauſe hee is borne as it were with a hood on his head. But I ſuppoſe that it doth betoken health of body both to the infant and alſo to his mother; for it is a token of eaſie deliverance. For when the birth is difficult and painfull, the child never bringeth that membrane out with him, but it remaineth behinde in the paſſage of the genitals or ſecret parts, becauſe they are narrow. For even ſo the Snake or Adder when ſhee would caſt her ſkinne thereby to renew her age, creepeth through ſome narrow or ſtraight paſſage. Preſently after the birth, the woman ſo delivered muſt take two or three ſpooneſuls of the oyle of ſweet almonds extracted without fire, and tempered with ſugar. Some will rather uſe the yolks of egges with ſugar, ſome the wine called Ipocras, others culliſes or gelly: but alwaies divers things are to bee uſed, according as the patient or the woman in childbed ſhall be grieved, and as the Phyſician ſhall give counſell, both to ceaſe and aſſwage the furious torments and paine of the throwes, to recover her ſtrength and nouriſh her.

What a woman in travell muſt take preſently after her deliverance.

Throwes come preſently after the birth of the child, becauſe that then the veines (nature being wholly converted to expulſion) caſt out the reliques of the menſtruall matter that hath beene ſuppreſſed for the ſpace of nine moneths, into the wombe with great violence, which becauſe they are groſſe, ſlimie and dreggiſh, cannot come forth without great paine both to the veines from whence they come, and alſo unto the wombe whereinto they goe: alſo then by the converſion of that portion thereof that remaineth into winde, and by the undiſcreete admiſſion of the aire in the time of the child-birth, the wombe and all the ſecret parts will ſwell, unleſſe it be prevented with ſome digeſting, repelling or mollifying oile, or by artificiall rowling of the parts about the belly.

The cauſe of the after-throwes.

Chap. XVII.

What is to bee done preſently after the child is borne.

Why the ſecundine or after-birth muſt bee taken away preſently after the birth of the childe.

The binding of the childs navel-ſtring after the birth.

PResently after the child is borne, the mydwife muſt draw away the ſecundine or after birth, as gently as ſhee can: but if ſhe cannot, let her put her hands into the wombe, and ſo draw it out, ſeparating it from the other parts; for otherwiſe if it ſhould continue longer, it would bee more difficult to bee gotten out, becauſe that preſently after the birth, the orifice of the wombe is drawn together and cloſed, and then all the ſecundine muſt be taken from the child. Therefore the navell ſtring muſt bee tyed with a double thread an inch from the belly. Let not the knot be too hard, leſt that part of the navell ſtring which is without the knot ſhould fall away ſooner than it ought, neither too ſlacke or looſe, leſt that an exceeding and mortall fluxe of bloud ſhould follow after it is cut off, and leſt that through it (that is to ſay, the navell ſtring) the cold aire ſhould enter into the childs body. When the knot is ſo made, the navell-ſtring muſt be cut in ſunder the breadth of two fingers beneath it with a ſharpe knife. Upon the ſection you muſt apply a double linnen cloth dipped in oyle of Roſes, or of ſweet almonds, to mitigate the paine; for ſo within a few dayes after, that which is beneath the knot will fall away, being deſtitute of life and nouriſhment, by reaſon that the veine and artery are tyed ſo cloſe, that no life nor nouriſhment can come unto it: commonly all mydwives doe let it lye unto the bare belly of the infant, whereof commeth grievous paine and griping, by reaſon of the coldneſſe thereof, which dyeth by little and little, as deſtitute of vitall heat. But it were farre better to roule it in ſoft cotton or lint, untill it be mortified, and ſo fall away.

Thoſe mydwives doe unadviſedly, who ſo ſoone as the infant is borne, doe preſently tye the navell ſtring and cut it off, not looking firſt for the voyding of the ſecundine. When all theſe things are done, the infant muſt bee wiped, cleanſed and rubbed from all filth and excrement with oyle of Roſes or Myrtles. For thereby the pores of the skinne will bee better ſhut, and the habite of the body the more ſtrengthened.

There bee ſome that waſh infants at that time in warme water and red wine, and afterwards annoynt them with the forenamed oyles. Others waſh them not with wine alone, but boyle therein red Roſes and the leaves of Myrtles, adding thereto a little ſalt; and then uſing this lotion for the ſpace of five or ſixe dayes, they not onely waſh away the filth, but alſo reſolve and digeſt, if there bee any hard or contuſed place in the infants tender body, by reaſon of the hard travell and labour in child-birth. Their toes and fingers muſt bee handled, drawne aſunder and bowed, and the joynts of the armes and legges muſt bee extended and bowed for many dayes and often; that thereby that portion of the excrementall humour that remaineth in the joynts, by motion may bee heated and reſolved. If there bee any default in the members, either in conformation, conſtruction or ſociety with thoſe that are adjoyning to them, it muſt bee corrected or amended with ſpeed. Moreover, you muſt looke whether any of the naturall paſſages bee ſtopped, or covered with a membrane, as it often happeneth. For if any ſuch cover or ſtop the orifices of the eares, noſtrils, mouth, yard or wombe, it muſt bee cut in ſunder by the Chyrurgion, and the paſſage muſt bee kept open by putting in of tents, peſſaries or doſels, leſt otherwiſe they ſhould joyne together againe after they are cut. If he have one finger more than hee ſhould naturally, if his fingers doe cleave cloſe together, like unto the feete of a Gooſe or Ducke, if the ligamentall membrane that is under the tongue bee more ſhort and ſtiffer than it ought, that the infant cannot ſucke, nor in time to come, ſpeake, by reaſon thereof; and if there be any other thing contrary to nature, it muſt bee all amended by the induſtry of ſome expert Chyrurgion.

The defaults that are cōmonly in children newly borne.

The defaults of conformation muſt be ſpeedily amended.

Many times in children newly borne, there ſticketh on the inner ſide of their mouth and on their tongue, a certain chalkie ſubſtance, both in colour & conſiſtence;

this affect proceeding from the diſtemperature of the mouth, the French-men call it the white Cancer. It will not permit the infant to ſuck, & will ſhortly breed & degenerate into ulcers that will creepe into the jawes, and even unto the throate, and unleſſe it bee cleanſed ſpeedily, will bee their death. For remedy whereof, it muſt bee cleanſed by deterſives, as with a linnen cloth bound to a little ſticke, and dipped in a medicine of an indifferent conſiſtence made with oyle of ſweete almonds, hony and ſugar. For by rubbing this gently on it, the filth may bee mollified, and ſo cleanſed or waſhed away.

Remedies for the cancer in a childs mouth.

Moreover it will bee very meete and convenient to give the infant one ſpoonefull of oyle of almonds, to make his belly looſe and ſlippery, to aſſwage the roughneſſe of the weaſon and gullet, and to diſſolve the tough phlegme, which cauſeth a cough, and ſometimes difficulty of breathing. If the eye lids cleave together, or if they bee joyned together, or agglutinated to the coats *cornea* or *adnata*; if the watery tumour called *hydrocephalos* affect the head, then muſt they bee cured by the proper remedies formerly preſcribed, againſt each diſeaſe.

Many from their birth have ſpots or markes, which the common people of France call *Signes*, that is, markes or ſignes. Some of theſe are plaine and equall with the skinne, others are raiſed up into little tumours, and like unto warts, ſome have haires upon them, many times they are ſmoothe, blacke or pale, yet for the moſt part red. When they ariſe in the face, they ſpread abroad thereon many times with great deformity. Many thinke the cauſe thereof to bee a certaine portion of the menſtruall matter cleaving to the ſides of the wombe, comming of a freſh flux, if happely the man doe yet uſe copulation with the woman, or elſe diſtilling out of the veines into the wombe, mixed and concorporated with the ſeedes at that time when they are congealed, infecting this or that part of the iſſue, being drawne out of the ſeminall body, with their owne colour. Women referre the cauſe thereof unto their longing when they are with childe; which may imprint the image of the thing they long for or deſire, in the child or iſſue that is not as yet formed (as the force or power of imagination in humane bodies is very great:) but when the child is formed, no imagination is able to leave the impreſſion of any thing in it, no more than it could cauſe hornes to grow on the head of King *Chypus* as hee ſlept preſently after hee was returned from attentively beholding Bulls fighting together. Some of thoſe ſpots bee curable, others not; as thoſe that are great, and thoſe that are on the lips, noſtrils, and eye-lids. But thoſe that are like unto warts, becauſe they are partakers of a certaine maligne quality and melancholicke matter, which may bee irritated by endeavouring to cure them, are not to bee medled with at all, for being troubled and angered, they ſoone turne into a Cancer (which they call *Noli me tangere*). Thoſe that are curable are ſmall, and in ſuch parts as they may bee dealt withall without danger. Therefore they muſt bee pierced through by the roots with a needle and a thread, and ſo being lifted up by the ends of the thread, they muſt bee cut away, and the wound that remaineth muſt be cured according to the generall method of wounds.

An old fable of King *Chypus*.

Which uncurable.

Which and how they are curable.

There are ſome that ſuppoſe the red ſpots that are raiſed up into little knobbes and bunches, may bee waſhed away and conſumed by rubbing and annoynting them often with menſtruall bloud, or the bloud of the ſecundine or after-birth. Thoſe that are hairie and ſomewhat raiſed up like unto a Want or Mouſe, muſt bee pierced through the roots in three or foure places, and ſtraightly bound, ſo that at length being deſtitute of life and nutriment, they may fall away: after they are fallen away, the ulcer that remaineth muſt bee cured as other ulcers are. If there bee any ſuperfluous fleſh remaining, it muſt bee taken away by applying *Ægyptiacum*, or the powder of mercury, and ſuch like: but if it be doubted that it commeth from the root of the tumour that may happely remaine, it muſt bee burned away by the root with oyle of vitrioll or *aqua fortis*.

There is alſo an other kinde or ſort of ſpots, of a livide or violet colour, comming eſpecially in the face about the lips, with a ſoft, ſlacke, laxe, thinne, and unpainefull tumour, and the veines as if they were varicous round about it. This kinde of tumour groweth greater when it ariſeth on children that are wayward and crying, and in men of riper yeares that are cholericke and angry, and then it will bee of a diverſe colour, like unto a lappet or flap of fleſh that hangeth over the Turkie-cocks bill. When they have done crying, or ceaſed their anger, the tumour will returne to his owne naturall colour againe. But you muſt not attempt to cure it in people that are of theſe conditions.

Chap. XVIII.

How to pull away the ſecundine or after-birth.

Why it is called the ſecundine.

I Suppoſe that they are called ſecundines, becauſe they doe grieve the woman that is with child the ſecond time, as it were a ſecond birth: for if there bee ſeverall children in the wombe at once, and of different ſexes, they then have every one their ſeverall ſecundines, which thing is very neceſſary to bee knowne by all mydwives. For they doe many times remaine behinde in the wombe when the child is borne, either by reaſon of the weakeneſſe of the woman in travell, which by contending and labouring for the birth of her childe, hath ſpent all her ſtrength: or elſe by a tumour riſing ſuddenly in the necke of the wombe, by reaſon of the long and difficult birth, and the cold aire unadviſedly permitted to ſtrike into the orifice of the wombe. For ſo the liberties of the wayes or paſſages are ſtopped and made more narrow, ſo that nothing can come forth: or elſe becauſe they are doubled and foulded in the wombe, and the waters gone out from them with the infant, ſo that they remaine as it were in a dry place: or elſe becauſe they yet ſticke in the wombe by the knots of the veines and arteries, which commonly happeneth in thoſe that are delivered before their time. For even as apples which are not ripe, cannot bee pulled from the tree but by violence; but when they are ripe, they will fall off of their owne accord: ſo the ſecundine before the naturall time of the birth can hardly bee pulled away but by violence; but at the prefixed naturall time of the birth, it may eaſily be drawne away.

The cauſes of the ſtaying of the ſecundines.

Accidents that follow the ſtaying of the ſecundines.

Many and grievous accidents follow the ſtaying of the ſecundine; as ſuffocation of the wombe, often ſwouning, by reaſon that groſſe vapours ariſe from the putrefaction unto the mydriffe, heart and braine: therefore they muſt bee pulled away with ſpeede from the wombe, gently handling the navell, if it may bee ſo poſſibly done. But if it cannot bee done ſo, the woman muſt bee placed as ſhee was wont when that the childe will not come forth naturally, but muſt bee drawne forth by art. Therefore the mydwife having her hand annoynted with oyle, muſt put it gently into the womb, and finding out the navell ſtring, muſt follow it untill it come unto the ſecundine, and if it doe as yet cleave to the wombe by the cotylidons, ſhee muſt ſhake and move it gently up and downe, that ſo when it is ſhaked and looſed, ſhee may draw it out gently; but if it ſhould bee drawne with violence, it were to be feared leſt that the wombe ſhould alſo follow: for by violent attraction ſome of the veſſels, and alſo ſome of the nervous ligaments, whereby the wombe is faſtened on each ſide, may bee rent, whereof followeth corruption of bloud ſhedde out of the veſſels, and thence commeth inflammation, an abſceſſe or a mortall gangrene. Neither is there leſſe danger of a convulſion by reaſon of the breaking of the nervous bodies, neither is there any leſſe danger of the falling downe of the wombe. If that there bee any knots or clods of bloud remaining together with the ſecundine, the mydwife muſt draw them out one by one, ſo that not any may bee left behinde.

The manner of drawing out the ſecundines that remaine after the birth.

The cauſe of the falling down of the wombe.

The accidents that come of the violent pulling of the wombe, together with the ſecundine.

Some women have voyded their ſecundine, when it could not bee drawne forth by any meanes, long after the birth of the child, by the necke of their wombe, piecemeale, rotten and corrupted, with many grievous and painefull accidents. Alſo it ſhall bee very requiſite to provoke the endeavour of the expulſive faculty by ſternutatories, aromaticke fomentations of the necke of the wombe, by mollifying injections: and contrariwiſe, by applying ſuch things to the noſtrils as yeeld a ranke ſavour or ſmell, with a potion made of mugwurt and bay berries taken in hony and wine mixed together, or with halfe a dramme of the powder of ſavine, or with the haire of a womans head, burnt and beaten to powder, and given to drink; and to conclude, with all things that provoke the tearmes or courſes.

CHAP. XIX.

What things muſt bee given to the infant by the mouth, before hee bee permitted to ſuck the Teat or Dugge.

IT will bee very profitable to rub all the inner ſide of the childes mouth and pallat gently with treacle and hony, or the oyle of ſweete almonds extracted without fire, and if you can, to cauſe it to ſwallow ſome of thoſe things: for thereby much flegmatick moyſture will bee drawne from the mouth, and alſo will bee moved or provoked to bee vomited up from the ſtomacke; for if theſe excrementall humours ſhould bee mixed with the milke that is ſucked, they would corrupt it, and then the vapours that ariſe from the corrupted milke unto the brain would inferre moſt pernicious accidents. And you may know that there are many excrementall things in the ſtomacke and guts of children by this, becauſe that ſo ſoon as they come into the world, and often before they ſuck milke or take any other thing, they voyde downewards many excrements diverſly coloured, as yellow, greene, and blacke. Therefore many, that they may ſpeedily evacuate the matter that cauſeth the fretting of the guts, doe not onely miniſter thoſe things fore-named, but alſo ſome laxative ſyrupe, as that that is made of damaske Roſes. But before the infant bee put to ſuck the mother, it is fitting to preſſe ſome milke out of her breaſt into its mouth, that ſo the fibres of the ſtomack may by little and little accuſtome themſelves to draw in the milke.

To draw fleame from the childs mouth.

Milke ſoon corrupted in a flegmatick ſtomack.

CHAP. XX.

That mothers ought to nurſe or give ſucke unto their owne children.

THat all mothers would nurſe their owne children were greatly to bee wiſhed: for the mothers milke is farre more familiar nouriſhment for the infant than that of any other nurſe: for it is nothing elſe but the ſame bloud made white in the dugges, wherewith before it was nouriſhed in the wombe. For the mother ought not to give the child ſuck for the ſpace of a few dayes after the birth, but firſt to expect the perfect expurgation and avoyding of the excrementall humours. And in the meane time let her cauſe her breaſts to bee ſucked of another, or many other children, or of ſome wholſome or ſober maide, whereby the milke may bee drawne by little and little unto her breaſts, and alſo by little and little purified.

The mothers milke is moſt familiar for the child.

For a certaine ſpace after the birth, the milke will bee troubled, and the humours of the body moved: ſo that by long ſtaying in the dugges, it will ſeeme to degenerate from its naturall goodneſſe, as the groſſeneſſe of it is ſomewhat congealed, the manifeſt heate in touching, and the yellow colour thereof teſtifieth evidently. Therefore it is neceſſary that others ſhould come in place thereof when it is ſucked out, wherewith the infant may be nouriſhed. But if the mother or the nurſe chance to take any diſeaſe, as a Feaver, Scouring, or any ſuch like, let her give the child to another, to give it ſucke, leſt that the child chance to take the nurſes diſeaſes. And moreover, mothers ought to nurſe their owne children, becauſe for the moſt part they are farre more vigilant and carefull in bringing up and attending their children, than hired and mercenary nurſes, which doe not ſo much regard the infant,

The diſeaſe of the nurſe is participated unto the child.

Gel.lib.12. ca.1.

as the gaine they ſhall have by the keeping of it, for the moſt part. Thoſe that doe not nurſe their owne children, cannot rightly bee termed mothers: for they doe not abſolutely performe the duty of a mother unto their childe, as *Marcus Aurelius* the Roman Emperour was wont to ſay. For this is a certaine unnaturall, imperfect and halfe kinde of a mothers duty, to beare a childe, and preſently to abandon or put it away as if it were forſaken: to nouriſh and feede a thing in their wombe (which they neither know nor ſee) with their owne bloud, and then not to nouriſh it when they ſee it in the world alive, a creature or reaſonable ſoule, now requiring the help and ſuſtentation of the mother.

Chap. XXI.

Of the choice of Nurſes.

The beſt age of a nurſe.

MAny husbands take ſuch pitty on their tender wives, that they provide nurſes for their children, that unto the paines that they have ſuſtained in bearing them, they may not alſo adde the trouble of nurſing them: wherefore ſuch a nurſe muſt bee choſen which hath had two or three children. For the dugges which have beene already ſucked and accuſtomed to bee filled, have the veines and arteries more large and capable to receive the more milke. In the choyce of a nurſe there are ten things to bee conſidered very diligently: as, her age, the habit of her body, her behaviour, the condition of her milke, the forme, not onely of her dugges or breaſts, but alſo of her teats or nipples, the time from her child-birth, the ſexe of her laſt infant or childe, that ſhee bee not with childe, that ſhee bee ſound and in perfect health. As concerning her age, ſhee ought not to bee under twenty five yeares, nor above thirty five: the time that is betweene is the time of ſtrength, more temperate, and more wholeſome and healthy, and leſſe abounding with excrementall humours. And becauſe her body doth not then grow or encreaſe, ſhee muſt of neceſſity have the more abundance of bloud. After thirty five yeares in many the menſtruall fluxes do ceaſe, and therefore it is to bee ſuppoſed that they have the leſſe nutriment for children.

The beſt habit of body in a nurſe.

Lib. de inf. nutr.

The nurſe muſt alſo be of a good habit, or ſquare or wel ſet body, her breaſt broad, her colour lively, not fat, nor leane, but well made, her fleſh not ſoft and tender, but thick, and hard or ſtrong, whereby ſhe may be the more able to endure watching & taking of pains about the child; ſhe muſt not have a red or freckled face, but browne or ſomewhat ſhadowed or mixed with redneſſe: for truly ſuch women are more hot than thoſe that are red in the face, by reaſon whereof they muſt needs concoct and turne their meate the better into bloud. For according to the judgement of *Sextus Cheronenſis*, as blackiſh or browne ground is more fertill than the white; even ſo a browne woman hath more ſtore of milke. You muſt looke well on her head, leſt ſhee ſhould have the ſcurfe or running ſores; ſee that her teeth bee not foule or rotten, nor her breath ſtinking, nor no ulcer nor ſore about her body, and that ſhe be not borne of gouty or leprous Parents.

Of what behaviour the nurſe muſt bee.

Shee ought to bee quicke and diligent in keeping the childe neate and cleane, chaſte, ſober, merry, alwaies laughing and ſmiling on her infant, often ſinging unto it, and ſpeaking diſtinctly and plainely, for ſhee is the onely miſtriſſe to teach the childe to ſpeake. Let her bee well mannered, becauſe the manners of the nurſe are participated unto the infant together with the milke. For the welpes of dogges, if they doe ſucke Wolves or Lioneſſes, will become more fierce and cruell than otherwiſe they would. Contrariwiſe, the Lions whelps will leave their ſavageneſſe and fierceneſſe, if that they bee brought up and nouriſhed with the milke of any Bitch, or other tame beaſt. If a Goat give a Lambe ſucke, the ſame Lambes wooll will be more hard than others: contrariwiſe, if a Sheep give a Kyd ſuck, the ſame Kyds haire will be more ſoft than another Kyds haire. She ought to be ſober, and the rather for this cauſe, becauſe many nurſes being overloaden with wine & banqueting, often ſet their children unto their breaſts to ſuck, and then fall aſleep, and ſo ſuddenly ſtrangle or choak them.

Shee

Why the nurſe muſt abſtaine from copulation.

Shee muſt abſtaine from copulation : for copulation troubleth and moveth the humours and the bloud, and therefore the milke it ſelfe ; and it diminiſheth the quantity of milke, becauſe it provoketh the menſtruall fluxe, and cauſeth the milke to have a certain ſtrong and virous quality, ſuch as we may perceive to breathe from them that are incenſed with the fervent luſt and deſire of venery. And moreover, becauſe that thereby they may happen to bee with childe, whereof enſueth diſcommodity both to her owne childe that is within her body, and alſo to the nurſe child: to the nurſe childe, becauſe that the milke that it ſucketh will be worſe and more depraved than otherwiſe it would bee, by reaſon that the more laudable bloud after the conception remaineth about the wombe , for the nutriment and increaſing of the infant in the wombe ; and the more impure bloud goeth into the dugges, which breedeth impure or uncleane milke: but to the conceived childe, becauſe it will cauſe it to have ſcarcity of foode ; for, ſo much as the ſucking childe ſucketh, ſo much the child conceived in the wombe, wanteth.

What dugs a nurſe ought to have.

Alſo ſhee ought to have a broad breaſt, and her dugges indifferently bigge, not ſlacke or hanging , but of a middle conſiſtence, betweene ſoft and hard ; for ſuch dugges will concoct the bloud into milke the better, becauſe that in firme fleſh the heate is more ſtrong and compact. You may by touching try whether the fleſh bee ſolid and firme, as alſo by the diſperſing of the veines, eaſily to bee ſeene by reaſon of their ſwelling and blewneſſe, through the dugges, as it were into many ſtreams or little rivelets ; for in fleſh that is looſe and ſlacke, they lie hidden. Thoſe dugges that are of a competent bigneſſe, receive or containe no more milke than is ſufficient to nouriſh the infant. In thoſe dugges that are great and hard, the milke is as it were ſuffocated, ſtopped or bound in, ſo that the childe in ſucking can ſcarce draw it out : and moreover, if the dugges bee hard, the childe putting his mouth to the breaſt, may ſtrike his noſe againſt it, and ſo hurt it, whereby hee may either refuſe to ſucke, or if hee doth proceede to ſucke, by continuall ſucking, and placing of his noſe on the hard breaſt, it may become flat, and the noſtrils turned upwards, to his great deformity, when hee ſhall come to age. If the teates or nipples of the dugges doe ſtand ſomewhat low or depreſſed inwards on the toppes of the dugges, the childe can hardly take them betweene its lippes, therefore his ſucking will bee very laborious. If the nipples or teats bee very bigge, they will ſo fill all his mouth, that he cannot well uſe his tongue in ſucking or in ſwallowing the milke.

What is to bee obſerved in the milke.

Wee may judge of or know the nature and condition of the milke, by the quantity, quality, colour, ſavour and taſte : when the quantity of the milke is ſo little, that it will not ſuffice to nouriſh the infant, it cannot bee good and laudable ; for it argueth ſome diſtemperature either of the whole body, or at leaſt of the dugges , eſpecially a hot and dry diſtemperature. But when it ſuper-aboundeth, and is more than the infant can ſpend, it exhauſteth the juice of the nurſes body ; and when it cannot all bee drawne out by the infant, it cluttereth, and congealeth or corrupteth in the dugges. Yet I would rather wiſh it to abound, than to bee defective, for the ſuper-abounding quantity may bee preſſed out before the child be ſet to the breaſt.

The laudable conſiſtence of milke.

That milke that is of a meane conſiſtence betweene thicke and thinne, is eſteemed to bee the beſt. For it betokeneth the ſtrength and vigour of the faculty that ingendereth it in the breaſts. Therefore if one droppe of the milke bee layd on the naile of ones thumbe, being firſt made very cleane and faire, if the thumbe bee not moved, and it runne off the naile, it ſignifieth that it is watery milke : but if it ſticke to the naile, although the end of the thumbe bee bowed downewards, it ſheweth that it is too groſſe and thicke : but if it remaine on the naile ſo long as you hold it upright, and fall from it when you hold it a little aſide or downewards by little and little, it ſheweth it is very good milke. And that which is exquiſitely white, is beſt of all. For the milke is no other thing than bloud made white.

Why the milke ought to be very white.

Therefore, if it bee of any other colour, it argueth a default in the bloud : ſo that if it bee browne, it betokeneth melancholy bloud ; if it be yellow, it ſignifieth cholericke bloud ; if it bee wanne and pale, it betokeneth phlegmaticke bloud ; if it bee ſomewhat red, it argueth the weakeneſſe of the faculty that engendreth the milke.

It

Why a woman that hath red hair, or freckles on her face cannot be a good nurſe.

It ought to be ſweet, fragrant, and pleaſant in ſmell; for if it ſtrike into the noſtrills with a certaine ſharpeneſſe, as for the moſt part the milke of women that have red haire and little freckles on their faces doth, it prognoſticates a hot and cholerick nature: if with a certaine ſowerneſſe, it portendeth a cold and melancholy nature. In taſte it ought to be ſweet, and as it were ſugred, for the bitter, ſaltiſh, ſharp, and ſtipticke, is naught. And here I cannot but admire the providence of nature, which hath cauſed the blood wherewith the childe ſhould be nouriſhed to be turned into milke: which unleſſe it were ſo, who is he that would not turne his face from, and abhorre ſo grievous and terrible a ſpectacle of the childes mouth ſo imbrued and beſmeared with blood? What mother or nurſe would not be aſtoniſhed or amazed at every moment with the feare of the blood ſo often ſhedde out, or ſucked by the infant for his nouriſhment? Moreover, we ſhould want two helps of ſuſtentation, that is to ſay, butter and cheeſe.

Neither ought the childe to bee permitted to ſucke within five or ſixe dayes after it is borne, both for the reaſon before alledged, and alſo becauſe he hath need of ſo much time to reſt quiet, and eaſe himſelfe after the paines hee hath ſuſtained in his birth: in the meane ſeaſon the mother muſt have her breaſts drawne by ſome maide that drinketh no wine, or elſe ſhe may ſucke or draw them her ſelfe with an artificiall inſtrument which I will deſcribe hereafter.

Why that nurſe that hath borne a man childe is to be preferred before another.

That nurſe that hath borne a man childe is to be preferred before another, becauſe her milke is the better concocted, the heate of the male childe doubling the mothers heate. And moreover, the women that are great with childe of a male childe, are better coloured, and in better ſtrength, and better able to doe any thing all the time of their greatneſſe, which proveth the ſame: and moreover the blood is more laudable, and the milke better. Furthermore, it behoveth the Nurſe to bee brought on bed, or to travell at her juſt and prefixed or naturall time: for when the childe is born before his time of ſome inward cauſe, it argueth that there is ſome default lurking and hidden in the body and humours thereof.

Why ſhe cannot be a good nurſe whoſe childe was born before the time.

Chap. XXII.

What diet the Nurſe ought to uſe, and in what ſituation ſhee ought to place the infant in the cradle.

Both in eating, drinking, ſleeping, watching, exerciſing and reſting, the nurſes diet muſt be divers, according as the nature of the childe both in habit and temperature ſhall be: as for example, if the childe bee altogether of a more hot blood, the nurſe both in feeding and ordering her ſelfe ought to follow a cooling diet. In generall, let her eat meates of good juice, moderate in quantity and quality, let her live in a pure and cleere aire, let her abſtaine from all ſpices, and all ſalted and ſpiced meats, and all ſharpe things, wine, eſpecially that which is not allayed or mixed with water, and carnall copulation with a man, let her avoyd all perturbations of the minde, but anger eſpecially, let her uſe moderate exerciſe, unleſſe it be the exerciſe of her armes and upper parts, rather than the legges and lower parts, whereby the greater attraction of the blood, that muſt be turned into milke, may bee made towards the dugges. Let her place her childe ſo in the cradle that his head may be higher than all the body, that ſo the excrementall humours may bee the better ſent from the braine unto the paſſages that are beneath it. Let her ſwathe it ſo as the neck and all the back-bone may be ſtraight and equall. As long as the childe ſucketh, and is not fed with ſtronger meat, it is better to lay him alway on his backe, than any other way, for the backe is, as it were the Keele in a ſhip, the ground-worke and foundation of all the whole body, whereon the infant may ſafely and eaſily reſt. But if hee lye on the ſide, it were danger leſt that the bones of the ribs being ſoft and tender, not ſtrong enough, and united with ſlacke bands, ſhould bow under the waight of the reſt, and ſo waxe crooked, whereby the infant might become crooke-backed. But when he beginneth to breed teeth

Anger greatly hurteth the nurſe.

The exerciſe of the arms is beſt for the nurſe.

How the child ſhould be placed in the cradle.

eeth, and to bee fed with more ſtrong meat, and alſo the bones and connexions of them begin to waxe more firme and hard, hee muſt bee layed one while on this ſide, another while on that, and now and then alſo on his backe. And the more hee groweth, the more let him be accuſtomed to lye on his ſides; and as hee lieth in the cradle, let him bee turned unto that place whereat the light commeth in, leſt that otherwiſe he might become poore-blind, for the eye of its owne nature is bright and light-ſome, and therefore alwaies deſireth the light, and abhorreth darkeneſſe, for all things are moſt delighted with their like, and ſhunne their contraries. Therefore unleſſe the light come directly into the childes face, he turneth himſelfe every way being very ſorrowfull, and ſtriveth to turne his head and eyes that hee may have the light; and that often turning and rowling of his eyes at length groweth into a cuſtome that cannot bee left: and ſo it commeth to paſſe that the infant doth either become poore-blind, if hee ſet his eyes ſtedfaſtly on one thing, or elſe his eyes doe become trembling, alwaies turning and unſtable, if hee caſt his eyes on many things that are round about him: which is the reaſon that nurſes, being taught by experience, cauſe over the head of the childe lying in the cradle, an arch or vault of wickers covered with cloath to be made, thereby to reſtraine, direct, and eſtabliſh the uncertaine and wandering motions of the childes eyes.

Why an arch of wickers muſt be made over the childes head lying in the cradle.

If the nurſe be ſquint-eyed, ſhe cannot look upon the childe but ſide-waies, whereof it commeth to paſſe that the childe being moiſt, tender, flexible and prone to any thing with his body, and ſo likewiſe with his eye, by a long and daily cuſtome unto his nurſes ſight, doth ſoone take the like cuſtome to looke after that ſort alſo, which afterwards he cannot leave or alter. For thoſe evill things that we learn in our youth, do ſtick firmly by us, but the good qualities are eaſily changed into worſe. In the eies of thoſe that are ſquint-eyed, thoſe two muſcles which do draw the eyes to the greater or leſſer corner, are chiefly or more frequently moved. Therefore either of theſe being confirmed in their turning aſide by long uſe, as the exerciſe of their proper office encreaſeth the ſtrength, ſoone overcomes the contrary or withſtanding muſcles, called the Antagoniſts, and brings them into their ſubjection, ſo that will they nill they, they bring the eye unto this or that corner as they liſt. So children become left-handed, when they permit their right hand to languiſh with idleneſſe and ſluggiſhneſſe, and ſtrengthen their left hand with continuall uſe and motion to do every action therewithall, and ſo bring by the exerciſe thereof, more nutriment unto that part. But if men (as ſome affirme) being of ripe yeers and in their full growth, by daily ſociety and company of thoſe that are lame and halt doe alſo halt, not minding ſo to doe, but it commeth againſt their wills, and when they thinke nothing thereof, why ſhould not the like happen in children, whoſe ſoft and tender ſubſtance is as flexible and pliant as waxe unto every impreſſion? Moreover, children, as they become lame and crook-backt, ſo doe they alſo become ſquint-eyed by the hereditary default of their parents.

Why a ſquint-eyed nurſe cauſeth the childe to be ſquint-eyed.

How children become left-handed.

CHAP. XXIII.

How to make pappe for children.

PAppe is a moſt meet foode or meat for children, becauſe they require moiſt nouriſhment, and it muſt bee anſwerable in thickeneſſe to the milke, that ſo it may not be difficult to be concocted or digeſted. For pap hath theſe three conditions, ſo that it be made with wheaten flower, and that not crude but boiled: let it be put into a new earthen pot or pipkin, and ſo ſet into an oven at the time when bread is ſet thereinto to bee baked, and let it remaine there untill the bread bee baked and drawne out; for when it is ſo baked it is leſſe clammy and crude. Thoſe that mixe the meale crude with the milke, are conſtrained to abide one of theſe diſcommodities or other, either to give the meale groſſe & clammy unto the child, if that the pap be onely firſt boiled over the fire in a pipkin or skillet ſo long as ſhall bee neceſſary

Three laudable conditions of pappe.

How the meale muſt be prepared to make the pap withall.

Why the meale wherewith the pap muſt be made, muſt firſt be boiled or baked.

for the milke; hence come obſtructions in the meſaraike veines, and in the ſmall veines of the liver, fretting and wormes in the guts, and the ſtone in the reines. Or elſe they give the child the milk, deſpoiled of its butteriſh and whayiſh portion, and the terreſtriall and cheeſelike or curdlike remaining, if the pap be boiled ſo long as is neceſſary for the meale: for the milke requireth not ſo great, neither can it ſuffer ſo long boyling as the meale. Thoſe that doe uſe crude meale, and have no hurt by it, are greatly bound to nature for ſo great a benefit. But *Galen* willeth children to bee nouriſhed onely with the nurſes milke, ſo long as the nurſe hath enough to nouriſh and feed it. And truely there are many children that are contented with milke only, and will receive no pappe untill they are three moneths old. If the child at any time bee coſtive, and cannot voide the excrements, let him have a cataplaſme made with one dramme of Aloes, of white and blacke Hellebore, of each fifteene graines, being all incorporated in as much of an oxe gall as is ſufficient, and extended or ſpread on cotton like unto a pultis, as broad as the palme of ones hand, and ſo apply it upon the navell warme: moreover, this cataplaſme hath alſo vertue to kill the wormes in the belly. Many times children have fretting of the guts, that maketh them to cry, which commeth of crudity. This muſt bee cured by applying unto the belly ſweaty or moiſt woole, macerated in oile of chamomile.

1. *de ſanit. tuend.*

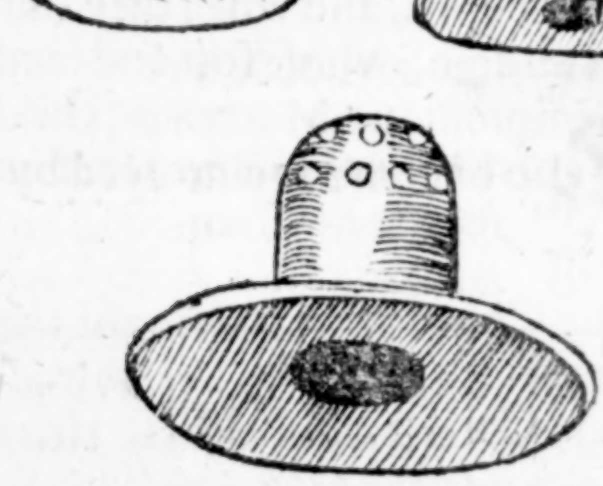
A cataplaſme to relaxe the childs belly.

For the fretting of the guts in children.

If when the childes teeth begin to grow, he chance to bite the nipple of the nurſes breaſt, there will bee an ulcer very contumacious and hard to be cured, becauſe that the ſucking of the childe, and the rubbing of the cloaths doe keep it alwaies raw; it muſt be cured with fomenting it with allome water, and then preſently after the fomentation putting thereupon a cover of leade, made like unto a hat, as they are here deſcribed, with many holes in the toppe, whereat both the milke, and alſo the ſanious matter that commeth from the ulcers may goe out, for lead it ſelfe will cure ulcers.

For the ulcers of the nipples or teats.

The figure of leaden Nipples to be put upon the Nipple or Teat of the Nurſe when it is ulcerated.



Children may be cauſed to ceaſe their crying foure manner of waies, that is to ſay, by giving them the teat, by rocking them in a cradle, by ſinging unto them, and by changing the cloaths and ſwathes wherein they are wrapped. They muſt not bee rocked too violently in the cradle, leſt that the milke that is ſucked ſhould be corrupted by the too violent motion, by reaſon whereof they muſt not be handled violently any other way, and not altogether prohibited or not ſuffered to cry. For by crying the breaſt and lungs are dilated and made bigger and wider, the naturall parts the ſtronger, and the braine, noſtrills, the eyes and mouth are purged, by the teares and filth that come from the eyes and noſtrills. But they muſt not bee permitted to cry long or fiercely, for feare of breaking the production of the *Peritonæum*, and thereby cauſing the falling downe of the guts into the cod, which rupture is called of the Greekes *Enterocele*, or of the caule, which the Greekes call *Epiplocele*.

What moderate crying worketh in the infant.

What immoderate crying cauſeth.

Chap. XXIIII.

Of the weaning of children.

Many are weaned in the eighteenth moneth, ſome in the twentieth, but all, or the moſt part, in the ſecond yeare, for then their teeth appeare, by whoſe preſence nature ſeemeth to require ſome harder meat than milke or pappe, wherewith children are delighted, and will feed more earneſtly thereon. But there is no certaine time of weaning of children. For the teeth of ſome will appeare ſooner, and ſome later; for they are prepared of nature for no other purpoſe than to chaw the meat. If children bee weaned before their teeth appeare, and bee fed with meat that is ſomewhat hard and ſolid, according to the judgement of *Avicen*, they are incident to many diſeaſes comming through crudity, becauſe the ſtomacke is yet but weake, and wanteth that preparation of the meates which is made in the mouth by chawing; which men of ripe yeers cannot want without offence: when the childe is two yeeres old, and the teeth appeare, if the childe more vehemently deſire harder meates, and doth feed on them with pleaſure & good ſucceſſe, he may be ſafely weaned; for it cannot be ſuppoſed that he hath this appetite of hard meats in vain, by the inſtinct of nature. Yet he may not be weaned without ſuch an appetite, if all other things be correſpondent, that is to ſay, his teeth and age, for thoſe things that are eaten without an appetite, cannot profit. But if the childe be weake, ſickly, or feeble, he ought not to be weaned. And when the meet time of weaning commeth, the nurſe muſt now and then uſe him to the teat, whereby he may leave it by little and little, and then let the teate be anointed or rubbed with bitter things, as with Aloes, water of the infuſion of *Colocynthus*, or worme-wood, or with muſtard, or ſoote ſteeped in water, or ſuch like. Children that are ſcabby in their heads, and over all their bodies, and which void much flegme at their mouth and noſtrills, and many excrements downwards, are like to be ſtrong and ſound of body; for ſo they are purged of excrementall humours: contrariwiſe, thoſe that are cleane and faire of body, gather the matter of many diſeaſes in their bodies, which in proceſſe of time will breake forth and appeare. Certainely by the ſodaine falling of ſuch matters into the backe-bone, many become crookebackt.

When children muſt be weaned

Why children muſt not be weaned before their teeth appeare.

How children muſt be weaned.

What children are ſtrong and ſound of body.

An often cauſe of ſudden crookedneſſe.

Chap. XXV.

By what ſignes it may bee knowne whether the childe in the wombe bee dead or alive.

If neither the Chirurgians hand, nor the mother can perceive the infant to move, if the waters bee flowed out, and ſecundine come forth, you may certainely affirme that the infant is dead in the wombe, for this is the moſt infallible ſigne of all others: for becauſe the child in the wombe doth breathe but by the artery of the navell, and the breath is received by the *Cotyledon* of the arteries of the wombe, it muſt of neceſſity come to paſſe that when the ſecundine is ſeparated from the infant, no aire or breath can come unto it. Wherefore ſo often as the ſecundine is excluded before the childe, you may take it for a certaine token of the death thereof: when the childe is dead, it will be more heavie to the mother than it was before when it was alive, becauſe it is now no more ſuſtained by the ſpirits and faculties wherewith before it was governed and ruled, for ſo we ſee dead men to be heavier than thoſe that are alive, & men that are weak through hunger and famine to be heavier than when they are well refreſhed, and alſo when the mother enclines her body any way, the infant falleth that way alſo even as it were a ſtone. The mother is alſo vexed with ſharpe paine from the privities even to the navell, with a perpetuall deſire of making water, and going to ſtoole, becauſe that nature is wholly buſied in

A moſt certaine ſign of the child dead in the wombe.

When the child is dead in the wombe hee is more heavie than he was before being alive.

That which is alive will not ſuffer that which is dead.

the expulſion or avoidance of that which is dead: for that which is alive will expell the dead ſo farre as it can from it ſelfe, becauſe the one is altogether different from the other; but likeneſſe, if any thing, conjoynes and unites things together: the genitalls are cold in touching, and the mother complaineth that ſhe feeleth a coldneſſe in her womb, by reaſon that the heat of the infant is extinguiſhed, wherewith before her heate was doubled: many filthy excrements come from her, and alſo the mothers breath ſtinketh, ſhe ſwouneth often, all which for the moſt part happen within three daies after the death of the childe: for the infants body will ſooner corrupt in the mothers wombe than it would in the open aire, becauſe that, according to the judgement of *Galen*, all hot and moiſt things, being in like manner encloſed in a hot and moiſt place, eſpecially if by reaſon of the thickeneſſe or ſtraiteneſſe of the place they cannot receive the aire, will ſpeedily corrupt. Now by the riſing up of ſuch vapours from the dead unto the braine and heart, ſuch accidents may ſoone follow, her face will be clean altered, ſeeming livid and ghaſtly, her dugs fall and hang looſe and lanke, and her belly will be more hard and ſwollen than it was before. In all bodies ſo putrefying, the naturall heat vaniſheth away, and in place thereof ſucceedeth a preternaturall, by the working whereof the putrefyed and diſſolved humours are ſtirred up into vapours, and converted into winde, and thoſe vapours, becauſe they poſſeſſe and fill more ſpace and roome (for naturaliſts ſay that of one part of water ten parts of aire are made) doe ſo puffe up the putrefyed body into a greater bigneſſe. You may note the ſame thing in bodies that are gangrenate, for they caſt forth many ſharpe vapours, yet neverthéleſſe they are ſwollen and puffed up.

Lib. de tumorib.

Why the belly of a woman will be more bigge when the child is dead within her, than it was before, when it was alive.

Now ſo ſoone as the Chirurgian ſhall know that the childe is dead by all theſe forenamed ſignes, he ſhall with all diligence endeavour to ſave the mother ſo ſpeedily as hee can, and if the Phyſitians cannot prevaile with potions, bathes, fumigations, ſternutatories, vomits, and liniments appointed to expell the infant, let him prepare himſelfe to the worke following; but firſt let him conſider the ſtrength of the woman, for if he perceive that ſhee bee weake and feeble by the ſmalneſſe of her pulſe, by her ſmall, ſeldome and cold breathing, and by the altered and death-like colour in her face, by her cold ſweats, and by the coldneſſe of the extreme parts, let him abſtaine from the worke, and onely affirme that ſhee will dye ſhortly; contrariwiſe, if her ſtrength be yet good, let him with all confidence and induſtry deliver her on this wiſe from the danger of death.

The ſignes of a woman that is weake.

Chap. XXVI.

Of the Chyrurgicall extraction of the childe from the wombe either dead or alive.

After what ſort the woman in travell muſt be placed when the child, being dead in her wombe, muſt be drawne out.

THerefore firſt of all the aire of the chamber muſt bee made temperate, and reduced unto a certaine mediocrity, ſo that it may neither be too hot nor too cold. Then ſhe muſt be aptly placed, that is to ſay, overthwart the bed ſide, with her buttockes ſomewhat high, having a hard ſtuffed pillow or boulſter under them, ſo that ſhe may be in a meane figure of ſituation, neither ſitting altogether upright, nor altogether lying along on her backe; for ſo ſhee may reſt quietly, and draw her breath with eaſe, neither ſhall the ligaments of the womb bee extended ſo as they would if ſhee lay upright on her backe, her heeles muſt bee drawn up cloſe to her buttocks, and there bound with broad and ſoft linnen rowlers. The rowler muſt firſt come about her neck, and then croſſe-wiſe over her ſhoulders, and ſo to the feet, and there it muſt croſſe again, and ſo be rowled about the legs and thighes, and then it muſt be brought up to the necke againe, and there made faſt, ſo that ſhe may not be able to move her ſelfe, even as one ſhould be tyed when he is to be cut of the ſtone. But that ſhee may not bee wearied, or leſt that her body ſhould yeeld or ſinke downe as the Chirurgian draweth the body of the infant from her, and ſo hinder the worke, let him cauſe her feet to bee ſet againſt the ſide of the bed,

How ſhe muſt be bound.

and then let ſome of the ſtrong ſtanders by hold her faſt by the legs and ſhoulders. Then that the aire may not enter into the wombe, and that the worke may bee done with the more decency, her privie parts & thighs muſt be covered with a warm double linnen cloath. Then muſt the Chirurgion, having his nailes cloſely pared, and his rings (if hee weare any) drawne off his fingers, and his armes naked, bare, and well anointed with oyle, gently draw the flappes of the necke of the wombe aſunder, and then let him put his hand gently into the mouth of the wombe, having firſt made it gentle and ſlippery with much oile; and when his hand is in, let him finde out the forme and ſituation of the childe, whether it be one or two, or whether it be a Mole or not. And when he findeth that he commeth naturally, with his head toward the mouth or orifice of the wombe, he muſt lift him up gently, and ſo turne him that his feet may come forwards, and when he hath brought his feet forwards, he muſt draw one of them gently out at the necke of the wombe, and then hee muſt binde it with ſome broad and ſoft or ſilken band a little above the heele with an indifferent ſlack knot, and when he hath ſo bound it, he muſt put it up againe into the wombe, then he muſt put his hand in againe, and finde out the other foote, and draw it alſo out of the wombe, and when it is out of the wombe, let him draw out the other againe whereunto he had before tyed the one end of the band, and when hee hath them both out, let him join them both cloſe together, & ſo by them by little & little let him draw all the whole body from the wombe. Alſo other women or Midwives may help the endeavour of the Chirurgion, by preſſing the patients belly with their hands downewards as the infant goeth out: and the woman her ſelfe by holding her breath, and cloſing her mouth and noſtrills, and by driving her breath downewards with great violence, may very much helpe the expulſion. I wiſh him to put backe the foot into the wombe againe after he hath tyed it, becauſe if that he ſhould permit it to remain in the necke of the womb, it would hinder the entrance of his hand when he putteth it in to draw out the other. But if there bee two children in the wombe at once, let the Chirurgian take heed leſt that he take not of either of them a legge, for by drawing them ſo, hee ſhall profit nothing at all, and yet exceedingly hurt the woman. Therefore that he may not bee ſo deceived, when hee hath drawne out one foot and tyed it, and put it up again, let him with his hand follow the band wherewithall the foot is tyed, and ſo goe unto the foot, and then to the groine of the childe, and then from thence he may ſoone finde out the other foot of the ſame child: for if it ſhould happen otherwiſe, he might draw the legges and the thighes out, but it would come no further, neither is it meet that hee ſhould come out with his armes along by his ſides, or bee drawne out on that ſort, but one of his armes muſt bee ſtretched out above his head, and the other down by his ſide, for otherwiſe the orifice of the womb when it were delivered of ſuch a groſſe trunke, as it would be when his body ſhould be drawne out with his armes along by his ſides, would ſo ſhrinke and draw it ſelfe when the body ſhould come unto the necke, onely by the accord of nature requiting union, that it would ſtrangle and kill the infant, ſo that hee cannot be drawne there-hence unleſſe it bee with a hooke put under, or faſtened under his chinne, in his mouth, or in the hollowneſſe of his eye. But if the infant lyeth as if hee would come with his hands forwards, or if his hands bee forth already, ſo that it may ſeeme hee may bee drawne forth eaſily that way, yet it muſt not be ſo done; for ſo his head would double backwards over his ſhoulders, to the great danger of his mother. Once I was called unto the birth of an infant, whom the midwives had aſſayed to draw out by the arme, ſo that the arme had been ſo long forth that it was gangrenate, whereby the childe dyed; I told them preſently that his arme muſt bee put in againe, and hee muſt bee turned otherwiſe. But when it could not bee put backe by reaſon of the great ſwelling thereof, and alſo of the mothers genitals, I determined to cut it off with an inciſion knife, cutting the muſcles as neare as I could to the ſhoulder, yet drawing the fleſh upwards, that when I had taken off the bone with a paire of cutting pincers, it might come downe againe to cover the ſhivered end of the bone, leſt otherwiſe when it were thruſt in againe into the wombe, it might hurt the mother. Which being done, I turned him with his feete forwards, and drew him out as is before ſayd. But if the tumour either naturally or by ſome

How the Chirurgion ought to prepare himſelfe and his patient to the drawing out of the child from the wombe.

How the infant that is dead in the womb muſt be turned, bound and drawne out.

A caution to avoid ſtrangling of the infant in drawing out the body.

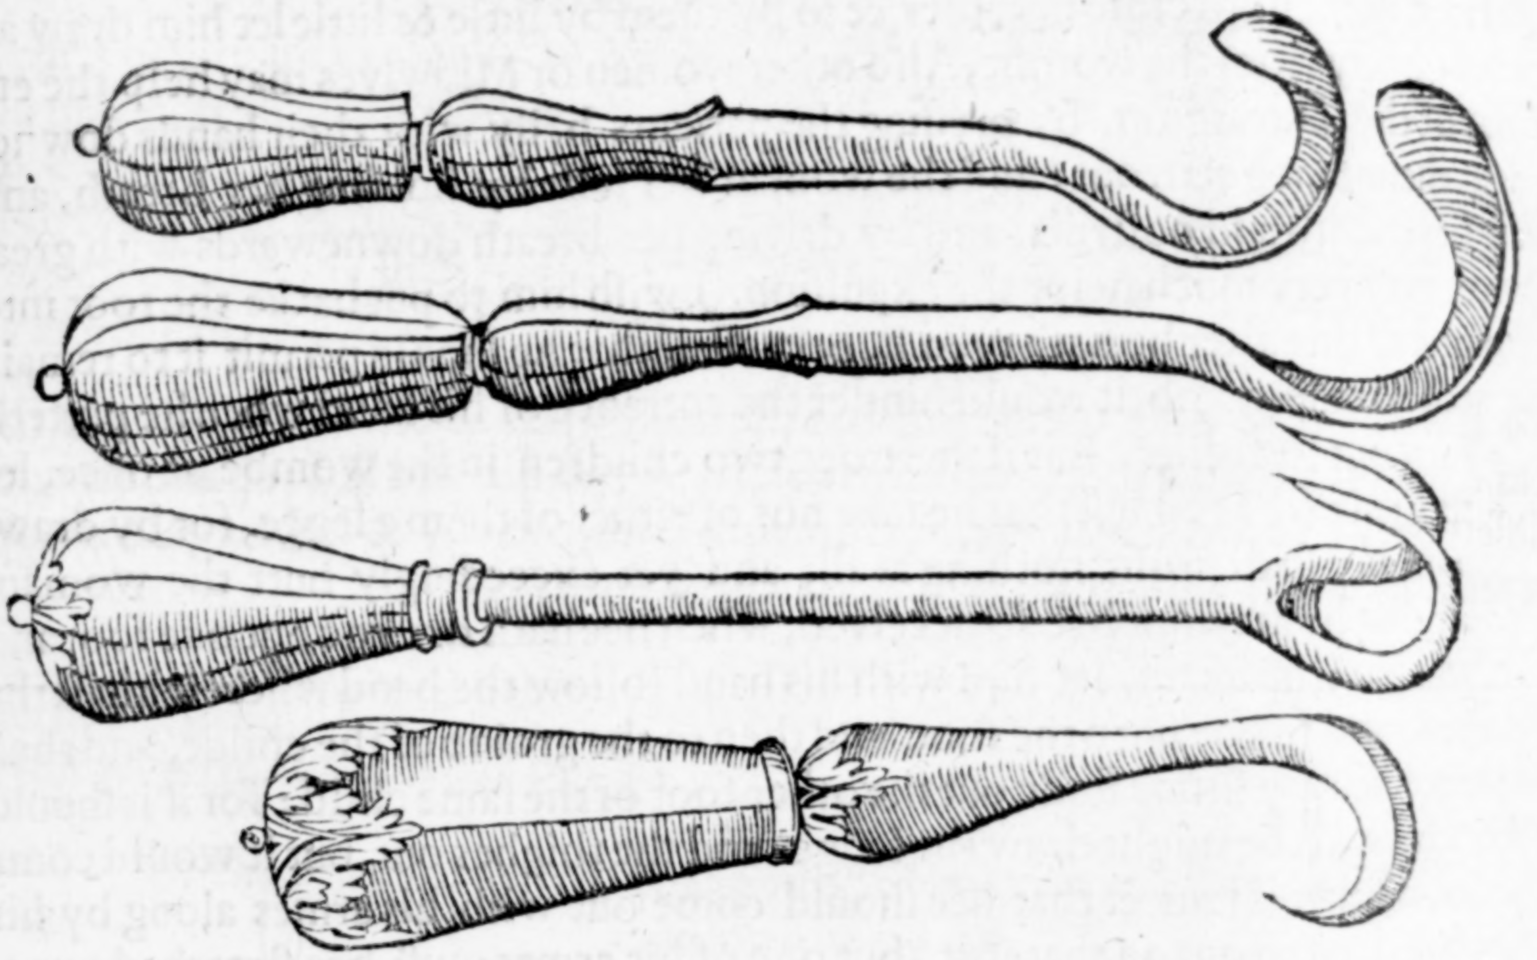
Why the child muſt not bee drawn out with his hands forwards.

A hiſtory.

To diminiſh the wind wherewith the infant being dead in the wombe, ſwelleth & is puffed up that he cannot be gotten out of the wombe.

accident, that is to ſay, by putrefaction, which may perchance come, bee ſo great that hee cannot bee turned according to the Chirurgions intention, nor be drawne out according as hee lyeth, the tumour muſt bee diminiſhed, and then hee muſt bee drawne out as is aforeſaid, and that muſt bee done at once. As for example, if the dead infant appeare at the orifice of the wombe, which our mydwives call the Garland, when it gapeth, is open and dilated, but yet his head being more great and puffed up with winde ſo that it cannot come forth, as cauſed to bee ſo through that diſeaſe which the Greeks call *Mucrophiſocephalos*, the Chirurgion muſt faſten a hooke under his chinne, or in his mouth, or elſe in the hole of his eye, or elſe, which is better and more expedient, in the hinder part of his head. For when the ſcull is ſo opened, there will bee a paſſage whereat the winde may paſſe out, and ſo when the tumour falleth and decreaſeth, let him draw the infant out by little and little, but not raſhly, leſt he ſhould break that whereon he hath taken hold: the figure of thoſe hookes is thus.

The forme of hookes for drawing out the infant that is dead in the wombe.

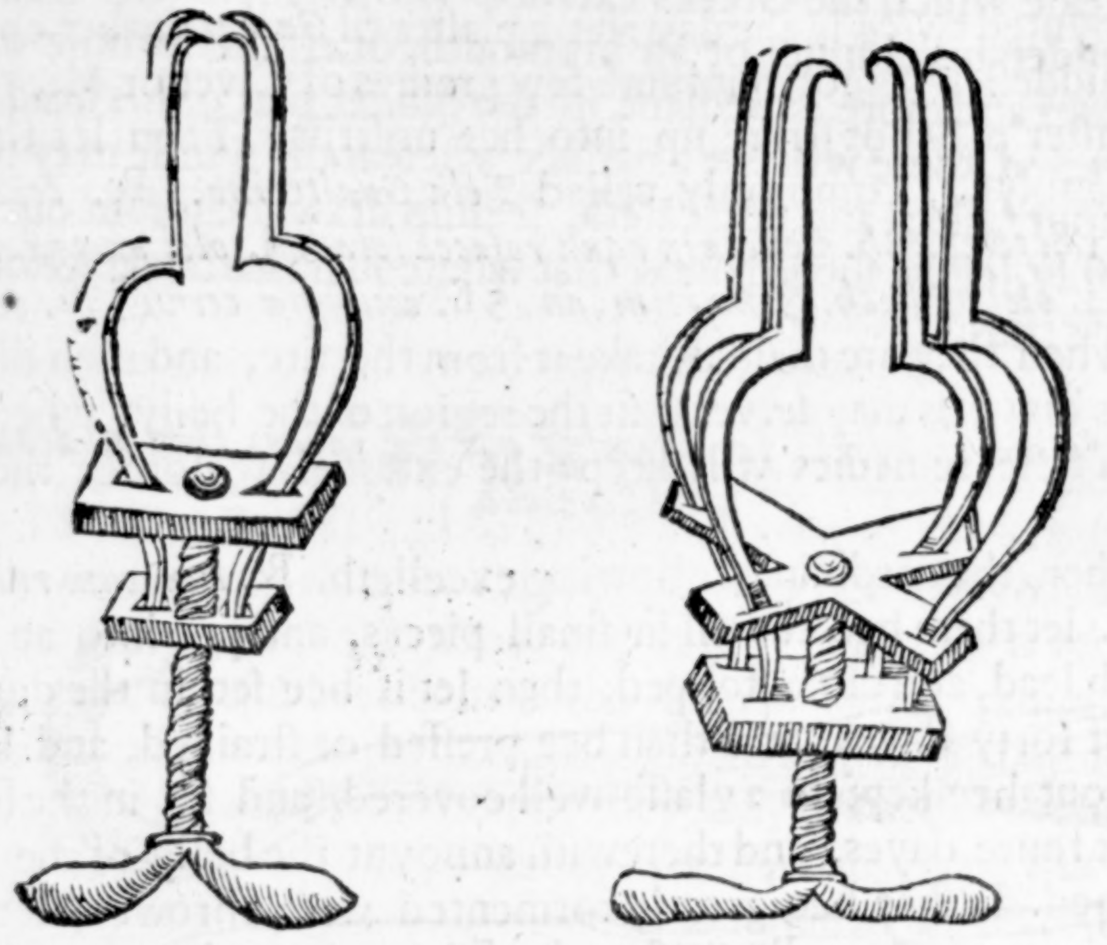


But if the breaſt bee troubled with the like fault, the hookes muſt bee faſtened about the chanell bone: if there bee a Dropſie or a Tympany in the belly, the hooks muſt bee faſtned either in the ſhort ribs, that is to ſay, in the muſcles that are betweene the ribbes, or eſpecially, if the diſeaſe doe alſo deſcend into the feete, about the bones that are above the groine; or elſe putting the crooked knife here pictured into the wombe with his left hand, let him make inciſion in the childs belly, and ſo get out all his entrals by the inciſion, for when hee is ſo bowelled, all the water that cauſed the dropſie will out. But the Chirurgion muſt do none of all theſe things but when the child is dead, and the woman that travelleth in ſuch danger that ſhee cannot otherwiſe be holpen.

How the head of the infant, if it remaine in the wombe ſeparated from the body, may be drawne out.

But if by any meanes it happeneth that all the infants members bee cut away by little and little, and that the head onely remaineth behinde in the wombe, which I have ſometimes againſt my will, and with great ſorrow ſeene, then the left hand being anoynted with oyle of Lillies or freſh butter muſt bee put into the wombe, wherewith the Chirurgion muſt find out the mouth, putting his fingers into it; then with his right hand hee muſt put up the hooke, according to the direction of the left hand, gently, & by little & little, and ſo faſten it in the mouth, eye, or under the chin, and when hee hath firmely fixed or faſtened it, hee muſt therewith draw out the head by little and little, for feare of looſening or breaking the part whereon hee hath hold. In ſtead of this hooke you may uſe the inſtruments that are here deſcribed, which therefore I have taken out of the Chirurgery of *Francis Dalechamps*, for they are ſo made, that they may eaſily take hold of a ſphæricall and round body with the branches, as with fingers.

Gryphons Talons, that is to ſay, inſtruments made to draw out the head of a dead infant that is ſeparated in the wombe from the reſt of the body.



But it is not very eaſie to take hold on the head when it remaineth alone in the wombe, by reaſon of the roundneſſe thereof, for it will ſlip and ſlide up and downe, unleſſe the belly be preſſed downe, and on both ſides, thereby to hold it unto the inſtrument, that it may with more facility take hold thereon.

Why the head being alone in the wombe, is more difficult to be drawne out.

CHAP. XXVII.

What muſt bee done unto the woman in travell preſently after her deliverance.

THere is nothing ſo great an enemy to a woman in travell, eſpecially to her whoſe child is drawne away by violence, as cold: wherefore with all care and diligence ſhee muſt bee kept and defended from cold. For after the birth, her body being voyde and empty, doth eaſily receive the ayre that will enter into every thing that is empty, and hence ſhee waxeth cold, her wombe is diſtended and puffed up, and the orifices of the veſſels thereof are ſhut and cloſed, whereof commeth ſuppreſſion of the after-birth, or other after purgations. And thereof commeth many grievous accidents, as hyſtericall ſuffocation, painefull fretting of the guts, feavers, and other mortall diſeaſes.

Cold an enemy to women in travell.

What accidents follow the taking of cold in a woman that is delivered of child.

What woman ſoever will avoyde that diſcommodity, let her hold her legges or thighes acroſſe, for in ſo doing, thoſe parts that were ſeparated will bee joyned and cloſe together againe. Let her belly bee alſo bound or rowled with a ligature of an indifferent breadth and length, which may keep the cold ayre from the wombe, and alſo preſſe the bloud out that is contained in all the ſubſtance thereof. Then give her ſome Capon broth or Caudle, with Saffron, or with the powder called *Pulvis ducis*, or elſe bread toaſted and dipped in wine wherein ſpice is brewed, for to reſtore her ſtrength, and to keepe away the fretting of the guts. When the ſecundine is drawne out, and is yet hot from the wombe, it muſt bee layd warme unto the region of the wombe, eſpecially in the winter, but in the ſummer, the hot skinne of a Weather newly killed muſt be laid unto all the whole belly, and unto the

Secundines muſt be laid to the region of the wombe whileſt they be warme.

region of the loynes. But then the curtaines of the bed muſt bee kept drawne, and all the windowes and doores of the chamber muſt bee kept ſhut with all diligence, that no cold ayre may come unto the woman that travelleth, but that ſhee may lye and take her reſt quietly. The Weathers ſkinne muſt bee taken away after that it hath lyen five or ſixe houres; and then all the region of her belly muſt bee annointed with the oyntment following.

Uuguents for the woman in travell that the region of the belly may not be wrinkled.

℞. *ſpermatis Ceti,* ℥ii. *olei amygdal. dulcium & hypericon. an.* ℥ i ß. *ſevi hircini.* ℥i. *olei myrtillor.* ℥i. *ceræ novæ quantum ſufficit*; make thereof an oyntment, wherewith let her bee annoynted twice in the day: let a plaſter of *Galbanum* bee applyed to the navell, in the middeſt whereof put ſome few graines of Civet or Muske, ſo that the ſmell of the plaſter may not ſtrike up into her noſtrils. Then let this medicine following bee applyed, commonly called *Tela Gualterina.* ℞. *ceræ novæ* ℥ iiii. *ſpermatis Ceti.* ℥ i ß. *terebinth. venetæ in aqua roſacea lotæ* ℥ ii. *olei amygdal. dulcium & hypericonis an.* ℥ i. *olei maſtich. & myrtini, an.* ℥ ß. *axungiæ cervi* ℥ iß. melt them all together, and when they are melted, take it from the fire, and then dippe a linnen cloth therein, as bigge as may ſerve to fit the region of the belly, whereunto it is to bee applyed. Theſe remedies will keepe the externall region of the belly from wrinkling.

The medicine called *Tela Gualterina.*

But of all other, the medicine following excelleth. ℞. *limacum rub.* ℔i. *florum anthos quart.* iii. let them bee cut all in ſmall pieces, and put into an earthen pot well nealed with lead, and cloſe ſtopped, then let it bee ſet in the dung of horſes for the ſpace of forty dayes, and then bee preſſed or ſtrained, and let the liqour that is ſtrayned out bee kept in a glaſſe well covered, and ſet in the ſunne for the ſpace of three or foure dayes, and therewith annoynt the belly of the woman that lyeth in child-bed. If ſhee bee greatly tormented with throwes, let the powder following bee given unto her. ℞. *aniſi conditi* ʒii. *nucis moſchat. cornu cervi uſt. an.* ʒi. ß. *nucleorum dactyllor.* ʒ iii. *ligni aloës & cinamomi an.* ʒ ii. make thereof a moſt ſubtle powder, let her take ʒi. thereof at once with white wine warme. Or, ℞. *rad. conſolidæ major.* ʒi ß. *nucleorum perſicorum, nucis moſchat. an.* ℈ii. *carab.* ℈ß. *ambræ græzæ gra.* iiii. make thereof a powder, let her take one dramme thereof at a time with white wine, or, if ſhee have a feaver, with the broth of a Capon. Let there be hot bagges applyed to the genitalls, belly and raynes; theſe bagges muſt bee made of millet and oates fryed in a frying-pan with a little white wine.

A powder for the fretting of the guts.

But if through the violence of the extraction the genitall parts bee torne, as ancient writers affirm it hath come to paſſe, ſo that the two holes, as the two holes of the privie parts and of the fundament have beene torne into one, then that which is rent muſt bee ſtitched up, and the wound cured according to art. Which is a moſt unfortunate chance for the mother afterwards, for when ſhee ſhall travell againe, ſhee cannot have her genitall parts to extend and draw themſelves in againe by reaſon of the ſcarre. So that then it will bee needfull that the Chirurgion ſhall againe open the place that was cicatrized, for otherwiſe ſhee ſhall never bee delivered, although ſhee ſtrive and contend never ſo much. I have done the like cure in two women that dwelt in Paris.

What muſt bee done when the groine is torne in child-birth.

Chap. XXVIII.

What cure muſt bee uſed to the Dugges and Teates of thoſe that are brought to bed.

To drive the milke downewards.

IF great ſtore and abundance of milke bee in the breaſts, and the woman bee not willing to nurſe her owne childe, they muſt bee annoynted with the unguent following, to repell the milke, and cauſe it to bee expelled through the wombe. ℞. *olei roſ. myrtini an.* ℥ iii. *aceti roſat.* ℥i. incorporate them together, and therewith annoynt the dugges foure times a day, and preſently after the annoynting beſprinkle them with the powder of myrtils, and then apply the plaſter following. ℞. *pulv. maſtichini,*

nuc.

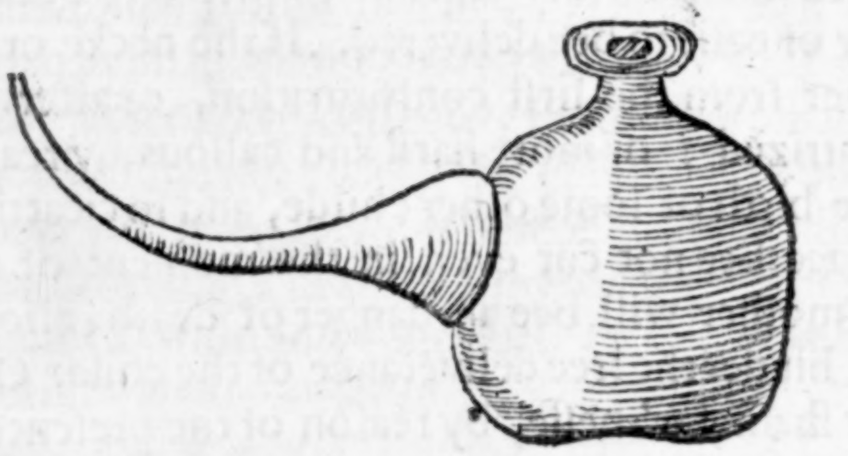
nucis moſchat. an. ʒii. *nucis cupreſſi* ʒiii. *balauſt. myrtill. an.* ʒ iß. *Ireos, florent.* ℥ß. *olei myrtini* ℥ iii. *terebinth. veneta* ℥ ii. *ceræ novæ quantum ſufficit*, make thereof a ſoft plaſter.

The leaves of brooke-lime, creſſes and boxe boyled together in urine and vinegar, are thought a preſent remedy for this purpoſe, that is to ſay, to draw the milke from the breaſts. And others take the clay that falleth downe into the bottome of the trough wherein the grindſtone, whereon ſwords are grownd, turneth, and mixe it with oyle of roſes, and apply it warme unto the dugges, which in ſhort ſpace, as it is thought, will aſſwage the paine, ſtay the inflammation, and drive the milke out of the dugges. The decoction of ground Ivie, Peruwincle, Sage, redde Roſes and roach Alome being prepared in oxycrate, and uſed in the forme of a fomentation, is thought to performe the like effect: the like vertue have the lees of red wine, applyed to the dugges with vinegar, or the diſtilled water of unripe Pine-apples applyed to the breaſts with linnen clothes wet therein, or hemlocke beaten and applyed with the young and tender leaves of a gourd.

By what reaſon, and which way cupping-glaſſes, being faſtened on the groine or above the navell, do draw the milke out of the breaſts.

This medicine following is approved by uſe: Take the leaves of Sage, Smallage, Rue, and Chervill, and cut or chop them very ſmall, and incorporate them in vinegar and oyle of Roſes, and ſo apply it warme to the breaſt, and renue it thrice a day. In the meane time let Cupping-glaſſes bee applyed to the inner ſide of the thigh and groine, and alſo above the navell. For this is very effectuall to draw the milke out of the breaſts into the wombe by the veines, whereby the wombe communicateth with the breaſts. Moreover, they may let children or little welpes ſucke their breaſts, whereby they may draw out the milke that is fixed faſt in their dugges, in ſteed whereof wee have invented this inſtrument of glaſſe, wherewith, when the broader orifice is faſtened or placed on the breaſt or dugge, and the pipe turned upwards towards her mouth, ſhee may ſuck her owne breaſts her ſelfe.

The forme of a little glaſſe, which being put on the nipple, the woman may ſucke her owne breaſts.



In ſteede of this inſtrument, a violl of glaſſe being firſt made warme, and the mouth thereof applyed to the nipple or teat, by reaſon of the heate and wideneſſe thereof will draw the milke forth into the bottome thereof, as it were by a certaine ſucking. The after purgations being firſt evacuated, which is done for the moſt part within twenty dayes after the birth, if the woman bee not in danger of a feaver, nor have any other accident, let her enter into a bath, made of marjerome, mints, ſage, roſemary, mugwurt, agrimonie, pennyroyall, the flowers of chamomile, melilote, dill, being boyled in moſt pure and cleare running water. All the day following let another ſuch like bath bee prepared, whereunto let theſe things following bee added. ℞. *farini fabarum & aven. an.* ℔. iii. *farin. orobi, lupinor. & gland. an.* ℔. i. *aluminis roch.* ʒiiii. *ſalis com.* ℔. ii. *gallarum, nucum cupreſſi, an.* ℥iii. *roſar. rub.* m. vi. *chariophyl. nucum moſchat. an.* ʒ iii. boyle them all in common water, then ſew them all in a cleane linnen cloth, as it were in a bagge, and caſt them therein into the bath wherein Iron red hot hath beene extinguiſhed, and let the woman that hath lately travelled ſit downe therein ſo long as ſhee pleaſeth, and when ſhee commeth out, let her bee layd warme in bedde, and let her take ſome preſerved Orange pill, or bread toaſted and dipped in Ipocras, or in wine brewed with ſpices, and then let her ſweate, if the ſweate will come forth of its owne accord.

Aſtringent fomentations for the privie parts.

On the next day let aſtringent fomentations bee applyed to the genitals on this wiſe prepared. ℞. *gallar. nucum Cupreſſi, corticum granat. an.* ℥ i. *roſar. rub.* m i. *thymi, majoran. an.* m. ß. *aluminis rochæ, ſalis com. an.* ʒ ii. boyle them all together in redde wine, and make thereof a decoction for a fomentation, for the forenamed uſe. The diſtilled liquor following is very excellent and effectuall to confirme and to draw in the dugges, or any other looſe parts. ℞. *charyophyl. nucis moſchat. nucum cupreſſi. an.* ℥ i ß. *maſtich.* ℥ ii. *alumin. roch.* ℥ i ß. *glandium & corticis querni, an.* ℔ ß. *roſar. rubr.* m. i. *cort. granat.* ℥ ii. *terræ ſigillat.* ℥ i. *cornu cervi uſti* ℥ ß. *myrtillor. ſanguinis dracon. an.* ℥ i. *boli armeni.* ℥ ii. *ireos florent.* ℥ i. *ſumach. berber. Hyppuris, an.* m. ß. *conquaſſentur omnia, & macerentur ſpatio duorum dierum. in* ℔ i ß. *aquæ roſarum* ℔ ii. *prunorum ſyveſtr. meſpilorum, pomorum quernorum, &* ℔ ß. *aquæ fabrorum, aceti deniquefortiſs.* ℥ iv. afterward diſtill it over a gentle fire, and keep the diſtilled liquor for your uſe, wherewith let the parts be fomented twice in a day. And after the fomentation, let wollen clothes or ſtupes of linnen cloth be dipped in the liquor, and then preſſed out and laid to the place. When all theſe things are done and paſt, the woman may againe keep company with her husband.

A diſtilled liquor for to draw together the dugs that are looſe and ſlacke.

Chap. XXIX.

What the cauſes of difficult and painefull travell in child-birth are.

The cauſes of the difficult child-birth that are in the woman that travelleth.

THe fault dependeth ſometimes on the mother, and ſometimes on the infant or childe within the wombe. On the mother, if ſhee bee more fat, if ſhee bee given to gurmundize or great eating, if ſhe be too leane or yong, as *Savanarola* thinketh her to bee, that is great with childe at nine yeares of age, or unexpert, or more old, or weaker than ſhee ſhould bee, eyther by nature or by ſome accident: as by diſeaſes that ſhee hath had a little before the time of child-birth, or with a great fluxe of bloud. But thoſe that fall in travell before the full and prefixed time, are very difficult to deliver, becauſe the fruit is yet unripe, and not ready or eaſie to bee delivered. If the necke or orifice of the wombe bee narrow, eyther from the firſt conformation, or afterwards by ſome chance, as by an ulcer cicatrized: or more hard and callous, by reaſon that it hath beene torne before at the birth of ſome other childe, and ſo cicatrized againe, ſo that if the cicatrizced place bee not cut even in the moment of the deliverance, both the childe and the mother will bee in danger of death; alſo the rude handling of the mydwife may hinder the free deliverance of the child. Oftentimes women are letted in travell by ſhamefac'tneſſe, by reaſon of the preſence of ſome man, or hate to ſome woman there preſent.

The paſsions of the mind hinder the birth.

If the ſecundine bee pulled away ſooner than it is neceſſary, it may cauſe a great fluxe of bloud to fill the wombe, ſo that then it cannot performe his excluſive faculty, no otherwiſe than the bladder when it is diſtended by reaſon of overabundance of water that is therein, cannot caſt it forth, ſo that there is a ſtoppage of the urine. But the wombe is much rather hindred, or the faculty of child-bith is ſtopped or delayed, if together with the ſtopping of the ſecundine, there be either a mole or ſome other body contrary to nature in the wombe. In the ſecundines of two women whom I delivered of two children that were dead in their bodies, I found a great quantity of ſand like unto that that is found about the banks of rivers, ſo that the gravell or ſand that was in each ſecundine was a full pound in weight.

The cauſes of difficult child-birth that are in the infant.

Alſo the infant may bee the occaſion of difficult child-birth, as, if too bigge, if it come overthwart, if it come with its face upwards, and its buttocks forwards, if it come with its feet and hands both forwards at once, if it be dead and ſwolne by reaſon of corruption, if it bee monſtrous, if it have two bodies or two heads, if it bee manifold or ſeven-fold, as *Albucraſis* affirmeth hee hath ſeene, if there bee a mole annexed

annexed thereto, if it be very weake, if when the waters are flowed out, it doth not move or ſtirre, or offer its ſelfe to come forth. Yet notwithſtanding, it happeneth ſometimes that the fault is neither in the mother nor the childe, but in the aire, which being cold, doth ſo binde, congeale and make ſtiffe the genitall parts, that they cannot bee relaxed: or, being contrariwiſe too hot, it weakeneth the woman that is in travell, by reaſon that it waſteth the ſpirits, wherein all the ſtrength conſiſteth: or in the ignorant and unexpert mydwife, who cannot artificially rule and governe the endeavours of the woman in travell.

The externall cauſes of diffi-cult child-birth.

The birth is wont to bee eaſie, if it bee in the due and prefixed naturall time, if the childe offer himſelfe luſtily to come forth with his head forwards, preſently after the waters are come forth, and the mother in like manner luſty and ſtrong: thoſe which are wont to bee troubled with very difficult child-birth, ought a little before the time of the birth, to goe into an halfe tub filled with the decoction of mollifying rootes and ſeeds, to have their genitals, wombe, and necke thereof to bee anoynted with much oyle, and the inteſtines that are full and loaded muſt bee unburthened of the excrements, and then the expulſive faculty provoked with a ſharpe glyſter, that the tumours and ſwelling of the birth concurring therewith, the more eaſie excluſion may be made. But I like it rather better, that the woman in travell ſhould be placed in a chaire that hath the backe thereof leaning backwards, than in her bed, but the chair muſt have a hole in the bottome, whereby the bones that muſt be dilated in the birth, may have more freedome to cloſe themſelves againe.

Which is an ea-ſie birth.

What cauſeth eaſineſſe of child-birth.

CHAP. XXX.

The cauſes of Abortion or untimely birth.

ABortion or untimely birth is one thing, and effluxion another. They call abortion the ſudden excluſion of the childe already formed and alive, before the perfect maturity thereof. But that is called effluxion, which is the falling downe of ſeeds mixed together and coagulated but for the ſpace of a few dayes, onely in the formes of membranes or tunicles, congealed bloud, and of an unſhapen or deformed piece of fleſh; the mydwives of our countrey call it a falſe branch or budde. This effluxion is the cauſe of great paine and moſt bitter and cruell torment to the woman: leaving behinde it weakneſſe of body farre greater than if the childe were borne at the due time. The cauſes of abortion or untimely birth, whereof the the child is called an abortive, are many, as a great ſcouring, a ſtrangury joyned with heate and inflammation, ſharpe fretting of the guts, a great and continuall cough, exceeding vomiting, vehement labour in running, leaping, and dauncing, and by a great fall from on high, carrying of a great burthen, riding on a trotting horſe, or in a Coach, by vehement, often and ardent copulation with men, or by a great blow or ſtroke on the belly. For all theſe & ſuch like vehement and inordinate motions diſſolve the ligaments of the wombe, and ſo cauſe abortion or untimely birth.

What Abortion is.

What Effluxion is.

Women are in more paine by reaſon of the ef-fluxion than at the true birth.

The cauſes of Abortion.

Alſo whatſoever preſſeth or girdeth in the mothers belly, and therewith alſo the wombe that is within it, as are thoſe Ivory or Whale-bone buskes, which women weare on their bodies, thereby to keepe downe their bellies; by theſe and ſuch like things the childe is letted or hindred from growing to his full ſtrength, ſo that by expreſſion, or as it were by compulſion, hee is often forced to come forth before the legitimate and lawfull time. Thundering, the noyſe of the ſhooting of great Ordnance, the ſound, and vehement noyſe of the ringing of Bells conſtraine women to fall in travell before their time, eſpecially women that are young, whoſe bodies are ſoft, ſlacke and tenderer than thoſe that bee of riper yeares. Long and great faſting, a great fluxe of bloud, eſpecially when the infant is growne ſomewhat great: but if it bee but two moneths old, the danger is not ſo great, becauſe then hee needeth not ſo great quantity of nouriſhment, alſo a long diſeaſe of the mother, which conſumeth the bloud, cauſeth the childe to come forth being deſtitute of

Girding of the belly may cauſe untimely birth.

ſtore of nouriſhment before the fit time. Moreover, fulneſſe, by reaſon of the eating great ſtore of meates, often maketh or cauſeth untimely birth; becauſe it depraveth the ſtrength, and preſſeth down the child: as likewiſe the uſe of meats that are of an evill juice, which they luſt or long for. But bathes, becauſe they relaxe the ligaments of the wombe, and hot houſes, for that the fervent and choaking ayre is received into the body, provoke the infant to ſtrive to goe forth to take the cold ayre, and ſo cauſe abortion.

How bathes & hot houſes cauſe untimely birth.

Hip. aph. 53. & 37 ſect 5.
Hip. aph 45 ſe. 5.
Hip. aph. 33. ſe. 5.

What women ſoever, being indifferently well in their bodies, travell in the ſecond or third moneth without any manifeſt cauſe, thoſe have the Cotylidones of their womb full of filth and matter, and cannot hold up the infant, by reaſon of the weight thereof, but are broken: Moreover, ſudden or continuall perturbations of the minde, whether they bee through anger or feare, may cauſe women to travell before their time, and are accounted as the cauſes of abortions, for that they cauſe great and vehement trouble in the body. Thoſe women that are like to travell before their time, their dugs will wax little: therefore when a woman is great with childe, if her dugs ſuddenly wax ſmall or ſlender, it is a ſigne that ſhee will travell before her time; the cauſe of ſuch ſhrinking of the dugs is, that the matter of the milke is drawne back into the wombe, by reaſon that the infant wanteth nouriſhment to nouriſh and ſuccour it withall. Which ſcarcity the infant not long abiding, ſtriveth to goe forth to ſeek that abroad which he cannot have within, for among the cauſes which do make the infant to come out of the womb, thoſe are moſt uſually named with *Hippocrates*, the neceſſity of a more large nutriment and aire.

Women are in more pain at the untimely birth than at the due time of birth.

The errour of the firſt child-birth continues afterwards.

A plaſter ſtaying the infant in the wombe.

What children are ten or eleven moneths in the wombe.

A male will bee borne ſooner than a female.

Therfore if a woman that is with child have one of her dugs ſmall, if ſhe have two children, ſhe is like to travell of one of them before the full and perfect time: ſo that if the right dug be ſmall, it is a man child, but if it be the left dug it is a female. Women are in farre more paine when they bring forth their children before the time, than if it were at the full and due time, becauſe that whatſoever is contrary to nature, is troubleſome, painefull, and alſo oftentimes dangerous. If there be any errour committed at the firſt time of childe-birth, it is commonly ſeene that it happeneth alwayes after at each time of child-birth. Therefore, to find out the cauſes of that errour, you muſt take the counſell of ſome Phyſician, and after his counſell endeavour to amend the ſame. Truly this plaſter following being applyed to the reines doth confirme the wombe, and ſtay the infant therein. ℞. *ladani* ʒ ii. *galang.* ℥ i. *nucis moſchat. nucis cupreſſi, boli armeni, terræ ſigill. ſanguin. dracon. balauſt. an.* ʒ ß. *acatiæ, pſidiorum, hypociſtid. an.* ℥ i. *maſtich. myrrhæ, an.* ʒ ii. *gummi arabic.* ʒ i. *terebinth. venet.* ʒ ii. *picis naval.* ℥ i. ß. *ceræ quantum ſufficit, fiat emplaſt. ſecundem artem*; ſpread it for your uſe upon leather. If the part begin to itch, let the plaſter be taken away, & in ſtead thereof uſe *unguent. roſat.* or *refrig. Galen.* or this that followeth. ℞. *olei myrtini, maſtich. cydonior. an.* ℥ i. *hypociſt. boli armen. ſang. dracon. acatiæ, an.* ʒ i. *ſant. citrini* ℥ ß. *ceræ quant. ſuf.* make thereof an oyntment according unto art. There are women that beare the child in their wombe ten or eleven whole moneths, and ſuch children have their conformation of much and large quantity of ſeede: wherefore they will bee more bigge, great and ſtrong, and therefore they require more time to come to their perfection and maturity; for thoſe fruits that are great will not bee ſo ſoone ripe as thoſe that are ſmall. But children that are ſmall and little of body do often come to their perfection and maturity in ſeven or nine months: if all other things are correſpondent in greatneſſe and bigneſſe of body, it happeneth for the moſt part that the woman with child is not delivered before the ninth moneth bee done, or at the leaſtwiſe in the ſame moneth. But a male child will bee commonly borne at the beginning, or a little before the beginning of the ſame moneth, by reaſon of his engrafted heat which cauſeth maturity and ripeneſſe. Furthermore, the infant is ſooner come to maturity and perfection in a hot woman than in a cold, for it is the property of heat to ripen.

CHAP.

CHAP. XXXI.

How to preſerve the infant being in the wombe, when the mother is dead.

If all the ſignes of death appeare in the woman that lieth in travell, and cannot be delivered, there muſt then be a Chirurgian ready and at hand, which may open her body ſo ſoone as ſhee is dead, whereby the infant may be preſerved in ſafety ; neither can it bee ſuppoſed ſufficient if the mothers mouth and privie parts bee held open ; for the infant being encloſed in his mothers wombe, and compaſſed with the membranes, cannot take his breath, but by the contractions and dilatations of the artery of the navell. But when the mother is dead, the lungs doe not execute their office and function : therefore they cannot gather in the aire that compaſſeth the body by the mouth or *aſpera arteria* into their owne ſubſtance, or into the arteries that are diſperſed throughout the body thereof, by reaſon whereof it cannot ſend it unto the heart by the veiny artery which is called *arteria venalis* : for if the heart want aire, there cannot bee any in the great artery which is called *arteria aorta*, whoſe function it is to draw it from the heart ; alſo by reaſon thereof it is wanting in the arteries of the wombe, which are as it were the little conduits of that great artery, whereinto the aire that is brought from the heart is derived, and floweth in unto theſe little ones of all the body, and likewiſe of the wombe. Wherefore it muſt of neceſſity follow that the aire is wanting to the cotyledons of the ſecundines, to the arterie of the infants navell, the iliacke arteries alſo, and therefore unto his heart, and ſo unto all his body : for the aire being drawne by the mothers lungs, is accuſtomed to come to the infant by this continuation of paſſages. Therefore becauſe death maketh all the motions of the mothers body to ceaſe, it is farre better to open her body ſo ſoone as ſhee is dead, beginning the inciſion at the cartelage, *Xiphoides*, or breaſt-blade, and making it in a forme ſemicircular, cutting the skinne, muſcles and *peritonæum*, not touching the guts : then the wombe being lifted up, muſt firſt be cut, leſt that otherwiſe the infant might perchance be touched or hurt with the knife.

Why it is not ſufficient to preſerve life in the childe to hold open the mouth and privie parts of the mother ſo ſoone as ſhe is dead and the childe alive in her body.

How the belly of the woman that dieth in travell muſt be cut open to ſave the childe.

You ſhall oftentimes finde the childe unmoveable, as though hee were dead ; but not becauſe he is dead indeed, but by reaſon that he, being deſtitute of the acceſſe of the ſpirits by the death of the mother, hath contracted a great weakeneſſe : yet you may know whether hee be dead indeed or not, by handling the artery of the navell, for it will beat and pant if he be alive, otherwiſe not ; but if there be any life yet remaining in him, ſhortly after he hath taken in the aire, and is recreated with the acceſſe thereof, he will move all his members, and alſo all his whole body. In ſo great a weakeneſſe or debility of the ſtrength of the childe, the ſecundine muſt not bee ſeparated as yet from the childe, by cutting the navell ſtring, but it muſt rather be laid cloſe to the region of the belly thereof, that thereby the heat (if there be any jot remaining) may bee ſtirred up againe. But I cannot ſufficiently marvaile at the inſolency of thoſe that affirme that they have ſeene women whoſe bellies and wombe have bin more than once cut, and the infant taken out, when it could no otherwiſe be gotten forth, and yet notwithſtanding alive; which thing there is no man can perſwade me can be done, without the death of the mother, by reaſon of the neceſſary greatneſſe of the wound that muſt be made in the muſcles of the belly, and ſubſtance of the wombe, for the wombe of a woman that is great with childe, by reaſon that it ſwelleth, and is diſtended with much blood, muſt needs yeeld a great flux of blood, which of neceſſity muſt be mortall. And to conclude, when that the wound or inciſion of the wombe is cicatrized, it will not permit or ſuffer the womb to be dilated or extended to receive or beare a new birth. For theſe and ſuch like other cauſes, this kinde of cure, as deſperate and dangerous, is not (in mine opinion) to be uſed.

How it may bee known whether the infant be alive or not.

CHAP.

Chap. XXXII.

Of ſuperfœtation.

What ſuperfœtation is.

A womans wombe is not diſtinguiſhed into divers cels.

The reaſon of ſuperfœtation.

Lib. de ſuperfœtationibus.

Why the womb after the conception of the ſeed, doth many times afterwards open.

SUperfœtation is when a woman doth beare two or more children at one time in her wombe, and they bee encloſed each in his ſeverall ſecundine: but thoſe that are included in the ſame ſecundine, are ſuppoſed to bee conceived at one and the ſame time of copulation, by reaſon of the great and copious abundance of ſeed, and theſe have no number of daies between their conception & birth, but all at once. For as preſently after meat the ſtomacke which is naturally of a good temper, is contracted or drawn together about the meate, to comprehend it on every ſide, though ſmall in quantity, as it were by both hands, ſo that it cannot rowle neither unto this or that ſide; ſo the wombe is drawne together unto the conception about both the ſeeds, as ſoone as they are brought into the capacity thereof, and is ſo drawne in unto it on every ſide, that it may come together into one body, not permitting any portion thereof to goe into any other region or ſide, ſo that by one time of copulation the ſeed that is mixed together, cannot engender more children than one, which are devided by their ſecundines. And moreover, becauſe there are no ſuch cells in the wombes of women, as are ſuppoſed, or rather knowne to bee in the wombs of beaſts, which therefore bring forth many at one conception or birth. But now if any part of the womans wombe doth not apply and adjoine it ſelfe cloſely to the conception of the ſeed already received, leſt any thing ſhould be given by nature for no purpoſe, it muſt of neceſſity follow that it muſt be filled with aire, which will alter and corrupt the ſeeds. Therefore the generation of more than one infant at a time, having every one his ſeverall ſecundine, is on this wiſe. If a woman conceave by copulation with a man as this day, and if that for a few daies after the conception, the orifice of the wombe be not exactly ſhut, but rather gape a little, and if ſhee doe then uſe copulation againe, ſo that at both theſe times of copulation there may be an effuſion or perfect mixture of the fertile ſeed in the wombe, there will follow a new conception, or ſuperfœtation. For ſuperfœtation is no other thing than a certaine ſecond conception, when the woman already with childe, againe uſeth copulation with a man, and ſo conceiveth againe, according to the judgement of *Hippocrates.* But there may be many cauſes alledged why the wombe which did joyne and cloſe doth open and unloſe it ſelfe againe. For there bee ſome that ſuppoſe the wombe to be open at certaine times after the conception, that there may be an iſſue out for certaine excrementall matters that are contained therein, and therefore that the woman that hath ſo conceived already, and ſhall then uſe copulation with a man againe, ſhall alſo conceive againe.

Lib. 7. cap. 11.

Others ſay that the wombe of it ſelfe, and of its own nature is very deſirous of ſeed or copulation, or elſe being heated or enflamed with the pleaſant motion of the man moving her thereto, doth at length uncloſe it ſelfe to receive the mans ſeed: for likewiſe it happeneth many times that the orifice of the ſtomack being ſhut after eating, is preſently unlooſed again, when other delicate meats are offered to be eaten: even ſo may the wombe uncloſe it ſelfe againe at certain ſeaſons, whereof come manifold iſſues, whoſe time of birth and alſo of conception are different. For as *Pliny* writeth, when there hath bin a little ſpace between two conceptions, they are both haſtened, as it appeared in *Hercules* and his brother *Iphicles*; and in her, which having two children at a birth, brought forth one like unto her husband, and another like unto the adulterer. And alſo in the Procomeſian ſlave or bond-woman, who by copulation on the ſame day brought forth one like unto her maſter, and another like unto his ſteward: and in another who brought forth one at the due time of childe-birth, and another at five moneths end. And againe in another, who bringing forth her burthen on the ſeventh moneth, brought forth two more in the moneths following. But this is a moſt manifeſt argument of ſuperfœtation, that as many children as are in the wombe (unleſſe they bee twinnes of the ſame ſexe) ſo many ſecundines are there, as I have often ſeene my ſelfe. And it is very likely that if they were conceived in the ſame moment of time, that they ſhould all bee included in one ſecundine. But when a woman hath more children than two at one burden, it ſeemeth to bee a monſtrous thing, becauſe that nature hath given her but two breaſts. Although wee ſhall hereafter rehearſe many examples of more numerous births.

Chap. XXXIII.

Of the tumour called Mola, *or a Mole growing in the wombe of Women.*

The reaſon of the name.

OF the greeke word *Myle*, which ſignifieth a Mill-ſtone, this tumour called *Mola* hath its name: for it is like unto a Mill-ſtone both in the round or circular figure, and alſo in hard conſiſtence, for the which ſelfe ſame reaſon the whirle-bone of the knee is called of the Latines *mola*, and of the Greeks *Myle*. But the tumor called *Mola*, whereof we heere entreate, is nothing elſe but a certain falſe conception of deformed fleſh, round and hard, conceived in the wombe as it were rude and unperfect, and not diſtinguiſhed into members, comming by corrupt, weake, and diſeaſed ſeed, and of the immoderate fluxe of the termes, as it is defined by *Hippocrates*. This is encloſed in no ſecundine, but as it were in its owne skinne.

What a *mola* is.

Lib. de ſteril.

There are ſome that thinke the *Mola* to bee engendered of the concourſe or mixture of the womans ſeed and menſtruall blood, without the communication of the mans ſeed. But the opinion of *Galen* is, that never any man ſaw a woman conceive either a *Mola*, or any other ſuch thing, without copulation of man, as an hen laieth eggs without a cock: for the onely cauſe and originall of that motion is in the mans ſeed, and the mans ſeed doth onely miniſter matter for the generation thereof. Of the ſame opinion is *Avicen*, who thinketh the *Mola* to be made by the confluxion of the mans ſeed that is unfertile, with the womans; when as it, becauſe unfruitfull, onely puffes up or makes the womans ſeed to ſwell as leaven into a greater bigneſſe, but not into any perfect ſhape or forme. Which is alſo the opinion of *Fernelius*, by the decrees of *Hippocrates* and *Avicen*: for the immoderate fluxes of the courſes are conducing to the generation of the *mola*, which overwhelming the mans ſeed, being now unfruitfull and weake, doth conſtraine it to deſiſt from its enterpriſe of conformation already begun, as vanquiſhed or wholly overcome: for the generation of the *mola* commeth not of a ſimple heat working upon a clammy and groſſe humour, as wormes are generated; but of both the ſeeds, by the efficacy of a certaine ſpirit, after a ſort prolificall, as may be underſtood by the membranes wherein the *mola* is encloſed, by the ligaments whereby many times it is faſtened or bound to the true conception or child, engendered or begotten by ſuperfœtation; and finally, by the encreaſe, and great and ſluggiſh waight. If all men were not perſwaded that the conflux of a mans ſeed muſt of neceſſity concurre to the generation of the *mola*, it would bee no ſmall cloake or cover to women to avoide the ſhame and reproach of their light behaviour.

Cap. 7. lib. 4. de uſu part.

How the *mola* is engendered.

Chap. XXXIIII.

How to diſcerne a true conception from a falſe conception or Mola.

The ſignes of a *mola* encloſed in the wombe.

WHen the *mola* is encloſed in the wombe, the ſame things appear as in the true and lawfull conception. But the more proper ſignes of the *mola* are theſe: there is a certaine pricking paine, which at the beginning troubleth the belly as if it were the cholicke, the belly will ſwell ſooner than it would if it were the true iſſue, and will be diſtended with greater hardneſſe, and is more difficult and troubleſome to carry, becauſe it is contrary to nature, By what faculty the wombe moveth.

How the motion of the *mola* differeth from the motion of the infant in the wombe.

The *mola* doth turne to each ſide of the wombe, as the ſituation of the body is.

and voyd of ſoule or life. Preſently after the conception the dugges ſwell and puffe up, but ſhortly they fall and become lanke and laxe; for nature ſendeth milk thither in vaine, becauſe there is no iſſue in the wombe that may ſpend the ſame. The *mola* will move before the third month, although it be obſcurely, but the true conception will not: but this motion of the *mola* is not of the intellectuall ſoule, but of the faculty of the wombe, and of the ſpirit of the ſeed diſperſed through the ſubſtance of the *mola*; for it is nouriſhed and encreaſeth after the manner of plants, but not by reaſon of a ſoul or ſpirit ſent from above, as the infant doth. Moreover, that motion that the infant hath in its due and appointed time, differeth much from the motion of the *mola*; for the childe is moved to the right ſide, to the left ſide, and to every ſide gently, but the *mola*, by reaſon of its heavineſſe, is fixed, and rowleth in manner of a ſtone, carried by the weight thereof unto what ſide ſoever the woman declineth her ſelfe. The woman that hath a *mola* in her wombe doth daily waxe leaner and leaner in all her members, but eſpecially in her legges, although notwithſtanding towards night they will ſwell, ſo that ſhee will bee very ſlow or heavie in going, the naturall heat forſaking the parts remote from the heart by little and little; and moreover, her belly ſwells, by reaſon that the menſtruall matter reſteth about thoſe places, and is not conſumed in the nouriſhment of the *mola*: ſhe is ſwolne as if ſhe had the dropſie, but that it is harder, and doth not riſe againe when it is preſſed with the fingers. The navell doth not ſtand out as it will do when the true iſſue is conteined in the womb, neither do the courſes flow as they ſometimes do in the true conception; but ſometimes great fluxes happen, which eaſe the waight of the belly. In many when the *mola* doth cleave not very faſt, it falleth away within three or foure moneths, being not as yet come unto its juſt bigneſſe; and many times it cleaveth to the ſides of the wombe and Cotyledons very firmely, ſo that ſome women carry it in their wombs five or ſixe yeeres, and ſome as long as they live.

A hiſtory.

The wife of *Guiliam Roger* Pewterer, dwelling in S. *Victors* ſtreet, bore a *mola* in her womb ſeventeen yeeres, who being of the age of fifty yeers, died; and I having opened her, found the body of her womb to be almoſt looſed, and not tyed or bound by its accuſtomed ligatures, but as it were hanging onely by the necke, and furthermore cleaving to the Kall adjoyning to it, having but onely one teſticle, and that on the right ſide, and that ſomewhat broader and looſer than uſuall: the hornes were not to be ſeene except it were on that ſide, the veſſells were on the necke onely, and there very manifeſt and puffed up, it was as bigge as a mans head. When I had taken it out of her body, I brought it home unto my houſe, that at my leaſure I might finde out what was conteined in it ſo long; therfore on a certaine day, calling together the chiefe Phyſitians of Paris, as *Maſſilaus*, *Alexis*, *Vigor*, *de* S. *Pont*. *Feure*, *Brovet*, *Violais*, *Grealmus*, *Ravin*, *Mareſcotius*, *Milotus*, *Hautin*, *Riolan*, *Luſſon*; and Chirurgians, as *Brun*, *Cointerell*, *Guillemean*: all theſe being preſent, I opened the wombe, and I found it in all the body thereof and in the proper tunicle, ſo ſchirrhous, and ſo hard, that I could hardly cut or make a knife to enter into it: the body thereof was three fingers thicke. In the midſt of the capacity thereof I found a lumpe of fleſh as bigge as both my fiſts, like unto a Cowes udder, cleaving to the ſides of the wombe but in certaine places, of a very thicke, unequall and cloddiſh ſubſtance, with many bodies therein, even as are commonly found in wennes and griſtles, diſperſed through it as if it were bones. The judgement of all that were preſent was, that this great tumor at the firſt was a *mola*, which in proceſs of time degenerated into a ſchirrous body, together with the proper ſubſtance of the womb. Moreover, in the middle of the neck of the womb, we found a tumor as big as a Turkies egge, of ſubſtance hard, cartilaginous and bonie, filling all the whole necke, but eſpecially the inward orifice of the womb, which the common people of *France* do call the Garland, ſo that by that paſſage nothing could goe out, or enter into the wombe: all that tumour weighed nine pounds and two ounces, which I, by reaſon of the novelty of the thing, keep in my cloſet, and here I have deſcribed it.

The deſcription of a *mola* carried ſeventeene yeeres in the wombe.

DD. *Shew that concavity wherein the* mola *was conteined or incloſed in the womb.*

As long as the woman carried this *Mola* in her wombe, ſhee felt moſt ſharpe pain in her belly, the region of her belly was marvellous hard, diſtended and large, as if it were a woman that had many children at once in her wombe, ſo that many Phyſicians when the time of child-birth was paſt, ſuppoſed that ſwelling of the belly to come of the dropſie, and aſſayed to cure it as they would the dropſie, but for all the medicines they could uſe, the belly became never the leſſer. Oftentimes the urine was ſtopped for the ſpace of three dayes, and then the making of urine was very painfull unto her, and many times alſo her excrements were ſtopped for the ſpace of a weeke, by reaſon that the guts were preſſed by the weight of the *Mola*. At certaine ſeaſons, as every third moneth, there came exceeding great fluxes, the matter thereof could not be carryed through the capacity of the wombe, as wee ſaid before, becauſe it was exactly ſhut and ſtopped, but through the veſſels by which virgins, and alſo certaine other women great with childe evacuate their menſtruall matter. If the *Mola* be expelled or caſt out in the firſt or ſecond moneth, as many times it ſo happeneth, it is called of women an unprofitable or falſe conception. Sometimes there are found in one wombe two or three moles ſeparated one from another, and ſometimes bound or tyed to the ſound and perfect infant. As it happened in the wife of *Valleriola* the Phyſician, which was delivered of a *Mola* which ſhe had carryed in her wombe twelve moneths, annexed with a child of foure moneths old, which had deprived the infant both of its roome and nutriment. For it is alwayes to be certainely ſuppoſed, that the *Mola*, as a cruell beaſt, by its ſociety, and keeping it from its nutriment and place, kils the infant that is joyned unto it.

A vaine or unprofitable conception.

The *mola* kils the infant in the womb when it is faſtened unto it.

I remember once I opened the body of a dead woman, which had a *Mola* in her wombe as bigge as a gooſe egge, which when nature had aſſayed by many vaine endeavours to caſt out, remained notwithſtanding, and at length putrefied, and therewith infected the whole wombe, whereof ſhe dyed. There be ſome which judging themſelves great with childe, doe about the ninth or tenth moneth expell no other thing but ſounding blaſts of winde; whereby the wombe ſuddenly falling downe and waxing more ſlender, they are ſaid in a mockery to have been delivered of a fart. To conclude, whatſoever reſembles being with child, if it be not excluded at the due and lawfull time of child-birth by its owne accord or by the ſtrength of nature, then muſt it bee expelled by art.

CHAP. XXXV.

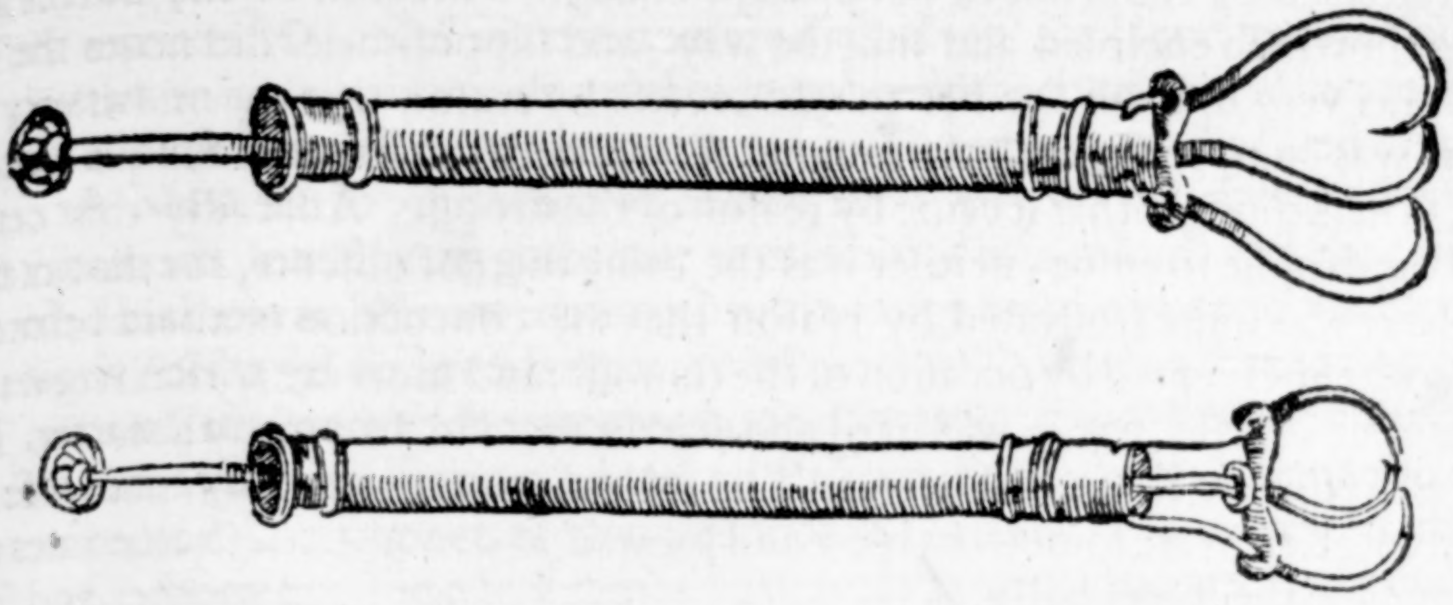
What cure muſt bee uſed to the Mola.

Thoſe things that provoke the flowers forcibly doe alſo conſume or waſt the *mola*.

ALL things that provoke the flowers and ſecundines, and exclude the infant being dead, are to be preſcribed, given inwardly, put up, and applyed outwardly, as the trochiſces of *myrrha*, hermodactils, and ſuch like, firſt having fomentations that are relaxing and mollifying alwaies applyed to the places. You muſt uſe theſe medicines and phlebotomy, diet and bathes then & ſo long as it ſhall ſeem neceſſary to the Phyſician that is preſent. But if it happens that the *mola* is ſeparated or looſed from the wombe, and nature cannot expell it when it is ſo looſed, let the Chirurgion place the woman in that ſituation that wee ſaid ſhe was to bee put in, when the child was to bee drawne from her. Then opening her genitall parts, let him take hold on it by putting an inſtrument into it, which by reaſon of the likeneſſe thereof, is called a Gryphons Talon, for it cannot be taken hold on otherwiſe, by reaſon of the roundneſſe thereof, for it hath no place whereon it may be taken hold of: therfore, when one taketh hold on it with his hand, it cannot be holden faſt by reaſon of the ſlipperineſſe thereof, but will run and ſlip backe into the hollowneſſe of the wombe, like unto a bowle or great ball; but it may bee more eaſily taken hold on with the Gryphons Talon, if the belly be preſſed on both ſides that it may remaine ſtill while the Gryphons Talon takes hold on it, for when it hath taken good hold on it, it may be eaſily drawne out. When the *mola* is drawne out, the ſame cure muſt be uſed to the woman, as is uſed to a woman after that ſhe is delivered of child.

The Chirurgicall extraction of the *mola*.

The figure of an inſtrument called a Gryphons Talon, to draw out the Mola *when it is looſe in the wombe.*



CHAP. XXXVI.

Of Tumours or ſwellings happening to the Pancreas *or ſweet-bread, and the whole Meſentery.*

THe tumours of other places and parts in the belly ought diligently to bee diſtinguiſhed from the *mola*, and other tumours of the wombe. For when tumours ariſe in the *glandula* called *Pancreas*, and in all the whole *Meſenterium*, many unſkilfull Chirurgions take them for *mola's* or ſcirrhous tumors of the wombe, and ſo goe erroneouſly about to cure them, as ſhall appeare by thoſe hiſtories following.

A hiſtory.

Iſabel Rolant the wife of *John Bony* dwelling in Paris in the ſtreet *Moncey* neere to St. *Gerviſe* his Church, being threeſcore yeares of age, departed this life in the yeare of our Lord God 1578. on the twenty ſecond day of October: and her body being opened in the preſence of Doctor *Milot* the Phyſician, hee when the Meſentery was taken out of the body, cauſed it to be carried home to his houſe, that at his leaſure he might find out the cauſe of this mortall diſeaſe, which was alwayes ſuſpected to be in the Meſentery. Therefore on a time calling *Varadeus, Brove, Chappell, Mareſcotius, Arragonius, Baillutius, Rebertius and Riolan*, all Doctors of Phyſick, and me and *Pineus* Chirurgions, to his houſe to ſee the ſame. Where wee found all the Meſentery and the *Pancreas* in the Meſentery ſwolne and puffed up with a marvellous and almoſt incredible tumour, ſo that it wayed ten pound and an halfe, altogether ſcirrhous on the out ſide, cleaving on the hinder part onely to the vertebres of the loynes: but on the fore part to the *Peritonæum*, being alſo ſcirrhous and wholly cartilaginous. Moreover, there were infinite other abſceſſes in the ſame Meſentery, every one cloſed in his ſeverall cyſt, ſome filled with a hony-like, ſome with a tallow-like, ſome with an albugineous, and ſome with a wateriſh liquor or humour, whereof ſome alſo were like unto pap, and to conclude, looke how many abſceſſes there were, ſo many kinds or differences of matters there were. It was then eight yeares ſince that tumour began to grow by little and little without feeling and paine unto ſuch a greatneſſe, becauſe that the Meſentery it ſelfe was without pain in a manner. For the woman her ſelfe could do all the faculties of nature almoſt as well as if ſhe had bin ſound and whole, except that two moneths before ſhe died, ſhe was conſtrained to keep her bed, becauſe ſhee had a continuall feaver, which endured ſo long as ſhe lived, and alſo becauſe that the Meſentery, being as it were ſeparated or torne from its roots or ſeate, did rowle up and downe in the belly, not without the feeling of grievous paine: for, as we ſaid before, it did ſtick but only to the vertebres of the loynes and *Peritonæum*, and nothing at all to the guts and other parts whereunto it is as it were naturally knit or joyned.

Apoſtumes of divers kinds in the *Meſenterium*.

The accidents that come when the *Meſenterium* is ſeparated from the bodies adjoyning.

Therefore becauſe the weight and heavineſſe thereof depreſſed the bladder, it cauſed a great difficulty in her making of water, and alſo becauſe it reſted on the guts, it made it very painefull for her to goe to ſtoole, ſo that the excrements would not come downe except ſhee tooke a ſharpe glyſter to cauſe them: and as concerning glyſters, they could not be put up high enough, by reaſon of the greatneſſe of the tumour which encloſed and ſhut the way; and ſuppoſitories did no good at all. It was alſo very difficult for her to take breath, by reaſon that the midriffe or *diaphragma* was compreſſed with the tumour. There were ſome that did ſuſpect it to be a *mola*, others thought that it came by reaſon of the dropſie. Aſſuredly this diſeaſe cauſed the dropſie to enſue; neither was the cauſe thereof obſcure, for the function of the liver was quite fruſtrated by reaſon that the concoction or alteration of the Chylus was intercepted by occaſion of the tumour: and moreover, the liver it ſelfe had a proper diſeaſe, for it was hard and ſcirrhous, and had many abſceſſes both within and without it, and all over it. The milt was ſcarce free from putrefaction, the guts and Kall were ſomewhat blew and ſpotted, and to bee briefe, there was nothing found in the lower belly.

The dropſie comming of a tumour of the *Meſenterium.*

Tom. 1. tra 1. c. 1.

There is the like hiſtory to bee read, written by *Philip Ingraſsias*, in his booke of tumours, of a certaine Moore that was hanged for theft, for (ſaith he) when his body was publikely diſſected, in the *Meſenterium* were found ſeventy ſcrophulous tumours, and ſo many abſceſſes were contained or encloſed in their ſeverall cyſts or skins, and ſticking to the externall tunicle, eſpecially of the greater guts: the matter conteyned in them was divers, for it was hard, knotty, clammy, glutinous, liquid and wateriſh, but the entrals, eſpecially the liver and the milt, were ſound and free from all manner of tainture, becauſe (as the ſame Author alledgeth) nature being ſtrong, had ſent all the evill juice, and the corruption of the entrals into the Meſentery: and verily this Moore, ſo long as he lived, was in good and perfect health. Without doubt the corruption of ſuperfluous humours for the moſt part is ſo great (as it is noted by *Fernelius*) that it cannot bee received in the receptacles that nature hath appointed for it; therefore then no ſmall portion thereof falleth downe into the parts adjoyning, and eſpecially into the Meſentery and *pancreas*, which are as it were the ſink of the whole body. In thoſe bodies which through continuall and daily gluttony abound with choler, melancholy and flegme, if it be not purged in time, nature being ſtrong and luſty, doth depell and drive it downe into the *pancreas* and the Meſentery, which are as places of no great repute, and that eſpecially out of the liver and milt by thoſe veines or branches of the *vena porta* which end or goe not into the guts, but are terminated in the Meſentery and *pancreas*. In theſe places divers humours are heaped together, which in proceſſe of time turne into a looſe and ſoft tumour, & then if they grow bigger, into a ſtiffe, hard and very ſcirrhous tumour. Whereof *Fernelius* affirmeth that in thoſe places he hath found the cauſes of choler, melancholy, fluxes, dyſenteries, cachexia's, atrophia's, conſumptions, tedious and uncertain fevers, and laſtly of many hidden diſeaſes, by the taking away whereof ſome have received their health, that have been thought paſt cure. Moreover *Ingraſsias* affirmeth out of *Julius Pollux* that Scrophulaes may be engendred in the Meſentery, which nothing differs from the mind & opinion of *Galen*, who ſaith that Scrophulaes are nothing elſe but indurate & ſcirrhous kernels. But the *Meſenterium* with his glandules being great and many, making the *Pancreas*, doth eſtabliſh, ſtrengthen and confirme the diviſions of the veſſels. Alſo the ſcirrhus of the proper ſubſtance of the wombe is to bee diſtinguiſhed from the *mola*: for in the bodies of ſome women that I have opened, I have found the wombe annoyed with a ſcirrhous tumour as big as a mans head, in the curing whereof Phyſicians nothing prevailed, becauſe they ſuppoſed it to bee a *mola* contained in the capacity of the wombe, and not a ſcirrhous tumour in the body thereof.

Lib. 6. part. morb. cap. 7.

The *Meſenterium* is the ſinke of the body.

The Scrophulaes in the *Meſenterium.*

A *ſcirrhus* of the wombe.

Chap. XXXVII.

Of the cauſe of barrenneſſe in men.

THere are many cauſes of barrenneſs in men, that is to ſay, the too hot, cold, dry or moyſt diſtemper of the ſeed, the more liquid and flexible conſiſtence thereof, ſo that it cannot ſtay in the womb, but will preſently flow out again: for ſuch is the ſeed of old men and ſtriplings, and of ſuch as uſe the act of generation too often and immoderately: for thereby the ſeed becommeth crude and wateriſh, becauſe that it doth not remaine his due and lawfull time in the teſticles, wherein it ſhould be perfectly wrought and concocted, but is evacuated by wanton copulation. Furthermore, that the ſeed may be fertile, it muſt of neceſſity be copious in quantity, but in quality well concocted, moderately thicke, clammy, and puffed up with the abundance of ſpirits; both theſe conditions are wanting in the ſeed of them that uſe copulation too often: and moreover, becauſe the wives of thoſe men never gather a juſt quantity of ſeede laudible both in quality and conſiſtence in their teſticles, whereby it commeth to paſſe that they are the leſſe provoked or delighted with venereous actions, and performe the act with leſſe alacrity, ſo that they yeeld themſelves leſſe prone to conception. Therefore let thoſe that would be parents of many children uſe a mediocrity in the uſe of venery.

How the ſeed is unfertile.

The woman may perceive that the mans ſeed hath ſome diſtemperature in it, if when ſhee hath received it into her wombe, ſhee feeleth it ſharpe, hot or cold, if the man be more quick or ſlow in the act. Many become barren after they have beene cut for the ſtone, and likewiſe when they have had a wound behind the eares, whereby certaine branches of the jugular veines and arteries have been cut, that are there, ſo that after thoſe veſſels have been cicatrized, there followed an interception of the ſeminall matter downewards, and alſo of the community which ought of neceſſity to be betweene the braine and the teſticles, ſo that when the conduits or paſſages are ſtopped, the ſtones or teſticles cannot any more receive, neither matter nor lively ſpirits from the braine in ſo great quantity as it was wont, whereof it muſt of neceſſity follow, that the ſeed muſt bee leſſer in quantity, and weaker in quality.

How the cutting of the veines behind the eares maketh men barren.

Thoſe that have their teſticles cut off, or elſe compreſſed or contuſed by violence, cannot beget children, becauſe that either they want the help that the teſticles ſhould miniſter in the act of generation, or elſe becauſe the paſſage of the ſeminall matter is intercepted or ſtopped with a Callus: by reaſon whereof they cannot yeeld forth ſeed, but a certaine clammy humour conteyned in the glandules called *proſtatæ* (yet with ſome feeling of delight).

Moreover the defects or imperfections of the yard may cauſe barrenneſſe: as, if it be too ſhort, or if it bee ſo unreaſonable great, that it renteth the privie parts of the woman, and ſo cauſeth a fluxe of bloud, for then it is ſo painefull to the woman, that ſhee cannot voyde her ſeed, for that cannot bee excluded without pleaſure and delight, alſo if the ſhortneſſe of the ligament that is under the yard doth make it to bee crooked, and violate the ſtiffe ſtraightneſſe thereof, ſo that it cannot be put directly or ſtraightly in the womans privie parts. There bee ſome that have not the orifice of the conduit of the yard rightly in the end thereof, but a little higher, ſo that they cannot ejaculate or caſt out their ſeed directly into the wombe.

The defaults of the yard.

Alſo the particular palſie of the yard is numbred among the cauſes of barrenneſſe; and you may prove whether the palſie be in the yard by dipping the genitals in cold water: for except they do draw themſelves together or ſhrinke up after it, it is a token of the palſie, for members that have the palſie, by the touching of cold water, do not ſhrinke up, but remaine in their accuſtomed laxity and looſeneſſe: but in this caſe the genitals are endued with ſmall ſenſe; the ſeed commeth out without pleaſure or ſtiffeneſſe of the yard; the ſtones in touching are cold; and to conclude, thoſe that have their bodies daily waxing leane through a conſumption, or that are vexed with an evill habit or diſpoſition, or with the obſtruction of ſome of the entrals, are barren and unfertile, and likewiſe thoſe in whom ſome noble part neceſſary to life

The ſigne of the palſie in the yard.

and generation exceedeth the bounds of nature with ſome great diſtemperature, and laſtly thoſe who by any meanes have their genitall parts deformed.

Magick bands and enchanted knots.

Here I omit thoſe that are witholden from the act of generation by inchantment, magick, witching, and enchanted knots, bands and ligatures, for thoſe cauſes belong not to phyſick, neither may they bee taken away by the remedies of our art. The Doctors of the Cannons lawes have made mention of thoſe magick bands which may have power in them, in the particular title *De frigidis, maleficiatis, impotentibus & incantatis* : alſo St. *Auguſt.* hath made mention of them, *Tract. 7. in Joan.*

Chap. XXXVIII.

Of the barrenneſſe or unfruitfulneſſe of women.

The cauſe why the neck of the wombe is narrow.

The membrane called *Hymen*.

A Woman may become barren or unfruitfull through the obſtruction of the paſſage of the ſeed, or through ſtraightneſſe or narrowneſſe of the necke of the wombe, comming either through the default of the formative facultie, or elſe afterwards by ſome miſchance, as by an abſceſſe, ſcirrhus, warts, chaps, or by an ulcer, which being cicatrized, doth make the way more narrow, ſo that the yard cannot have free paſſage thereinto: Moreover, the membrane called *Hymen*, when it groweth in the midſt or in the bottome of the neck of the wombe, hinders the receiving of the mans ſeede. Alſo if the womb be over ſlippery, or more looſe, or ſlack, or over wide, it maketh the woman to bee barren, ſo doth the ſuppreſſion of the menſtruall fluxes, or the too immoderate flowing of the courſes or whites : which commeth by the default of the wombe or ſome entrall, or of the whole body, which conſumeth the menſtruall matter, and carrieth the ſeed away with it.

The cauſe of the fluxe of women.

The cold and moyſt diſtemperature of the wombe, extinguiſhes and ſuffocates the mans ſeed, and maketh it that it will not ſtay or cleave unto the wombe, and ſtay till it be concocted : but the more hot and dry doth corrupt for want of nouriſhment, for the ſeeds that are ſowne either in a mariſh or ſandy ground cannot proſper well : alſo a *mola* contained in the wombe, the falling down of the wombe, the leanneſſe of the womans body, ill humours bred by eating crude and raw fruits, or great or overmuch drinking of water, whereof obſtructions and crudities follow, which hinder her fruitfulneſſe. Furthermore, by the uſe of ſtupefactive things, the ſeminall matter is congealed and reſtrained, and though it flow and be caſt out, yet it is deprived of the prolificke power, and of the lively heat and ſpirits, the orifices or cotylidones of the veines and arteries are ſtopped, and ſo the paſſage for the menſtruall matter into the wombe, is ſtopped. When the Kall is ſo fat that it girdeth in the wombe narrowly, it hindereth the fruitfulneſſe of the woman, becauſe it will not permit the mans ſeed to enter into the wombe. Moreover the fat and fleſhy habit of the man or woman hinder generation. For it hindreth them that they cannot joyne their genitall parts together : and by how much the more bloud goeth into fat, by ſo much the leſſe is remaining to be turned into ſeed & menſtruall bloud, which two are the originals & principals of generation. Thoſe women that are ſpeckled in the face, ſome what lean, & pale, becauſe they have their genitals moyſtned with a ſaltiſh, ſharp and tickling humour, are more given to venery than thoſe that are red & fat. Finally, *Hippocrates* ſets downe foure cauſes onely why women are barren and unfruitfull. The firſt is, becauſe they cannot receive the mans ſeede, by reaſon of the default of the neck of the wombe ; the ſecond, becauſe when it is received into the wombe, they cannot conceive it ; the third is, becauſe they cannot nouriſh it ; the fourth, becauſe they are not able to carry or beare it untill the due and lawfull time of birth. Theſe things are neceſſary to generation, the object, wil, faculty, concourſe of the ſeeds, and the remaining or abiding thereof in the wombe, untill the due and appointed naturall time.

Aph. 38. ſect. 5. Gal. lib. 14. de uſu par. cap. 9. Ariſt. in prob. ſect. de ſter. quæ. 3. & 4.

Chap. XXXIX.

The ſignes of a diſtempered wombe.

THat woman is thought to have her wombe too hot, whoſe courſes come forth ſparingly and with paine, and exulcerate by reaſon of their heate, the ſuperfluous matter of the bloud being diſſolved or turned into wind by the power of the heat: whereupon that menſtruall bloud that floweth forth is more groſſe and black. For it is the property of heat, by digeſting the thinner ſubſtance, to thicken the reſt, and by aduſtion to make it more black. Furthermore, ſhee that hath her genitals itching with the deſire of copulation, will ſoone exclude the ſeede in copulation, and ſhee ſhall feele it more ſharpe as it goeth through the paſſages. That woman hath too cold a wombe whoſe flowers are either ſtopped, or flow ſparingly, and thoſe pale and not well coloured.

The ſignes of a hot wombe.

The ſignes of a cold wombe.

Thoſe that have leſſe deſire of copulation, have leſſe delight therein, and their ſeed is more liquid and wateriſh, and not ſtayning a linnen cloth by ſticking thereunto, and it is ſparingly and ſlowly caſt forth. That wombe is too moiſt that floweth continually with many liquid excrements, which therefore will not hold the ſeed, but preſently after copulation ſuffereth it to fall out, which will eaſily cauſe abortion. The ſignes of too dry a wombe appeare in the little quantity of the courſes, in the profuſion of a ſmall quantity of ſeed, by the deſire of copulation, whereby it may be made ſlippery by the moyſture of the ſeede, by the fiſſures in the necke thereof, by the chaps and itching, for all things for want of moyſture will ſoone chap, even like unto the ground, which in the ſummer by reaſon of a great drought or dryneſſe, will chap and chinke this way and that way, and on the contrary, with moiſture it will cloſe and joyne together againe as it were with glew.

The ſignes of a moyſt wombe.

The ſignes of a dry wombe.

A woman is thought to have all opportunities unto conception when her courſes or flowers doe ceaſe, for then the wombe is voyd of excrementall filth, and becauſe it is yet open, it will the more eaſily receive the mans ſeede, and when it hath received it, it will better retaine it in the wrinkles of the cotylidones yet gaping as it were in rough and unequall places. Yet a woman will eaſily conceave a little before the time that the flowers ought to flow: becauſe that the menſtruall matter falling at firſt like dew into the wombe, is very meet and fit to nouriſh the ſeede, and not to drive it out againe, or to ſuffocate it.

A meet time for conception.

Thoſe which uſe copulation when their courſes fall downe abundantly, will very hardly or ſeldome conceive, and if they doe conceive, the child will be weake and diſeaſed, and eſpecially if the womans bloud that flowes out be unſound; but if the bloud bee good and laudable, the childe will bee ſubject to all plethoricke diſeaſes. There are ſome women in whom preſently after the fluxe of the termes, the orifice of the wombe will be cloſed, ſo that they muſt of neceſſity uſe copulation with a man when their menſtruall fluxe floweth, if at leſt they would conceive at all. A woman may beare children from the age of fourteene untill forty or fifty: which time whoſoever doth exceed, will beare untill threeſcore yeares, becauſe the menſtruall fluxes are kept, the prolificall faculty is alſo preſerved: therefore many women have brought forth children at that age, but after that time no woman can beare, as *Ariſtotle* writeth.

Ariſt. l. 7. de hiſt. anim. c. 2. & c. 5.

Yet *Pliny* ſaith that *Cornelia* (who was of the houſe of the *Scipioes*) being in the ſixty ſecond yeare of her age, bare *Voluſius Saturnius*, who was Conſull; *Valeſcus de Tarenta* alſo affirmeth, that he ſaw a woman that bare a childe on the ſixty ſecond yeare of her age, having borne before on the ſixtieth and ſixty firſt yeare. Therefore it is to bee ſuppoſed that by reaſon of the variety of the ayre, region, diet and temperament, the menſtruall fluxe and procreative faculty ceaſeth in ſome ſooner, in ſome later; which variety taketh place alſo in men. For in them although the ſeede be genitable for the moſt part in the ſecond ſeventh yeare, yet truely it is unfruitfull untill the third ſeventh yeare. And whereas moſt men beget children untill they bee

Lib. 7. cap. 14.

Lib. 6. cap. 12.

Lib. 7. de hiſt. animal. c. 1. & c. 6.

threeſcore yeers old, which time if they paſſe, they beget till ſeventy : yet there are ſome knowne that have begot children untill the eightieth yeere. Moreover, *Pliny* writeth that *Maſiniſſa* the King begot a ſonne when hee was foureſcore and ſixe yeeres of age, and alſo *Cato* the Cenſor after that he was foureſcore.

Lib. 7. cap. 14.

CHAP. XL.

Of the falling downe, or perverſion, or turning of the wombe.

What is the falling downe of the wombe.

THe wombe is ſaid to fall downe and be perverted, when it is moved out of its proper and naturall place; as when the bands and ligatures thereof being looſed and relaxed, it falleth downe unto one ſide or other, or into its owne necke, or elſe paſſeth further, ſo that it comes out at the necke, and a great portion thereof appeares without the privie parts. Therefore what things ſoever reſolve, relaxe, or burſt the ligaments or bands whereby the wombe is tyed, are ſuppoſed to be the cauſes of this accident. It ſometimes happens by vehement labour or travell in childe-birth, when the wombe with violence excluding the iſſue and the ſecundines, alſo followes and falls downe, turning the inner ſide thereof outward. And ſometimes the fooliſh raſhneſſe of the midwife, when ſhee draweth away the wombe with the infant, or with the ſecundine cleaving faſt thereunto, and ſo drawing it downe and turning the inner ſide outward. Furthermore, a heavie bearing of the womb, the bearing or the carriage of a great burthen, holding or ſtretching of the hands or body upwards in the time of greatneſſe with childe, a fall, contuſion, ſhaking, or jogling by riding, either in a waggon or a coach, or on horſe backe, or by leaping or dancing, the falling downe of a more large and abundant humor, great griping, a ſtrong and continuall cough, a *Teneſmus*, or often deſire to go to ſtoole, yet not voiding any thing, neeſing, a manifold and great birth, difficult bearing of the wombe, an aſtmaticall and orthopnoicall difficulty of breathing, whatſoever doth waightily preſſe downe the *Diaphragma* or Midriffe, or the muſcles of the *Epigaſtrium*, the taking of cold aire in the time of travell with childe, or in the flowing of the menſtruall fluxe, ſitting on a cold marble ſtone, or any other ſuch like cold thing, are thought often times to bee the occaſion of theſe accidents, becauſe they may bring the wombe out of its place.

The cauſes.

Ariſt. lib. 7. de hiſtor. anim. cap. 2.

It falls downe in many (ſaith *Ariſtotle*) by reaſon of the deſire of copulation that they have, either by reaſon of the luſtineſſe of their youth, or elſe becauſe they have abſtained a long time from it.

The ſignes.

You may know that the wombe is fallen downe by the pain of thoſe parts wherehence it is fallen, that is to ſay by the entrals, loynes, *os ſacrum*, and by a tractable tumour at the necke of the wombe, and often with a viſible hanging out, of a diverſe greatneſſe, according to the quantity that is fallen downe. It is ſeene ſometimes like unto a piece of red fleſh, hanging out at the necke of the wombe, of the bigneſſe and forme of a Gooſe egge; if the woman ſtand upright, ſhee feeleth the weight to ly on her privie parts, but if ſhe ſit or ly, then ſhe perceiveth it on her back, or goe to the ſtoole, the ſtraight gut called *inteſtinum rectum* will bee preſſed or loaden as it were with a burthen, if ſhee lye on her belly, then her urine will bee ſtopped, ſo that ſhee ſhall feare to uſe copulation with a man.

The prognoſtications.

When the wombe is newly relaxed in a young woman, it may bee ſoone cured, but if it hath beene long downe in an old woman, it is not to bee helped. If the palſie of the ligaments thereof have occaſioned the falling, it ſcarce admits of cure, but if it fall downe by meanes of putrefaction, it cannot poſſibly be cured. If a great quantity thereof hang out betweene the thighes, it can hardly be cured; but it is corrupted by taking the ayre, and by the falling downe of the urine and filth, and by the motions of the thighs in going it is ulcerated, and ſo putrefies.

A hiſtory.

I remember that once I cured a young woman who had her wombe hanging out at her privie parts as big as an egge, and I did ſo well performe and perfect the cure thereof, that afterwards ſhe conceived, and bare children many times, and her womb never fell downe.

CHAP. XLI.

The cure of the falling downe of the Wombe.

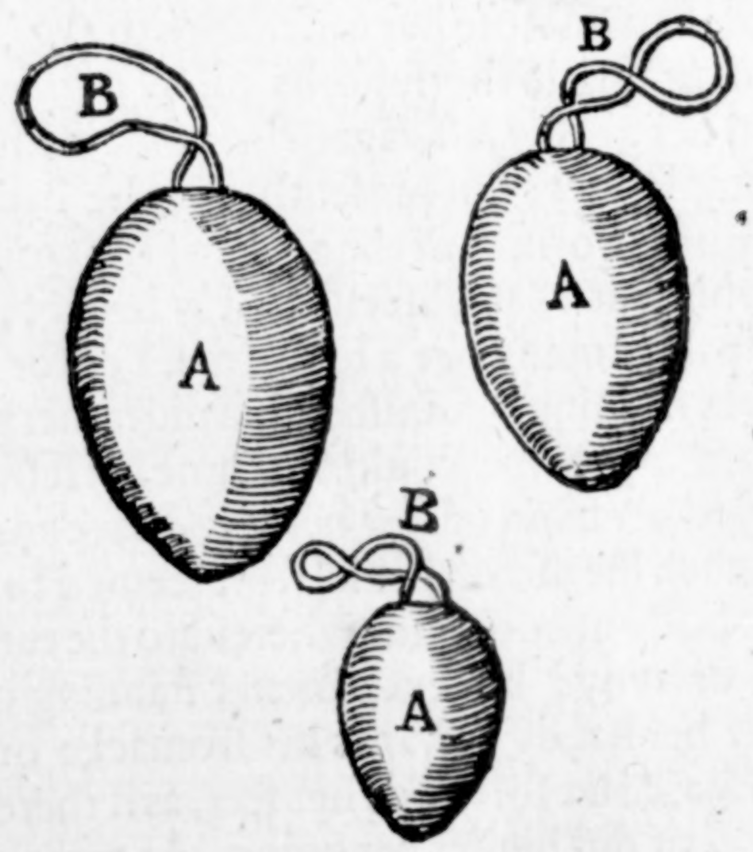
Remedies for the aſcenſion of the wombe.

BY this word, falling downe of the wombe, we underſtand every motion of the womb out of its place or ſeat: therefore if the wombe aſcend upwards, wee muſt uſe the ſame medicines as in the ſtrangulation of the wombe. If it bee turned towards either ſide, it muſt bee reſtored and drawne backe to its right place, by applying and uſing cupping glaſſes. But if it deſcend and fall downe into its owne neck, but yet not in great quantity, the woman muſt be placed ſo that her buttockes may be very high, and her legs acroſſe; then cupping glaſſes muſt bee applied to her navell and *Hypogaſtrium*, and when the wombe is ſo brought into its place, injections that binde and dry ſtrongly muſt bee injected into the necke of the wombe, ſtinking fumigations muſt bee uſed unto the privie parts, and ſweet things uſed to the mouth and noſe. But if the wombe hang downe in great quantity betweene the thighes, it muſt be cured by placing the woman after another ſort, and by uſing other kinde of medicines. Firſt of all ſhee muſt bee ſo layed on her backe, her buttockes and thighes ſo lifted up, and her legges ſo drawne backe as when the childe or ſecundine are to bee taken or drawne from her; then the necke of the wombe, and whatſoever hangeth out thereat, muſt be anointed with oile of lillies, freſh butter, capons greaſe, and ſuch like, then it muſt be thruſt gently with the fingers up into its place, the ſick or pained woman in the mean time helping or furthering the endeavour by drawing in of her breath as if ſhe did ſuppe, drawing up as it were that which is fallen downe.

For the falling downe of the wombe, properly ſo called.

After that the wombe is reſtored unto its place, whatſoever is filled with the ointment muſt be wiped with a ſoft and cleane cloth, leſt that by the ſlipperineſſe thereof the wombe ſhould fall downe againe; the genitalls muſt bee fomented with an aſtringent decoction, made with pomegranate pills, cypreſſe nuts, galles, roach allome, horſe-taile, ſumach, berberies, boiled in the water wherein Smithes quench their irons; of theſe materialls make a powder, wherewith let thoſe places be ſprinkled: let a peſſary of a competent bigneſſe be put in at the necke of the wombe, but let it bee eight or nine fingers in length, according to the proportion of the grieved patients body. Let them bee made either with latin, or of corke covered with waxe, of an ovall forme, having a thred at one end, whereby they may bee drawne backe againe as need requires.

The formes of ovall peſſaries.



A. *ſheweth the body of the Peſſary.*
B. *ſheweth the thread wherewith it muſt be tyed to the thigh.*

When all this is done, let the ſicke woman keep her ſelfe quiet in her bed, with her buttocks lying very high, and her legs acroſſe, for the ſpace of eight or ten daies: in the meane while the application of cupping glaſſes will ſtay the wombe in the right place and ſeat after it is reſtored thereunto: but if ſhee hath taken any hurt by cold aire, let the privie parts be fomented with a diſcuſſing and heating fomentation, on this wiſe. ℞. *fol. alth. ſalv. lavend. roriſmar. artemiſ. flor. chamæm. melilot. an.* m ß. *ſem. aniſ. fænugr. an.* ʒ i. let them bee all well boyled in water and wine, and make thereof a decoction for your uſe. Give her alſo glyſters, that when the guts are emptied of the excrements, the womb may the better be received into the voyd and empty capacity of the belly: for this reaſon the bladder is alſo to be emptied, for otherwiſe it were dangerous leſt that the wombe lying betweene them both being full, ſhould be kept down and cannot be put up into its owne proper place by reaſon therof. Alſo vomiting is ſuppoſed to be a ſingular remedy to draw up the womb that is fallen down: furthermore alſo it purgeth out the phlegme which did moiſten and relaxe the ligaments of the wombe; for as the wombe in the time of copulation at the beginning of the conception is moved downewards to meet the ſeed, ſo the ſtomacke, even of its owne accord, is lifted upwards when it is provoked by the injury of any thing that is contrary unto it, to caſt it out with greater violence; but when it is ſo raiſed up, it drawes up together therewith the *peritonæum*, the wombe, and alſo the bodie or parts annexed unto it. If it cannot bee cured or reſtored unto its place by theſe preſcribed remedies, and that it be ulcerated and ſo putrefyed that it cannot be reſtored unto his place againe, we are commanded by the precepts of art to cut it away, and then to cure the womb according to art, but firſt it ſhould be tyed, and as much as is neceſſary muſt bee cut off, and the reſt ſeared with a cautery. There are ſome women that have had almoſt all their wombe cut off, without any danger of their life, as *Paulus* teſtifieth.

A diſcuſſing & heating fomentation.

How vomiting is profitable to the falling down of the wombe.

The cutting away of the womb when it is putrefyed.

Lib. 6.

John Langius Phyſitian to the Count *Palatine*, writeth that *Carpus* the Chirurgian tooke out the wombe of a woman of *Bononia*, he being preſent, and yet the woman lived and was very well after it. *Antonius Benivenius* Phyſitian of *Florence*, writeth that hee was called by *Ugolius* the Phyſitian to the cure of a woman whoſe wombe was corrupted and fell away from her by peeces, and yet ſhee lived ten yeeres after it.

Epiſt. 39. lib. 2. Epiſt. med.

Tract. de mirand. morbor. cauſ.

A hiſtory.

There was a certaine woman, being ſound of body, of good repute, and about the age of thirty yeers, in whom ſhortly after ſhe had been married the ſecond time, which was in *Anno* 1571. having no childe by her firſt husband, the lawfull ſignes of a right conception did appear: yet in proceſſe of time there aroſe about the lower part of her privities the ſenſe or feeling of a waight or heavineſſe, being ſo troubleſome unto her by reaſon that it was painefull, and alſo for that it ſtopped her urine, that ſhe was conſtrained to diſcloſe her miſchance to *Chriſtopher Mombey* a Chirurgian her neighbour dwelling in the ſuburbs of S. *Germans*; who having ſeen the tumour, or ſwelling in her groine, aſſwaged the paine with mollifying and anodine fomentations and cataplaſmes; but preſently after he had done this, hee found on the inner ſide of the lip of the orifice of the necke of the wombe, an apoſtume rotten & running as if it had bin out of an abſceſſe newly broken, with ſanious matter, ſomewhat red, yellow, & pale, running out a long time. Yet for all this the feeling of the heavineſs or waight was nothing diminiſhed, but did rather encreaſe daily, ſo that from the yeere of our Lord 1573. ſhe could not turne herſelfe being in bed on this or that ſide, unleſſe ſhe layed her hand on her belly to beare and eaſe her ſelfe of the waight, and alſo ſhe ſaid when ſhe turned her ſelf, ſhe ſeemed to feele a thing like unto a bowle to rowle in her body unto the ſide whereunto ſhe turned her ſelfe, neither could ſhee goe to ſtoole, or avoyd her excrements ſtanding or ſitting, unleſſe ſhee lifted up that waight with her hands towards her ſtomacke or midriffe: when ſhee was about to go ſhe could ſcarce ſet forwards her feet, as if there had ſomething hanged between her thighes, that did hinder her going. At certaine ſeaſons that rotten apoſtume would open, or uncloſe of it ſelfe, and flow or run with its wonted ſanious matter, but then ſhe was grievouſly vexed with paine of the head, and all her members, ſwouning, loathing, vomiting, and almoſt choking, ſo that by the perſwaſion

on of a fooliſh woman ſhe was induced and contented to take *Antimonium*; the working and ſtrength thereof was ſo great and violent, that after many vomits, with many frettings of the guts and watry dejections or ſtooles, ſhe thought her fundament fell downe; but being certified by a woman that was a familiar friend of hers, unto whom ſhe ſhewed her ſelfe, that there was nothing fallen downe at or from her fundament, but it was from her wombe, ſhee called, in the yeere of our Lord 1575. Chirurgians, as my ſelfe, *James Guillemeau*, and *Antony Vieux*, that we might helpe her in this extremity.

Antimonium taken in a potion doth cauſe the wombe to fall downe.

When we had diligently and with good conſideration weighed the whole eſtate of her diſeaſe, wee agreed with one conſent, that that which was fallen down ſhould bee cut away, becauſe that by the blacke colour, ſtinking, and other ſuch ſignes it gave a manifeſt teſtimony of a putrefyed and corrupted thing. Therefore for two daies wee drew out the body by little and little, and piece-meale, which ſeemed unto the Phyſicians that wee had called, as *Alexius*, *Gaudinus*, *Feureus*, and *Violaneus*, and alſo to our ſelves, to be the body of the wombe, which thing we proved to bee ſo, becauſe one of the teſticles came out whole, and alſo a thicke membrane or skin, being the relick of the *mola*, which being ſuppurated, and the abſceſſe broken, came out by little and little in matter; after that all this body was ſo drawne away, the ſicke woman began to waxe better and better, yet notwithſtanding for the ſpace of nine dayes before it was taken away, ſhe voided nothing by ſiege, and her urine alſo was ſtopped for the ſpace of foure daies.

The ſignes of the ſubſtance of the wombe drawne out.

After this all things became as they were before, and ſhee lived in good health three moneths after, and then died of a Pleuriſie that came on her very ſuddenly, and I having opened her body, obſerving and marking every thing very diligently, could not finde the wombe at all, but inſtead thereof there was a certaine hard and callous body, which nature, who is never idle, had framed in ſtead thereof to ſupply the want thereof, or to fill the hollowneſſe of the belly.

Chap. XLII.

Of the tunicle or membrane called Hymen.

IN ſome virgins or maidens in the orifice of the neck of the womb there is found a certaine tunicle or membrane called of antient writers *Hymen*, which prohibiteth the copulation of a man, and cauſeth a woman to be barren; this tunicle is ſuppoſed by many, and they not of the common ſort onely, but alſo learned Phyſitians, to be, as it were, the encloſure of the virginity or maidenhead. But I could never finde it in any, ſeeking of all ages from three to twelve, of all that I had under my hands in the Hoſpitall of *Paris*.

Whether there be a membrane called *Hymen*.

Yet once I ſaw it in a virgin of ſeaventeene yeeres, whom her mother had contracted to a man, and ſhe knew neverthleſſe there was ſomething in her privie parts that hindered her from bearing of children, who deſired me to ſee her; and I found a certaine very thin nervous membrane a little beneath the *nymphæ*, neere unto the orifice of the neck of the wombe; in the midſt there was a very little hole whereout the termes might flow: I ſeeing the thickeneſſe thereof, cut it in ſunder with my ſizzers, and told her mother what ſhe ſhould doe afterwards: and truely ſhee married ſhortly after and bore children. *Realdus Columbus* is of my opinion, and ſaith that this is ſeene very ſeldome, for theſe are his words: under the *nymphæ* in many, but not in all virgins, there is another membrane, which when it is preſent (which is but ſeldome) it ſtoppeth, ſo that the yard cannot be put into the orifice of the wombe; for it is very thicke above towards the bladder, it hath an hole by which the courſes flow out. And hee alſo addeth that he obſerved it in two young virgins, and in one elder maide.

A hiſtory.

Lib. 11. cap. 16.

Avicen writeth that in virgins in the necke of the wombe there are tunicles compoſed of veines and ligaments very little, riſing from each part of the necke thereof, which

Lib. 3. ſen 21. tract. 1. cap. 1.

which at the firſt time of copulation are wont to bee broken, and the blood to runne out. *Almanſor* writeth that in virgins, the paſſage or necke of the wombe is very wrinkled, or narrow and ſtraight, and thoſe wrinkles to be woaven or ſtayed together with many little veines aad arteries, which are broken at the firſt time of copulation.

The trifles of midwives about the membrane called *Hymea*.

Theſe are the judgements of Phyſitians of this membrane: Midwives will certainly affirme that they know a virgin from one that is defloured, by the breach or ſoundneſſe of that membrane. But by their report too credulous Judges are ſoone brought to commit an errour. For that Midwives can ſpeake nothing certainely of this membrane, may bee proved by this, becauſe that one ſaith that the ſituation thereof is in the very entrance of the privie parts, others ſay it is in the midſt of the necke of the wombe, and others ſay it is within at the inner orifice thereof, and ſome are of an opinion that they ſay or ſuppoſe that it cannot be ſeen or perceived before the firſt birth. But truly of a thing ſo rare, and which is contrary to nature, there cannot be any thing ſpoken for certainty. Therefore the blood that commeth out at the firſt time of copulation, comes not alwaies by the breaking of that membrane, but by the breaking and violating or renting of the little veines which are woaven and beſpread all over the ſuperficial & inward parts of the womb and neck thereof, deſcending into the wrinkles, which in thoſe that have not yet uſed the act of generation, are cloſed as if they were glewed together: although that thoſe maides that are at their due time of marriage, feele no pain nor no flux of blood, eſpecially if the mans yard be anſwerable to the neck of the womb; whereby it appeares evidently how greatly the inhabitants of *Fez*, the metropolitane city of *Mauritania*, are deceived: for *Leo* the Affrican writeth that it is the cuſtome among them, that ſo ſoon as the married man and his ſpouſe are returned home to their houſe from the church where they have been married, they preſently ſhut themſelves into a chamber, and make faſt the dore, while the marriage dinner is preparing: in the mean while ſome old or grave matron ſtandeth waiting before the chamber dore, to receive a bloody linnen cloth the new married husband is to deliver her there, which when ſhe hath received, ſhe brings it into the midſt of all the company of gueſts, as a freſh ſpoile and teſtimony of the married wives virginity, and then for joy thereof they all fall to banqueting ſolemnely. But if through evill fortune it happeneth that in this time of copulation the ſpouſe bleedeth not in the privie parts, ſhee is reſtored againe unto her parents, which is a very great reproach unto them, and all the gueſts depart home ſad, heavie, and without dinner.

What virgins at the firſt time of copulation doe not bleed at their privie parts. *Lib.* 3.

The filthy deceit of bauds & harlots.

Moreover, there are ſome, that having learned the moſt filthy and infamous arts of bawdry, proſtitute common harlots to make gaine thereof, making men that are naughtily given to beleeve that they are pure virgins, making them to thinke that the act of generation is very painefull and grievous unto them, as if they had never uſed it before, although they are very expert therein indeed; for they doe cauſe the necke of the wombe to be ſo wrinkled and ſhrunke together, ſo that the ſides thereof ſhall even almoſt cloſe or meet together; then they put thereinto the bladders of fiſhes, or galles of beaſts filled full of blood, and ſo deceive the ignorant and young lecher, by the fraud and deceit of their evill arts, and in the time of copulation they mixe ſighes with groanes, and womanlike cryings, and the crocodiles teares, that they may ſeeme to be virgins, and never to have dealt with man before.

CHAP. XLIII.

A memorable hiſtory of the membrane called Hymen.

Lib. de preſt. dæmon. cap. 38.

JOhn *Wierus* writeth that there was a maid at Camburge, who in the middeſt of the necke of the wombe, had a thicke and ſtrong membrane growing overthwart, ſo that when the monethly termes ſhould come out, it would not permit them, ſo that thereby the menſtruall matter was ſtopped and flowed back againe, which cauſed a great tumour and diſtenſion in the belly, with great torment, as if ſhe had beene in travell with child:

the mydwives being called, and having ſeene and conſidered all that had beene done, and did appeare, did all with one voyce affirme, that ſhee ſuſtained the paines of childe-birth, although that the maide her ſelfe denyed that ſhee ever dealt with man. Therefore then this foreſaid Author was called, who, when the mydwives were void of help and counſell, might helpe this wretched maid, having already had her urine ſtopped now three whole weeks, and perplexed with great watchings, loſſe of appetite, and loathing: and when hee had ſeene the grieved place, and marked the orifice of the neck of the wombe, he ſaw it ſtopped with a thick membrane; he knew alſo that that ſudden breaking out of bloud into the wombe and the veſſels thereof, and the paſſage for thoſe matters that was ſtopped, was the cauſe of her grievous and tormenting paine. And therefore hee called a Chirurgian preſently, and willed him to divide the membrane that was in the midſt, that did ſtop the fluxe of the bloud, which being done, there came forth as much black congealed and putrefied bloud as wayed ſome eight pounds. In three dayes after ſhee was well and void of all diſeaſe and paine. I have thought it good to ſet downe this example here, becauſe it is worthy to be noted, and profitable to be imitated, as the like occaſion ſhall happen.

Chap. XLIIII.

Of the ſtrangulation of the wombe.

What is the ſtrangulation of the wombe.

THe ſtrangulation of the wombe, or that commeth from the wombe, is an interception or ſtopping of the liberty in breathing or taking wind, becauſe that the wombe, ſwolne or puffed up by reaſon of the acceſſe of groſſe vapours and humours that are contained therein, and alſo ſnatched as it were by a convulſive motion, by reaſon that the veſſels and ligaments diſtended with fulneſſe, are ſo carried upwards againſt the midriffe and parts of the breaſt, that it maketh the breath to bee ſhort, and often as if a thing lay upon the breaſt and preſſed it.

Why the womb ſwelleth.

Moreover, the wombe ſwelleth, becauſe there is contained or incloſed in it a certaine ſubſtance, cauſed by the defluxion either of the ſeed or flowers, or of the womb or whites, or of ſome other humour, tumour, abſceſſe, rotten apoſtume, or ſome ill juice, putrefying, or getting or engendering an ill quality, and reſolved into groſſe vapours. Theſe, as they affect ſundry or divers places, inferre divers and ſundry accidents, as rumbling and noyſe in the belly, if it be in the guts, deſire to vomit, after (with ſeldome vomiting) commeth wearineſſe and loathing of meat, if it trouble the ſtomack. Choaking with ſtrangulation, if it aſſaile the breaſt and throate; ſwowning, if it vex the heart; madneſſe, or elſe that which is contrary thereto, ſound ſleep or drouſineſſe, if it grieve the brain: all which oftentimes prove as maligne as the biting of a mad dogge, or equall the ſtinging or bitings of venemous beaſts.

The accidents that come of the ſtrangling of the wombe.

Why the ſtrangulation that commeth of the corruption of the ſeed is more dangerous than that that comes of the corruption of the bloud.

It hath been obſerved, that more grievous ſymptomes have proceeded from the corruption of the ſeede, than of the menſtruall bloud. For by how much every thing is more perfect and noble, while it is conteyned within the bounds of the integrity of its owne nature, by ſo much it is the more grievous and perillous, when by corruption it hath once tranſgreſſed the lawes thereof. But this kind of accident doth very ſeldome grieve thoſe women which have their menſtruall fluxe well and orderly, and doe uſe copulation familiarly; but very often thoſe women that have not their menſtruall fluxe as they ſhould, and do want, and are deſtitute of husbands, eſpecially if they be great eaters, and lead a ſolitary life. When the veſſels and ligaments of the wombe are ſwollen and diſtended as wee ſaid before, ſo much as is added to their latitude or breadth, ſo much is wanting in their length: and therefore it hapneth that the wombe, being removed out of its ſeate, doth one while fall to the right ſide towards the liver, ſometimes to the left ſide towards the milt, ſometimes upwards unto the midriffe and ſtomacke, ſometimes downewards, and ſo forwards unto the bladder, whereof commeth an Iſchury and ſtrangury; or backwards, whereof

The cauſe of the divers turning of the wombe into divers parts of the body.

of commeth oppreſſion of the ſtraight gut, and ſuppreſſion of the excrements, and the *Teneſmus.*

But although wee acknowledge the wombe to decline to thoſe parts which wee named, yet it is not by accident onely, as when it is drawne by the proper and common ligaments and bands, when they are contracted or made ſhorter, being diſtended with fulneſſe, but alſo of its ſelfe, as when it is forced or provoked through the griefe of ſomething contrary to nature that is contained therein: it wandreth ſometimes unto one ſide, and ſometimes unto another part with a plaine and evident naturall motion, like unto the ſtomack which imbraceth any thing that is gentle and milde, but avoydeth any thing that is offenſive and hurtfull; yet we deny that ſo great accidents may bee ſtirred up by the falling of it alone unto this or that ſide, for then it might happen, that women that are great with childe, whoſe wombes are ſo diſtended by reaſon that the childe is great, that it doth preſſe the midriffe, might be troubled with a ſtrangulation like unto this; but much rather by a venemous humour breathing out a maligne and groſſe vapour, not onely by the veines and arteries, but alſo by the pores that are inviſible, which pollutes the faculties of the parts which it toucheth with its venemous malignity & infection, and intercepts the functions thereof. Neither doth the variety of the parts receiving only, but alſo of the matter received, cauſe variety of accidents.

The wombe is not ſo greatly moved by an accident, but by it ſelfe.

Whereof come ſuch divers accidents of ſtrangulation of the wombe.

The cauſe of ſleepineſs in the ſtrangulation of the wombe.

For, ſome accidents come by ſuppreſſion of the termes, others come by corruption of the ſeede, but if the matter bee cold, it bringeth a drouſineſſe, being lifted up unto the braine, whereby the woman ſinketh downe as if ſhee were aſtoniſhed, and lyeth without motion, and ſenſe or feeling, and the beating of the arteries, and the breathing are ſo ſmall, that ſomtimes it is thought they are not at all, but that the woman is altogether dead. If it be more groſſe, it inferreth a convulſion; if it participate of the nature of a groſſe melancholick humour, it bringeth ſuch heavineſſe, fear, and ſorrowfulneſſe, that the party that is vexed therewith ſhall thinke that ſhee ſhall die preſently, and cannot be brought out of this minde by any meanes or reaſon: if of a cholerick humour, it cauſeth the madneſſe called *furor uterinus*, and ſuch a pratling, that they ſpeake all things that are to be concealed; and a giddineſſe of the head, by reaſon that the animal ſpirit is ſuddenly ſhaken by the admixtion of a putrefied vapour and hot ſpirit: but nothing is more admirable, than that this diſeaſe taketh the patient ſometimes with laughing, and ſometimes with weeping, for ſome at the firſt will weepe and then laugh in the ſame diſeaſe and ſtate thereof.

The cauſe of a drouſie madnes.

A hiſtory.

But it exceedeth all admiration which *Hollerius* writeth uſually happened to two of the daughters of the Provoſt of Roven. For they were held with long laughter for an houre or two before the fitte, which neither for feare, admonition, nor for any other meanes they could hold; and their parents chid them, and asked them wherefore they did ſo, they anſwered, that they were not able to ſtay their laughter. The aſcention of the wombe is diligently to bee diſtinguiſhed from the ſtrangulation thereof; for the accidents of the aſcention and of the ſtrangulation are not one, but the woman is onely oppreſſed with a certaine paine of the heart, difficulty of breathing, or ſwouning, but yet without feare, without raving or idle talking, or any other greater accident.

The aſcention of the womb is to be diſtinguiſhed from the ſtangulation.

Therefore often times contrary cauſes inferre the aſcention: that is, overmuch dryneſſe of the wombe, labouring through the defect of moyſture, whereby it is forced after too violent and immoderate evacuations of the flowers, and in childebed, and ſuch like, and laborious and painefull travell in child-birth, through which occaſion it waxeth hot, contrary to nature, and withereth and turneth it ſelfe with a certaine violence unto the parts adjoyning, that is to ſay, unto the liver, ſtomacke and midriffe: if happely it may draw ſome moyſture therehence unto it. I omit that the wombe may be brought unto its place upwards by often ſmelling to aromatick things, yet in the meane while it infers not the ſtrangulation that wee deſcribed before.

CHAP. XLV.

The ſignes of imminent ſtrangulation of the wombe.

BEfore that theſe forenamed accidents come, the woman thinks that a certaine painefull thing ariſeth from her wombe unto the orifice of the ſtomacke and heart, and ſhee thinketh her ſelfe to bee oppreſſed and choaked, ſhee complaineth her ſelfe to bee in great paine, and that a certaine lumpe or heavie thing climes up from the lower parts unto her throat, and ſtoppeth her winde, her heart burneth and panteth. And in many the wombe and veſſels of the wombe ſo ſwell, that they cannot ſtand upright on their legs, but are conſtrained to lye downe flat on their bellies, that they may bee the leſſe grieved with the paine, and to preſſe that downe ſtrongly with their hands, that ſeemeth to ariſe upwards, although that not the wombe it ſelfe, but the vapour aſcendeth from the wombe, as wee ſaid before: but when the fitte is at hand, their faces are pale on a ſudden, their underſtanding is darkened, they become ſlow and weak in the legges, with unableneſſe to ſtand. Hereof commeth ſound ſleepe, fooliſh talking, interception of the ſenſes, and breathe as if they were dead, loſſe of ſpeech, the contraction of their legs, and the like.

The wombe it ſelfe doth not ſo well make the aſcention as the vapour thereof.

CHAP. XLVI.

How to know whether the woman be dead in the ſtrangulation of the wombe or not.

I Have thought it meet (becauſe many women not onely in ancient times, but in our owne and our fathers memory have beene ſo taken with this kind of ſymptome, that they have beene ſuppoſed and layd out for dead, although truly they were alive:) to ſet downe the ſignes in ſuch a caſe which do argue life and death. Therefore firſt of all it may be proved, whether ſhe be alive or dead, by laying or holding a cleere and ſmooth looking-glaſſe before her mouth and noſtrils. For, if ſhe breathe, although it be never ſo obſcurely, the thin vapour that commeth out will ſtaine or make the glaſſe duskie. Alſo a fine downiſh feather taken from under the wing of any bird, or elſe a fine flocke being held before the mouth, will by the trembling or ſhaking motion thereof, ſhew that there is ſome breath, and therefore life remaining in the body. But you may prove moſt certainly whether there be any ſparke of life remaining in the body, by blowing ſome ſneeſing powders of pellitory of Spaine, & ellebore into the noſtrils. But though there no breath appeare, yet muſt you not judge the woman for dead, for the ſmall vitall heat, by which, being drawn into the heart, ſhe yet liveth, is contented with tranſpiration onely, and requires not much attraction, which is performed by the contraction & dilatation of the breaſt and lungs unto the preſervation of its ſelfe. For ſo flyes, gnats, piſmires and ſuch like, becauſe they are of a cold temperament, live unmoveably incloſed in the caves of the earth, no token of breathing appearing in them, becauſe there is a little heat left in them, which may be conſerved by the office of the arteries and heart, that is to ſay, by perſpiration, without the motion of the breaſt, becauſe the greateſt uſe of reſpiration is that the inward heat may be preſerved by refrigeration and ventilation. Thoſe that do not mark this, fall into that errour which almoſt coſt the life of him who in our time firſt gave life to anotomicall adminiſtration, that was almoſt decayed and neglected.

Women living taken for dead.

How women that have the ſuffocation of the wombe, live only by tranſpiration without breathing.

How flies, gnats and piſmires do live all the winter without breathing.

For he being called in Spaine to open the body of a noble woman which was ſuppoſed dead through ſtrangulation of the wombe, behold at the ſecond impreſſion of the inciſion knife, ſhe began ſuddenly to come to her ſelfe, and by the moving of her members and body, which was ſuppoſed to be altogether dead, and with crying, to ſhew manifeſt ſignes that there was ſome life remaining in her. Which thing

A hiſtory.

ſtrooke ſuch an admiration & horror into the hearts of all her friends that were preſent, that they accounted the Phyſician, being before of a good fame and report, as infamous, odious and deteſtable, ſo that it wanted but little but that they would have ſcratched out his eyes preſently: wherefore hee thought there was no better way for him, if he would live ſafe, than to forſake the countrey. But neither could hee ſo alſo avoyde the horrible pricke and inward wound of his conſcience (from whoſe judgment no offender can be abſolved) for his inconſiderate dealing, but within few dayes after, being conſumed with ſorrow, he dyed, to the great loſſe of the common wealth, and the art of phyſick.

Chap. XLVII.

How to know whether the ſtrangulation of the wombe comes of the ſuppreſsion of the flowers, or the corruption of the ſeed.

The ſignes of ſuffocation of the womb comming of corrupt ſeed.

The ſigns when it comes of the ſuppreſsion of the flowers.

THere are two chiefe cauſes eſpecially, as moſt frequently happening of the ſtrangulation of the wombe: but when it proceedeth from the corruption of the ſeed, all the accidents are more grievous and violent: difficulty of breathing goes before, and ſhortly after comes deprivation thereof; the whole habit of the body ſeemeth more cold than a ſtone: the woman is a widow: or elſe hath great ſtore or abundance of ſeed, and hath been uſed to the company of a man, by the abſence whereof ſhe was before wont to be pained with heavineſſe of the head, to loath her meat, and to bee troubled with ſadneſſe and feare, but chiefly with melancholy. Moreover when ſhe hath ſatisfied, and every way fulfilled her luſt, and then preſently on a ſudden begins to containe her ſelfe. It is very likely that ſhee is ſuffocated by the ſuppreſſion of the flowers, which formerly had them well and ſufficiently, which formerly hath bin fed with hot, moiſt, and many meats, and therefore engendring much bloud, which ſitteth much, which is grieved with ſome weight and ſwelling in the region of the belly, with paine in the ſtomacke, and a deſire to vomit, and with ſuch other accidents as come by the ſuppreſſion of the flowers. Thoſe who are freed from the fit of the ſuffocation of the wombe, either by nature or by art, in a ſhort time their colour commeth into their faces by little and little, and the whole body beginneth to wax ſtrong, and the teeth, that were ſet and cloſed faſt together, begin (the jawes being looſed) to open and uncloſe againe, and laſtly, ſome moiſture floweth from the ſecret parts with a certaine tickling pleaſure; but in ſome women, as in thoſe eſpecially in whom the necke of the wombe is tickled with the mydwives finger, in ſtead of that moyſture comes thick and groſſe ſeed, which moyſture or ſeed when it is fallen, the wombe being before as it were raging, is reſtored unto its owne proper nature and place, and by little and little all ſymptomes vaniſh away. Men by the ſuppreſſion of their ſeede have not the like ſymptomes as women have, becauſe mans ſeed is not ſo cold and moyſt, but far more perfect and better digeſted, and therefore more meet to reſiſt putrefaction, and whiles it is brought or drawn together by little and little, it is diſſipated by great and violent exerciſe.

The ſignes of one recovering of r from the ſuffocation of the wombe.

Why the ſuppreſsion of the ſeed is not perilous or deadly to men.

Chap. XLVIII.

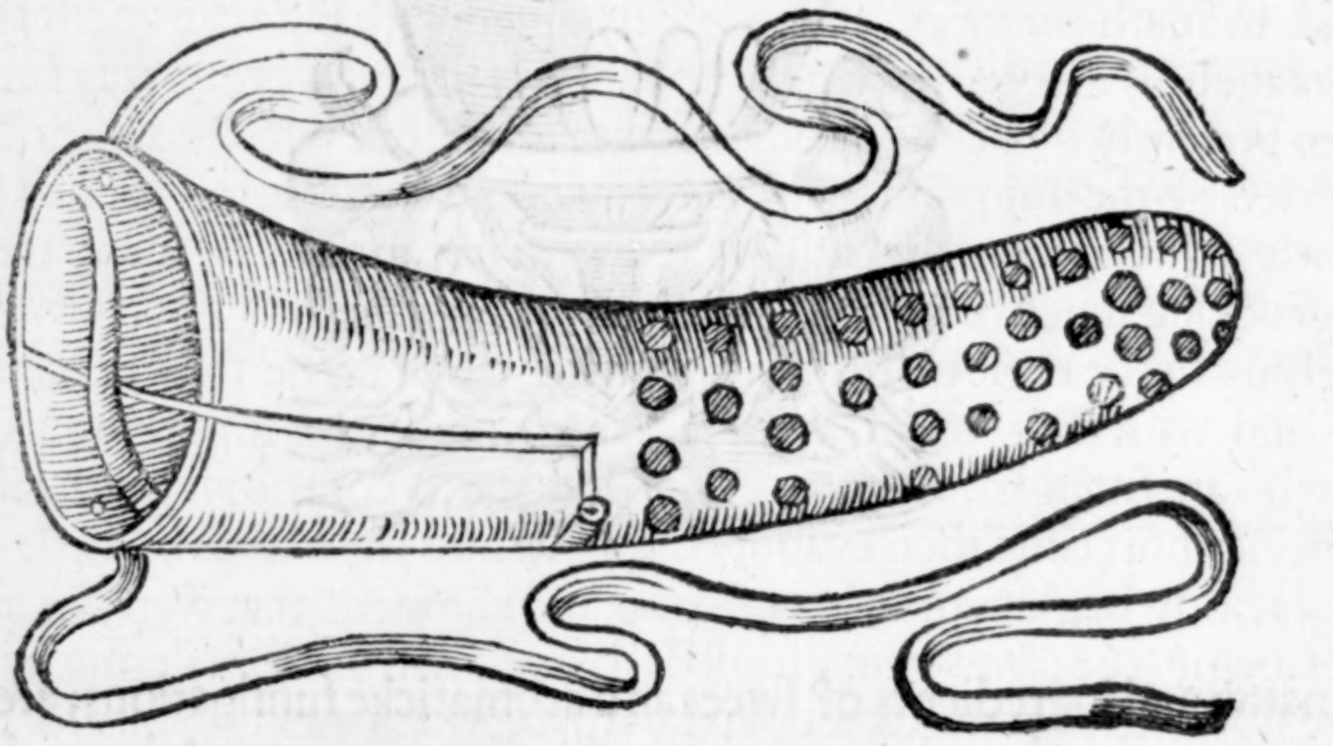
Of the cure of the ſtrangulation of the wombe.

The pulling of the haires of the lower parts are profitable both for this malady and for the cauſe of the ſame.

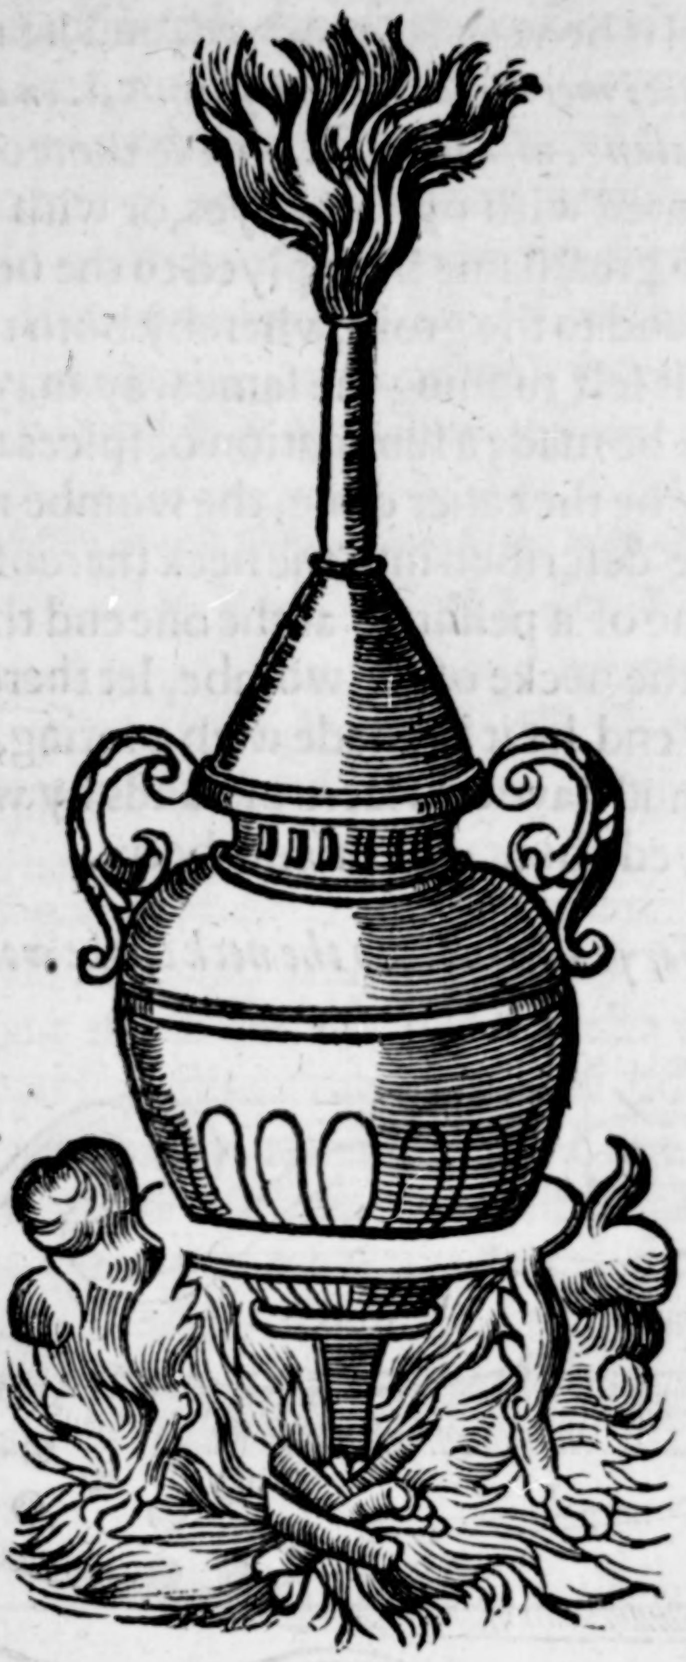
SEeing that the ſtrangulation of the wombe is a ſudden and ſharp diſeaſe, it therefore requireth a preſent and ſpeedy remedy, for if it be neglected it many times cauſeth preſent death. Therefore, when this malady commeth, the ſick woman muſt preſently be placed on her back, having her breaſt and ſtomack looſe, and all her clothes & garments ſlack & looſe about her, whereby ſhe may take breath the more eaſily; and ſhe muſt be called on by her owne name, with a loud voice in her eares, and pulled hard by the haires of the temples and neck, but yet eſpecially by the haires of the ſecret parts, that by provoking or cauſing paine in the lower parts, the patient may not onely be brought to her ſelfe againe, but alſo that the ſharpe and maligne vapour aſcending upwards, may be drawne downewards: the legs and armes muſt bee bound and tied with painefull ligatures, all the body muſt bee rubbed over with rough linnen clothes beſprinkled with ſalt and vinegar, untill it be very ſore and red, and let this peſſary following be put into the wombe. ℞. *ſucci mercurial. artemiſ. an.* ℥ii. *in quibus diſſolve pul. bened.* ʒiii. *pul. radic. enulæ camp. galang. minor. an.* ʒi. make thereof a peſſary. Then let the ſoales of her feet bee anoynted with oyle of bayes, or with ſome ſuch like oyle, let a great cupping-glaſſe with a great flame be applyed to the belly below the navell, to the inner part of the thigh, and to the groin, whereby both the matter that climes upwards, and alſo the womb it ſelf running the ſame way, may be brought downwards or drawn back. There may be made a fumigation of ſpices to be received up into the wombe, which, that it may be the eaſier done, the wombe may be held open by putting in this inſtrument here deſcribed into the neck thereof. Let it be made of gold, ſilver or latin into the forme of a peſſary; at the one end thereof, that is to ſay, that end which goeth up into the necke of the wombe, let there be made many holes on each ſide, but at the lower end let it be made with a ſpring, that it may open and ſhut as you wil have it. Alſo it muſt have two laces or bands by which it muſt be made faſt unto a ſwathe or girdle tyed about the patients belly.

A Peſſary.

The forme of a Peſſary to be put into the neck of the wombe to hold it open.



The deſcription of a veſſell made with a funnell or pipe for to fumigate the wombe.



The matter of ſweet fumigations.

The matter and ingredients of ſweet and aromaticke fumigations, are cinnamon, callam. aromat. lig. aloes, ladanum, benzoin, thyme, pepper, cloves, lavander, calaminth, mugwort, penniroyall, *alepta moſchat.* nutmegs, muske, moſſe, amber, ſquinant, and ſuch like, which for their ſweet ſmell and ſympathy, allure or entice the wombe downewards, by their heat conſume and digeſt the thicke vapours, and putrefied ill juice. Contrariwiſe, let the noſtrils bee perfumed with fœtide and ranke ſmels, and let theſe be made with *gum. galbanum, ſagapenum, ammoniacum, aſſa fœtida, bitumen,* oyle of Jeat, ſnuffe of a tallow candle when it is blowne out, with the fume of birds feathers, eſpecially of Partridges and Woodcocks, of mans haire or goats haire, of old leather, of horſe hoofes, and ſuch like things burned, whoſe noyſome or offenſive ſavour the wombe avoyding, doth returne unto its owne place or ſeate againe.

By what power ſweet fumigations do reſtore the womb unto its owne nature and place.

Stinking ſmels to be applied to the noſtrils.

Moreover it ſhall be very neceſſary to procure vomit by thruſting a gooſe feather downe into the throate, or elſe the haires of the patients owne head. Shortly after ſhee muſt uſe a potion of fifteene graines of blacke pepper bruiſed and diſſolved in *hydromel,* or water and hony mixed together, or in ſome ſtrong wine, which remedy *Avicen* holdeth for a ſecret.

Avicens ſecret for ſuffocation of the wombe.

Alſo in ſtead thereof three houres before meat ʒ ß. of treacle diſſolved in ℥ i. of the water of wormewood may be given her: Alſo it is thought that one drop of the oyle of Jeat dropped on the tongue, is a very profitable remedy. There bee ſome that allow a potion of halfe a dram of *Caſtoreum* diſſolved in white wine, or in the broth of a capon: alſo it is profitable not onely to give her treacle to drinke, but alſo

Caſtoreum drunken.

ſo to inject it into the wombe, being firſt diſſolved in *aqua vitæ*, and in the meane time to drop two drops of oyle of ſage, or ſome ſuch chymicall oyle into the eares. If ſhee bee drouſie or ſleepy, ſhe muſt be awaked or kept waking with ſneeſing powders of white ellebore and pellitory.

Expreſsions into the wombe.

It is alſo requiſite to inject glyſters both into the fundament and ſecret parts, which muſt be made of the decoction of things that diſcuſſe winde, as of calamint, mugwort, lavender, pennyroyall, chamomel, melilote, and ſuch like; and let peſſaries or ſuppoſitories be made of ladanum, ginger, *gallia moſchat.* treacle, mithridate, civet and muske, of the oyle of cloves, anniſeeds, ſage, roſemary, and ſuch like, chymically drawne; this following is a convenient deſcription of a glyſter. ℞. *radic. enulæ, camp. Ireos, ebuli, ariſtoloch. an.* ℥ i. *fol. abſynth. artemeſiæ, matricar. puleg. origani, an.* m. i. *baccarum lauri, juniperi & ſambuc. an.* p. i. *ſem. amios, cymini, rutæ an.* ʒ ii. *florum ſtœchados, roriſmarin. ſalviæ, centaur. minor. an.* p. ii. *fiat decoctio, cape colaturæ* ℔. i. *in qua diſſolve mellis anthoſati, ſacch. rubr. & bened. an.* ℥ i. *diacharth.* ʒ ii. *olei aneth. nard. an.* ℥ i ß. make thereof a glyſter, and apply this plaſter following to the belly. ℞. *maſs. empl. oxycrocei, & melilot. an.* ℥ iii. *olei nard.* as much as ſhall ſuffice to make it conveniently ſoft, make thereof a plaſter, and ſpread it on leather, and apply it to the region of the belly when the fitte is ended: if ſhe be married, let her forthwith uſe copulation, and bee ſtrongly encountered by her husband, for there is no remedy more preſent than this.

The matter of peſſaries.

A glyſter ſcattering groſſe vapours.

A quick, certain & a pleaſant remedy for the ſuffocation of the wombe.

Let the mydwife annoint her fingers with *oleum nardinum* or *moſchetalinum*, or of cloves, or elſe of ſpike mixed with muske, ambergreeſe, civet, and other ſweet powders, and with theſe let her rub or tickle the top of the necke of the wombe which toucheth the inner orifice; but her ſecret parts muſt firſt be warmed by the applying of warme linnen clothes, for ſo at length the venemous matter contained in the wombe, ſhall bee diſſolved and flow out, and the maligne, ſharpe and flatulent vapours, whereby the wombe is driven as it were into a fury or rage, ſhall bee reſolved and diſſipated, and ſo when the conjunct matter of the diſeaſe is ſcattered and waſted, the wombe, and alſo the woman ſhall bee reſtored unto themſelves againe. Some hold it for a ſecret to rub the navell with the juice of garlicke boyled and mixed with aloes.

Tickling of the neck of the wombe.

Chap. XLIX.

Of womens monethly fluxe or courſes.

VSually they call the fluxe of bloud, that iſſueth from the ſecret parts of women, monethly flowers or courſes, becauſe it happeneth to them every month ſo long as they are in health. There bee ſome which call them termes, becauſe they returne at their uſuall time. Many of the French men call it ſepmaines, becauſe in ſuch as ſit much, and are given to plentifull feeding, it endureth almoſt for the ſpace of ſeven dayes. Some call them purgations, becauſe that by this fluxe all a womans body is purged of ſuperfluous humours. There bee ſome alſo that call thoſe fluxes the flowers, becauſe that as in plants the flower buddeth out before the fruits, ſo in women kinde this flux goeth before the iſſue, or the conception thereof.

The reaſon of the names of the monthly flux of women.

For the courſes flow not before a woman bee able to conceive: for how ſhould the ſeede being caſt into the wombe have his nouriſhment and encreaſe, and how ſhould the child have his nouriſhment when it is formed of the ſeed, if this neceſſary humour were wanting in the wombe? yet it may bee ſome women may conceive without this fluxe of the courſes: but that is in ſuch as have ſo much of the humour gathered together, as is wont to remaine in thoſe which are purged, although it bee not ſo great a quantity that it may flow out, as it is recorded by *Ariſtotle*. But as it is in ſome very great, and in ſome very little, ſo it is in ſome ſeldome, and in ſome very often.

What women do conceive this flux not appearing at all.

There are ſome that are purged twice, and ſome thrice in a moneth, but it is altogether

What women have this menſtruall flux often, abundantly & for a longer ſpace than others.

together in thoſe who have a great liver, large veines, and are filled and fed with many and greatly nouriſhing meats, which ſit idely at home all day, which having ſlept all night, doe notwithſtanding lye in bed ſleeping a great part of the day alſo, which live in a hot, moyſt, rainie and ſoutherly ayre, which uſe warme bathes of ſweet waters and gentle frictions, which uſe and are greatly delighted with carnall copulation : in theſe and ſuch like women the courſes flow more frequently and abundantly.

What women have thi fluxe more ſeldome, leſſe, and a far more ſhort time than others.

But contrariwiſe, in thoſe that have ſmall and obſcure veines, in thoſe that have their bodies more furniſhed and bigge either with fleſh or with fat, are more ſeldome purged, and alſo more ſparingly, becauſe that the ſuperfluous quantity of bloud uſeth to goe into the habit of the body. Alſo tender, delicate and faire women are leſſe purged than thoſe that are browne and endued with a more compact fleſh, becauſe that by the rarity of their bodies, they ſuffer a greater waſting or diſſipation of their ſubſtance by tranſpiration. Moreover, they are not ſo greatly purged with this kind of purgation, which have ſome other ſolemne or accuſtomed evacuation in any other place of their body, as by the noſe or hemorrhoids.

Why young women are purged in the new of the Moone.

And as concerning their age, old women are purged when the Moone is old, and young women when the Moone is new, as it is thought. I thinke the cauſe thereof is, for that the Moone ruleth moyſt bodies, for by the variable motion thereof the Sea floweth and ebbeth, and bones, marrow and plants abound with their genitall humour.

Why old women are purged in the wane of the Moone.

Therefore young people which have much bloud, and more fluxible, and their bodies more fluxible, are ſoone moved unto a fluxe, although it bee even in the firſt quarter of the Moones riſingor increaſing : but the humours of old women, becauſe they wax ſtiffe as it were with cold, & are not ſo abundant, and have more denſe bodies and ſtraighter veſſels, are not ſo apt to a fluxe, nor do they ſo eaſily flow, except it bee in the full of the Moon, or elſe in the decreaſe ; that is to ſay, becauſe the bloud that is gathered in the full of the Moon falls from the body even of its own weight, for that by reaſon of the decreaſing or wane of the Moone this time of the month is more cold and moyſt.

Chap. L.

The cauſes of the monethly flux or courſes.

The materiall cauſe of the monthly fluxe.

BEcauſe a woman is more cold, and therefore hath the digeſtive faculty more weake, it commeth to paſſe, that ſhee requireth and deſireth more meate or foode than ſhee can digeſt or concoct : And becauſe that ſuperfluous humour that remaineth is not digeſted by exerciſe, nor by the efficacy of ſtrong and lively heat, therefore by the providence or benefit of nature it floweth out by the veines of the wombe, by the power of the expulſive faculty, at its owne certaine and prefixed ſeaſon or time. But then eſpecially it beginneth to flow, and a certaine crude portion of bloud to bee expelled, being hurtfull and maligne otherwiſe in no quality, when nature hath laid her principall foundations of the encreaſe of the body, ſo that in greatneſſe of the body, ſhe hath come as it were in a manner to the higheſt toppe, that is to ſay, from the thirteenth to the fiftieth yeare of our age.

When the monthly flux begins to flow.

The final cauſe.

A woman exceeds a man in quantity of bloud.

Moreover, the childe cannot bee formed in the wombe, nor have his nutriment or encreaſe without this fluxe : therefore this is another finall cauſe of the monethly flux. Many are perſwaded that women do farre more abound with bloud than men, conſidering how great an abundance of bloud they caſt forth of their ſecret parts every moneth, from the thirteenth to the fiftieth yeare of their age : how much women great with childe, of whom alſo many are menſtruall, yeelde unto the nutriment and encreaſe of the childe in their wombes, and how much Phyſicians take from women that are with childe by opening of a veine, which otherwiſe would bee delivered before their naturall and prefixed time ; how great a quantity thereof they avoid in the birth of their children, and for ten or twelve daies after, and how great a quantity of milk they ſpend for the nouriſhment of the child when they give ſucke, which milke is none other thing than blood made white by the power of the kernels that are in the dugges, which doth ſuffice to nouriſh the childe, be he great or little; yet notwithſtanding many nurſes in the meane while are menſtruall: and as that may be true, ſo certainely this is true, that one dramme (that I may ſo ſpeake) of a mans blood, is of more efficacy to nouriſh and encreaſe, than two pounds of womans blood, becauſe it is farre more perfect, more concocted, wrought, and better repleniſhed with abundance of ſpirits: whereby it commeth to paſſe that a man endued with a more ſtrong heat, doth more eaſily convert what meat ſoever he eateth into the nouriſhment & ſubſtance of his body; & if that any ſuperfluity remains, he doth eaſily digeſt and ſcatter it by inſenſible tranſpiration. But a woman being more cold than a man, becauſe ſhee taketh more than ſhee can concoct, doth gather together more humours, which becauſe ſhee cannot diſperſe, by reaſon of the unperfectneſſe and weakeneſſe of her heat, it is neceſſary that ſhee ſhould ſuffer, and have her monethly purgation, eſpecially when ſhee groweth unto ſome bigneſſe; but there is no ſuch need in a man.

A man exceedeth a woman in the quality of his blood.

A man is more hot than a woman, and therefore not menſtruall.

Chap. LI.

The cauſes of the ſuppreſsion of the courſes or menſtruall fluxe.

THe courſes are ſuppreſſed or ſtopped by many cauſes, as by ſharpe vehement, and long diſeaſes, by feare, ſorrow, hunger, immoderate labours, watchings, fluxes of the belly, great bleeding, hœmorrhoides, fluxes of blood at the mouth, and evacuations in any other part of the body whatſoever, often opening of a veine, great ſweats, ulcers flowing much and long, ſcabbineſſe of the whole skinne, immoderate groſſeneſſe and clammineſſe of the blood, and by eating of raw fruites, and drinking of cold water, by ſluggiſhneſſe and thickneſſe of the veſſels, and alſo the obſtruction of them by the defaults and diſeaſes of the wombe, by diſtemperature, an abſceſſe, an ulcer, by the obſtruction of the inner orifice thereof, by the growing of a Callus, caruncle, cicatrize of a wound or ulcer, or membrane growing there, by injecting of aſtringent things into the necke of the wombe, which place many women endeavour fooliſhly to make narrow: I ſpeake nothing of age, greatneſſe with child, & nurſing of children, becauſe theſe cauſes are not beſides nature, neither doe they require the helpe of the Phyſitian.

The fooliſh endeavour of making the orifice of the wombe narrow, is rewarded with the diſcommodity of ſtopping of the flowers.

Many women, when their flowers or tearmes be ſtopped, degenerate after a manner into a certaine manly nature, whence they are called *Viragines*, that is to ſay, ſtout, or manly women; therefore their voice is more loud and bigge, like unto a mans, and they become bearded.

What women are called *viragines.*

In the city *Abdera* (ſaith Hippocrates) *Phaethuſa* the wife of *Pytheas* at the firſt did beare children and was fruitfull, but when her husband was exiled, her flowers were ſtopped for a long time: but when theſe things happened, her body became manlike and rough, and had a beard, and her voice was great and ſhrill. The very ſame thing happened to *Namyſia* the wife of *Gorgippus* in *Thaſus*. Thoſe virgins that from the beginning have not their monethly fluxe, and yet neverthleſſe enjoy their perfect health, they muſt neceſſarily be hot and dry, or rather of a manly heat and dryneſſe, that they may ſo diſperſe and diſſipate by tranſpiration, as men doe, the excrements that are gathered, but verily all ſuch are barren.

Lib. 6. epidem. ſect. 7.

The women that are called *viragines* are barren.

Chap. LII.

What accidents follow the ſuppreſsion or ſtopping of the monthly fluxe or flowers.

WHen the flowers or monethly fluxe are ſtopped, diſeaſes affect the womb, and from thence paſſe into all the whole body. For thereof commeth ſuffocation of the womb, head ache, ſwouning, beating of the heart, and ſwelling of the breaſts and ſecret parts, inflammation of the wombe, an abſceſſe, ulcer, cancer, a feaver, nauſeouſneſſe, vomitings, difficult and ſlow concoction, the dropſie, ſtrangury, the full wombe preſſing upon the orifice of the bladder, blacke and bloody urine, by reaſon that portion of the blood ſweateth out into the bladder. In many women the ſtopped matter of the monethly fluxe is excluded by vomiting, urine, and the hœmorrhoides, in ſome it groweth into *varices*. In my wife, when ſhee was a maide, the menſtruall matter was excluded and purged by the noſtrills. The wife of *Peter Feure* of *Caſteaudun*, was purged of her menſtruall matter by the dugges every moneth, and in ſuch abundance, that ſcarce three or foure cloaths were able to dry it and ſucke it up.

Why the ſtrangury, or bloodineſſe of the urine followeth the ſuppreſsion of the flowers.

Hiſtories of ſuch as were purged of their menſtruall flux by the noſe and dugges.

In thoſe that have not the fluxe monethly to evacuate this plenitude by ſome part or place of the body, there often followes difficulty of breathing, melancholy, madneſſe, the gout, an ill diſpoſition of the whole body, diſſolution of the ſtrength of the whole body, want of appetite, a conſumption, the falling ſickeneſſe, an apoplexie.

Thoſe whoſe blood is laudable, yet not ſo abundant, doe receive no other diſcommodity by the ſuppreſſion of the flowers, unleſſe it be that the wombe burnes or itcheth with the deſire of copulation, by reaſon that the wombe is diſtended with hot and itching blood, eſpecially if they lead a ſedentary life. Thoſe women that have beene accuſtomed to beare children, are not ſo grieved and evill at eaſe when their flowers are ſtopped by any chance contrary to nature, as thoſe women which did never conceive, becauſe they have beene uſed to be filled, and the veſſels by reaſon of their cuſtomary repletion and diſtention, are more large and capacious: when the courſes flow, the appetite is partly dejected, for that nature, being then wholly applied to expulſion, cannot throughly concoct or digeſt, the face waxeth pale, and without its lively colour, becauſe that the heat with the ſpirits, go from without inwards, ſo to helpe and aide the expulſive faculty.

To what women the ſuppreſsion of the moneths is moſt grievous

Chap. LIII.

Of provoking the flowers or courſes.

THe ſuppreſſion of the flowers is a plethorick diſeaſe, and therefore muſt be cured by evacuation, which muſt be done by opening the veine called *Saphena* which is at the ankle, but firſt let the baſilike veine of the arme be opened, eſpecially if the body bee plethoricke, leſt that there ſhould a greater attraction be made into the wombe, and by ſuch attraction or flowing in, there ſhould come a greater obſtruction. When the veines of the wombe are diſtended with ſo great a ſwelling that they may be ſeen, it will be very profitable to apply horſe-leeches to the necke thereof: peſſaries for women may be uſed; but fumigations of aromaticke things are more meet for maides, becauſe they are baſhfull and ſhamefaced. Unguents, liniments, emplaſters, cataplaſmes, that ſerve for that matter, are to bee preſcribed and applied to the ſecret parts, ligatures and frictions of the thighes and legges are not to bee omitted, fomentations and ſternutatories are to be uſed, and cupping glaſſes are to bee applied to the groines, walking, dancing, riding, often and wanton copulation with her husband, and ſuch like exerciſes, provoke

Why the veine called *baſilica* in the arme muſt be opened before the vein *ſaphena* in the foot.

Horſe-leeches to be applied to the neck of the wombe.

Plants that provoke the flowers

voke the flowers. Of plants, the flowers of St. Johns wort, the rootes of fennell, and aſparagus, bruſcus or butchers broom, of parſley, brooke-lime, baſill, balme, betony, garlicke, onions, criſta marina, coſtmary, the rinde or barke of caſſia fiſtula, calamint, origanum, pennyroyall, mugwort, thyme, hiſſope, ſage, marjoram, roſemary, horehound, rue, ſavine, ſpurge, ſaffron, agaricke, the flowers of elder, bay berries, the berries of Ivie, ſcammony, *Cantharides*, *pyrethrum* or pellitory of Spaine, *euphorbium*. The aromaticke things are *amomum*, cynamon, ſquinanth, nutmegs, *calamus aromaticus*, *cyperus*, ginger, cloves, galangall, pepper, cubibes, amber, muske, ſpiknard, and ſuch like; of all which let fomentations, fumigations, baths, broaths, boles, potions, pills, ſyrupes, apozemes, and opiates be made as the Phyſitians ſhall thinke good.

Sweet things.

An apozeme to provoke the flowers.

The apozeme that followeth is proved to be very effectuall. ℞. *fol. & flor. dictam. an.* p ii. *pimpinel.* m ß. *omnium capillar. an.* p i. *artemiſ. thymi, marjor. origan. an.* m ß. *rad. rub. major. petroſelin. fænicul. an.* ℥ i ß. *rad. pæon. biſtort. an.* ʒ ß. *cicerum rub. ſem. pæon. fænicul. an.* ʒ ß. make thereof a decoction in a ſufficient quantity of water, adding thereto cinamon ʒ iii. in one pinte of the decoction diſſolve (after it is ſtrained) of the ſyrupe of mugwort, and of hiſſope, *an.* ℥ ii. *diarrhod. abbat.* ʒ i. let it bee ſtrained through a bagge, with ʒ ii. of the kernells of dates, and let her take ℥ iiii. in the morning.

Let peſſaries bee made with *galbanum*, *ammoniacum*, and ſuch like mollifying things, beaten into a maſſe in a mortar with a hot peſtell, and made into the forme of a peſſary, and then let them be mixed with oile of Jaſmine, *euphorbium*, an oxe gall, the juice of mugwort, and other ſuch like, wherein there is power to provoke the flowers, as with ſcammony in powder: let them be as bigge as ones thumbe, ſixe fingers long, and rowled in lawne, or ſome ſuch like thinne linnen cloath; of the ſame things nodula's may bee made. Alſo peſſaries may be prepared with hony boyled, adding thereto convenient powders, as of ſcammony, pellitory, and ſuch like. Neither ought theſe to ſtay long in the necke of the wombe, leſt they ſhould exulcerate, and they muſt be pulled backe by a threed that muſt bee put through them, and then the orifice of the womb muſt be fomented with white wine of the decoction of pennyroyall or mother-wort.

What cauſes of the ſtopping of the flowers muſt be cured before the diſeaſe it ſelfe.

But it is to be noted, that if the ſuppreſſion of the flowers happeneth through the default of the ſtopped orifice of the womb, or by inflammation, theſe maladies muſt firſt bee cured before wee come unto thoſe things that of their proper ſtrength and vertue provoke the flowers: as for example, if ſuch things be made and given when the wombe is enflamed, the blood being drawne into the grieved place, and the humours ſharpened, and the body of the wombe heated, the inflammation will be encreaſed. So if there be any ſuperfluous fleſh, if there be any Callus of a wound or ulcer, or if there be any membrane ſhutting the orifice of the wombe, and ſo ſtopping the fluxe of the flowers, they muſt firſt bee conſumed and taken away before any of thoſe things bee adminiſtred. But the oportunity of taking and applying of things, muſt be taken from the time wherein the ſicke woman was wont to be purged before the ſtopping, or if ſhe never had the flowers, in the decreaſe of the moone; for ſo we ſhall have cuſtome, nature, and the externall efficient cauſe to helpe art. When theſe medicines are uſed, the women are not to bee put into bathes or hot houſes, as many doe, except the malady proceed from the denſity of the veſſels, and the groſſeneſſe and clammineſſe of the blood. For ſweats hinder the menſtruall fluxe, by diverting and turning the matter another way.

The fitteſt time to provoke the flowers.

Why hot houſes do hurt thoſe in whom the flowers are to be provoked.

Chap. LIIII.

The ſignes of the approaching of the menſtruall fluxe.

What women do love and what women doe loath the act of generation when the moneths are ſtopped.

WHen the monethly fluxe firſt approacheth, the dugges itch and become more ſwollen and hard than they were wont, the woman is more deſirous of copulation, by reaſon of the ebullition of the provoked blood, and the acrimony of the blood that remaineth, her voice becommeth bigger, her ſecret parts itch, burne, ſwell, and waxe red. If they ſtay long, ſhee hath paine in her loynes and head, nauſeouſneſſe and vomiting troubleth the ſtomacke: notwithſtanding, if thoſe matters which flow together in the wombe, either of their owne nature, or by corruption, be cold, they loath the act of generation, by reaſon that the wombe waxeth feeble through ſluggiſhneſſe and watery humours filling the ſame, and it floweth by the ſecret parts very ſoftly. Thoſe maides that are marriageable, although they have the menſtruall fluxe very well, yet they are troubled with head ache, nauſeouſneſſe, and often vomiting, want of appetite, longing, an ill habite of body, difficulty of breathing, trembling of the heart, ſwouning, melancholy, fearfull dreames, watching, with ſadneſſe and heavineſſe, becauſe that the genitall parts burning & itching, they imagine the act of generation, whereby it commeth to paſſe that the ſeminall matter, either remaining in the teſticles in great abundance, or elſe powred into the hollowneſſe of the womb, by the tickling of the genitalls, is corrupted, and acquireth a venemous quality, and cauſeth ſuch like accidents as happens in the ſuffocation of the wombe.

With what accidents thoſe that are mariageable and are not maried, are troubled.

The cauſe of ſo many accidents

Maides that live in the country are not ſo troubled with thoſe diſeaſes, becauſe there is no ſuch lying in wait for their maiden-heads, and alſo they live ſparingly and hardly, and ſpend their time in continuall labour. You may ſee many maides ſo full of juice, that it runneth in great abundance, as if they were not menſtruall, into their dugges, and is there converted into milke, which they have in as great quantity as nurſes, as we read it recorded by *Hippocrates*. If a woman which is neither great with child, nor hath born children, hath milke, ſhe wants the menſtruall fluxes; whereby you may underſtand that that concluſion is not good which affirmeth that a woman which hath milke in her breaſts, either to be delivered of childe, or to be great with childe: for *Cardanus* writeth that hee knew one *Antony Buzus* at *Genua*, who being thirty yeeres of age, had ſo much milk in his breaſts as was ſufficient to nurſe a child; for the breeding and efficient cauſe of milke proceeds not onely from the engrafted faculty of the glandulous ſubſtance, but much rather from the action of the mans ſeed; for proofe whereof you may ſee many men that have very much milk in their breaſts, and many women that almoſt have no milke, unleſſe they receive mans ſeed. Alſo women that are ſtrong and luſty like unto men, which the Latines call *Viragines*, that is to ſay, whoſe ſeed commeth unto a manly nature, when the flowers are ſtopped, concoct the blood, and therefore when it wanteth paſſage forth, by the likeneſſe of the ſubſtance it is drawne into the duggs, and becommeth perfect milk: thoſe that have the flowers plentifully and continually for the ſpace of foure or five daies, are better purged and with more happy ſucceſſe than thoſe that have them for a longer time.

Aph. 36, ſect. 5.

Lib. 2. de ſubt.

The efficient cauſe of the milke is to be noted.

Chap. LV.

What accidents follow immoderate fluxes of the flowers or courſes.

IF the menſtruall flux floweth immoderately, there alſo followes many accidents; for the cocoction is fruſtrated, the appetite overthrown, then followes coldneſſe throughout all the body, exolution of all the faculties, an ill habite of all the body, leanneſſe, the dropſie, a hecticke feaver, convulſion, ſwouning, and often ſodaine death: if any have them too exceeding immoderately, the blood is ſharpe and burning, and alſo ſtinking, the ſicke woman is troubled with a continuall feaver, and her tongue will bee dry, ulcers ariſe in the gummes and all the whole mouth. In women the flowers doe flow by the veines and arteries which riſe out of the ſpermaticke veſſels, and are ended in the bottome and ſides of the wombe, but in virgins and in women great with childe, whoſe children are ſound and healthfull, by the branches of the hypogaſtrick veine and artery, which are ſpred and diſperſed over the necke of the wombe. The cauſe of this immoderate flux is in the quantity or quality of the blood, in both the fault is unreaſonable copulation, eſpecially with a man that hath a yard of a monſtrous greatneſſe, and the diſſolution of the retentive faculty of the veſſels: oftentimes alſo the flowers flow immoderately by reaſon of a painfull & a difficult birth of the child or the after-birth, being pulled by violence from the cotyledons of the wombe, or by reaſon that the veines and arteries of the necke of the wombe are torne by the comming forth of the infant with great travell, and many times by the uſe of ſharpe medicines, and exulcerating peſſaries. Often times alſo nature avoides all the juice of the whole body critically by the wombe after a great diſeaſe, which fluxe is not raſhly or ſodainely to be ſtopped. That menſtruall blood that floweth from the wombe is more groſſe, blacke, and clotty, but that which commeth from the necke of the wombe is more cleere, liquid and red.

By what pores the flowers doe flow in a woman and in a maide.

The cauſes of an unreaſonable fluxe of blood.

The criticall fluxe of the flowers.

The ſignes of blood flowing from the womb or necke of the wombe.

Chap. LVI.

Of ſtopping the immoderate flowing of the flowers or courſes.

YOu muſt make choice of ſuch meats and drinkes as have power to incraſſate the blood, for as the flowers are provoked with meats that are hot, and of ſubtle parts, ſo they are ſtopped by ſuch meates as are cooling, thickening, aſtringent and ſtipticke, as are barly waters, ſodden rice, the extreme parts of beaſts, as of oxen, calves, ſheep, either fryed or ſodden with ſorrell, purſlaine, plantaine, ſhepheards purſe, ſumach, the buds of brambles, berberries, and ſuch like. It is ſuppoſed that a harts horne burned, waſhed, and taken in aſtringent water, will ſtoppe all immoderate fluxes; likewiſe *ſanguis draconis, terra ſigillata, bolus armenus, lapis hæmatites*, corall beaten into moſt ſubtle powder and drunke in ſteeled water; alſo pappe made with milk, wherein ſteele hath often times been quenched, and the floure of wheat, barly, beanes or rice, is very effectuall for the ſame. Quinces, cervices, medlars, cornelian berries, or cherries may likewiſe be eaten at the ſecond courſe, Juleps are to be uſed of ſteeled waters, with the ſyrupe of dry roſes, pomegranates, ſorrell, myrtles, quinces, or old conſerves of red roſes, but wine is to bee avoided: but if the ſtrength be ſo extenuated that they require it, you muſt chooſe groſſe and aſtringent wine tempered with ſteeled water; exerciſes are to be ſhunned, eſpecially venereous exerciſes, anger is to bee avoided, a cold aire is to be choſen, which, if it be not ſo naturally, muſt bee made ſo by ſprinkeling cold things on the ground, eſpecially if the ſummer or heat bee then in his full ſtrength; ſound ſleeping ſtayes all evacuations except ſweating. The opening of a

The inſtitution or order of life.

veine in the arme, cupping glaſſes faſtened on the breaſts, bands, and painfull frictions of the upper parts are greatly commended in this malady.

Purging.

But if you perceive that the cauſe of this accident lieth in a cholerick ill juice mixed with the blood, the body muſt bee purged with medicines that purge choler and water, as Rubarbe, Myrobalanes, Tamarinds, Sebeſtens, and the purging ſyrupe of roſes.

Chap. LVII.

Of locall medicines to bee uſed againſt the immoderate flowing of the Courſes.

An unguent.

ALſo unguents are made to ſtay the immoderate fluxe of the tearmes, and likewiſe injections and peſſaries This or ſuch like may bee the forme of an unguent. ℞. *ol. maſtich. & myrt. an.* ʒ ii. *nucum cupreſ. olibani, myrtil. an.* ʒ ii. *ſucci roſar. rubr.* ℥ i. *pulv. maſtichin.* ℥ ii. *boli armen. terræ ſigillat. an.* ʒ ß. *ceræ quantum ſufficit, fiat unguentum.* An injection may be thus made. ℞. *aq. plantag. roſar. rubrar. burſæ paſtor. centinodii, an.* ℔ ß. *corticis querni, nucum cupreſſi, gallar. non maturar. an.* ʒ ii. *berberis, ſumach. balauſt. alumin. roch. an.* ʒ i. make thereof a decoction, and inject it with a ſyringe blunt pointed into the wombe, leſt if it ſhould be ſharpe it might hurt the ſides of the necke of the wombe; alſo ſnailes beaten with their ſhells and applied to the navell, are very profitable. Quinces roaſted under the coals, and incorporated with the powder of myrtills, and bole armenick, and put into the necke of the wombe, are marvellous effectuall for this matter. The forme of a peſſary may be thus. ℞. *gallar. immaturar. combuſt. & in aceto extinctar.* ʒ ii. *ammo.* ʒ ß. *ſang. dracon. pul. rad. ſymphyt. ſumach. maſtich. ſucci acaciæ, cornu cer. uſt. colophon, myrrhæ, ſcoriæ ferri, an.* ʒ i. *caphur.* ℈ ii. mixe them, and incorporate them all together with the juice of knot-graſſe, ſyngreen, night-ſhade, henbane, water lillies, plantaine, of each as much as is ſufficient, and make thereof a peſſary:

An aſtringent injection.

Aſtringent peſſaries.

Cooling things, as oxycrate, *unguentum roſatum,* and ſuch like, are with great profit uſed to the region of the loines, thighes, and genitall parts: but if this immoderate flux doe come by eroſion, ſo that the matter thereof continually exulcerateth the necke of the wombe, let the place be anointed with the milke of a ſhee Aſſe, with barly water, or binding and aſtringent mucelages, as of *pſilium,* quinces, gumme tragacanth, arabicke, and ſuch like.

Chap. LVIII.

Of womens fluxes, or the Whites.

The reaſon of the name.

The differences

BEſides the forenamed fluxe, which by the law of nature happeneth to women monethly, there is alſo another called a womans fluxe, becauſe it is onely proper and peculiar to them: this ſometimes wearieth the woman with a long and continuall diſtillation from the wombe, or through the wombe, comming from the whole body without paine, no otherwiſe than when the whole ſuperfluous filth of the body is purged by the reines or urine; ſometimes it returneth at uncertaine ſeaſons, and ſometimes with pain and exulcerating the places of the wombe: it differeth from the menſtruall fluxe, becauſe that this for the ſpace of a few dayes, as it ſhall ſeeme convenient to nature, caſteth forth laudable blood, but this womans fluxe yeeldeth impure ill juice, ſometimes ſanious, ſometimes ſerous and livide, otherwhiles white and thicke, like unto barly creame, proceeding from flegmaticke blood: this laſt kind thereof is moſt frequent. Therefore wee ſee women that are flegmaticke, and of a ſoft and looſe habite of body, to be often troubled with this diſeaſe, and therefore they will ſay among themſelves

What women are apt to this fluxe.

ſelves that they have the whites. And as the matter is divers, ſo it will ſtaine their ſmockes with a different colour. Truely if it bee perfectly red and ſanguine, it is to be thought that it commeth by erroſion, or the exolution of the ſubſtance of the veſſels of the wombe, or of the necke thereof: therefore it commeth very ſeldome of blood, and not at all except the woman be either great with childe, or ceaſe to bee menſtruall for ſome other cauſe; for then in ſtead of the monethly fluxe there floweth a certaine whayiſh excrement, which ſtaineth her cloaths with the colour of water wherein fleſh is waſhed.

Womens fluxe commeth very ſeldome of blood.

Alſo it very ſeldome proceeds of a melancholy humour, and then for the moſt part it cauſeth a cancer in the wombe. But often times the purulent and bloody matter of an ulcer lying hidden in the wombe, deceiveth the unskilfull Chirurgian or Phyſitian: but it is not ſo hard to know theſe diſeaſes one from the other; for the matter that floweth from an ulcer, becauſe (as it is ſaid) it is purulent, it is alſo leſſer, groſſer, ſtinking, and more white. But thoſe that have ulcers in thoſe places, eſpecially in the necke of the wombe, cannot have copulation with a man without paine.

By what ſignes an ulcer in the wombe may be known from the white flowers.

Chap. LIX.

Of the cauſes of the Whites.

Sometimes the cauſe of the whites conſiſteth in the proper weakneſſe of the wombe, or elſe in the uncleanneſſe thereof, and ſometimes by the default of the principall parts. For if the brain or the ſtomacke be cooled, or the liver ſtopped or ſchirrous, many crudities are engendered, which if they runne or fall downe into the wombe that is weake by nature, they cauſe the fluxe of the wombe, or whites: but if this fluxe be moderate and not ſharpe, it keepeth the body from maligne diſeaſes; otherwiſe it uſeth to inferre a conſumption, leanneſſe, paleneſſe, and an œdematous ſwelling of the legges, the falling downe of the wombe, the dejection of the appetite and all the faculties, and continuall ſadneſſe and ſorrowfulneſſe; from which it is very hard to perſwade the ſicke woman, becauſe that her minde and heart will bee almoſt broken, by reaſon of the ſhame that ſhee taketh becauſe ſuch filth floweth continually; it hindereth conception, becauſe it either corrupteth, or driveth out the ſeed when it is conceived. Often times, if it ſtoppeth for a few moneths, the matter that ſtayeth there cauſeth an abſceſſe about the wombe in the body or necke thereof, and by the breaking of the abſceſſe there followeth rotten and cancerous ulcers, ſometimes in the wombe, ſometimes in the groine, and often in the hippes.

How a womans fluxe is wholſome.

How it cauſeth diſeaſes.

How it letteth the conception.

This diſeaſe is hard to bee cured, not onely by reaſon of it ſelfe, as becauſe all the whole filth and ſuperfluous excrements of a womans body floweth downe into the womb, as it were into a ſink, becauſe it is naturally weak, hath an inferiour ſituation, many veſſells ending therein; and laſt of all, becauſe the courſes are wont to come through it; as alſo by reaſon of the ſicke woman, who often times had rather dye than to have that place ſeene, the diſeaſe knowne, or permit locall medicines to bee applied thereto: for ſo ſaith *Montanus*, that on a time hee was called to a noble woman of *Italy* who was troubled with this diſeaſe, unto whom hee gave counſell to have cleanſing decoctions injected into her wombe, which when ſhee heard, ſhe fell into a ſwoune, and deſired her husband never thereafter to uſe his counſell in any thing.

Why it is hard to be cured.

A hiſtory.

Chap. LX.

The cure of the Whites.

If the fluxe of a woman be red, wherein it differeth from the menſtruall flux.

A womans flux is not ſuddenly to be ſtopped.

What baths are profitable.

An aſtringent injection.

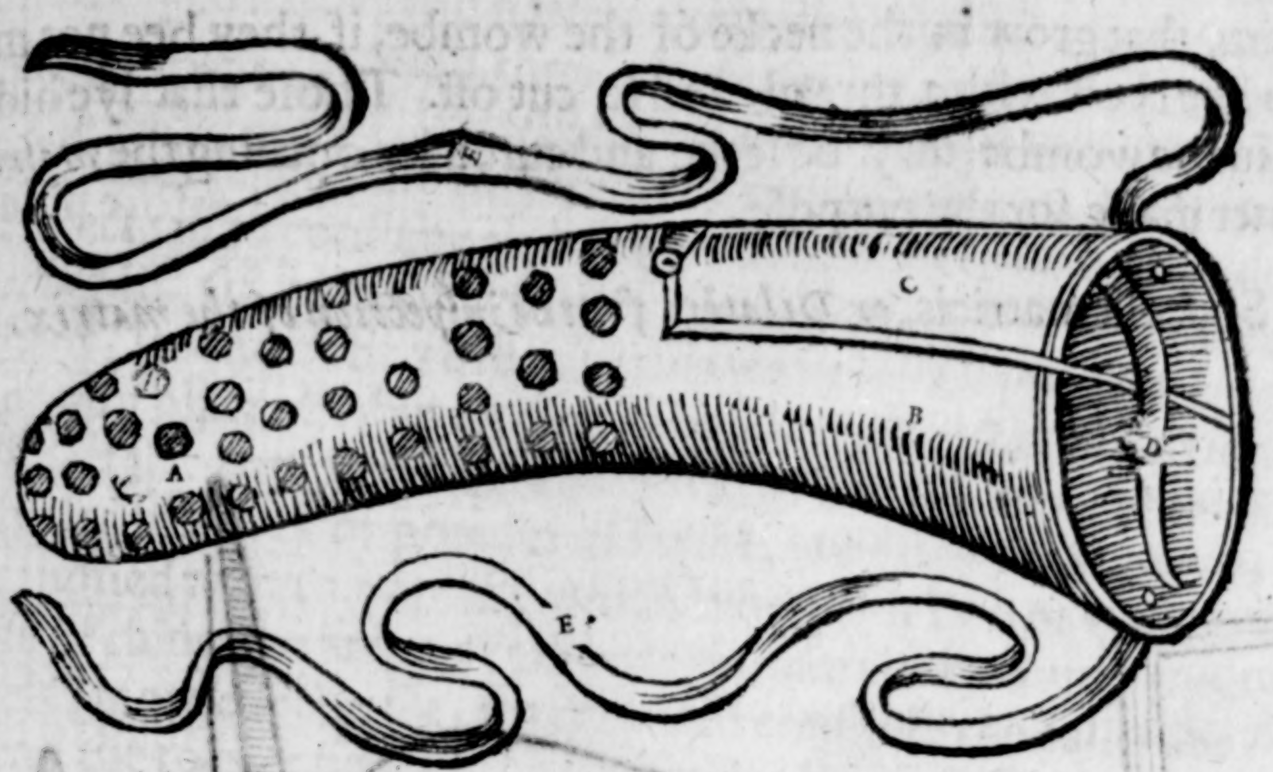
IF the matter that floweth out in this diſeaſe bee of a red colour, it differeth from the naturall monthly fluxe in this onely, becauſe it keeps no order or certain time in its returning. Therfore phlebotomy and other remedies which we have ſpoken of, as requiſite for the menſtruall fluxe when it floweth immoderately, is here neceſſary to be uſed. But if it bee white, or doth teſtifie or argue the ill juice of this or that humour by any other colour, a purgation muſt be preſcribed of ſuch things as are proper to the humour that offends: for it is not good to ſtop ſuch a flux ſuddenly; for it is neceſſary, that ſo the body ſhould be purged of ſuch filth or abundance of humours: for they that doe haſten to ſtop it, cauſe the dropſie, by reaſon that this ſinke of humours is turned backe into the liver; or elſe a cancer in the womb, becauſe it is ſtayed there; or a feaver, or other diſeaſes, according to the condition of the part that receiveth it. Therefore we muſt not come to locall deterſives, deſiccatives, reſtrictives, unleſſe we have firſt uſed univerſall remedies according to art. Alom baths, baths of brimſtone, and of bitumen, or iron, are convenient for the whites that come of a phlegmaticke humour; inſtead whereof bathes may bee made of the decoction of herbes that are hot, dry, and endued with an aromaticke power, with alome and pebbles, or flint-ſtones red hot throwne into the ſame. Let this bee the forme of a cleanſing decoction and injection. ℞. *fol. abſynth. agrimon. centinod. burſ. paſt. an.* m ß. boyle them together, and make thereof a decoction, in which diſſolve *mellis roſar.* ℥ ii. *aloes, myrrhæ, ſalis nitri, an.* ʒ i. make thereof an injection, the woman being ſo placed on a pillow under her buttockes that the necke of the wombe being more high, may be wide open: when the injection is received, let the woman let her legges acroſſe, and draw them up to her buttockes, and ſo ſhee may keepe that which is injected. They that endeavour to dry and bind more ſtrongly, adde the juice of *acatia*, greene galles, the rindes of pomegranates, roch alome, romane vitrioll, and they boile them in Smithes water and red wine; peſſaries may be made of the like faculty.

The ſignes of a putrefyed ulcer in the wombe.

The virulent *Gonorrhæa* is like unto the fluxe of women.

If the matter that commeth forth be of an ill colour or ſmell, it is like that there is a rotten ulcer; therefore we ought to inject thoſe things that have power to correct the putrefaction: among which *ægyptiacum*, diſſolved in lye or red wine, excelleth. There are women which when they are troubled with a virulent *Gonorrhæa*, or an involuntary fluxe of the ſeed, cloaking the fault with an honeſt name, doe untruly ſay that they have the whites, becauſe that in both theſe diſeaſes a great abundance of filth is voided. But the Chyrurgian may eaſily perceive that malady by the rottenneſſe of the matter that floweth out, and hee ſhall perſwade himſelfe that it will not bee cured without ſalivation or fluxing at the mouth, and ſweats. In the meane while let him put in an inſtrument made like unto a peſſary, and cauſe the ſicke woman to hold it there: this inſtrument muſt have many holes in the upper end, through which the purulent matter may paſſe, which by ſtaying or ſtopping might get a ſharpneſſe; as alſo that ſo the womb may breathe the more freely, and may be kept more temperate and coole by receiving the aire, by the benefit of a ſpring whereby this inſtrument, being made like unto a peſſary, is opened and ſhut.

The forme of an inſtrument made like unto a peſſary, whereby the wombe may bee ventilated.



A. *ſheweth the end of the inſtrument, which muſt have many holes therein.*
B. *ſheweth the body of the inſtrument.*
C. *ſheweth the plate whereby the mouth of the inſtrument is opened and ſhut, as wide and as cloſe as you will, for to receive the aire more freely.*
D. *ſheweth the ſpring.*
E E *ſhew the laces and bands to tye about the patients body, that ſo the inſtrument may be ſtayed and kept faſt in his place.*

CHAP. LXI.

Of the hœmorrhoides and wartes of the necke of the wombe.

Like as in the fundament, ſo in the necke of the wombe there are hœmorrhoides, and as it were varicous veines, often times flowing with much blood, or with a red and ſtinking whayiſh humor. Some of theſe by reaſon of their redneſſe and great inequality as it were of knobs, are like unripe mulberries, and are called vulgarly *venæ morales*, that is to ſay, the veines or hœmorrhoides like unto mulberries; others are like unto grapes, and therefore are named *uvales*; other ſome are like unto warts, and therefore are called *venæ verrucales*; ſome appeare & ſhew themſelves with a great tumour, others are little and in the bottome of the neck of the wombe, others are in the ſide or edge thereof. *Achrochordon* is a kinde of wart with a callous bunch or knot, having a thin or ſlender root, and a greater head, like unto the knot of a rope, hanging by a ſmall thread; it is called of the Arabians, *verruca botoralis.*

The differences of the hœmorrhoides of the necke of the wombe.

What an *Acrochordon* is.

There is alſo another kinde of wart, which becauſe of his great roughneſſe and unequality is called *thymus*, as reſembling the flower of Thyme. All ſuch diſeaſes are exaſperated and made more grievous by any exerciſe, eſpecially by venereous acts: many times they have a certaine malignity, and an hidden virulency joyned with them, by occaſion whereof they are aggravated even by touching onely, becauſe they have their matter of a raging humour: therefore to theſe we may not rightly uſe a true, but onely the palliative cure, as they terme it: the Latines call them onely *ficus*, but the French men name them with an adjunct, St. *Fiacrius* figges.

What a *thymus* is.

St. *Fiacrius* figges.

CHAP.

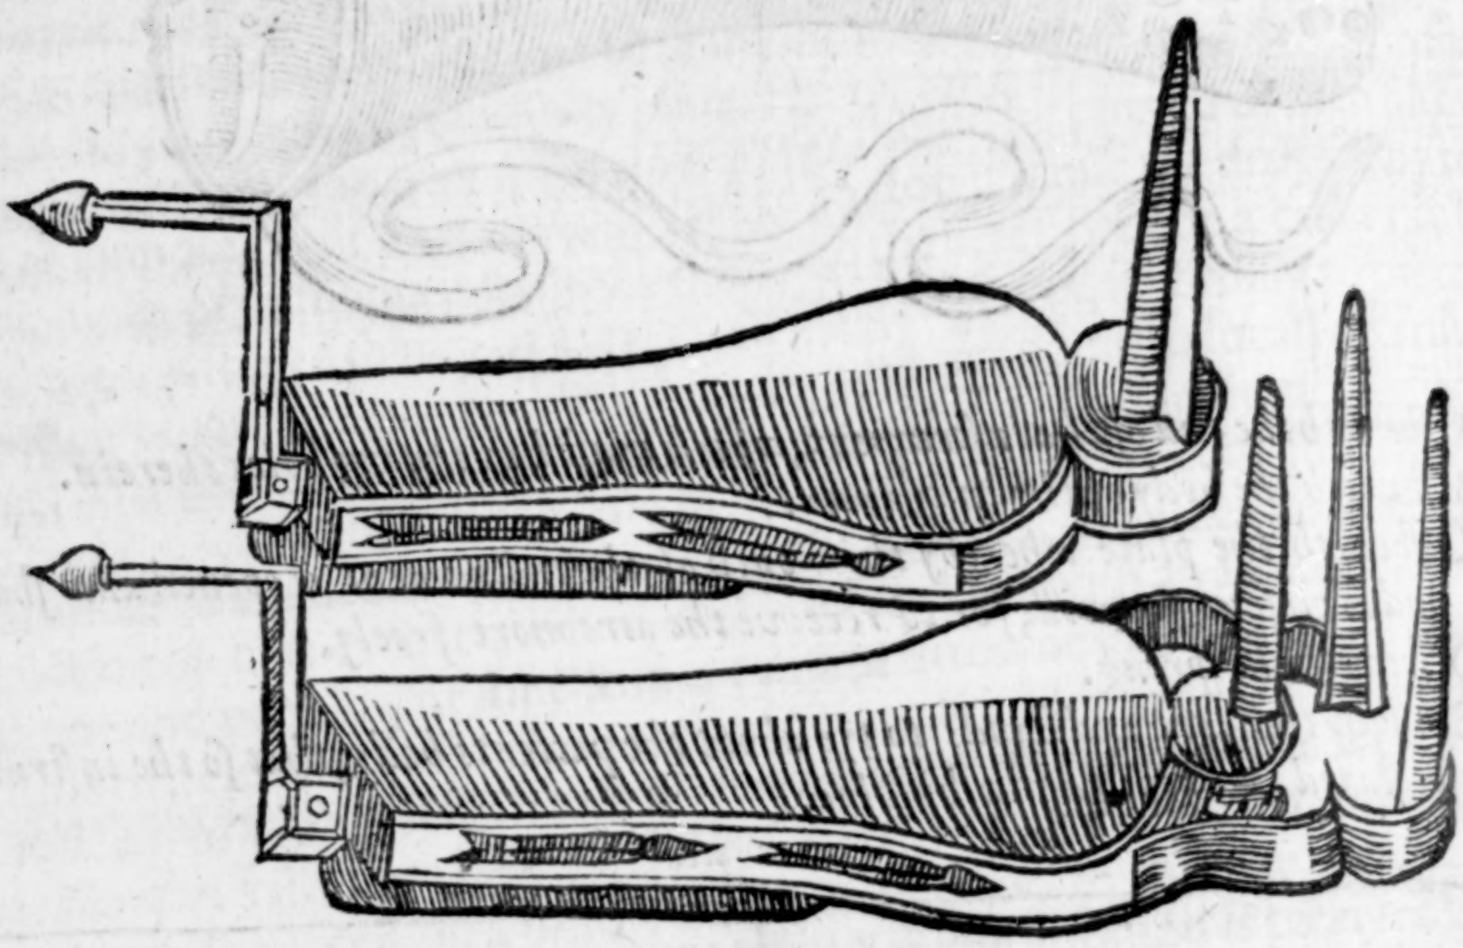
CHAP. LXII.

Of the cure of the Warts that are in the necke of the wombe.

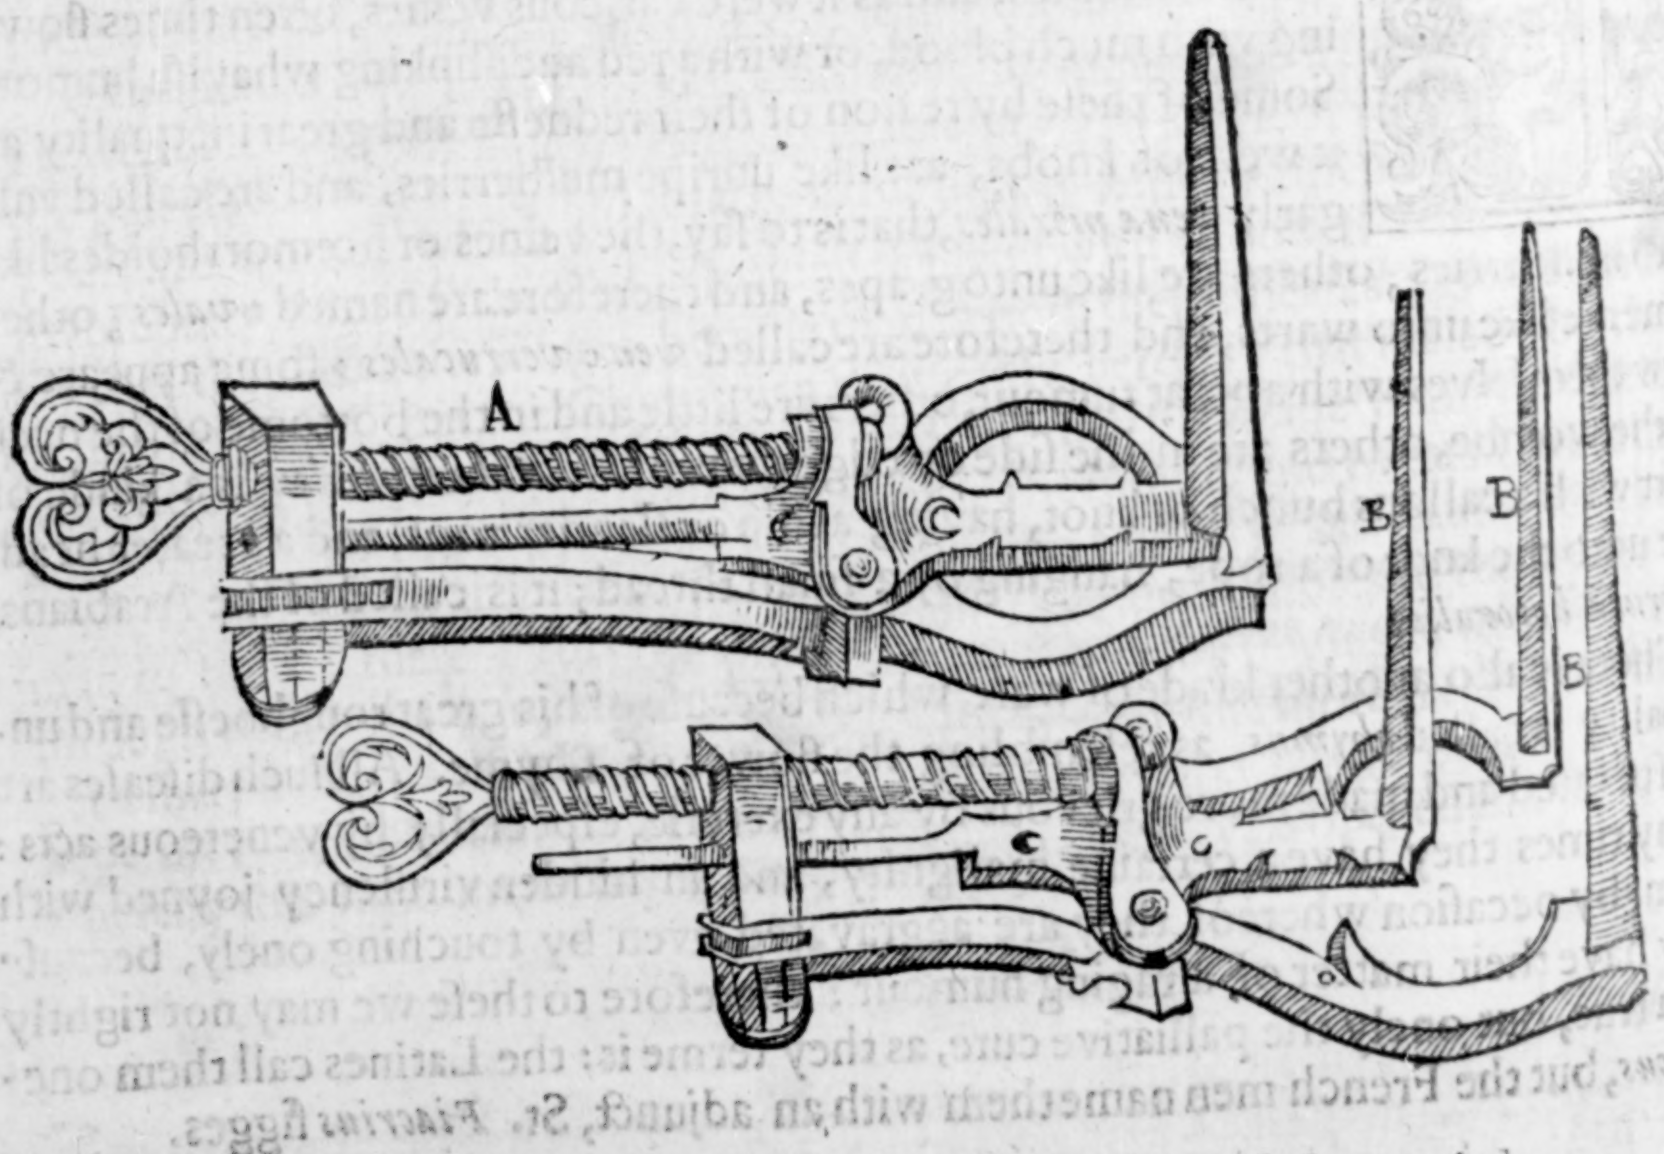
What warts of the womb muſt be bound and ſo cut off.

THe warts that grow in the necke of the wombe, if they bee not maligne are to bee tyed with a thread, and ſo cut off. Thoſe that lye hid more deep in the wombe, may be ſeene and cured by opening the *matrix* with a dilater made for the purpoſe.

Divers Specula matricis, *or Dilators for the inſpection of the matrix.*



An other forme of a dilater or Speculum matricis, *whereof the declaration followeth.*



A. *ſheweth the ſcrew which ſhutteth and openeth the dilater of the matrix.*

B.B. *ſhew the armes or branches of the inſtrument, which ought to be eight or nine fingers long.*

But theſe dilaters of the matrix ought to be of a bigneſſe correſpondent to the patients body; let them be put into the matrix when the woman is placed as wee have ſaid, when the child is to be drawne out of her body. That inſtrument is moſt meet to tye the warts, which wee have deſcribed in the relaxation of the palate or *Uvula*: let them bee tyed harder and harder every day untill they fall away. Therefore for the curing of warts there are three chiefe ſcopes, as bands, ſections, cauteries; and leſt they grow up againe, let oyle of vitrioll be dropped on the place, or *aqua fortis*, or ſome of the lye wherewith potentiall cauteries are made. This water following is moſt effectuall to conſume and waſte warts. ℞. *aq. plantag.* ℥ vi. *virid. æris*, ʒ ii. *alum. roch.* ʒ iii. *ſal. com.* ℥ ß. *vit. rom. & ſublim. an.* ʒ ß. beat them all together, and boile them; let one or two drops of this water be dropped on the grieved place, not touching any place elſe; but if there be an ulcer, it muſt be cured as I have ſhewed before. A certain man, ſtudious of phyſick, of late affirmed to me that oxe dung tempered with the leaves or powder of ſavine, would waſte the warts of the wombe, if it were applied thereto warme; which whether it be true or not, let experience, the miſtreſſe of things, be judge: verily *cantharides* put into unguents, will doe it, and (as it is likely) more effectually; for they will conſume the callouſneſſe which groweth betweene the toes or fingers. I have proved by experience that the warts that grow on the hands, may be cured by applying of purſlain beaten or ſtampt in its own juice. The leaves and flowers of marigolds doe certainely performe the ſelfe ſame thing.

Three ſcopes of the cure of warts in the wombe.

An effectuall water to conſume warts.

Unguents to conſume warts.

CHAP. LXIII.

Of chaps, and thoſe wrinkled and hard excreſcences which the greeks call Condylomata.

Chapps or fiſſures, are cleft and very long little ulcers, with paine very ſharpe and burning, by reaſon of the biting of an acride, ſalt and drying humour, making ſo great a contraction, and often times narrowneſſe in the fundament and the necke of the wombe, that ſcarcely the toppe of ones finger may be put into the orifice thereof, like unto pieces of leather or parchment, which are wrinkled and parched by holding of them to the fire. They riſe ſometimes in the mouth, ſo that the patient can neither ſpeake, eat, nor open his mouth, ſo that the Chirurgian is conſtrained to cut it. In the cure thereof, all ſharpe things are to be avoided, and thoſe which mollifie are to be uſed, and the grieved part or place is to be moiſtened with fomentations, liniments, cataplaſmes, emplaſters, and if the malady bee in the wombe, a dilater of the matrix or peſſary muſt be put thereinto very often, ſo to widen that which is over hard, & too much drawn together or narrow, and then the cleft little ulcers muſt be cicatrized.

What chaps are.

The cure.

Condylomata are certaine wrinkled and hard bunches, and as it were excreſcences of fleſh, riſing eſpecially in the wrinkled edges of the fundament and neck of the womb. Cooling and relaxing medicines ought to be uſed againſt this diſeaſe, ſuch as are oile of egges, and oyle of linſeed, take of each of them two ounces, beat them together a long time in a leaden mortar, and therewith anoint the grieved part; but if there be an inflammation, put thereto a little camphire.

What *condylomata* are.

The cure.

CHAP. LXIV.

Of the itching of the wombe.

IN women, eſpecially ſuch as are old, there often times commeth an itching in the neck of the wombe, which doth ſo trouble them with pain and a deſire to ſcratch, that it taketh away their ſleep. Not long ſince a woman asked my counſell, that was ſo troubled with this kind of malady, that ſhe was conſtrained to extinguiſh or ſtay the itching burning of her

What the itch of the womb is.

A hiſtory.

The cauſe of the itch.

The vertue of *unguent. enulat.*

her ſecret parts by ſprinkling cinders of fire, and rubbing them hard on the place, I counſelled her to take *agypt.* diſſolved in ſea-water or lye, & inject it into her ſecret parts with a ſyringe, and to wet ſtupes of flaxe in the ſame medicine, and put them up into the wombe, and ſo ſhe was cured. Many times this itch commeth in the fundament or teſticles of aged men, by reaſon of the gathering together or confluxe of ſalt flegme, which when it falleth into the eyes, it cauſeth the patient to have much adoe to refraine ſcratching: when this matter hath diſperſed it ſelfe into the whole habite of the body, it cauſeth a burning or itching ſcabbe, which muſt be cured by a cooling and a moiſtening diet, by phlebotomy and purging of the ſalt humour, by bathes and hornes applied, with ſcarification and anointing of the whole body with the unction following. ℞. *axung. porcin. recent.* ℔ i ß. *ſap. nig. vel gallici, ſalis nitri, aſſat. tartar. ſtaphiſag. an.* ℥ ß. *ſulph. viv.* ℥ i. *argent. viv.* ℥ ii. *acet. roſ. quart.* i. incorporate them all together, and make thereof a liniment according to art, and uſe it as is ſaid before: *unguentum enulatum cum mercurio* is thought to have great force, not without deſert, to aſſwage the itch, and dry the ſcab. Some uſe this that followeth. ℞. *alum. ſpum. nitr. ſulph. viv. an.* ʒ vi. *ſtaphiſ.* ℥ i. let them all be diſſolved in vinegar of roſes, adding thereto *butyr. recent. q. ſ.* make thereof a liniment for the forenamed uſe.

CHAP. LXV.

Of the relaxation of the great gut or inteſtine, which happeneth to women.

The cauſe.

The cure.

An effectuall remedy.

The differences and ſignes.

A hiſtory.

MAny women that have had great travell and ſtraines in child-birth, have the great inteſtine (called of the Latines *craſſum inteſtinum*) or gut, relaxed and ſlipped down; which kind of affect happeneth much to children, by reaſon of a phlegmaticke humour moiſtening the ſphincter muſcle of the fundament, and the two others called *levatores*. For the cure thereof, firſt of all the gut called *rectum inteſtinum* or the ſtraight gut, is to be fomented with a decoction of heating and reſolving herbes, as of ſage, roſemary, lavander, thyme, and ſuch like; and then of aſtringent things, as of roſes, myrtills, the rinds of pomegranats, cypreſſe nuts, galles, with a little alome, then it muſt be ſprinkled with the pouder of things that are aſtringent without biting, and laſt of all it is to be reſtored and gently thruſt into its place. That is ſuppoſed to bee an effectuall and ſingular remedy for this purpoſe, which is made of twelve red ſnailes put into a pot with ℥ ß. of alome, and as much of ſalt, and ſhaken up and down a long time, for ſo at length when they are dead there will remaine an humour, which muſt bee put upon cotton, and applied to the gut that is fallen downe. By the ſame cauſe (that is to ſay of painefull childe-birth in ſome women) there ariſeth a great ſwelling in the navell; for when the *peritonæum* is relaxed or broken, ſometimes the Kall, and ſometimes the guts ſlippe out: many times flatulencies come thither: the cauſe, as I now ſhewed, is over great ſtraining or ſtretching of the belly, by a great burthen carried in the wombe, and great travaile in childe-birth: if the fallen downe guts make that tumour, paine joyned together with that tumour doth vexe the patient, and if it be preſſed you may heare the noiſe of the guts going backe againe: if it be the Kall, then the tumour is ſoft, and almoſt without pain, neither can you heare any noiſe by compreſſion: if it be winde, the tumour is looſe and ſoft, yet it is ſuch as will yeeld to the preſſing of the finger with ſome ſound, and will ſoone returne againe: if the tumour be great, it cannot be cured unleſſe the *peritonæum* bee cut, as it is ſaid in the cure of ruptures. In the church-porches of *Paris* I have ſeene begger-women, who by the falling downe of the guts, have had ſuch tumours as big as a bowle, who notwithſtanding could goe, and doe all other things as if they had beene ſound and in perfect health: I think it was becauſe the *fæces* or excrements, by reaſon of the greatneſſe of the tumor, and the bigneſſe or wideneſſe of the inteſtines, had a free paſſage in and out.

Chap. LXVI.

Of the relaxation of the navell in children.

OFten times in children newly borne, the navell ſwelleth as bigge as an egg, becauſe it hath not bin well cut or bound, or becauſe the whayiſh humours are flowed thither, or becauſe that part hath extended it ſelfe too much by crying, by reaſon of the paines of the fretting of the childes guts, many times the childe bringeth that tumour joined with an abſceſſe with him from his mother wombe: but let not the Chirurgian aſſay to open that abſceſſe, for if it be opened, the guts come out through the inciſion, as I have ſeene in many, and eſpecially in a child of my Lord *Martigues*; for when *Peter* of the Rocke, the Chirurgian, opened an abſceſſe that was in it, the bowels ranne out at the inciſion, and the infant died; and it wanted but little that the Gentlemen of my Lords retinue that were there, had ſtrangled the Chirurgian. Therefore when *John Gromontius* the Carver deſired me, and requeſted mee of late that I would doe the like in his ſonne, I refuſed to doe it, becauſe it was in danger of its life by it already, and in three daies after the abſceſſe broke, and the bowells guſhed out, and the childe died.

An abſceſſe not to be opened.

A hiſtory.

Chap. LXVII.

Of the paine that children have in breeding of teeth.

CHildren are greatly vexed with their teeth, which cauſe great paine when they begin to break, as it were, out of their ſhell or ſheath, and begin to come forth, the gummes being broken, which for the moſt part happeneth about the ſeventh month of the childs age. This pain commeth with itching and ſcratching of the gummes, an inflammation, fluxe of the belly, whereof many times commeth a feaver, falling of the hair, a convulſion, and at length death. The cauſe of the paine is the ſolution of the continuity of the gummes by the comming forth of the teeth. The ſignes of that pain is an unaccuſtomed burning, or heat of the childes mouth, which may bee perceived by the nurſe that giveth it ſucke, a ſwelling of the gummes and cheekes, and the childes being more wayward and crying than it was wont, and it will put its fingers to its mouth, and it will rubbe them on its gummes as though it were about to ſcratch, and it ſlavereth much. That the Phyſitian may remedy this, hee muſt cure the nurſe as if ſhe had the feaver, and ſhee muſt not ſuffer the childe to ſucke ſo often, but make him coole and moiſt when hee thirſteth by giving him at certaine times *ſyrupus alexandrinus*, *ſyrup. de limonibus*, or the ſyrupe of pomegranats with boiled water; yet the childe muſt not hold thoſe things that are actually cold long in his mouth, for ſuch by binding the gums, doe in ſome ſort ſtay the teeth that are newly comming forth; but things that lenifie and mollifie are rather to bee uſed, that is to ſay, ſuch things as doe by little and little relaxe the looſe fleſh of the gummes, and alſo aſſwage the paine. Therefore the nurſe ſhall often times rubbe the childs gummes with her fingers, anointed or beſmeared with oyle of ſweet almonds, freſh butter, hony, ſugar, mucilage of the ſeeds of *pſilium*, or of the ſeeds of marſh mallowes extracted in the water of pellitory of the wall. Some thinke that the braine of a hare, or of a ſucking pig roſted or ſodden, through a ſecret property, are effectuall for the ſame: and on the outſide ſhall be applied a cataplaſme of barly meale, milke, oyle of roſes, and the yelkes of egges. Alſo a ſticke of liquorice ſhaven and bruiſed and anointed with hony, or any of the forenamed ſyrupes, and often rubbed in the mouth or on the gummes, is likewiſe profitable: ſo is alſo any toy for the childe to play withall, wherein a wolves tooth is ſet, for this by ſcratching doth aſſwage the painfull itching, and rarifie the gummes, and in ſome weareth them that the teeth appeare the ſooner. But many times it happeneth that

The time of breeding of the teeth.

The cauſe of the paine in breeding teeth.

The ſignes.

The cure.

What power ſcratching of the gums hath to aſſwage the pain of them.

all theſe and ſuch like medicines profit nothing at all, by reaſon of the contumacy of the gums, by hardneſſe or the weakneſſe of the childes nature: therefore in ſuch a cauſe, before the forenamed mortall accidents come, I would perſwade the Chirurgian to open the gummes in ſuch places as the teeth bunch out with a little ſwelling, with a knife or lancet, ſo breaking and opening a way for them, notwithſtanding that a little fluxe of blood will follow by the tenſion of the gummes: of which kind of remedy I have with proſperous and happy ſucceſſe made tryall in ſome of mine owne children, in the preſence of *Feureus*, *Altinus*, and *Cortinus*, Doctors of Phyſick, and *Guillemeau* the Kings Chirurgian, which is much better and more ſafe than to doe as ſome nurſes doe, who taught onely by the inſtinct of nature, with their nailes and ſcratching, breake and teare, or rent the childrens gummes. The Duke of *Nevers* had a ſonne of eight moneths old, which died of late, and when wee, with the Phyſitians that were preſent, diligently ſought for the cauſe of his death, we could impute it unto nothing elſe, than to the contumacious hardneſſe of the gums, which was greater than was convenient for a childe of that age; for therefore the teeth could not breake forth, nor make a paſſage for themſelves to come forth: of which our judgement this was the tryall, that when we cut his gummes with a knife, we found all his teeth appearing as it were in an array, ready to come forth, which if it had bin done when he lived, doubtleſſe he might have beene preſerved.

A hiſtory.

The End of the twenty fourth Booke.

OF MONSTERS AND PRODIGIES.

The Twenty Fifth Book.

The Preface.

Wee call Monſters, what things ſoever are brought forth contrary to the common decree and order of nature. So wee terme that infant monſtrous, which is borne with one arme alone, or with two heads. But we define Prodigies, thoſe things which happen contrary to the whole courſe of nature, that is, altogether differing and diſſenting from nature: as, if a woman ſhould bee delivered of a Snake, or a Dogge. Of the firſt ſort are thought all thoſe, in which any of thoſe things, which ought, and are accuſtomed to bee, according to nature, is wanting, or doth abound, is changed, worne, covered or defended, hurt, or not put in his right place: for ſomtimes ſome are born with more fingers than they ſhould, otherſome but with one finger: ſome with thoſe parts devided which ſhould be joyned, others with thoſe parts joyned which ſhould bee devided: ſome are borne with the privityes of both ſexes, male and female. And Ariſtotle ſaw a Goate with a horne upon her knee. No living creature was ever borne which wanted the Heart, but ſome have beene ſeene wanting the Spleene, others with two Spleenes, and ſome wanting one of the Reines. And none have bin known to have wanted the whole Liver, although ſome have bin found that had it not perfect and whole: and there have beene thoſe which wanted the Gall, when by nature they ſhould have had it: and beſides, it hath beene ſeene that the Liver, contrary to his naturall ſite, hath lien on the left ſide, and the Spleene on the right. Some women alſo have had their privities cloſed, and not perforated, the membranous obſtacle, which they call the Hymen, *hindering. And men are ſometimes borne with their fundaments, eares, noſes, and the reſt of the paſſages ſhut, and are accounted monſtrous, nature erring from its entended ſcope. But to conclude, thoſe Monſters are thought to portend ſome ill, which are much differing from their nature.*

What a monſter is.

What a prodigie is.

Lib. 4. gen. anim. cap. 4.

CHAP. I.

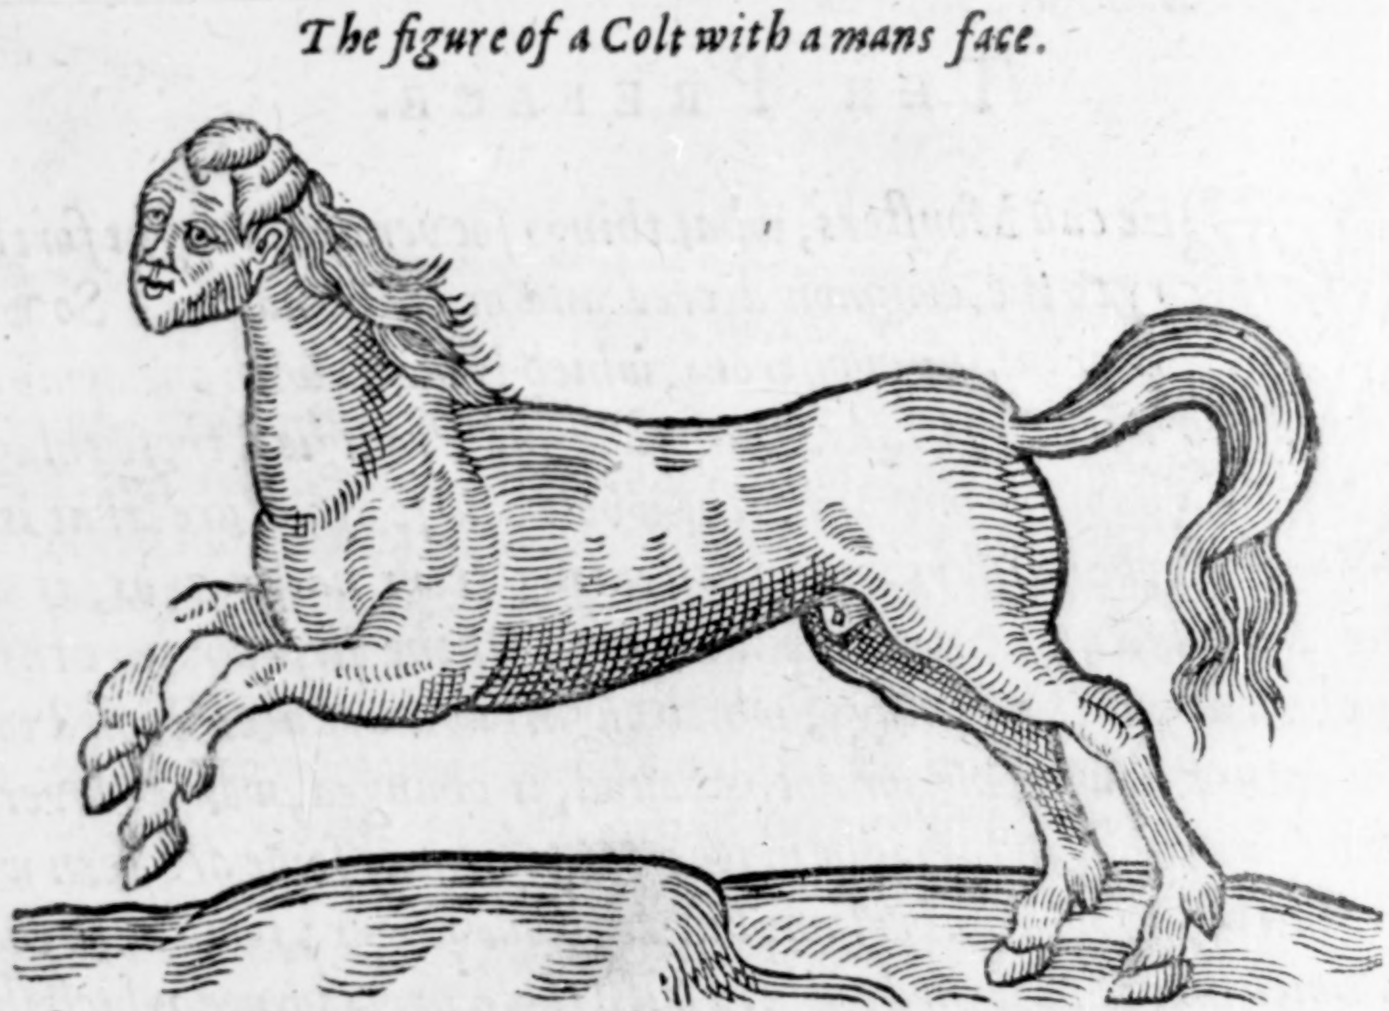
Of the cauſe of Monſters; and firſt of thoſe Monſters which appeare for the glory of God, and the puniſhent of mens wickedneſſe.

THere are reckoned up many cauſes of monſters; the firſt whereof is the glory of God, that his immenſe power may be manifeſted to thoſe which are ignorant of it, by the ſending of thoſe things which happen contrary to nature: for thus our Saviour Chriſt anſwered the Diſciples (asking whether he or his parents had offended, who, being born blind, received his ſight from him) that neither he nor his parents had committed any fault ſo great, but this to have happened onely that the glory and majeſty of God ſhould be divulged by that miracle, and ſuch great workes.

Another cauſe is, that God may either puniſh mens wickedneſſe, or ſhew ſignes of puniſhment at hand, becauſe parents ſometimes lye and joine themſelves together without law and meaſure, or luxuriouſly and beaſtly, or at ſuch times as they ought to forbeare by the command of God and the Church, ſuch monſtrous, horrid and unnaturall births doe happen.

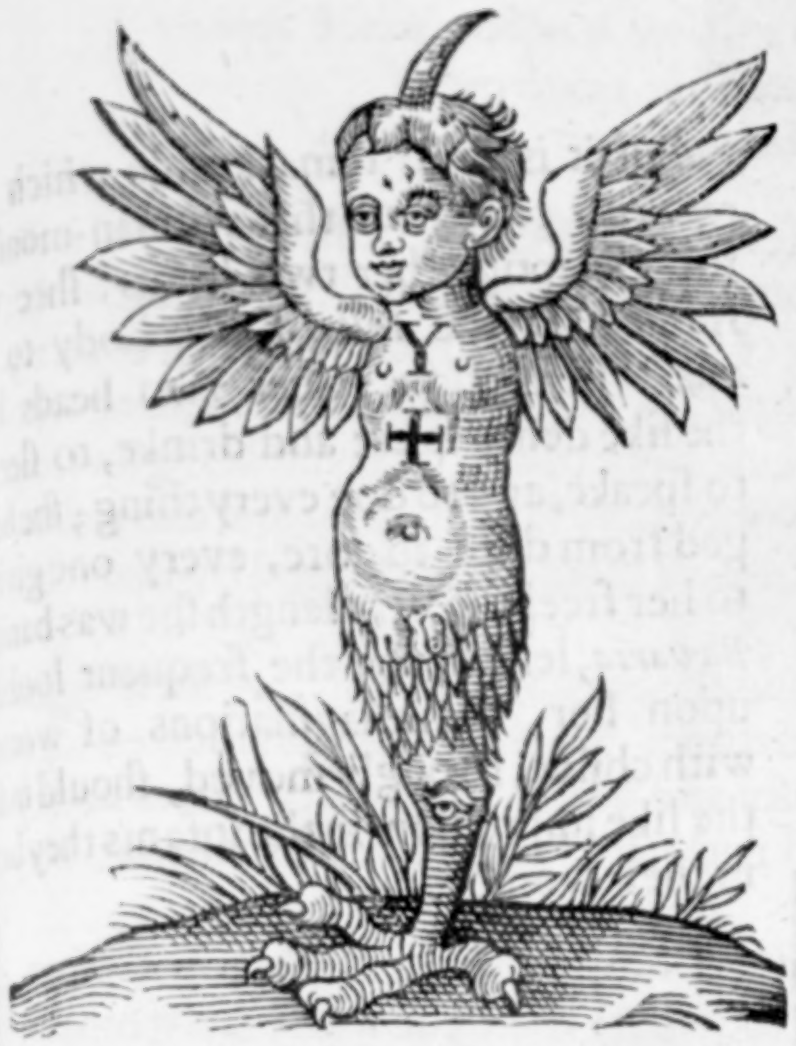
At *Verona Anno Dom.* 1254. a mare foaled a colt, with the perfect face of a man, but all the reſt of the body like an horſe: a little after that, the warre betweene the *Florentines* and *Piſans* began, by which all *Italy* was in a combuſtion.

The figure of a Colt with a mans face.



About the time that Pope *Julius* the ſecond raiſed up all *Italy*, and the greateſt part of Chriſtendome, againſt *Lewis* the twelfth the King of *France*, in the yeere of our Lord 1512. (in which yeere, upon Eaſter day, neere *Ravenna* was fought that mortall battell, in which the Popes forces were overthrowne) a monſter was borne in *Ravenna*, having a horne upon the crowne of his head, and beſides, two wings, and one foot alone, moſt like to the feet of birds of prey, and in the knee thereof an eye, the privities of male and female, the reſt of the body like a man, as you may ſee by the following figure.

The figure of a winged Monſter.



The third cauſe is, an abundance of ſeed & overflowing matter. The fourth, the ſame in too little quantity, and deficient. The fift, the force and efficacy of imagination. The ſixt, the ſtraightneſſe of the wombe. The ſeaventh, the diſorderly ſite of the party with childe, and the poſition of the parts of the body. The eighth, a fall, ſtraine or ſtroake, eſpecially upon the belly of a woman with child. The ninth, hereditary diſeaſes, or affects by any other accident. The tenth, the confuſion and mingling together of the ſeed. The eleventh, the craft and wickedneſſe of the divell. There are ſome others which are accounted for monſters, becauſe they have their originall or eſſence full of admiration, or doe aſſume a certaine prodigious forme by the craft of ſome begging companions; therefore we will ſpeak briefly of them in their place in this our treatiſe of monſters.

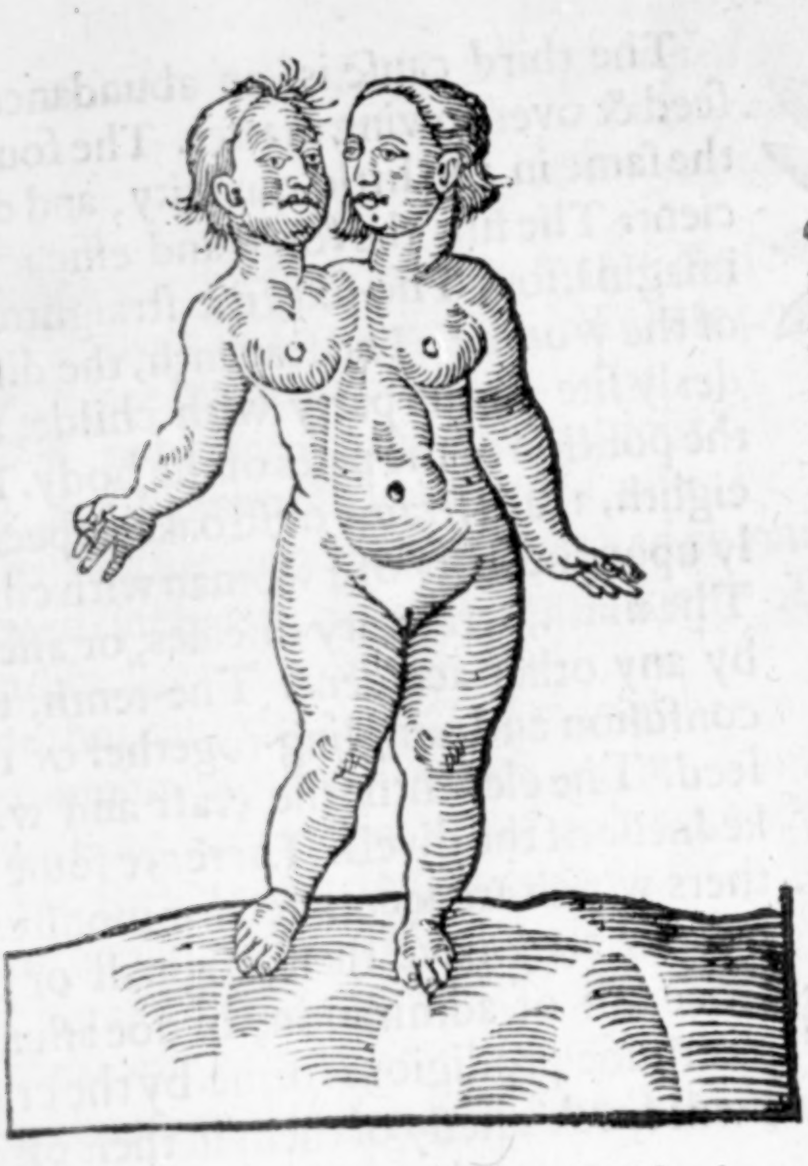
Chap. II.

Of monſters cauſed by too great abundance of ſeed.

Seeing wee have already handled the two former and truely finall cauſes of monſters, we muſt now come to thoſe which are the matereall, corporeall, and efficient cauſes, taking our beginning from that we call the too great abundance of the matter of ſeed. It is the opinion of thoſe Philoſophers which have written of monſters, that if at any time a creature bearing one at once, as man, ſhall caſt forth more ſeed in copulation than is neceſſary to the generation of one body, it cannot be that onely one ſhould bee begot of all that; therefore from thence either two or more muſt ariſe: whereby it commeth to paſſe, that theſe are rather judged wonders, becauſe they happen ſeldome, and contrary to common cuſtome. Superfluous parts happen by the ſame cauſe, that twinnes, and many at one birth, contrary to natures courſe, doe chance, that is, by a larger effuſion of ſeed than is required for the framing of that part, that ſo it exceeds either in number or elſe in greatneſſe. So *Auſtin* tells that in his time in the Eaſt an infant was borne, having all the parts from the belly upwards double, but from thence downewards ſingle and ſimple: for it had two heads, foure eyes, two breaſts, foure hands, in all the reſt like to another child, and it lived a little while. *Cælius Rhodiginus* ſaith he ſaw two monſters in *Italy*, the one male, the other female, handſomly & neatly made through all their bodies, except their heads, which were double; the male died within a few daies after it was borne; but the female (whoſe ſhape is here delineated) lived 20. five yeers, which is contrary to the common cuſtome of monſters; for they for the moſt part are very ſhort lived, becauſe they both live and are born, as it were, againſt natures conſent; to which may be added, they doe not love themſelves, by reaſon they are made a ſcorne to others, and by that meanes lead a hated life.

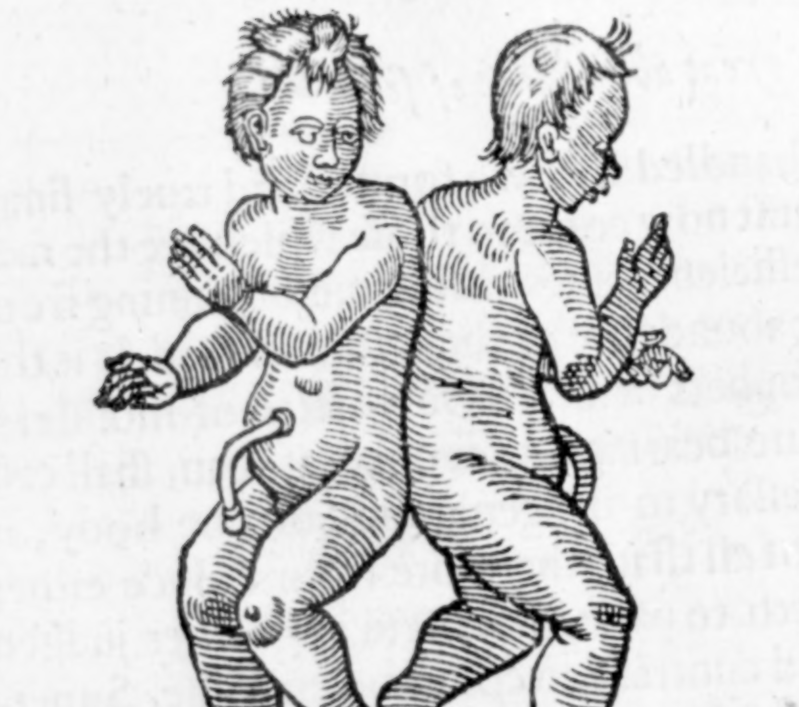
Monſters are ſeldome long lived.

The effigies of a maide with two heads.



But it is moſt remarkeable which *Lycoſthenes* telleth of this woman-monſter, for excepting her two heads, ſhee was framed in the reſt of her body to an exact perfection: her two heads had the like deſire to eat and drinke, to ſleepe, to ſpeake, and to doe every thing; ſhe begged from dore to dore, every one giving to her freely. Yet at length ſhe was baniſht *Bavaria*, leſt that by the frequent looking upon her, the imaginations of women with childe, ſtrongly moved, ſhould make the like impreſſion in the infants they bare in their wombes.

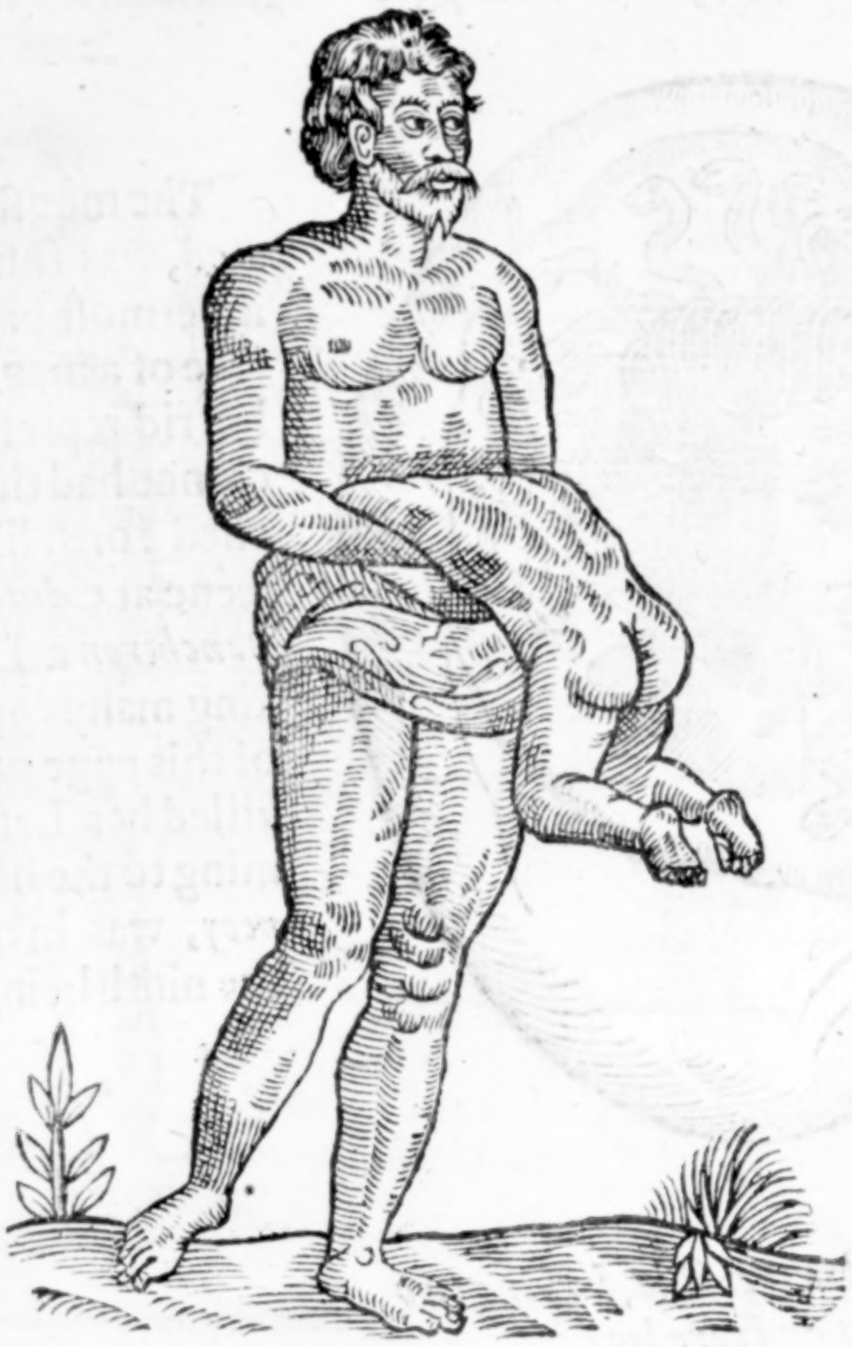
The effigies of two girles whoſe backes grew together.



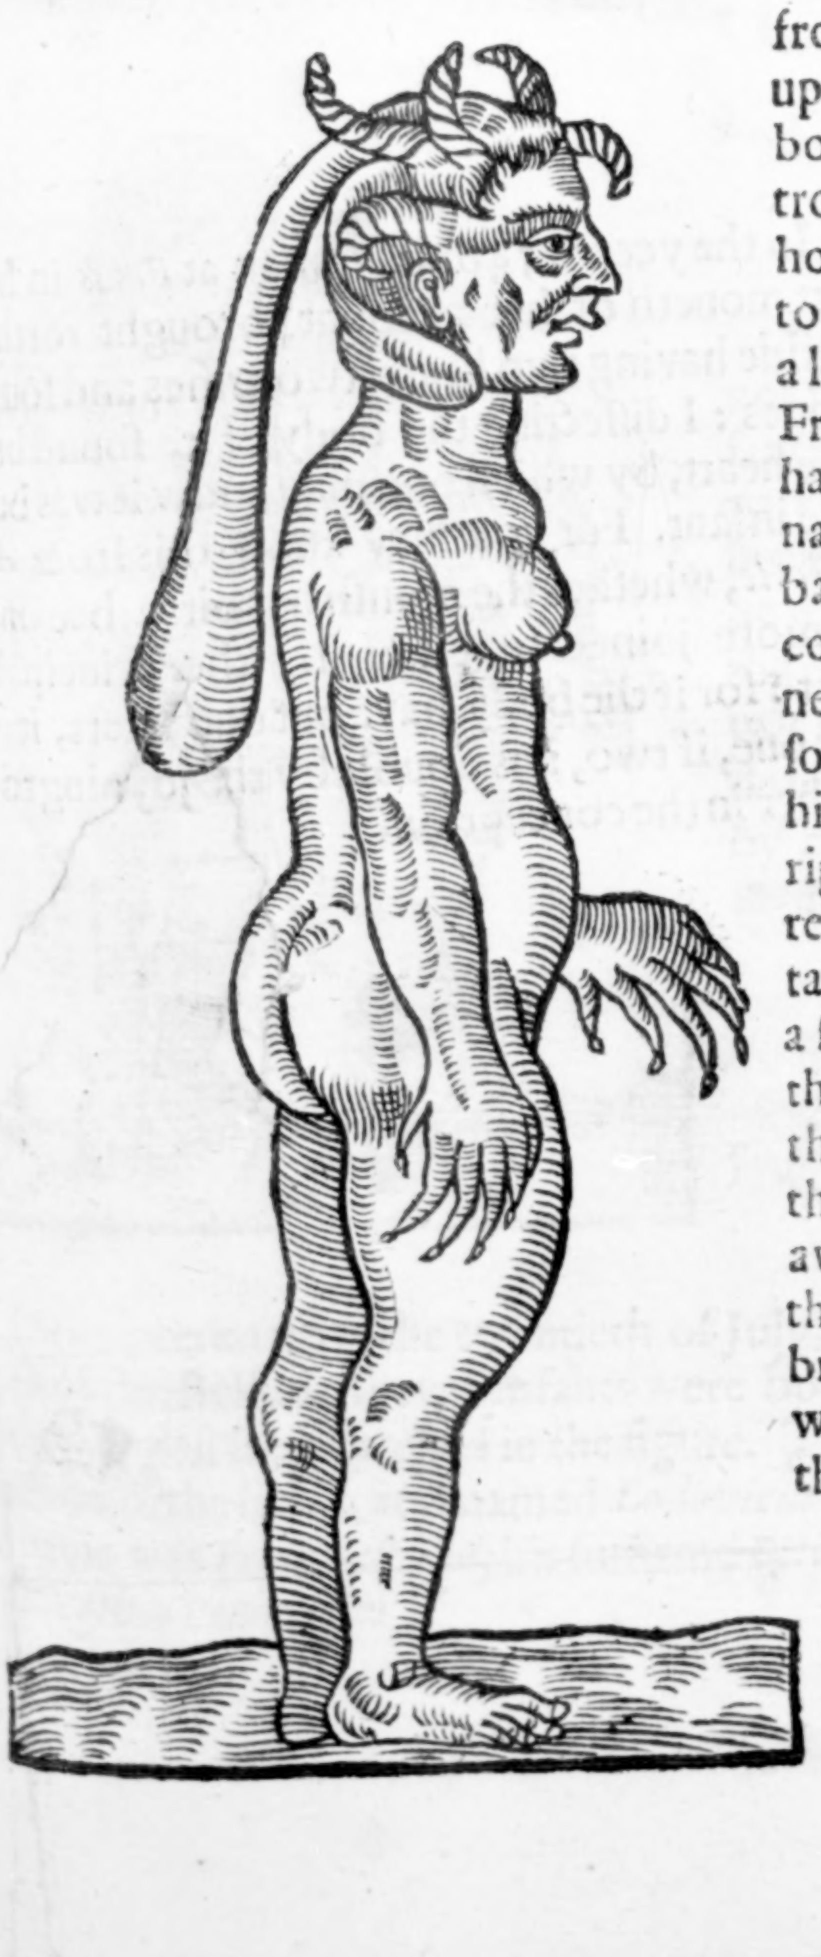
In the yeere of our Lord 1475. at *Verona* in *Italy*, two Girles were borne with their backes ſticking together from the lower part of the ſhoulders unto the very buttockes. The novelty and ſtrangeneſſe of the thing moved their parents, being but poor, to carry them through all the chiefe townes in *Italy* to get mony of all ſuch as came to ſee them.

In the yeere 1530. there was a man to bee ſeene at *Paris*, out of whoſe belly another, perfect in all his members except his head, hanged forth as if he had been grafted there. The man was forty yeeres old, and hee carried the other implanted or growing out of him, in his armes, with ſuch admiration to the beholders, that many ranne very earneſtly to ſee him.

The figure of a man with another growing out of him.

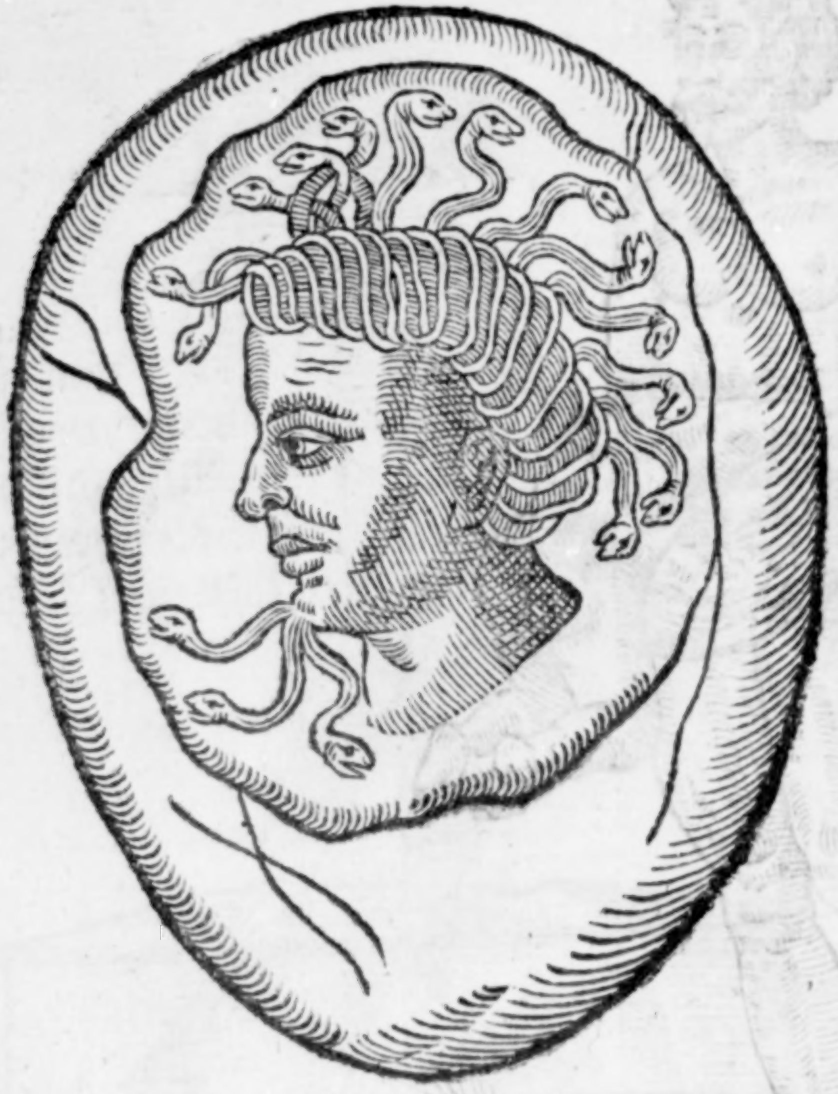


The effigies of the horned or hooded monſter.



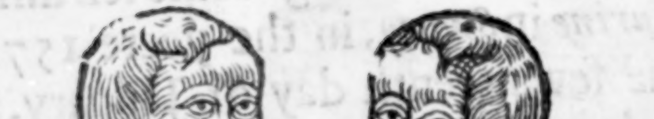
At *Quiers*, a ſmall village ſome ten miles from *Turine* in *Savoy*, in the yeere 1578. upon the ſeventeenth day of January, about eight a clocke at night, an honeſt matron brought forth a childe having five hornes, like to Rams hornes, ſet oppoſite to one another upon his head: he had alſo a long piece of fleſh, like in ſome ſort to a French-hood which women uſed to wear, hanging downe from his forehead by the nape of his necke almoſt the length of his backe: two other pieces of fleſh, like the collar of a ſhirt, were wrapped about his necke: the fingers ends of both his hands ſomewhat reſembled a Haukes talons, and his knees ſeemed to be in his hammes: the right leg and the right foot were of a very red colour; the reſt of the body was of a tawny colour: it is ſaid he gave ſo terrible a ſcritch when he was brought forth, that the Midwives, and the reſt of the women that were at her labour, were ſo frighted that they preſently left the houſe and ran away. When the Duke of *Savoy* heard of this monſter, he commanded it ſhould be brought to him, which performed, one would hardly think what various cenſures the Courtiers gave of it.

The ſhape of a monſter found in an egge.



The monſter you ſee here delineated, was found in the middle and innermoſt part of an egge, with the face of a man, but haires yeelding a horrid repreſentation of ſnakes; the chinne had three other ſnakes ſtretched forth like a beard. It was firſt ſeene at *Autun*, at the houſe of one *Bancheron* a Lawyer, a maide breaking many eggs to butter: the white of this egge given a Cat, preſently killed her. Laſtly, this monſter comming to the hands of the Baron *Senecy*, was brought to King *Charles* the ninth being then at *Metz*.

The effigies of a monſtrous childe, having two heads, two armes & foure legs.



In the yeere 1546. a woman at *Paris* in her ſixt moneth of her account, brought forth a childe having two heads, two armes and foure legges: I diſſecting the body of it, found but one heart, by which one may know it was but one infant. For you may know this from *Ariſtotle*, whether the monſtrous birth bee one or more joined together, by the principall part: for if the body have but one heart, it is but one, if two, it is double by the joyning together in the conception.

The

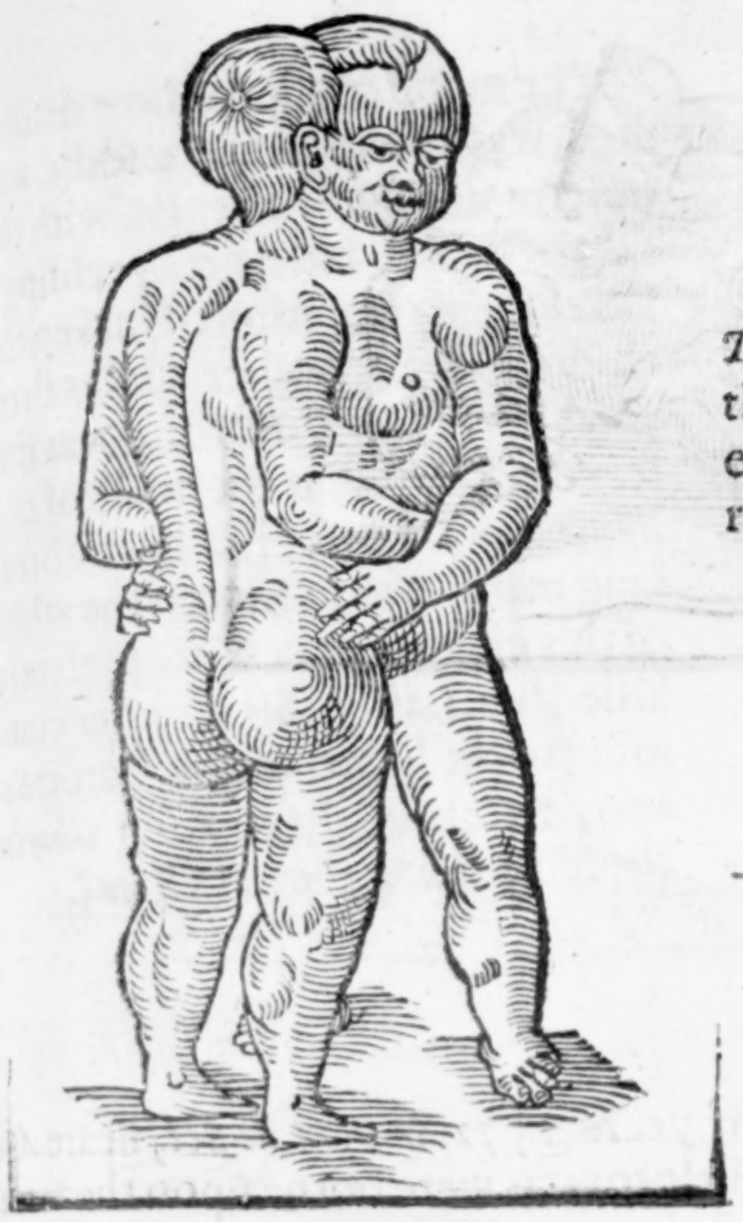
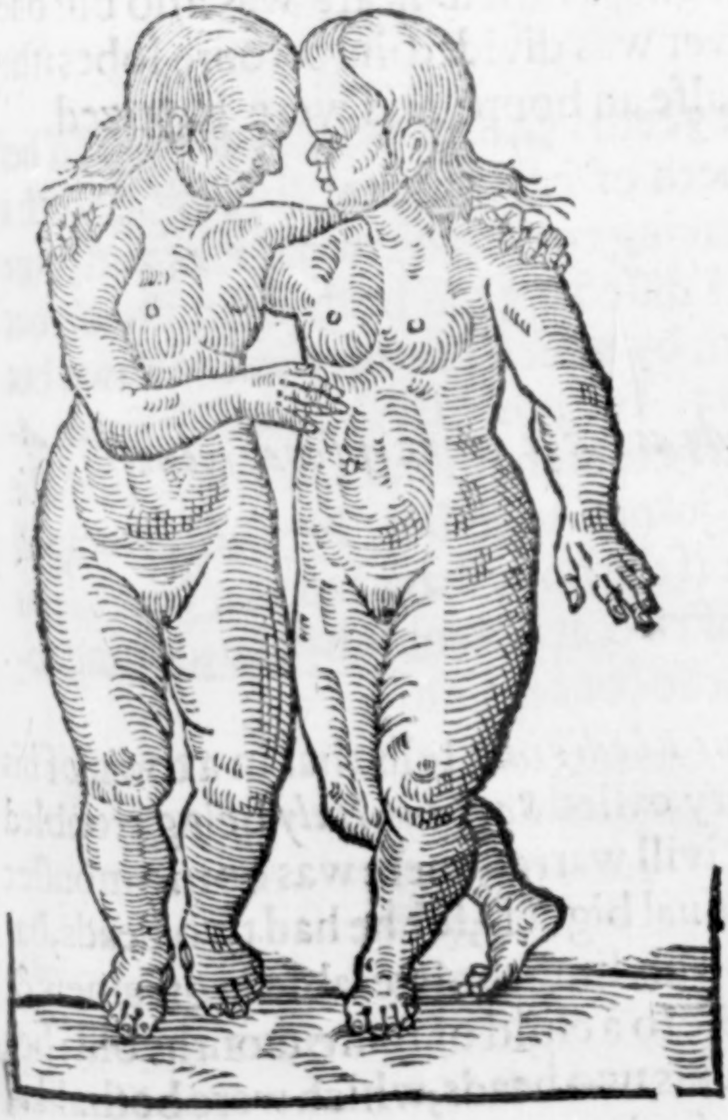
The portraiture of Twinnes joyned together with one head.



In the yeere 1569. a certaine woman of *Towers* was delivered of twinnes joyned together with one head, and mutually embracing each other. *Renatus Ciretus* the famous Chirurgian of thoſe parts, ſent mee their *Sceleton.*

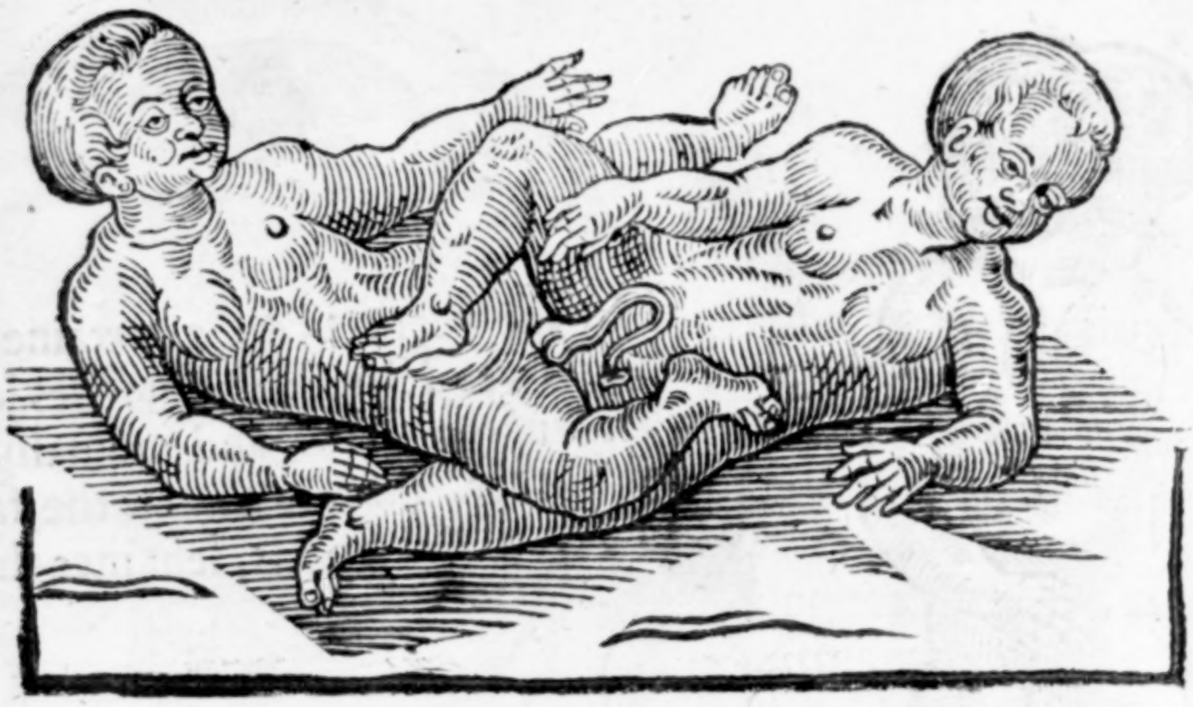
The effigies of two girles, being Twinnes, joyned together by their fore-heads.



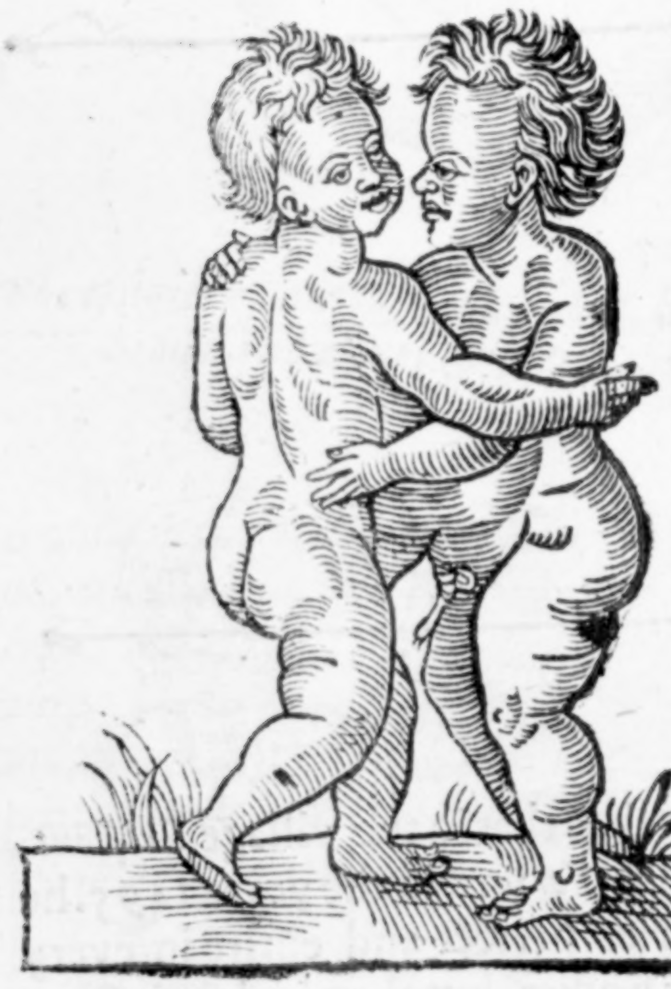
Munſter writes that in the village *Briſtant*, not farre from *Wormes*, in the yeere 1495. he ſaw two Girles perfect and entire in every part of their bodies, but they had their foreheads ſo joined together that they could not be parted or ſevered by any art: they lived together ten yeeres; then the one dying, it was needfull to ſeparate the living from the dead: but ſhe did not long out-live her ſiſter, by reaſon of the malignity of the wound made in parting them aſunder.

In the yeere 1570. the twentieth of July, at *Paris*, in the ſtreet *Gravilliers*, at the ſigne of the Bell, theſe two infants were borne, differing in ſexe, with that ſhape of body that you ſee expreſſed in the figure. They were baptized in the Church of St. *Nicholas* of the fields, and named *Ludovicus* and *Ludovica*, their father was a Maſon, his name was *Peter German*, his ſurname *Petit Dieu* (i) little-God, his mothers name was *Mathea Petronilla.*

The ſhape of the infants lately borne at Paris.

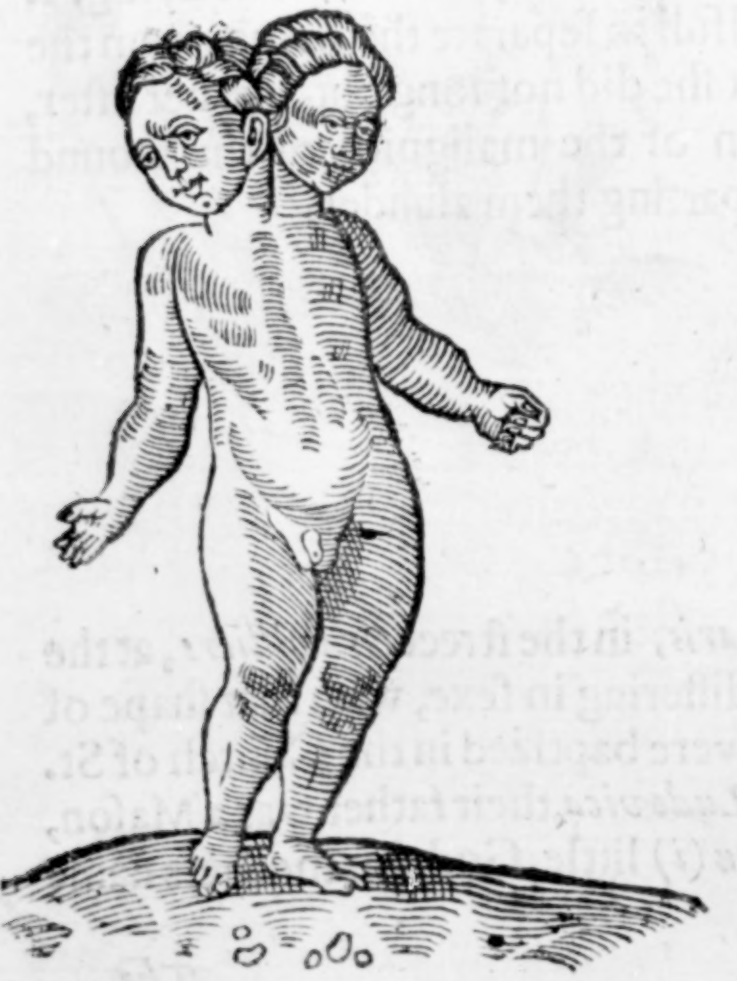


The figure of two girles joyned together in their breaſts, and belly.



In the yeere 1572. in *Pont de See*, neare *Angers* a little towne, were borne upon the tenth day of *July*, two girles, perfect in their limbs, but that they had but foure fingers apiece on their left hands: they clave together in their fore parts, from their chin to the navell, which was but one, as their heart was alſo but one; their liver was divided into foure lobes: they lived halfe an houre, and were baptized.

The figure of a child with two heads, and the body as bigge as one of foure moneths old.



Var. lect. lib. 24. cap. 3.

Cælius Rhodiginus tells that in a town of his country called *SarZano*, *Italy* being troubled with civill warres, there was born a monſter of unuſual bigneſs; for he had two heads, having all his limbs anſwerable in greatneſs & tallneſſe to a child of foure months old: between his two heads, which were both alike, at the ſetting on of the ſhoulder, it had a third hand put forth, which did not exceed the eares in length, for it was not all ſeen: it was born the 5. of the Ides of *March* 1514.

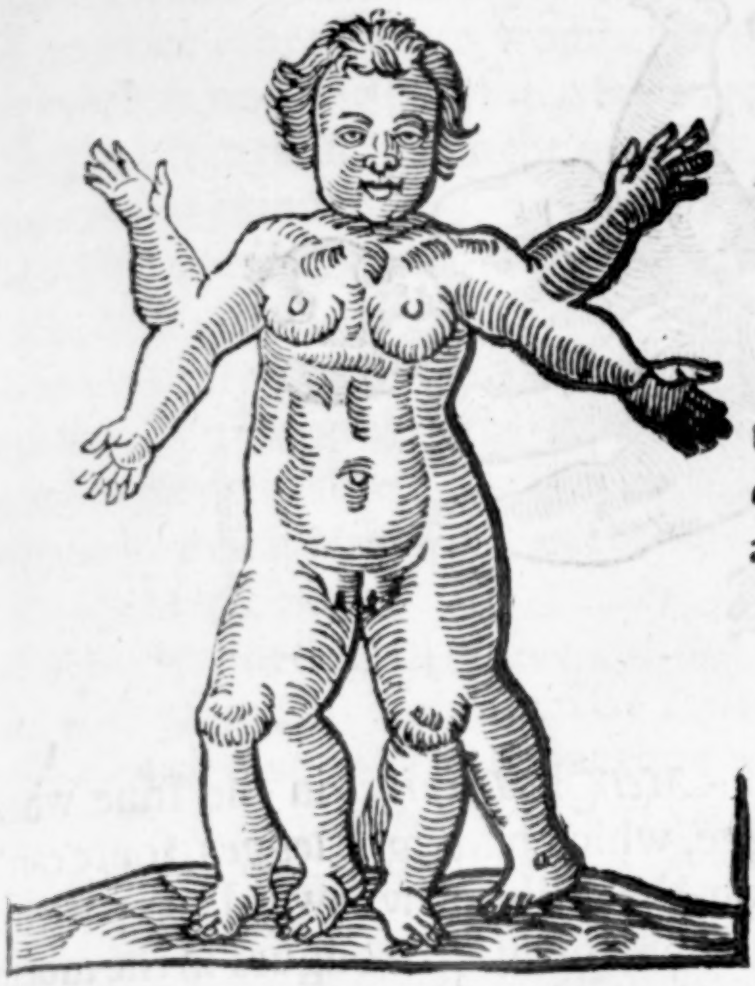
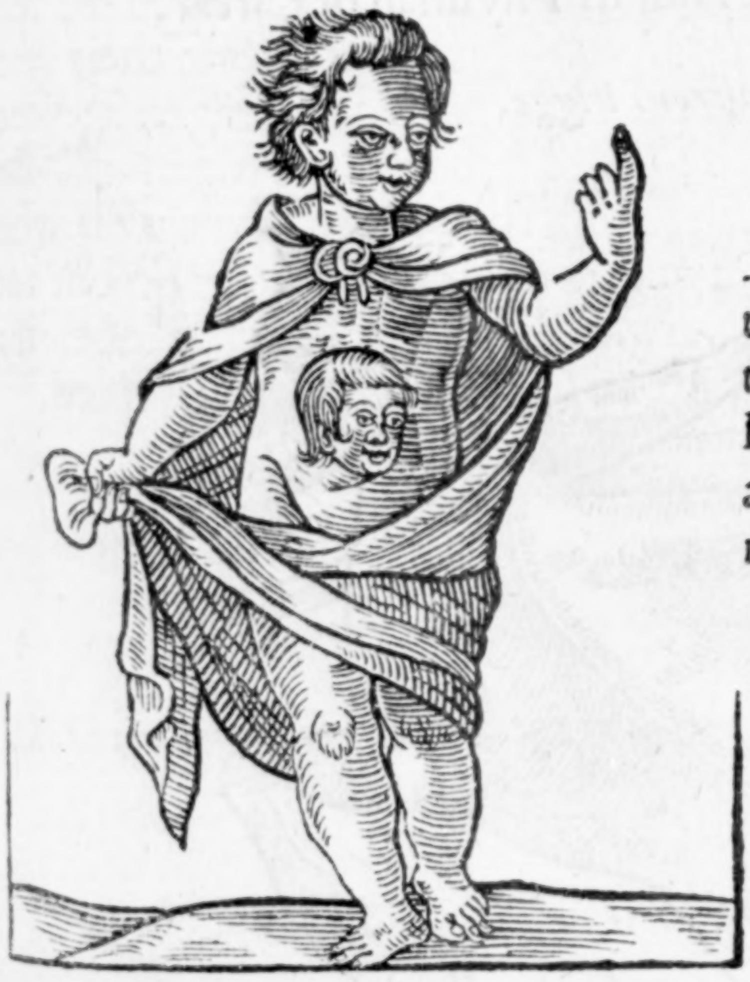
The figure of one with foure legges and as many armes.



Jovianus Pontanus tells in the yeere 1529. the ninth day of *January*, there was a man childe borne in *Germany*, having foure armes and as many legges.

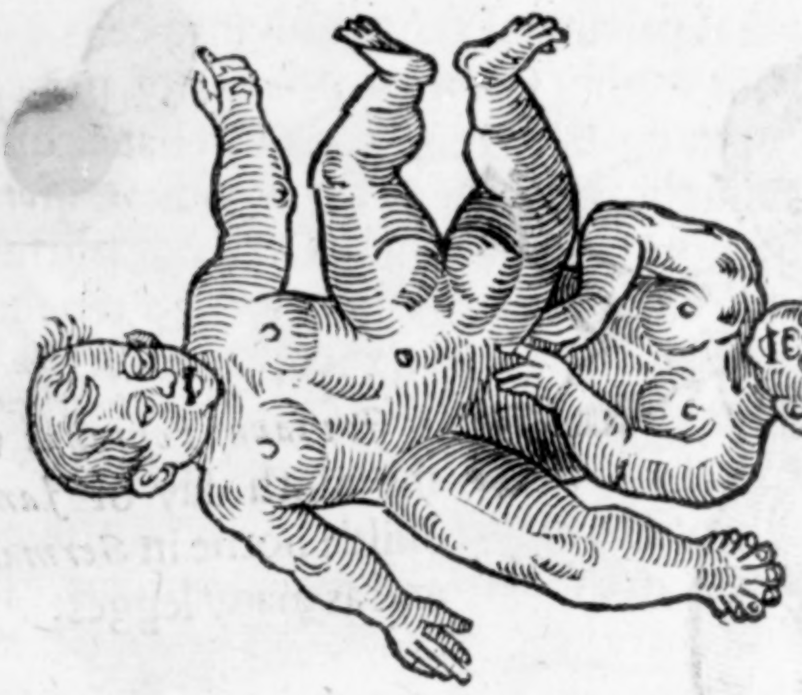
The figure of a man out of whoſe belly another head ſhewed it ſelfe.



In the yeere that *Francis* the firſt King of *France* entered into league with the *Swiſſes*, there was borne a monſter in *Germany*, out of the midſt of whoſe belly there ſtood a great head; it came to mans age, and this lower, and as it were inſerted head, was nouriſhed as much as the true and upper head.

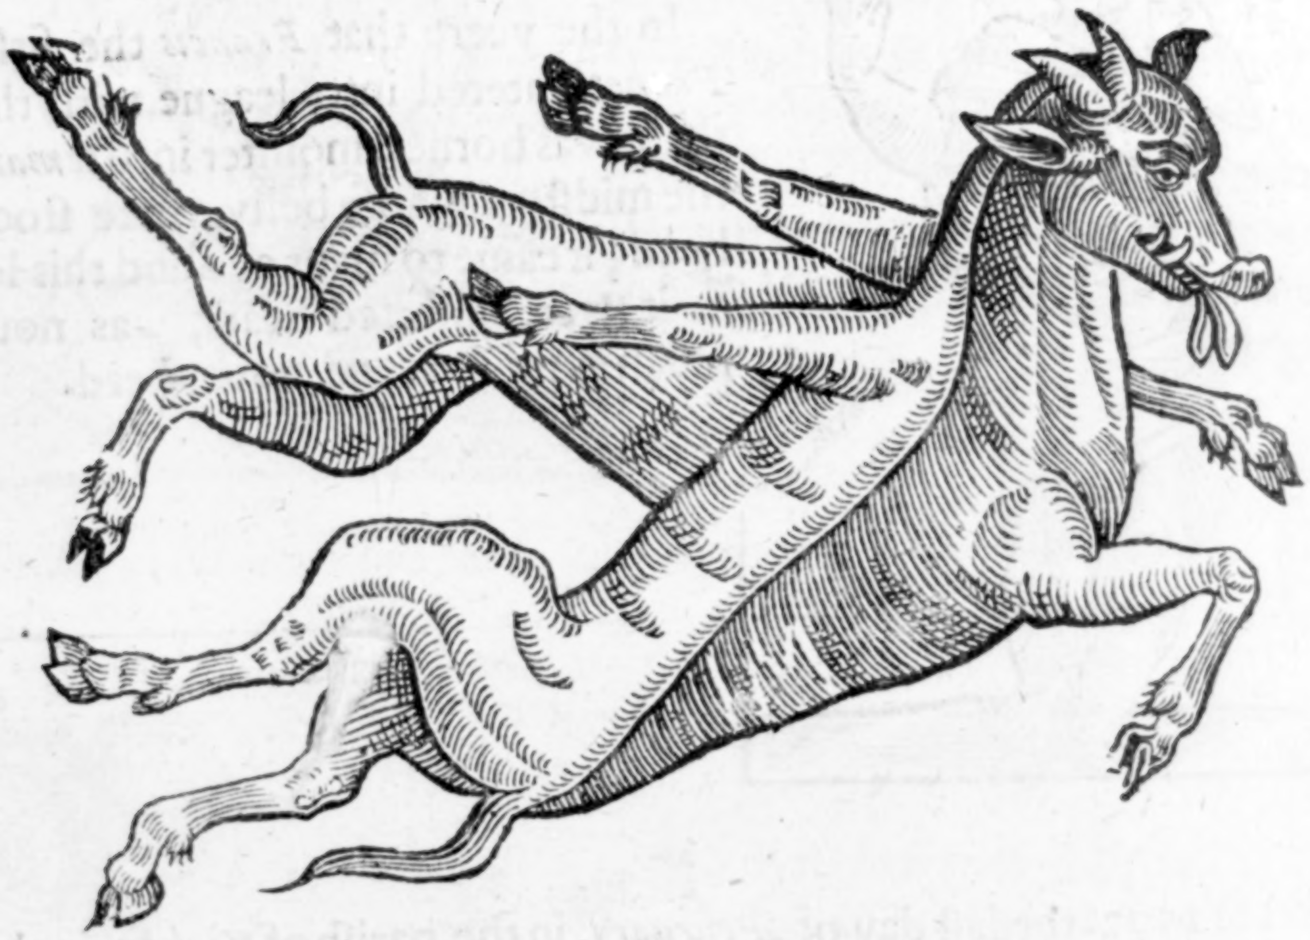
In the yeere 1572. the laſt day of *February*, in the pariſh of *Viaban*, in the way as you goe from *Carnuta* to *Paris*, in a ſmall village called *Bordes*, one called *Cypriana Giranda* the, wife of *James Merchant* a husbandman, brought forth this monſter whoſe ſhape you ſee here delineated, which lived untill the Sunday following, being but of one onely ſexe, which was the female.

The ſhape of two monſtrous Twinnes, being but of one onely Sexe.



In the yeere 1572. on Eaſter Munday at *Metz* in *Loraine*, in the Inne whoſe ſigne is the Holy-Ghoſt, a Sow pigged a pigge, which had eight legges, foure eares, and the head of a dogge; the hinder part from the belly downeward was parted in two as in twinnes, but the foreparts grew into one; it had two tongues in the mouth, with foure teeth in the upper jaw, and as many in the lower. The ſexe was not to be diſtinguiſhed, whether it were a Bore or Sow pigge, for there was one ſlit under the taile, and the hinder parts were all rent and open. The ſhape of this monſter, as it is here ſet downe, was ſent me by *Borgeſius* the famous Phyſitian of *Metz*.

The ſhape of a monſtrous Pigge.



CHAP. III.

Of women bringing many children at one birth.

WOman is a creature bringing uſually but one at a birth: but there have been ſome who have brought forth two, ſome three, ſome foure, five, ſixe, or more at one birth. *Empedocles* thought that the abundance of ſeed was the cauſe of ſuch numerous births: the *Stoikes* affirme the divers cells or partitions of the wombe to be the cauſe: for the ſeed being

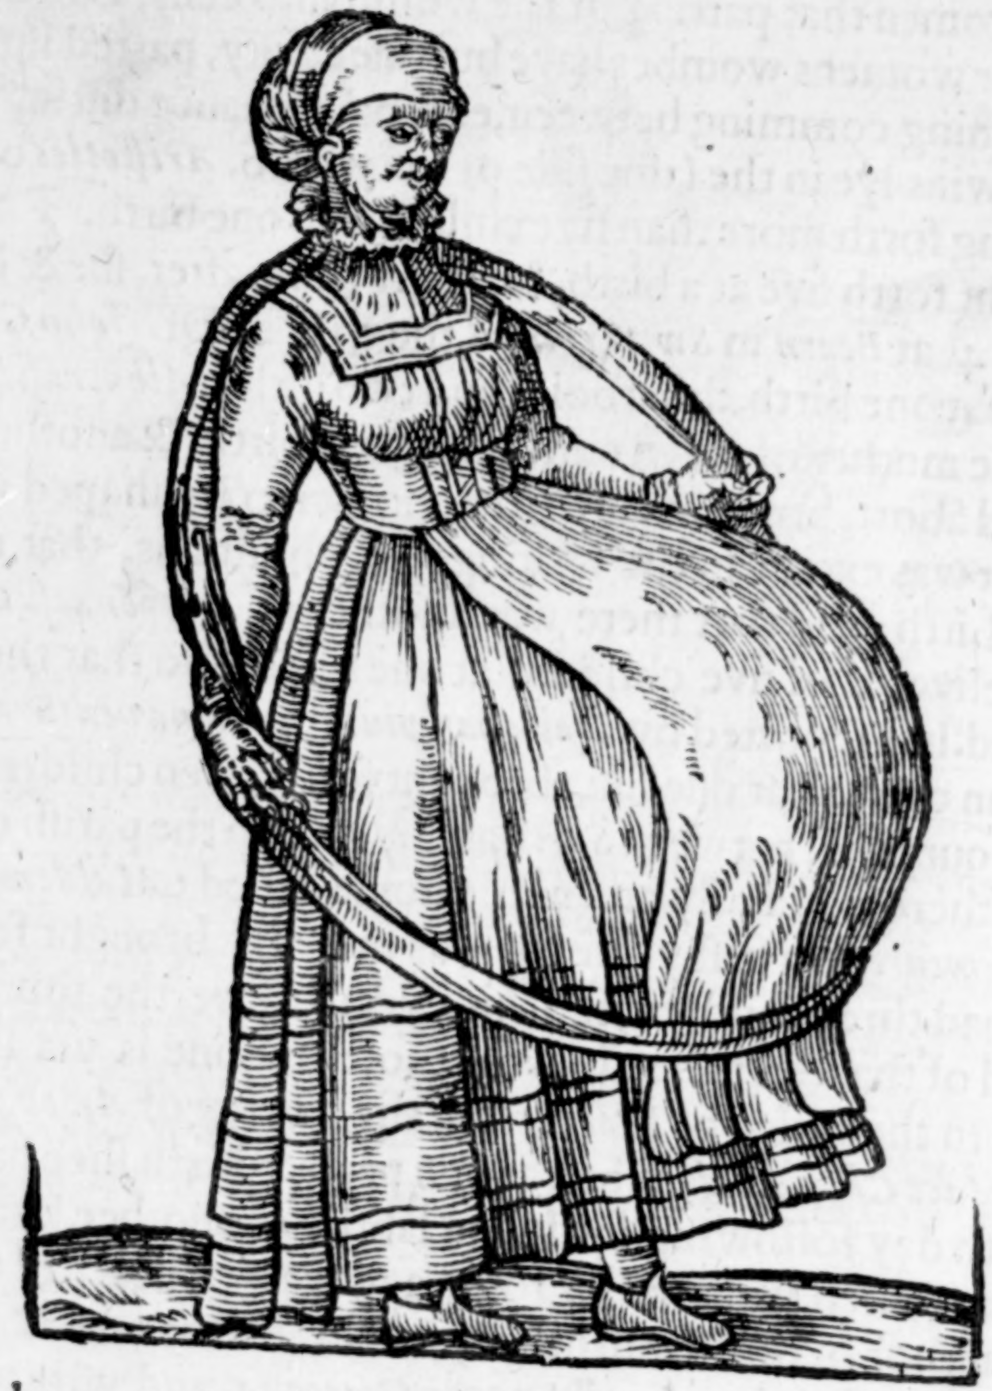
varioufly parted into theſe partitions, and the conception divided, there are more children brought forth; no otherwiſe than in rivers, the water beating againſt the rockes, is turned into divers circles or rounds. But *Ariſtotle* ſaith there is no reaſon to think ſo, for in women that parting of the womb into cells, as in dogs and ſowes, taketh no place; for womens wombes have but one cavity, parted into two receſſes, the right & left, nothing comming between, except by chance diſtinguiſhed by a certain line; for often twins lye in the ſame ſide of the womb. *Ariſtotles* opinion is, that a woman cannot bring forth more than five children at one birth. The maide of *Augustus Cæſar* brought forth five at a birth, & a ſhort while after, ſhe & her children died. In the yeer 1554. at *Bearn* in *SwitZerland*, the wife of Dr. *John Gelinger* brought forth five children at one birth, three boies and two girles. *Albucraſis*, affirmes a woman to have bin the mother of ſeven children at one birth; & another, who by ſome externall injury did abort, brought forth fifteene perfectly ſhaped in all their parts. *Pliny* reports that it was extant in the writings of Phyſitians, that twelve children were borne at one birth; and that there was another in *Peloponneſus* which foure ſeverall times was delivered of five children at one birth, and that the greater part of thoſe children lived. It is reported by *Dalechampius* that *Bonaventura* the ſlave of one *Savill*, a Gentleman of *Sena*, at one time brought forth ſeven children, of which four were baptized. In our time, between *Sarte* and *Maine*, in the pariſh of *Seaux*, not far from *Chambellay*, there is a family and noble houſe called *Maldemeure*; the wife of the Lord of *Maldemeure*, the firſt yeere ſhe was married brought forth twinnes, the ſecond yeere ſhe had three children, the third yeere foure, the fourth yeere five, the fift yeere ſixe, and of that birth ſhe died: of thoſe ſixe one is yet alive, and is Lord of *Maldemeure*. In the valley of *Beaufort*, in the county of *Anjou*, a young woman the daughter of *Mace Channiere*, when at one perfect birth ſhee had brought forth one child, the tenth day following ſhe fell in labour of another, but could not be delivered untill it was pulled from her by force, and was the death of the mother. *Martin Cromerus* the author of the Poliſh hiſtory, writeth that one *Margaret*, a woman ſprung from a noble and antient family neere *Cracovia*, and wife to Count *Virboſlaus*, brought forth at one birth thirty five live children, upon the twentieth day of *January*, in the yeere 1296. *Franciſcus Picus Mirandula* writeth that one *Dorothy* an Italian had twenty children at two births, at the firſt nine, and at the ſecond eleven, and that ſhe was ſo bigge, that ſhe was forced to beare up her belly, which lay upon her knees, with a broad and large ſcarfe tyed about her necke, as you may ſee by the following figure.

4. de gen. anim. cap. 4.

Lib. 7. cap. 11.
Cap. 3.

The ninth book of the Poliſh hiſtory.

The picture of Dorothy, *great with child with many children.*



And they are to bee reprehended here againe, who affirme the cauſe of numerous births to conſiſt in the variety of the cells of the wombe, for they feigne a womans wombe to have ſeven cells or partitions, three on the right ſide for males, three on the left ſide for females, and one in the midſt for Hermaphrodites or Scrats: and this untruth hath gon ſo far, that there have bnene ſome that affirmed every of theſe ſeven cells to have bin divided into ten partitions, into which the ſeed diſperſed, doth bring forth a divers and numerous encreaſe, according to the variety of the cells furniſhed with the matter of ſeed; which though it may ſeeme to have been the opinion of *Hippocrates*, in his book *De natura Pueri*, notwithſtanding it is repugnant to reaſon, and to thoſe things which are manifeſtly apparent to the eyes and ſenſes.

Lib. 4. de gen. anim. cap. 4. The opinion of *Ariſtotle* is more probable, who ſaith twinnes and more at one birth, are begot and brought forth by the ſame cauſe that the ſixt finger groweth on the hand, that is, by the abundant plenty of the ſeed, which is greater and more copious than can bee all taken up in the naturall framing of one body: for if it all be forced into one, it maketh one with the parts encreaſed more than is fit, either in greatneſſe or number; but if it bee, as it were, cloven into divers parts, it cauſeth more than one at one birth.

Chap. IV.

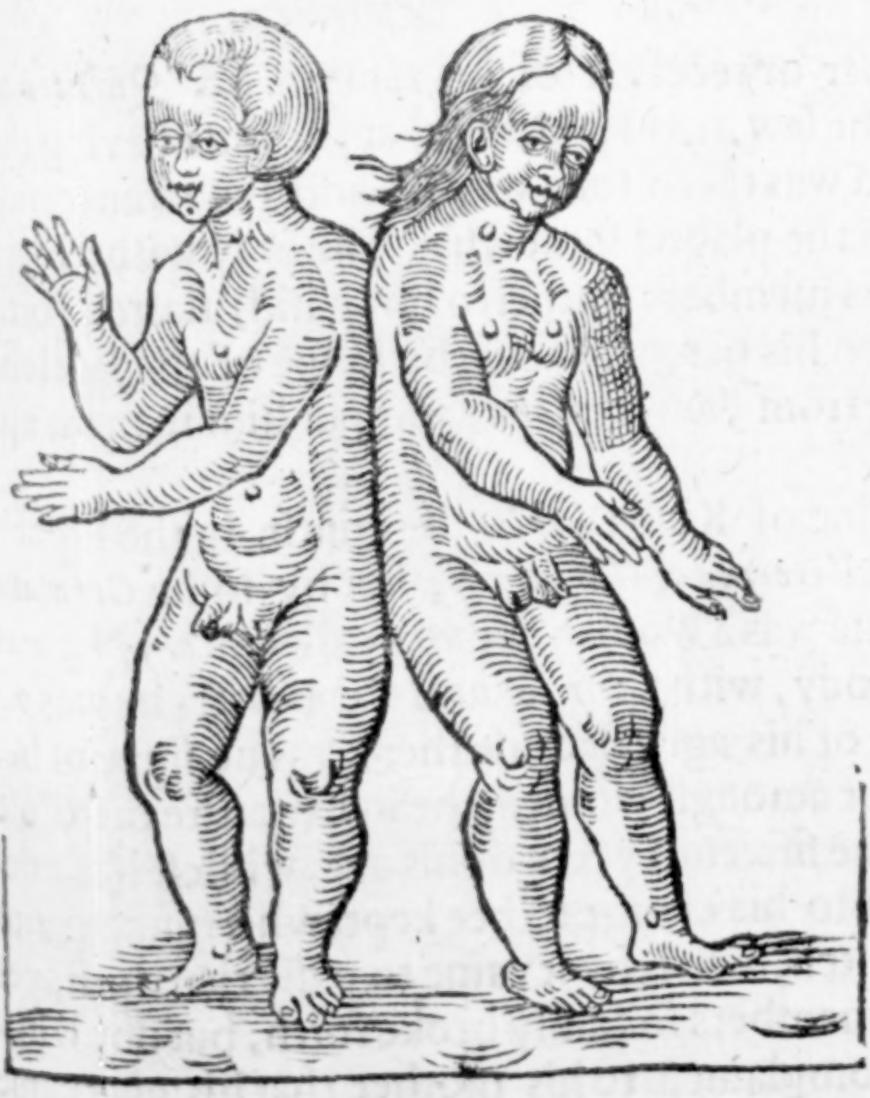
Of Hermaphrodites or Scrats.

AND here alſo we muſt ſpeake of Hermaphrodites, becauſe they draw the cauſe of their generation and conformation from the plenty and abundance of ſeed, and are called ſo becauſe they are of both ſexes, the woman yeelding as much ſeed as the man. For hereupon it commeth to paſſe that the forming faculty (which alwaies endeavours to produce ſomething like it ſelfe) doth labour both the matters almoſt with equall force, and is the cauſe that one body is of both ſexes.

Yet ſome make foure differences of Hermaphrodites; the firſt of which is the male Hermaphrodite, who is a perfect and abſolute male, and hath onely a ſlit in the *Perinæum* not perforated, and from which neither urine nor ſeed doth flow. The ſecond is the female, which beſides her naturall privity, hath a fleſhy and skinny ſimilitude of a mans yard, but unapt for erection and ejaculation of ſeed, and wanteth the cod and ſtones; the third difference is of thoſe, which albeit they beare the expreſſe figures of members belonging to both ſexes, commonly ſet the one againſt the other, yet are found unapt for generation, the one of them onely ſerving for making of water: the fourth difference is of thoſe who are able in both ſexes, and throughly performe the part both of man and woman, becauſe they have the genitalls of both ſexes compleat and perfect, and alſo the right breaſt like a man, and the left like a woman: the lawes command thoſe to chuſe the ſexe which they will uſe, and in which they will remaine and live, judging them to death if they be found to have departed from the ſexe they made choice of, for ſome are thought to have abuſed both, and promiſcuouſly to have had their pleaſure with men and women. There are ſignes by which the Phyſitians may diſcerne whether the Hermaphrodites are able in the male or female ſexe, or whether they are impotent in both: theſe ſignes are moſt apparent in the privities and face; for if the matrix be exact in all its demenſions, and ſo perforated that it may admit a mans yard, if the courſes flow that way, if the haire of the head bee long, ſlender, and ſoft, and to conclude, if to this tender habite of the body a timide and weake condition of the minde be added, the female ſexe is predominant, and they are plainely to bee judged women. But if they have the *Perinæum* and fundament full of haires (the which in women are commonly without any) if they have a yard of a convenient largeneſſe, if it ſtand well & readily, and yeeld ſeed, the male ſexe hath the preheminence, and they are to be judged men. But if the conformation of both the genitalls be alike in figure, quantity, and efficacy, it is thought to be equally able in both ſexes: although by the opinion of *Ariſtotle*, thoſe who have double genitals, the one of the male, the other of the female, the one of them is alwaies perfect, the other imperfect.

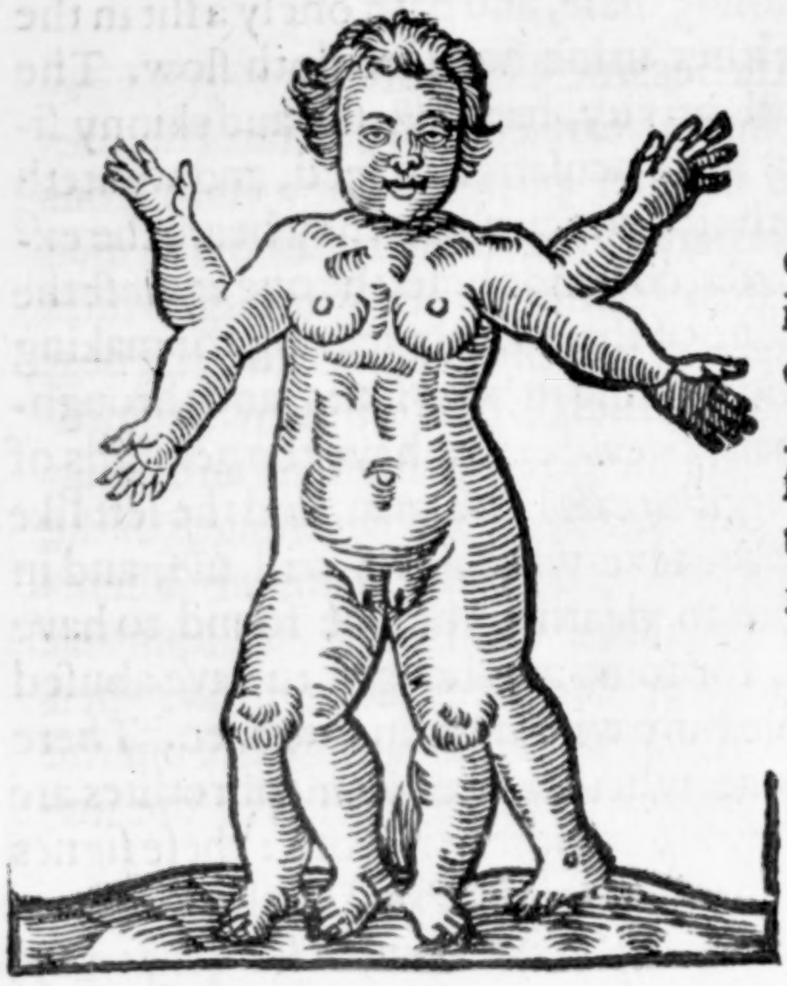
Lib. 4. de gener. anim. cap. 5.

The figure of Hermaphrodite twinnes cleaving together with their backes.



Anno Dom. 1486. In the *Palatinate*, at the village *Robach*, neere *Heidelberg*, there were twinnes, both Hermaphrodites, borne with their backs ſticking together.

The effigies of an Hermaphrodite, having foure hands and feet.



The ſame day the *Venetians* and *Genoeſes* entred into league, there was a monſter borne in *Italy* having foure armes and feet, and but one head; it lived a little after it was baptized. *James Rueſ a Helvetian* Chirurgian ſaith hee ſaw the like, but which beſides had the privities of both ſexes, whoſe figure I have therefore here ſet forth.

Chap. V.

Of the changing of Sexe.

Amatus *Luſitanus* reports that in the village *Eſquina*, there was a maid named *Maria Pateca*, who at the appointed age for her courſes to flow, had in ſtead of them a mans yard, lying before that time hid and covered, ſo that of a woman ſhe became a man, and therefore laying aſide her womans habite, was cloathed in mans, and changing her name, was called *Emanuel*; who when hee had got much wealth by many and great negotiations and commerce in *India*, returned into his country, and married a wife: but *Luſitanus* ſaith he did not certainely know whether he had any children, but that he was certaine he remained alwaies beardleſſe.

Anthony Loqueneux, the Kings keeper or receiver of his rents of St. *Quintin* at *Vermandois*, lately affirmed to me that he ſaw a man at *Reimes*, at the Inne having the ſign of the ſwan, in the yeer 1560. who was taken for a woman untill the fourteenth yeere of his age; for then it happened as he played ſomewhat wantonly with a maid which lay in the ſame bed with him, his members (hitherto lying hid) ſtarted forth and unfolded them ſelves: which when his parents knew (by helpe of the Eccleſiaſticke power) they changed his name from *Joane* to *John*, and put him in mans apparell.

Some yeeres agone, being in the traine of King *Charles* the ninth, in the French Glaſſe-houſe, I was ſhewed a man called *Germane Garnierus*, but by ſome *Germane Maria* (becauſe in former times when he was a woman hee was called *Mary*) he was of an indifferent ſtature, and well ſet body, with a thicke and red beard; he was taken for a girle untill the fifteenth yeere of his age, becauſe there was no ſigne of being a man ſeene in his body, and for that amongſt women, he in like attire did thoſe things which pertaine to women: in the fifteenth yeere of his age, whileſt he ſomewhat earneſtly purſued hogges given into his charge to bee kept, who running into the corne, he leaped violently over a ditch, whereby it came to paſſe that the ſtayes and foldings being broken, his hidden members ſodainly broke forth, but not without paine; going home, hee weeping complained to his mother that his guts came forth: with which his mother amazed, calling Phyſitians and Surgeons to counſell, heard he was turned into a man; therefore the whole buſineſſe being brought to the Cardinall the Biſhop of *Lenancure*, an aſſembly being called, he received the name and habite of a man.

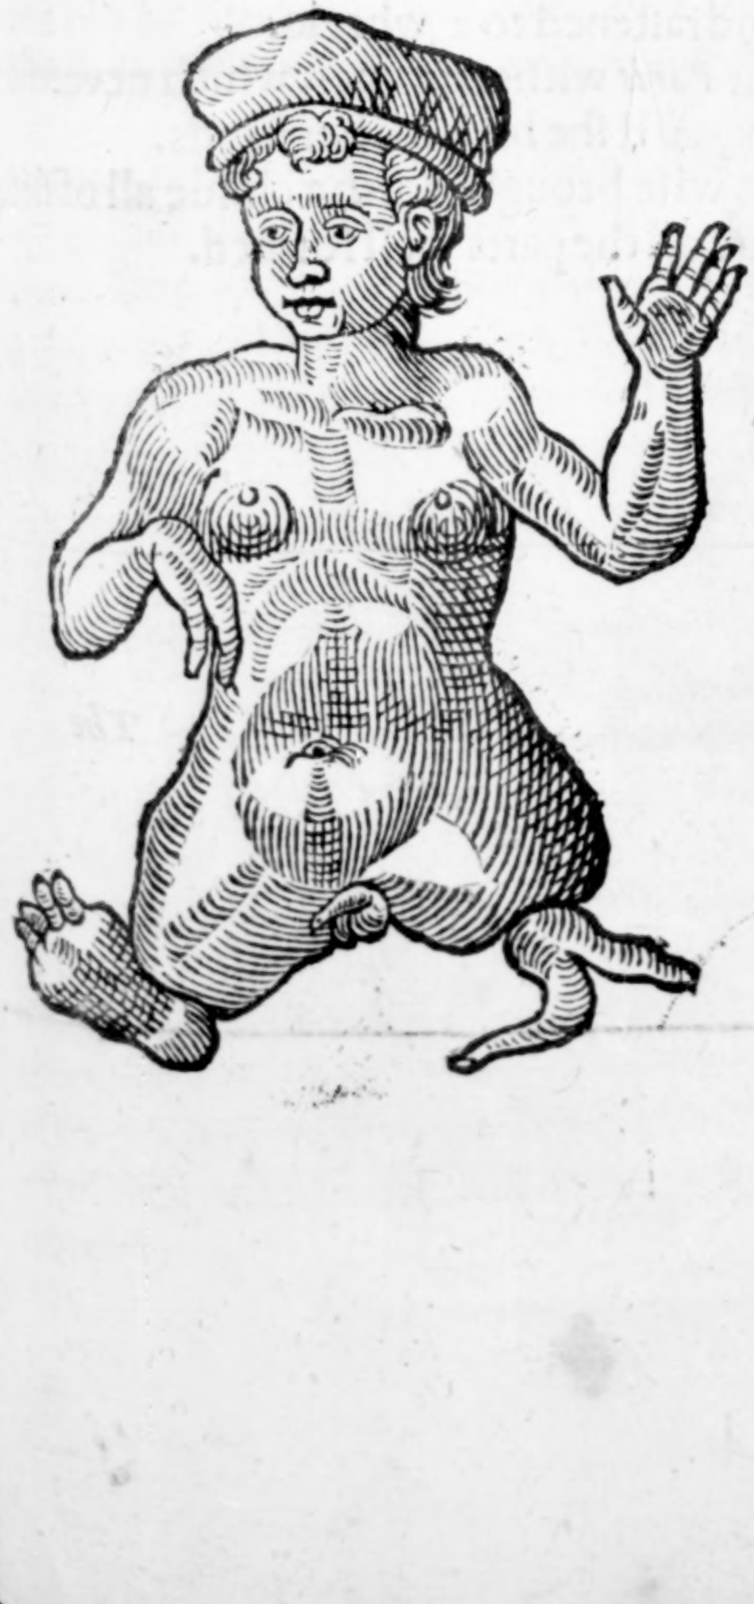
Pliny reports that the ſonne of *Caſsinus* of a girle became a boy, living with his parents; but by the command of the Soothſayers he was carried into a deſart Iſle, becauſe they thought ſuch monſters did alwaies ſhew or portend ſome monſtrous thing. Certainely women have ſo many and like parts lying in their wombe, as men have hanging forth; onely a ſtrong and lively heat ſeemes to bee wanting, which may drive forth that which lyes hid within: therefore in proceſſe of time, the heat being encreaſed and flouriſhing, and the humidity (which is predominant in childhood) overcome, it is not impoſſible that the virile members, which hitherto ſluggiſh by defect of heat, lay hid, may be put forth, eſpecially if to that ſtrength of the growing heat ſome vehement concuſſion or jactation of the body be joined. Therefore I thinke it manifeſt by theſe experiments and reaſons, that it is not fabulous that ſome women have beene changed into men: but you ſhall finde in no hiſtory men that have degenerated into women; for nature alwaies intends and goes from the imperfect to the more perfect, but not baſely from the more perfect to the imperfect.

CHAP. VI.

Of monſters cauſed by defect of ſeed.

IF, on the contrary, the ſeed be any thing deficient in quantity, for the conformation of the infant or infants, ſome one or more members will be wanting, or more ſhort and decrepite. Hereupon it happens that nature intending twinnes, a childe is borne with two heads, and but one arme, or altogether lame in the reſt of his limbes.

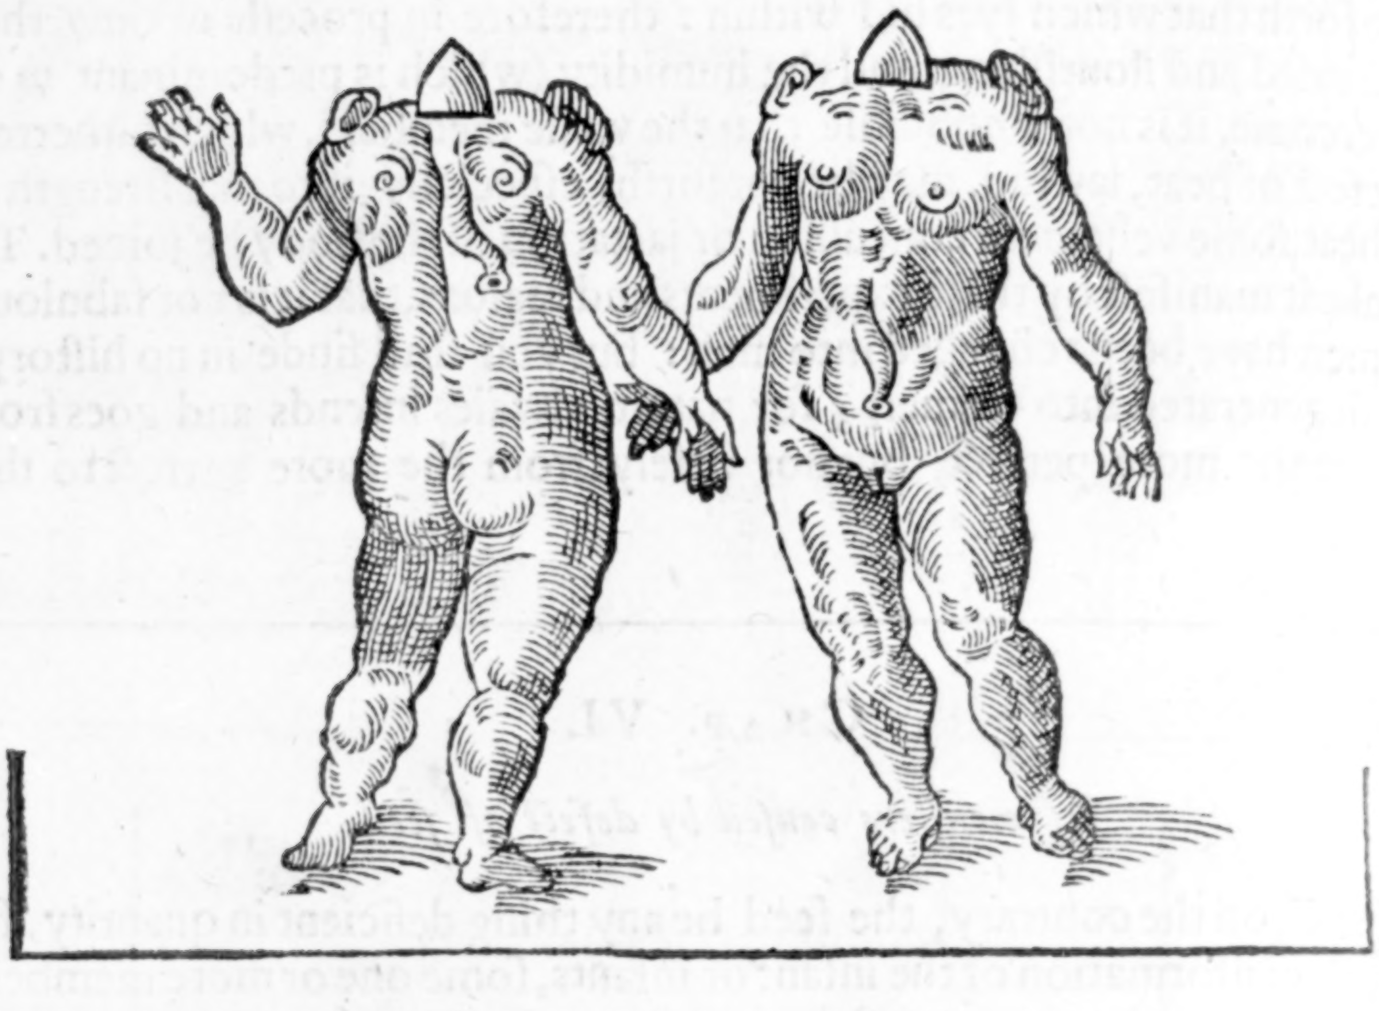
The effigies of a monſtrous childe, by reaſon of the defect of the matter of ſeed.



Anno Dom. 1573. I ſaw at St. *Andrewes* Church in *Paris*, a boy nine yeeres old, borne in the village *Parpavilla*, ſixe miles from *Guiſe*; his fathers name was *Peter Renard*, and his mother, *Marquete*: hee had but two fingers on his right hand, his arm was well proportioned from the top of his ſhoulder almoſt to his wreſt, but from thence to his two fingers ends it was very deformed, he wanted his leggs and thighes, although from the right buttocke a certaine unperfect figure, having onely foure toes, ſeemed to put it ſelfe forth; from the midſt of the left buttock two toes ſprung out, the one of which was not much unlike a mans yard, as you may ſee by the figure.

In the yeere 1562. in the Calends of *November*, at *Villa franca* in *Gaſcony*, this monſter, a headleſſe woman, whoſe figure thou heere ſeeſt, was borne, which figure Dr. *John Altinus* the Phyſitian gave to mee when I went about this booke of Monſters, he having received it from *Fontanus* the Phyſitian of *Angoleſtre*, who ſeriouſly affirmed he ſaw it.

The figure of a monſtrous woman without a head, before and behind.



A few yeeres agone there was a man of forty yeeres old to be ſeene at *Paris*, who although he wanted his armes, notwithſtanding did indifferently performe all thoſe things which are uſually done with the hands, for with the top of his ſhoulder, head and necke, hee would ſtrike an Axe or Hatchet with as ſure and ſtrong a blow into a poaſt, as any other man could doe with his hand; and hee would laſh a coach-mans whip, that he would make it give a great crack, by the ſtrong refraction of the aire: but he ate, drunke, plaid at cardes, and ſuch like, with his feet. But at laſt he was taken for a thiefe and murderer, was hanged and faſtened to a wheele.

Alſo not long agoe there was a woman at *Paris* without armes, which nevertheleſſe did cut, ſew, and doe many other things, as if ſhe had had her hands.

Sect. 2. lib. 2. epidem. We read in *Hippocrates*, that *Attagenis* his wife brought forth a childe all of fleſh without any bone, and notwithſtanding it had all the parts well formed.

Chap.

Chap. VII.

Of monſters which take their cauſe and ſhape by imagination.

The force of imagination upon the body and humours.

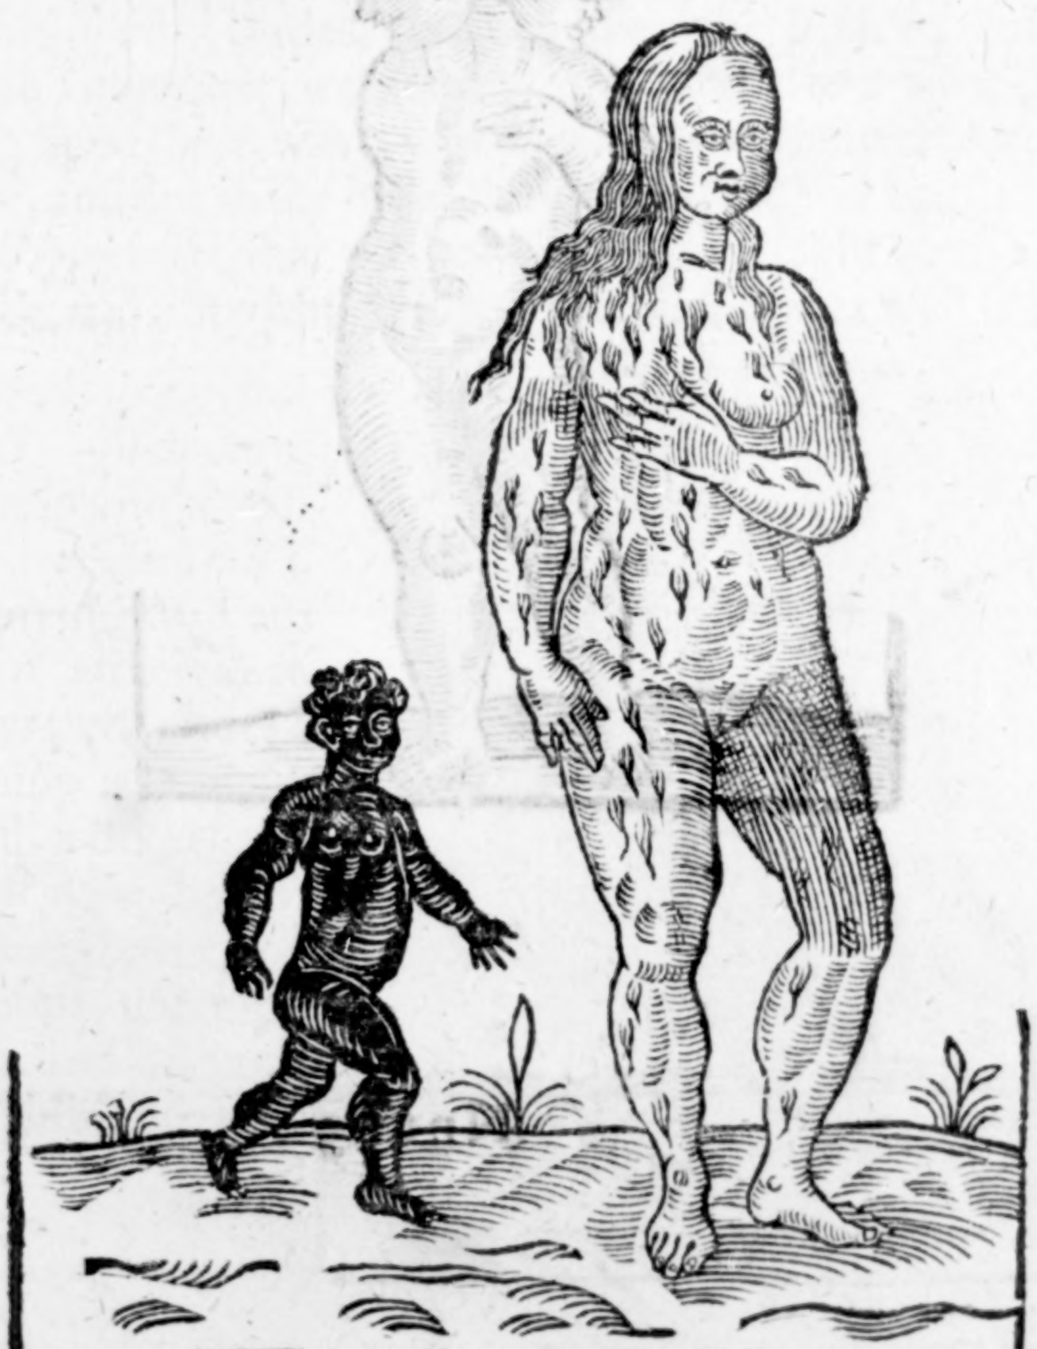
THe antients having diligently ſought into all the ſecrets of nature, have marked and obſerved other cauſes of the generation of monſters: for, underſtanding the force of imagination to bee ſo powerfull in us, as for the moſt part, it may alter the body of them that imagine, they ſoon perſwaded themſelves that the faculty which formeth the infant may be led and governed by the firme and ſtrong cogitation of the Parents begetting them (often deluded by nocturnall and deceitfull apparitions) or by the mother conceiving them, and ſo that which is ſtrongly conceived in the mind, imprints the force into the infant conceived in the wombe: which thing many thinke to be confirmed by *Moſes*, becauſe he tells that *Jacob* encreaſed and bettered the part of the ſheepe granted to him by *Laban*, his wives father, by putting roddes, having the barke in part pulled off, finely ſtroaked with white and greene, in the places where they uſed to drinke, eſpecially at the time they engendered, that the repreſentation apprehended in the conception, ſhould be preſently impreſſed in the young; for the force of imagination hath ſo much power over the infant, that it ſets upon it the notes or characters of the thing conceived.

Gen. chap. 30.

We have read in *Heliodorus* that *Perſina* Queene of *Æthiopia*, by her husband *Hidustes*, being alſo an Æthiope, had a daughter of a white complexion, becauſe in the embraces of her husband, by which ſhe proved with childe, ſhe earneſtly fixed her eye and mind upon the picture of the faire *Andromeda* ſtanding oppoſite to her. *Damaſcene* reports that he ſaw a maide hairy like a Beare, which had that deformity by no other cauſe or occaſion than that her mother earneſtly beheld, in the very inſtant of receiving and conceiving the ſeed, the image of St. *John* covered with a camells ſkinne, hanging upon the poaſts of the bed.

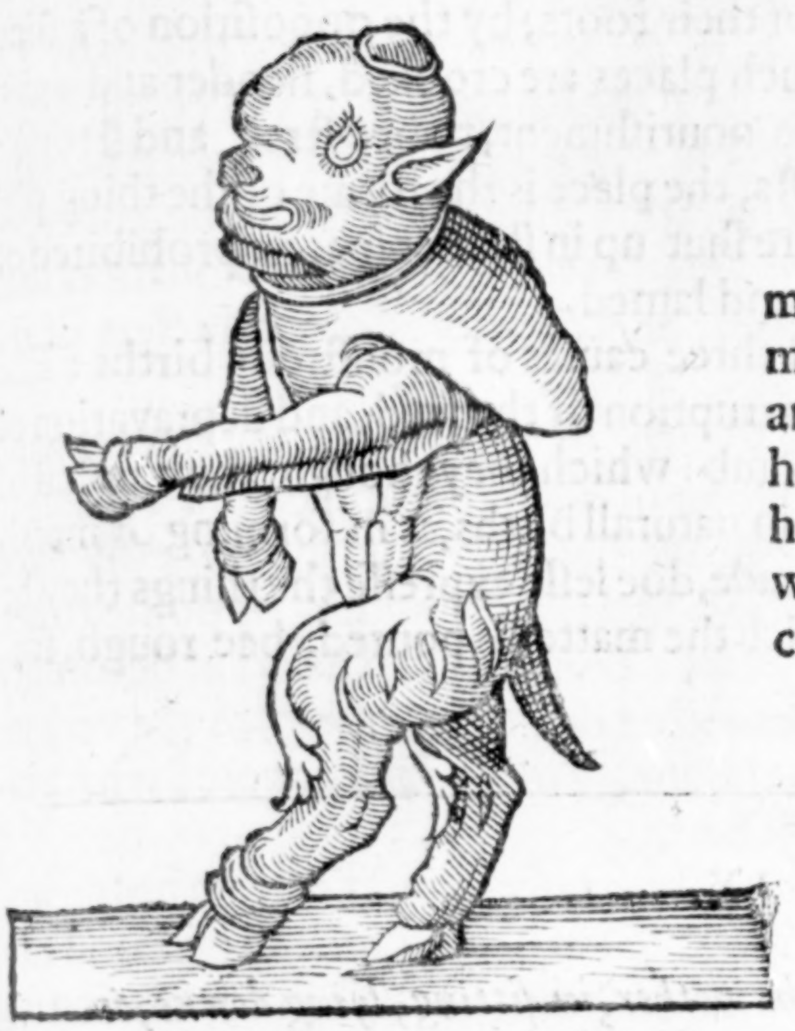
They ſay *Hippocrates*, by this explication of the cauſes, freed a certain noble woman from ſuſpicion of adultery, who being white her ſelfe, and her husband alſo white, brought forth a childe as blacke as an Æthiopian, becauſe in copulation ſhe ſtrongly and continually had in her minde the picture of the Æthiope.

The effigies of a maid all hairy, and an infant that was blacke by the imagination of their Parents.



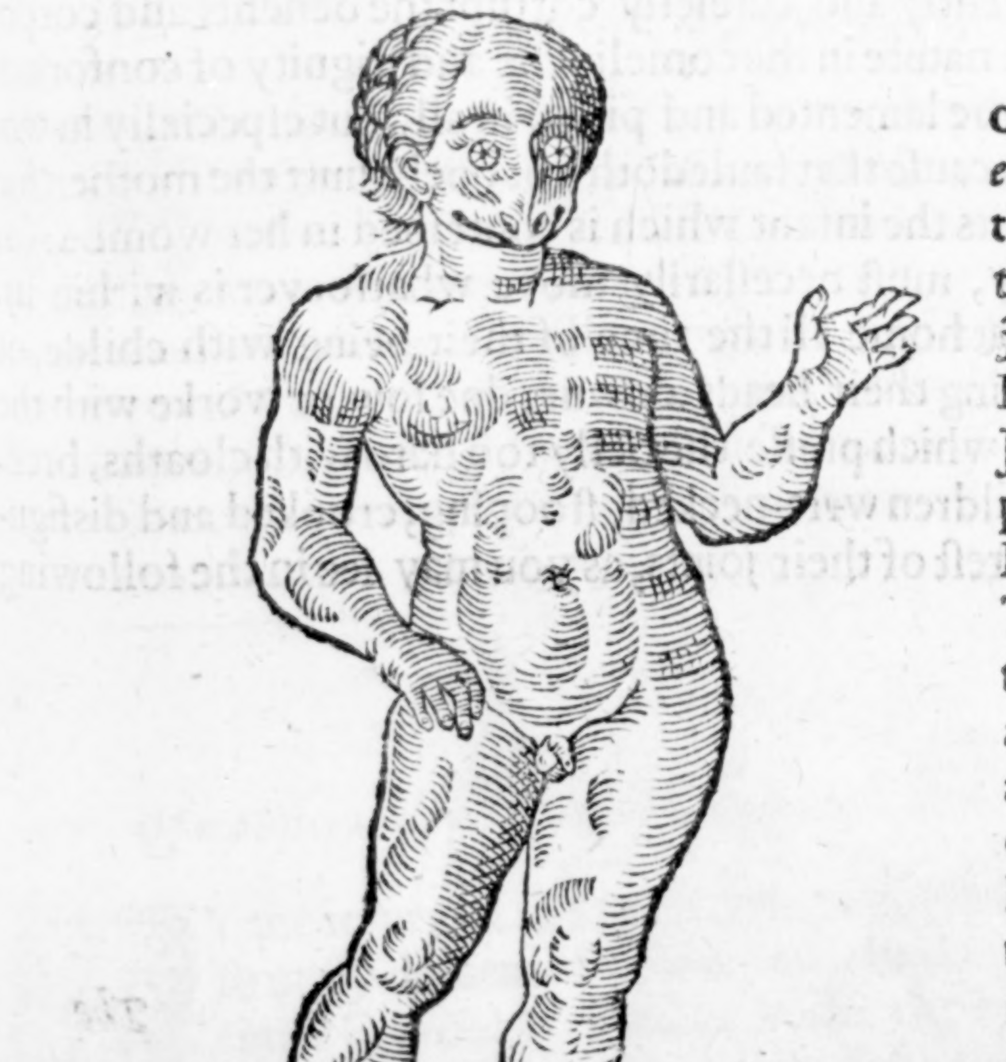
There are ſome who thinke the infant once formed in the wombe, which is done at the utmoſt within two & forty.dayes after the conception, is in no danger of the mothers imagination, neither of the ſeed of the father which is caſt into the womb; becauſe when it hath got a perfect figure, it cannot be altered with any external form of things; which whether it be true, or no, is not here to be enquired of: truly I think it beſt to keep the woman, all the time ſhe goeth with childe, from the ſight of ſuch ſhapes and figures.

The effigies of a horrid Monſter, having feet, hands, and other parts like a Calfe.



In *Stecquer* a village of *Saxony*, they ſay, a monſter was borne, with foure feet, eyes, mouth, and noſe like a calfe, with a round and redde excreſcence of fleſh on the forehead, and alſo a piece of fleſh like a hood hung from his necke upon his backe, and it was deformed with its thighes torne and cut.

The figure of an infant with a face like a Frog.



Anno Dom. 1517. in the pariſh of Kingſ-wood, in the forreſt *Biera*, in the way to *Fontain-Bleau*, there was a monſter borne, with the face of a Frog, being ſeen by *John Bellanger*, Chirurgian to the Kings Engineers, before the Juſtices of the towne of *Harmoy*; principally *John Bribon* the Kings procurator in that place. The fathers name was *Amadæus* the *Little*, his mothers, *Magdalene Sarbucata*, who troubled with a feaver, by a womans perſwaſion, held a quicke frogge in her hand untill it died, ſhe came thus to bed with her husband and conceived; *Bellanger*, a man of an acute wit, thought this was the cauſe of the monſtrous deformity of the childe.

CHAP. VIII.

Of Monſters cauſed by the ſtraitneſſe of the wombe.

That the ſtraitneſſe or littleneſſe of the wombe may be the occaſion of monſters.

WEE are conſtrained to confeſſe by the event of things, that monſters are bred and cauſed by the ſtraitneſſe of the wombe; for ſo apples hanging upon the trees, if before they come to juſt ripeneſſe, they bee put into ſtrait veſſels, their growth is hindered. So ſome whelps which women take delight in, are hindered from any further growth by the littleneſſe of the place in which they are kept. Who knowes not that the plants growing in the earth, are hindered from a longer progreſſe and propagation of their roots, by the oppoſition of a flint, or any other ſolid body, and therefore in ſuch places are crooked, ſlender and weak, but on the other part, where they have free nouriſhment, to bee ſtrait and ſtrong: for ſeeing that by the opinion of Naturaliſts, the place is the forme of the thing placed; it is neceſſary that thoſe things that are ſhut up in ſtraiter ſpaces, prohibited of free motion, ſhould be leſſened, depraved and lamed.

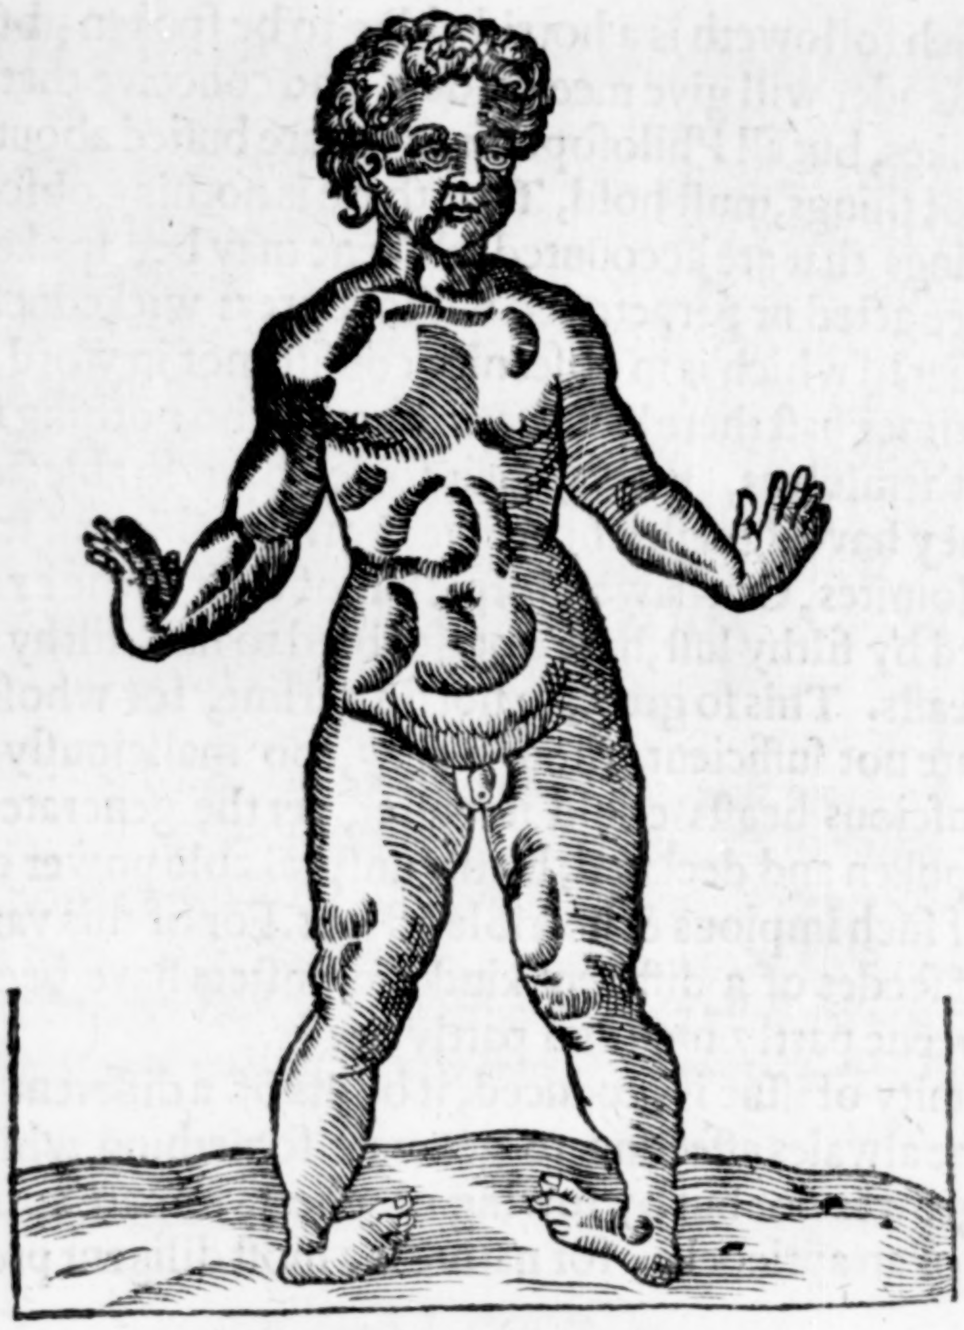
Empedocles and *Diphilus* acknowledged three cauſes of monſtrous births: The too great or ſmall matter of the ſeed; the corruption of the ſeed; and depravation of growth by the ſtraitneſſe or figure of the womb: which they thought the chiefeſt of all; becauſe they thought the caſe was ſuch in naturall births, as in forming of metals and fuſible things, of which ſtatues being made, doe leſſe expreſſe the things they be made for, if the moldes or formes into which the matter is poured, bee rough, ſcabrous, too ſtrait, or otherwiſe faulty.

CHAP. IX.

Of monſters cauſed by the ill placing of the mother, in ſitting, lying downe, or any other ſite of the body in the time of her being with childe.

WEE often too negligently and careleſly corrupt the benefits and corporall endowments of nature in the comelineſſe and dignity of conformation: it is a thing to be lamented and pitied in all, but eſpecially in women with childe, becauſe that fault doth not onely hurt the mother, but deformes and perverts the infant which is conteined in her wombe: for wee moving any manner of way, muſt neceſſarily move whatſoever is within us. Therefore they which ſit idely at home all the time of their being with childe, or croſſe-legged, thoſe which holding their heads downe, doe ſow or worke with the needle, or doe any other labour, which preſſe the belly too hard with cloaths, breeches or ſwathes, doe produce children wrie-necked, ſtooping, crooked and disfigured in their feet, hands, and the reſt of their joints, as you may ſee in the following figure.

The effigies of a childe, who from the firſt conception, by the ſite of the mother, had his hands and feet ſtanding crooked.



CHAP. X.

Of monſters cauſed by a ſtroake, fall, or the like occaſion.

THere is no doubt but if any injury happen to a woman with childe, by reaſon of a ſtroake, fall from on high, or the like occaſion, the hurt alſo may extend to the child. Therefore by theſe occaſions the tender bones may bee broken, wreſted, ſtrained, or depraved after ſome other monſtrous manner; and more, by the like violence of ſuch things, a veine is often opened or broken, or a fluxe of blood, or great vomiting is cauſed by the vehement concuſſion of the whole body, by which meanes the childe wants nouriſhment, and therefore will be ſmall and little, and altogether monſtrous.

CHAP. XI.

Of monſters which have their originall by reaſon of hereditary diſeaſes.

BY the injury of hereditary diſeaſes, infants grow monſtrous, that is, monſtrouſly deformed: for crooke-backt produce crooke-backt, and often times ſo crooked, that betweene the bunch behind and before, the head lies hid, as a Tortoiſe in her ſhell: ſo lame produce lame, flat noſed their like, dwarfes bring forth dwarfes, leane bring forth leane, and fat produce fat.

CHAP.

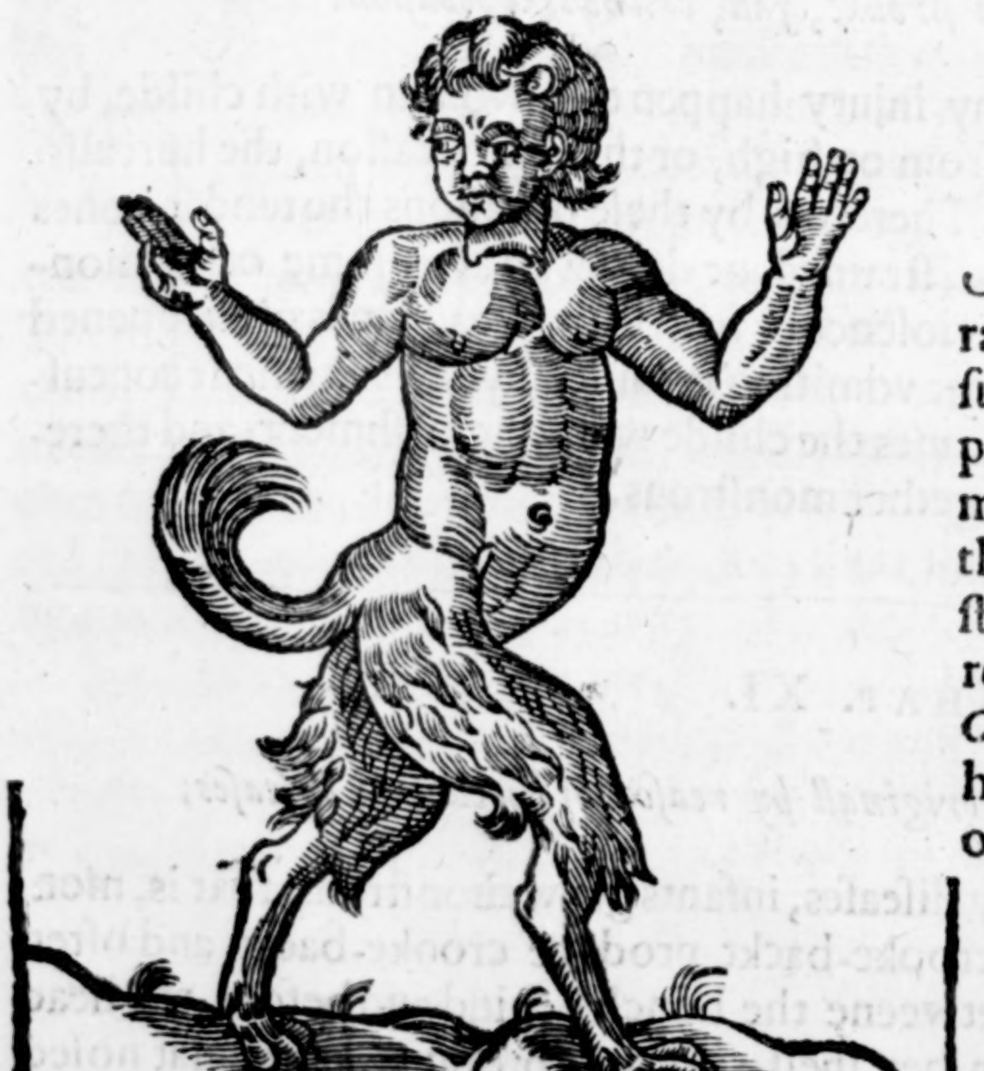
Chap. XII.

Of monsters by the confuſion of ſeed of divers kindes.

THat which followeth is a horrid thing to be ſpoken; but the chaſt minde of the Reader will give mee pardon, and conceive that, which not onely the Stoikes, but all Philoſophers, who are buſied about the ſearch of the cauſes of things, muſt hold, That there is nothing obſcene or filthy to be ſpoken. Thoſe things that are accounted obſcene may bee ſpoken without blame, but they cannot bee acted or perpetrated without great wickedneſſe, fury and madneſſe; therefore that ill which is in obſcenity conſiſts not in word, but wholly in the act. Therefore in times paſt there have beene ſome, who nothing fearing the Deity, neither Law, nor themſelves, that is, their ſoule, have ſo abjected and proſtrated themſelves, that they have thought themſelves nothing different from beaſts: wherefore Atheiſts, Sodomites, Out-lawes, forgetfull of their owne excellency and divinity, & transformed by filthy luſt, have not doubted to have filthy and abhominable copulation with beaſts. This ſo great, ſo horrid a crime, for whoſe expiation all the fires in the world are not ſufficient, though they, too maliciouſly crafty, have concealed, and the conſcious beaſts could not utter, yet the generated miſ-ſhapen iſſue hath abundantly ſpoken and declared, by the unſpeakable power of God, the revenger and puniſher of ſuch impious & horrible actions. For of this various and promiſcuous confuſion of ſeedes of a different kinde, monſters have beene generated and borne, who have beene partly men and partly beaſts.

The like deformity of iſſue is produced, if beaſts of a different ſpecies doe copulate together, nature alwaies affecting to generate ſomething which may bee like it ſelfe: for wheat growes not but by ſowing of wheat; nor an apricocke but by the ſetting or grafting of an apricocke; for nature is a moſt diligent preſerver of the ſpecies of things.

The effigies of a monſter halfe man and halfe dogge.

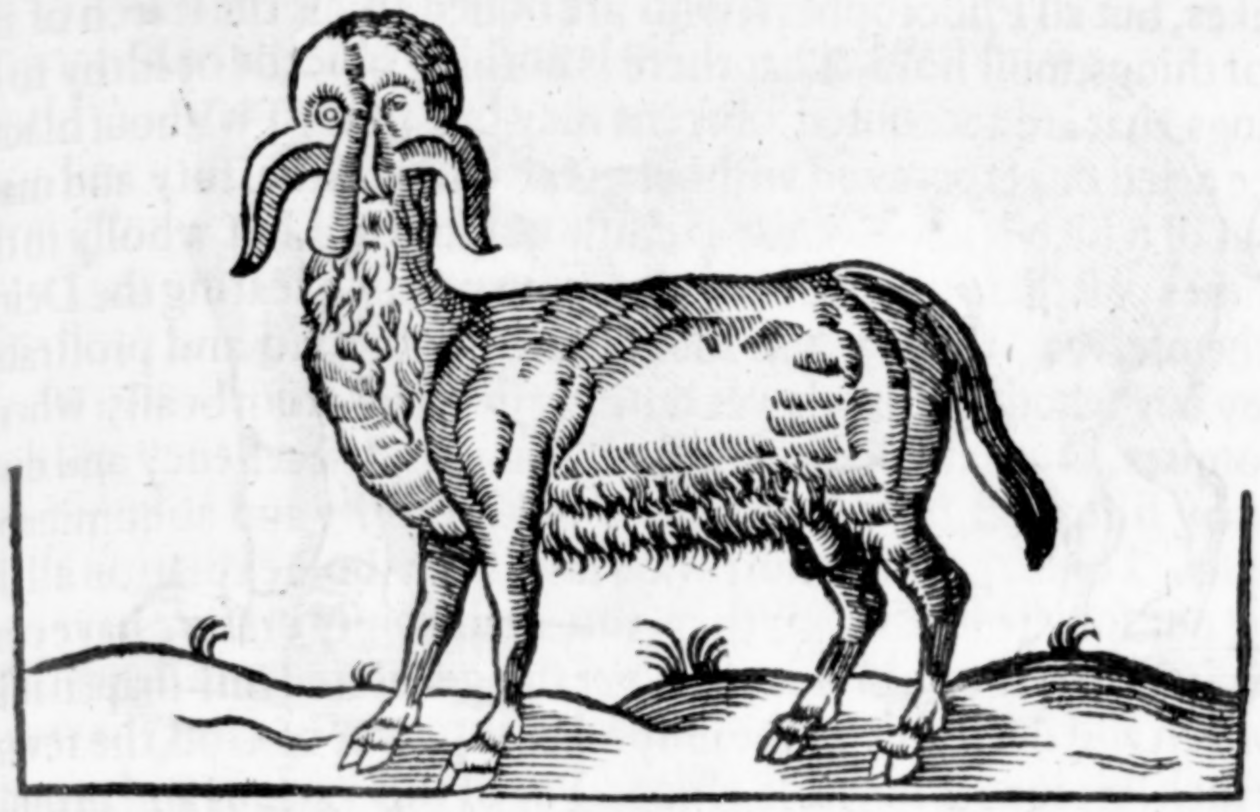


Anno Dom. 1493. there was generated of a woman and a dogge, an iſſue, which from the navell upwards perfectly reſembled the ſhape of the mother, but therehence downewards the ſire, that is, the dogge. This monſter was ſent to the Pope that then reigned, as *Volaterane* writeth: alſo *Cardane* mentions it; wherefore I have here given you the figure thereof.

Card. lib. 14. de var. rerum cap. 64.

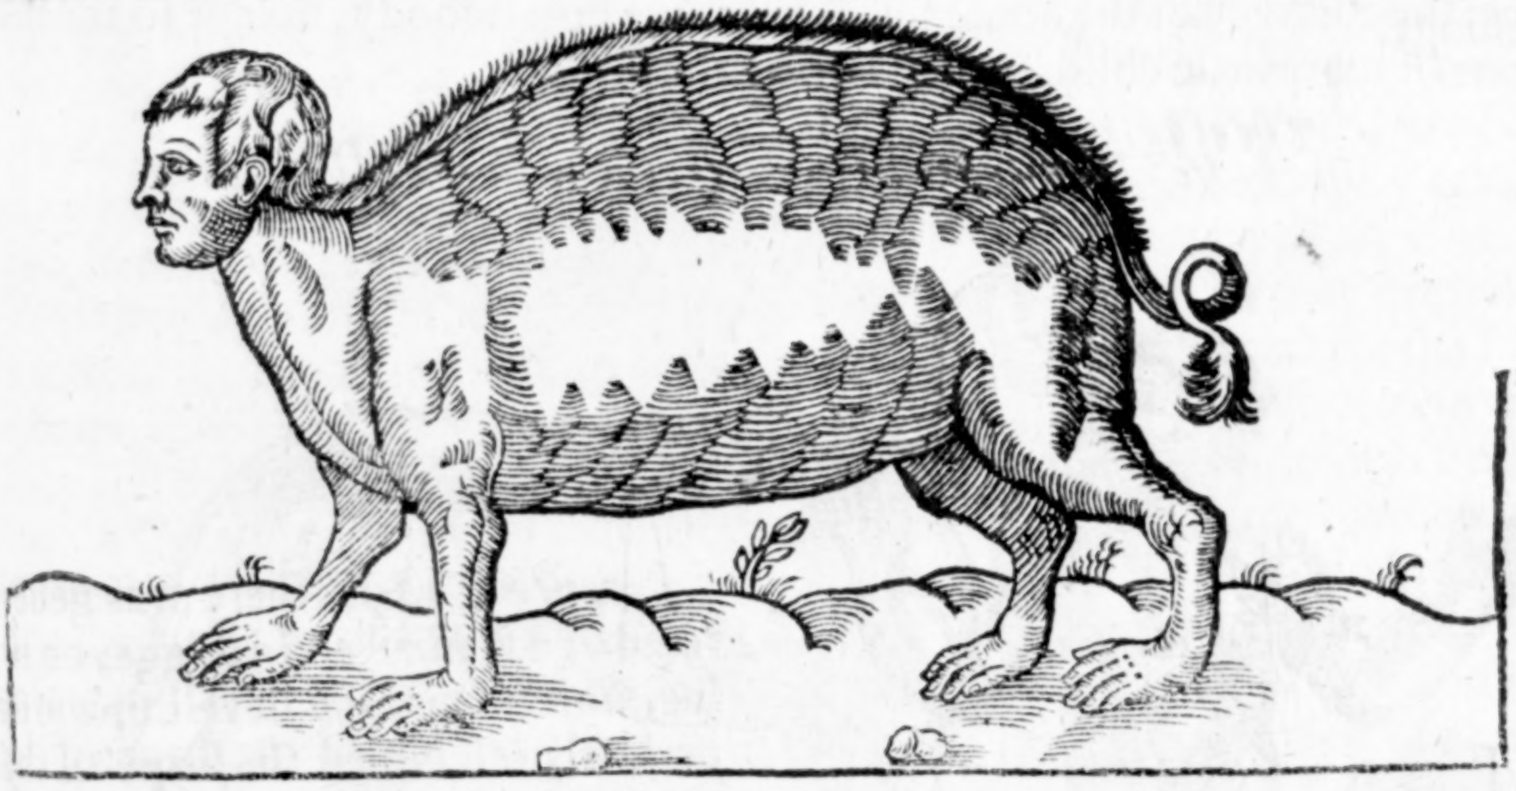
Cælius Rhodiginus writes that at *Sibaris*, a heards-man called *Chrathis* fell in love with a Goat, and accompanied with her, and of this deteſtable and brutiſh copulation an infant was born, which in legges reſembled the damme, but the face was like the fathers.

The figure of a monſter in face reſembling a man, but a Goat in his other members.



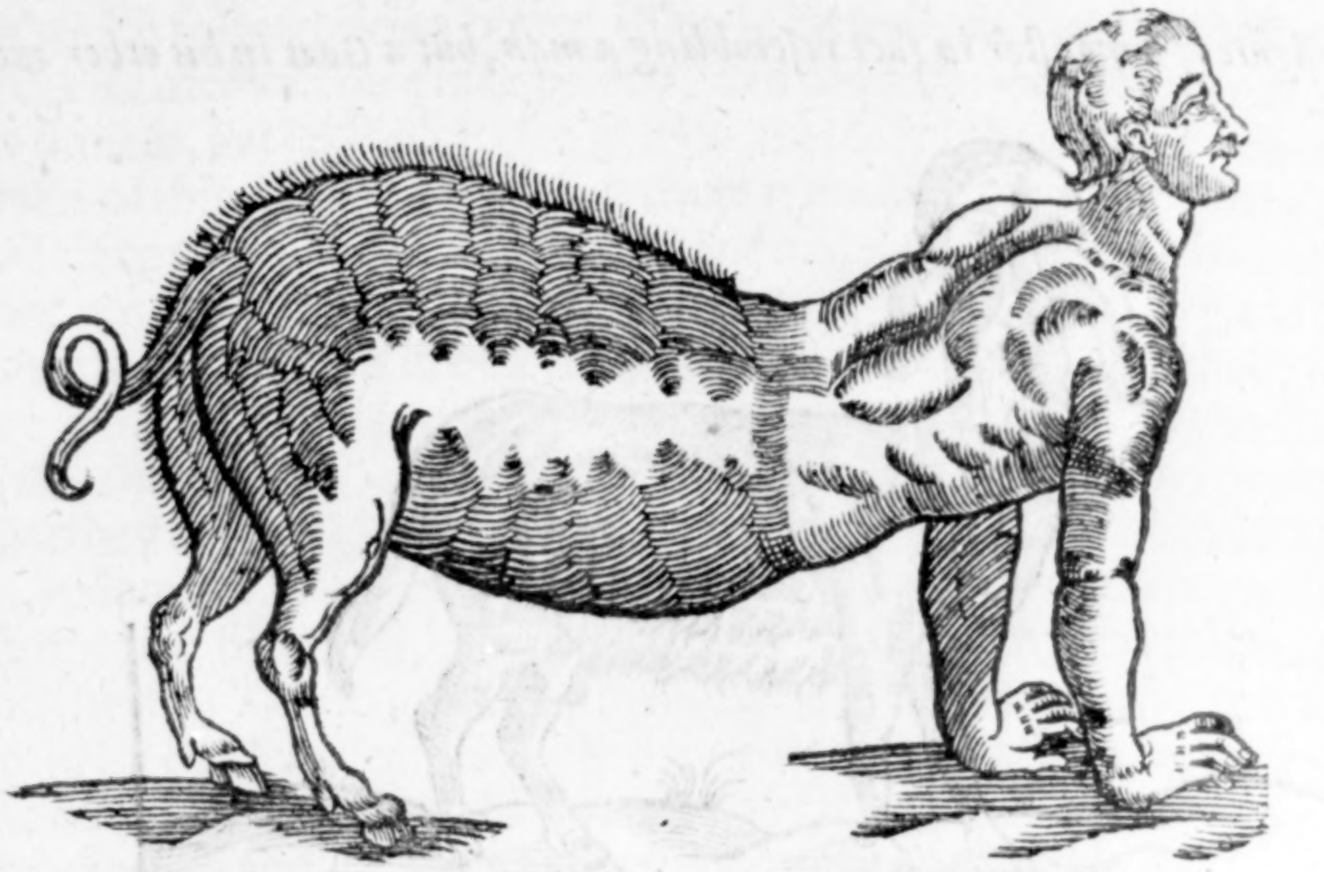
Anno Dom. 1110. In a certaine towne of *Liege* (as ſaith *Lycoſthenes*) a ſow farrowed a pig with the head, face, hands, and feet of a man, but in the reſt of the body reſembling a ſwine.

The figure of a pigge, with the head, face, hands, and feet of a man.



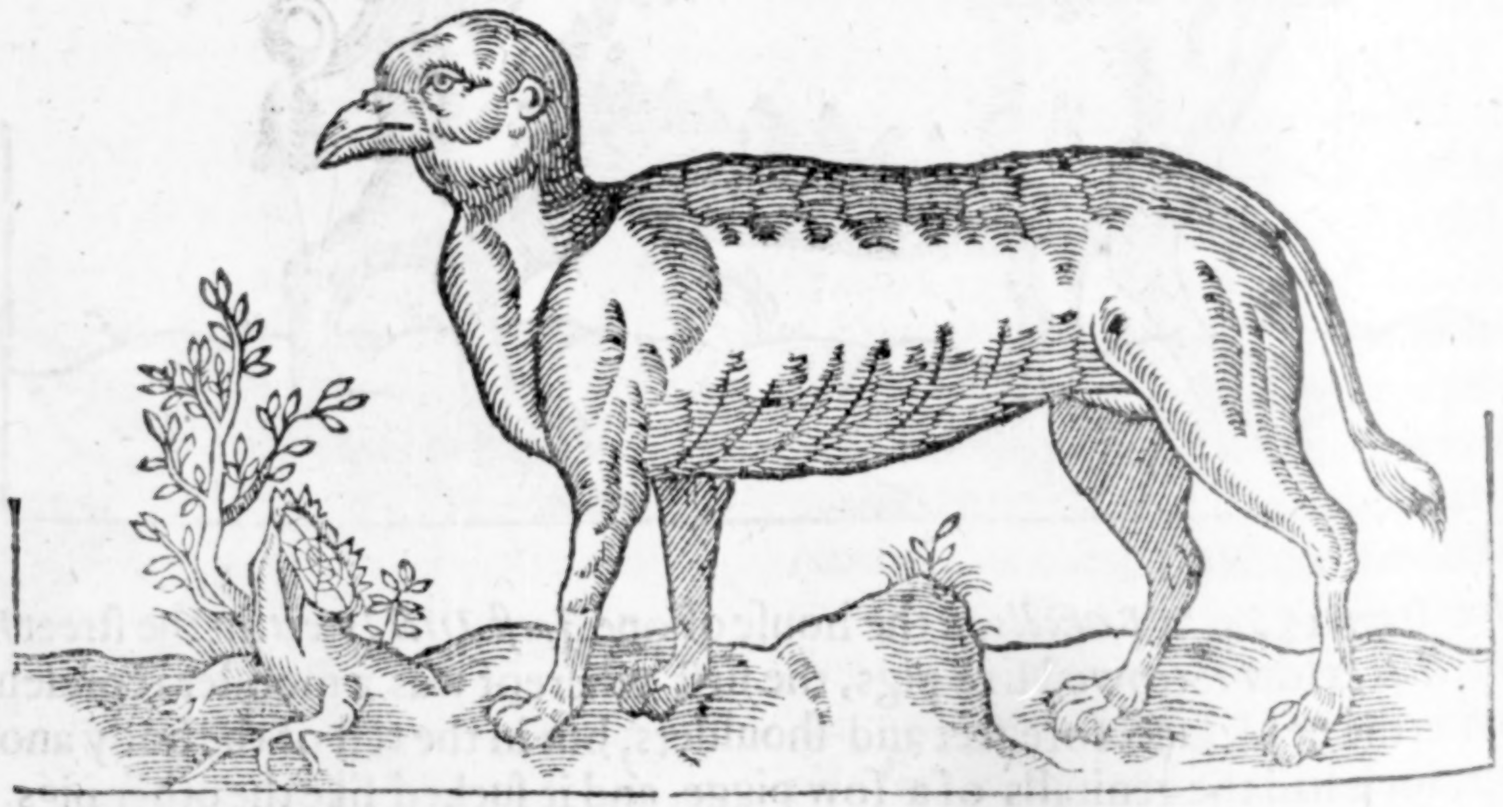
Anno Dom. 1564. at *Bruxels*, at the houſe of one *Ioeſt Dictzpeert*, in the ſtreet *Warmoesbroects*, a ſow farrowed ſixe pigs, the firſt whereof was a monſter repreſenting a man in the head, face, fore feet and ſhoulders, but in the reſt of the body another pigge, for it had the genitalls of a ſow pigge, and it ſucked like the other pigs. But the ſecond day after it was farrowed, it was killed of the people together with the ſow, by reaſon of the monſtrouſneſſe of the thing. Here followeth the figure thereof.

The effigies of a monſter halfe man and halfe ſwine.



Anno Dom. 1571. at *Antwerpe*, the wife of one *Michaell* a Printer, dwelling with one *John Molline* a Graver or Carver, at the ſigne of the Golden Foot, in the *Cami-ſtrate*, on St. *Thomas* his day, at ten of the clocke in the morning, brought forth a monſter wholly like a dogge, but that it had a ſhorter necke, and the head of a bird, but without any feathers on it. This monſter was not alive, for that the mother was delivered before her time; but ſhe giving a great ſcritch in the inſtant of her deliverance, the chimney of the houſe fell downe, yet hurt nobody, no not ſo much as any one of foure little children that ſate by the fire ſide.

The figure of a monſter like a dogge, but with a head like a bird.



Lewis Celleus writeth that hee hath read in an approved author, that an Ewe once brought forth a Lion, a beaſt of an unlike and adverſe nature to her.

Anno Dom. 1577. in the towne *Blandy*, three miles from *Melon*, there was lambed a Lambe, having three heads, the middlemoſt of which was bigger than the reſt, when one bleated they all bleated. *John Bellanger* the Chirurgian of *Melon* affirmed that hee ſaw this monſter, and he got it drawne, and ſent the figure thereof to mee, with that humane monſter that had the head of a Frogge, which we have formerly deſcribed.

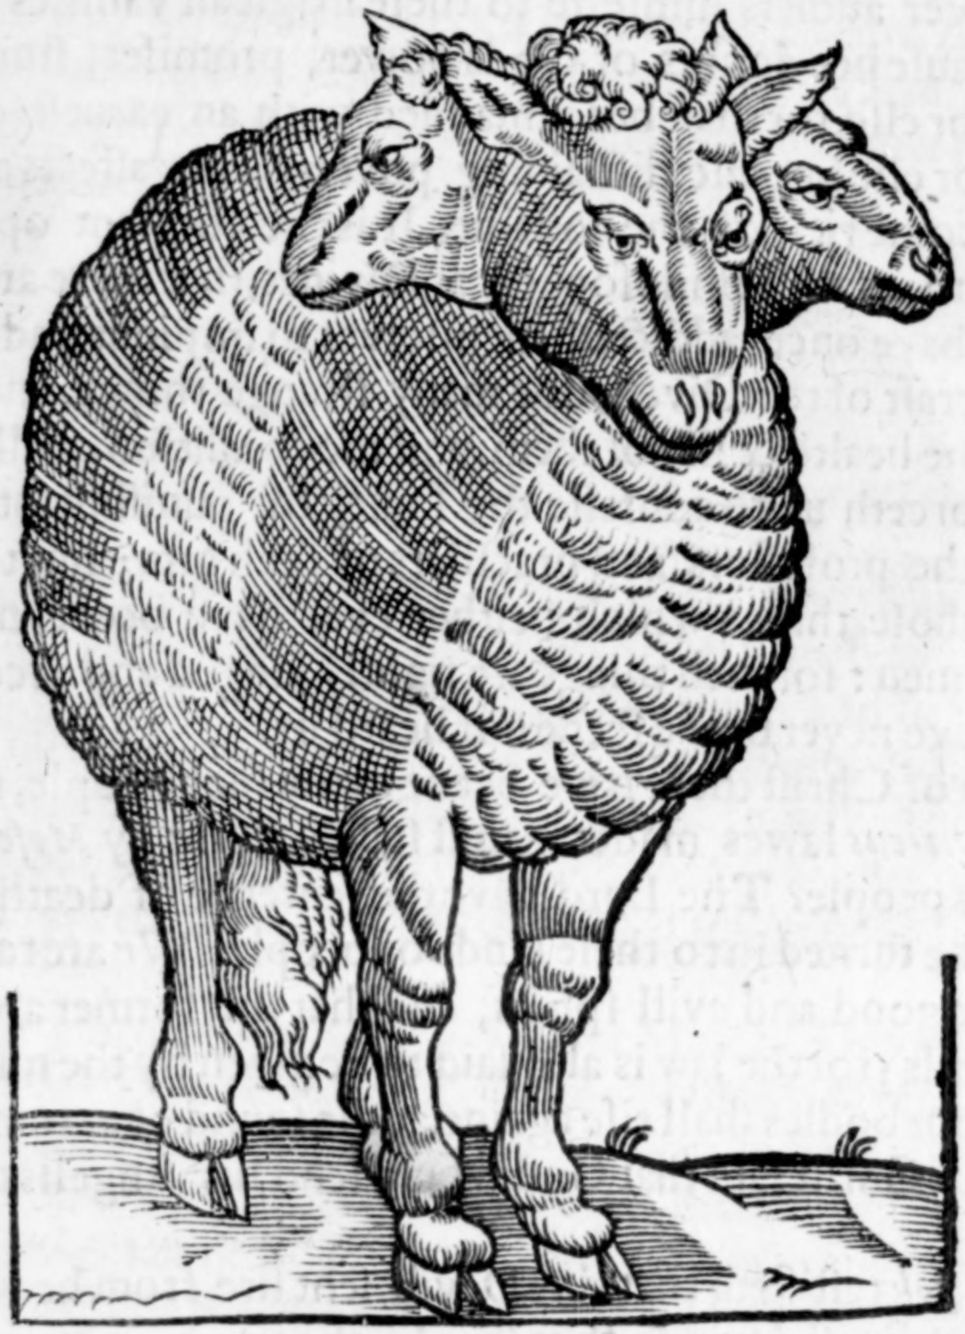
The figure of a three-headed Lambe.



There are ſome monſters in whoſe generation by this there may ſeeme to be ſome divine cauſe, for that their beginnings cannot be derived or drawne from the generall cauſe of monſters, that is, nature, or the errors thereof, by reaſon of ſome of the forementioned particular cauſes: ſuch are theſe monſters that are wholly againſt all nature, like that which we formerly mentioned, of a Lion yeaned by an Ewe.

Yet Aſtrologers (leſt there ſhould ſeeme to be any thing which they are ignorant of) referre the cauſes of theſe to certaine conſtellations and aſpects of the Planets and Stars, according to *Ariſtotles* ſaying in his Problemes; in confirmation whereof they tell this tale. It happened in the time of *Albertus Magnus,* that in a certaine village, a Cow brought forth a Calfe, which was halfe a man: the towneſmen apprehended the heardſ-man, and condemned him as guilty of ſuch a crime, to be preſently burnt together with the cow; but by good lucke *Albertus* was there, to whom they gave credit by reaſon of his much and certaine experience in Aſtrologie, that it was not occaſioned by any humane wickedneſſe, but by the efficacy of a certaine poſition of the ſtarres, that this monſter was borne.

CHAP. XIII.

Of monſters occaſioned by the craft and ſubtlety of the Devill.

IN treating of ſuch monſters as are occaſioned by the craft of the Devill, wee crave pardon of the courteous Reader, if peradventure going further from our purpoſe, wee may ſeeme to ſpeake more freely and largely of the exiſtence, nature, and kindes of Devills. Therefore firſt it is manifeſt that there are Conjurers, Charmers, and Witches, which whatſoever they do, performe it by an agreement & compact with the Devill, to whom they have addicted themſelves: for none can be admitted into that ſociety of Witches, who

There are ſorcerers, and how they come ſo to be.

What induceth them thereto.

hath not forſaken God the Creator, and his Saviour, and hath not transferred the worſhip due to him above, upon the Devill, to whom he hath obliged himſelfe. And aſſuredly, whoſoever addicts himſelfe to theſe magicall vanities and witch-crafts, doth it, either becauſe hee doubts of Gods power, promiſes, ſtudy and great good will towards us: or elſe for that hee is madded with an earneſt deſire of knowing things to come; or elſe becauſe diſdaining poverty, hee affects and deſires from a poore eſtate to become rich on the ſodaine. It is the conſtant opinion of all, both ancient and modern, as well Philoſophers as Divines, that there are ſome ſuch men; which when they have once addicted themſelves to impious and divelliſh arts, can by the wondrous craft of the Divell, doe many ſtrange things, and change and corrupt bodies, and the health & life of them, and the condition of all mundane things. Alſo experience forceth us to confeſſe the ſame, for puniſhments are ordained by the lawes againſt the profeſſors and practiſers of ſuch arts; but there are no lawes ordained againſt thoſe things which neither ever have beene, nor ever came into the knowledge of men: for ſuch things are rightly judged and accounted for impoſſibilities, which have never beene ſeene nor heard of.

Exod. cap. 22.
Levit. cap. 19.
Hebr. 1. 14.
Galat. 3. 19.
1 Theſ. 4. 16.

Before the birth of Chriſt there have beene many ſuch people, for you may finde in *Exodus* and *Leviticus* lawes made againſt ſuch perſons by *Moſes*, by whom God gave the law to his people. The Lord gave the ſentence of death to *Ochaſias* by his Prophet, for that he turned in to theſe kinde of people. We are taught by the ſcriptures that there are good and evill ſpirits, and that the former are termed Angells, but the latter Devills; for the law is alſo ſaid to be given by the miniſtry of Angels: and it is ſaid that our bodies ſhall riſe againe at the ſound of a trumpet, and the voice of an Arch-angell. Chriſt ſaid that God would ſend his Angells to receive the elect into the heavens.

John 13.
Mar. 26. 34.

The hiſtorie of *Job* teſtifieth that the Devill ſent fire from heaven, and killed his ſheep and cattell, and raiſed winds that ſhooke the foure corners of the houſe, and overwhelmed his children in the ruines thereof. The hiſtory of *Achab* mentioneth a certaine lying ſpirit in the mouth of the falſe Prophets. Sathan entring into *Judas*, moved him to betray Chriſt. Devils, who in a great number poſſeſſed the body of a man, were called a Legion, and obtained of Chriſt that they might enter into ſwine, whom they carried headlong into the Sea.

The power of evill ſpirits over mankind.

The differences of devills.

In the beginning God created a great number of Angells, that thoſe divine and incorporeall ſpitits might inhabite heaven, and as meſſengers, ſignifie Gods pleaſure to men, and as miniſters or ſervants, performe his commands, who might be as overſeers and protectors of humane affaires. Yet of this great number there were ſome who were blinded by pride, and thereby alſo caſt downe from the preſence, and heavenly habitation of God the creator. Theſe harmefull and crafty ſpirits delude mens mindes by divers jugling trickes, and are alwaies contriving ſomething to our harme, and would in a ſhort ſpace deſtroy mankinde, but that God reſtraines their fury; for they can onely doe ſo much as is permitted them: Expelled heaven, ſome of them inhabite the aire, others, the bowels of the earth, there to remaine untill God ſhall come to judge the world: and as you ſee the clouds in the aire ſomewhiles to reſemble centaures, otherwhile ſerpents, rocks, towers, men, birds, fiſhes, and other ſhapes: ſo theſe ſpirits turne themſelves into all the ſhapes and wondrous formes of things; as oft times into wild beaſts, into ſerpents, toads, owles, lapwings, crowes or ravens, goats, aſſes, dogs, cats, wolves, buls, and the like. Moreover, they oft times aſſume and enter humane bodies, as well dead as alive, whom they torment and puniſh, yea alſo they transforme themſelves into angells of light.

The deluſions of devills.

They feigne themſelves to bee ſhut up and forced by magicall rings, but that is onely their deceit and craft, they wiſh, feare, love, hate, and oft times as by the appointment and decree of God they puniſh malefactors: for we read that God ſent evill angels into Egypt, there to deſtroy. They houle on the night, they murmure & rattle, as if they were bound in chaines, they move benches, tables, counters, props, cupboards, children in the cradles, play at tables and cheſſe, turne over books, tell mony, walk up & down roomes, and are heard to laugh, to open windowes & dores, caſt ſounding veſſels, as braſſe and the like, upon the ground, breake ſtone pots and glaſſes, and make other the like noiſes. Yet none of all theſe things appeare to us when as wee ariſe in the morning, neither finde we any thing out of its place or broken. They are called by divers names; as, Devills, evill Spirits, *Incubi*, *Sucubi*, Hobgoblines, Fairies, Robin-good-fellowes, evill Angels, Sathan, Lucifer, the father of lies, Prince of darkeneſſe and of the world, Legion, and other names agreeable to their offices and natures.

Their titles & names.

Chap. XIV.

Of the ſubterrene Devills, and ſuch as haunt Mines.

Lewis *Lavater* writes, that by the certaine report of ſuch as worke in Mines, that in ſome Mines there are ſeene ſpirits, who in the ſhape and habite of men, worke there, and running up and downe ſeeme to doe much worke, when as notwithſtanding they doe nothing indeed. But in the meane time they hurt none of the by-ſtanders, unleſſe they bee provoked thereto by words, or laughter. For then they will throw ſome heavie or hard thing upon him that hurt them, or injure them ſome other way.

What the devills in Mines doe.

The ſame author affirmes that there is a ſilver Mine in *Rhetia*, out of which *Peter Briot*, the Governour of the place, did in his time get much ſilver. In this Mine there was a Devill, who chiefly on Frie-dayes, when as the Miners put the minerall they had digged into tubbes, kept a great quarter, and made himſelfe exceeding buſie, and poured the minerall, as he liſted, out of one tubbe into another. It happened one day that he was more buſie than he uſed to be, ſo that one of the Miners reviled him, and bad him bee gone on a vengeance to the puniſhment appointed for him. The Devill offended with his imprecation and ſcoffe, ſo wreſted the Miner, taking him by the head, that twining his necke about, hee ſet his face behinde him, yet was not the workman killed therewith, but lived, and was known by divers for many yeeres after.

Chap. XV.

By what meanes the Devills may deceive us.

Our mindes involved in the earthy habitation of our bodies, may bee deluded by the Devills divers waies; for they excell in purity and ſubtlety of eſſence, and in the much uſe of things: beſides, they challenge a great preheminence, as the Princes of this world, over all ſublunary bodies. Wherefore it is no marvell if they, the teachers and parents of lyes, ſhould caſt clouds and miſts before our eyes from the beginning, & turne themſelves into a thouſand ſhapes of things and bodies, that by theſe juglings and trickes they may ſhadow and darken mens mindes.

Devills are ſpirits, and from eternity.

Chap. XVI.

Of Sucubi *and* Incubi.

Powerfull by theſe forementioned arts and deceipts, they have ſundry times accompanied with men in copulation, whereupon ſuch as have had to doe with men, were called *Sucubi*, thoſe which made uſe of women, *Incubi*. Verily St. *Auguſtine* ſeemeth not to be altogether againſt it, but that they, taking upon them the ſhape of man, may fill the genitalls

The reaſon of the name. *Lib. 15. de civit Dei, cap. 22, & 23.*

talls, as by the helpe of nature, to the end, that by this meanes they may draw aſide the unwary, by the flames of luſt, from vertue and chaſtity.

A hiſtory.

John Ruef in his book of the conception and generation of man, writes that in his time, a certaine woman of monſtrous luſt, and wondrous impudency, had to doe by night with a Divell, that turned himſelfe into a man, and that her belly ſwelled up preſently after the act; and when as ſhe thought ſhee was with childe, ſhe fell into ſo grievous a diſeaſe, that ſhee voided all her entrailes by ſtoole, medicines nothing at all prevailing.

Another.

The like hiſtory is told of the ſervant of a certaine Butcher, who thinking too attentively on venereous matters, a Divell appeared to him in the ſhape of a woman, with whom (ſuppoſing it to bee a woman) when as hee had to doe, his genitalls ſo burned after the act, that becomming enflamed, hee died with a great deale of torment.

An opinion confuted.

Neither doth *Peter Paludanus*, and *Martin Arelatenſis* thinke it abſurd to affirme that Devills may beget children, if they ſhall ejaculate into the womans womb ſeed taken from ſome man, either dead or alive. Yet this opinion is moſt abſurd and full of falſitie, mans ſeed conſiſting of a ſeminall or ſanguineous matter, and much ſpirit: if it runne otherwaies than into the wombe from the teſticles, and ſtay never ſo little a while, it loſeth its ſtrength and efficacy, the heat and ſpirits vaniſhing away; for even the too great length of a mans yard, is reckoned amongſt the cauſes of barrenneſſe, by reaſon that the ſeed is cooled by the length of the way. If any in copulation, after the ejaculation of the ſeed, preſently draw themſelves from the womans embraces, they are thought not to generate, by reaſon of the aire entring into the yet open womb, which is thought to corrupt the ſeed. By which it appeares how falſe that hiſtory in *Averrois* is, of a certaine woman that ſaid ſhe conceived with child by a mans ſeed ſhed in a bath, and ſo drawne into her wombe, ſhe entring the bath preſently after his departure forth. It is much leſſe credible that Divells can copulate with women, for they are of an abſolute ſpirituous nature, but blood and fleſh are neceſſary for the generation of man. What naturall reaſon can allow that the incorporeall Divells can love corporeall women? And how can we thinke that they can generate, who want the inſtruments of generation? How can they who neither eate nor drinke be ſaid to ſwell with ſeed? Now where the propagation of the ſpecies is not neceſſary to bee ſupplied by the ſucceſſion of Individuals, Nature hath given no deſire of venery, neither hath it imparted the uſe of generation; but the divels once created were made immortall by Gods appointment: If the faculty of generation ſhould be granted to devills, long ſince all places had beene full of them. Wherefore if at any time women with childe by the familiarity of the devill, ſeeme to travell, we muſt thinke it happens by thoſe arts we mentioned in the former chapter, to wit, they uſe to ſtuffe up the bodies of living women with old clouts, bones, pieces of iron, thornes, twiſted haires, pieces of wood, ſerpents, and a world of ſuch trumpery, wholly diſſenting from a womans nature: who afterwards, the time, as it were, of their delivery drawing nigh, through the wombe of her that was falſly judged with child, before the blinded, and, as it were, bound up eyes of the by-ſtanding women, they give vent to their impoſtures. The following hiſtory, recorded in the writings of many moſt credible authors, may give credit hereto.

Averrois his hiſtory convict of falſhood.

The illuſions of the devills.

A hiſtory.

There was at *Conſtance* a faire damoſell called *Margaret*, who ſerved a wealthy Citizen: ſhe gave it out every where that ſhe was with child by lying with the devill on a certaine night. Wherefore the Magiſtrates thought it fit ſhe ſhould bee kept in priſon, that it might bee apparent both to them and others, what the end of this exploit would bee. The time of deliverance approaching, ſhee felt paines like thoſe which women endure in travell; at length, after many throwes, by the midwives helpe, in ſtead of a childe, ſhee brought forth iron nailes, pieces of wood, of glaſſe, bones, ſtones, haires, towe, and the like things, as much different from each other, as from the nature of her that brought them forth, and which were formerly thruſt in by the devill to delude the too credulous mindes of men.

Our ſins are the cauſe that the devils abuſe us.

The Church acknowledgeth that devils, by the permiſſion and appointment of God puniſhing our wickedneſſe, may abuſe a certaine ſhape, ſo to uſe copulation with mankinde. But that a humane birth may thence ariſe, it not onely affirmes to bee falſe, but deteſts as impious, as which beleeves that there was never any man begot without the ſeed of man, our Saviour Chriſt excepted. Now what confuſion and perturbation of creatures ſhould poſſeſſe this world (as *Caſſianus* ſaith) if divells could conceive by copulation with men? or if women ſhould prove with childe by accompanying them, howmany monſters would the divells have brought forth from the beginning of the world? how many prodigies by caſting their ſeed into the wombes of wilde and brute beaſts? for by the opinion of Philoſophers, as often as faculty and will concurre, the effect muſt neceſſarily follow: now the Devils never have wanted will to diſturbe mankinde, and the order of this world: for the devill, as they ſay, is our enemy from the beginning; and as God is the author of order, and beauty, ſo the devill, by pride, contrary to God, is the cauſer of confuſion and wickedneſſe.

Wherefore if power ſhould accrew equall to his evill minde and nature, and his infinite deſire of miſchiefe and envie, who can doubt but a great confuſion of all things and ſpecies, and alſo great deformity would invade the decent and comely order of this univerſe, monſters ariſing on every ſide? But ſeeing that devills are incorporeall, what reaſon can induce us to beleeve that they can be delighted with venereous actions? and what will can there be where as there is no delight, nor any decay of the ſpecies to be feared? ſeeing that by Gods appointment they are immortall, ſo to remaine for ever in puniſhment: ſo what need they ſucceſſion of individualls by generation? wherefore if they neither will nor can, it is a madneſſe to thinke that they doe commixe with man.

CHAP. XVII.

Of Magicke and ſupernaturall diſeaſes and remedies.

That I may refreſh the mind of the Reader, invited to theſe hiſtories of monſters, raiſed up by the art of the divell, witches, and conjurers, his ſervants, I have thought good to add the following hiſtories of certaine diſeaſes, and remedies ſupernaturall, and wholly magicall, out of *Fernelius*. There are diſeaſes, which as they are ſent amongſt men by God being offended, ſo they cannot expect cure otherwiſe than from God, from whence they are thought ſupernaturally to have their eſſence and cure. Thus the aire oft-times, yet chiefly in the time of King *David*, being defiled with the peſtilence, killed ſixty odde thouſand perſons.

Lib. 2. de abdit. cauſ. cap. 16.

Thus *Ezechias* was ſtrucke with a grievous diſeaſe: *Job* was defiled with filthy ulcers by Sathan at Gods command. And as the Devill, the cruell enemy of mankinde, commonly uſeth by Gods permiſſion to afflict thoſe, ſo wicked perſons by the wondrous ſubtlety of the devill, offer violence, and doe harme to many. Some invoke I know not what ſpirits, and adjure them with herbes, exorciſmes, imprecations, incantations, charmes: others hang about their neckes, or otherwiſe carry certaine writings, characters, rings, images, and other ſuch impious ſtuffe. Some uſe ſongs, ſounds or numbers: ſometimes potions, perfumes, and ſmells; ſometimes geſtures and jugling. There be ſome that make the portraiture of the abſent party in waxe, and boaſt that they can cauſe or bring a diſeaſe into what ſoever part thereof they prick, by the force of their words and ſtarres, into the like part of the party abſent; and they have no few other tricks to bring diſeaſes.

Witches hurt by the devills aſſiſtance.

We know for certain that magicians, witches, and conjurers, have by charmes ſo bound ſome, that they could not have to do with their wives; and have made others ſo impotent, as if they had bin gelt or made eunuches. Neither do wicked men onely ſend diſeaſes into mans body, but alſo devills themſelves. Theſe truely are ſoone diſtracted with a certain fury, but in this one thing they differ from ſimple madneſſe, for that they ſpeake things of great difficulty, tell things paſt and hid, diſcloſe the

ſecrets

ſecrets of ſuch as are preſent, and revile them many waies, and are terrified, tremble or grow angry by the power of divine words.

A hiſtory.

One not very long agone, being by reaſon of heat exceeding dry in the night time, riſing out of his ſleep, and not finding drinke, took an apple that he found by chance, and eating it, he thought his jawes were ſhut and held faſt as by ones hands, and that he was almoſt ſtrangled: and alſo, now poſſeſſed of a Devill entring into him, hee ſeemed in the darke to bee devoured of a huge exceeding blacke dogge, which hee, afterwards reſtored to his former health, orderly related to me. There were divers, who by his pulſe, heat, and the roughneſſe of his tongue, thought him to be in a feaver, and by his watching, and the perturbation of his minde, thought him onely to rave.

A hiſtory.

Another young Noble-man, ſome few yeeres ſince, was troubled at ſet times with a ſhaking of the body, and as it were, a convulſion, wherewith one while hee would move onely his left arme, another while the right arme, and alſo ſometimes but one finger onely, ſomewhiles but one legge, ſometimes the other, and at other times the whole trunk of his body, with ſuch force and agility, that lying in his bed, he could ſcarce be held by foure men; his head lay without any ſhaking, his tongue and ſpeech was free, his underſtanding ſound, and all his ſenſes perfect even in the height of his fit. He was taken at the leaſt ten times a day, well in the ſpaces between, but wearied with labour: it might have beene judged a true Epilepſie, if the underſtanding and ſenſes had failed.

monſterous Tale

The moſt judicious Phyſitians who were called to him, judged it a convulſion, coſen-germane to the falling ſickeneſſe, proceeding from a maligne and venemous vapour impact in the ſpine of the backe, whence a vapour diſperſed it ſelfe over all the nerves, which paſſe from the ſpine every way into the limbes, but not into the braine. To remove this, which they judged the cauſe, frequent glyſters are ordained, and ſtrong purges of all ſorts, cupping glaſſes are applied to the beginnings of the nerves, fomentations, unctions, emplaſters, firſt to diſcuſſe, then to ſtrengthen and weare away the maligne quality: Theſe things doing little good, he was ſweated with bathes, ſtoves, and a decoction of *Guajacum*, which did no more good than the former, for that wee were all farre from the knowledge of the true cauſe of his diſeaſe: for in the third moneth, a certaine Devill was found to be the author of all this ill, bewraying himſelfe by voice, & unaccuſtomed words and ſentences, as well latine as greeke (though the patient were ignorant of the greeke tongue): he laied open many ſecrets of the by-ſtanders, but chiefly of the Phyſitians, deriding them for that hee had abuſed them to the patients great harme, becauſe they had brought his body ſo low by needleſſe purgations.

The devill ſhewes himſelfe by ſpeaking of greeke.

When his father came to viſite him, he would cry out long before he came at him, or ſaw him, drive away this viſitant, & keep him from comming in here, or elſe pluck his chaine from about his necke: for on this (as it is the cuſtome of the French order of Knights) there hangs the image of St. *Michael*. If holy or divine things were read before him, he ſhooke and trembled more violently. When his fit was over, hee remembred all that he had done, and affirmed that hee did it againſt his will, and that he was ſorry for it. The devill, forced by ceremonies and exorciſmes, denied that he was damned for any crime, and ſaid that he was a ſpirit: being asked who he was, and by what meanes and power he did theſe things, he ſaid that hee had many habitations into which hee could betake him ſelfe, and in the time of his reſt, hee could torment others: that he was caſt into this body by a certain perſon whom he would not name, and that he entred by his feet up to his necke, and that he would go forth againe the ſame way, when as his appointed time was come. He ſpoke of ſundry other things, as others which are poſſeſſed uſe to doe.

Devils wax angry, and are terrifyed by divine things.

Now I ſpeake not theſe things as new or ſtrange, but that it may appeare that devills ſometimes entring into the body, doe ſomewhiles torment it by divers and uncouth waies; other whiles they doe not enter in, but either agitate the good humours of the body, or draw the ill into the principall parts, or with them obſtruct the veins or other paſſages, or change the ſtructure of the inſtruments, from which cauſes innumerable diſeaſes proceed: of theſe, Divells are the authors, and wretched and forlorne perſons the miniſters: and the reaſon of theſe things is beyond the ſearch of nature.

Pliny tells that the Emperour *Nero* in his time, found magicall arts moſt vain and falſe: but what need we alledge profane writers, when as thoſe things that are recorded in ſcripture of the pythoniſſe, of the woman ſpeaking in her belly, of King *Nebuchodonozor*, of the Magitians of *Pharaoh*, and other ſuch things not a few, prove that there both is, and hath beene Magicke? *Pliny* tells of *Denarchus*, that he taſting of the entrailes of a ſacrificed childe, turned himſelfe into a Wolfe. We read in *Homer* that *Circes*, in the long wandering of *Ulyſſes*, changed his companions into beaſts, with an inchanted cuppe or potion: and in *Virgil*, that the growing corne may bee ſpoiled or carried away by inchantments: which things, unleſſe they were approved and witneſſed by many mens credits, the wiſedome of Magiſtrates and Lawyers, would not have made ſo many Lawes againſt Magitians, neither would there have beene a mulct impoſed upon their heads by the law of the twelve tables, who had enchanted other mens corne. But as in magicall arts the devill doth not exhibite things them ſelves, as thoſe which he cannot make, but onely certaine ſhewes or appearances of things: ſo in theſe which are any wayes accommodated to the uſe of Phyſicke, the cure is neither certaine, nor ſafe, but deceitfull, captious, and dangerous.

I have ſeene the Jaundiſe, over the whole body, cured in one night, by a written ſcroule hanged about the neck: alſo I have ſeene Agues chaſed away by words and ſuch ceremonies, but within a ſhort while after they returned againe and became much worſe. Now there are ſome vaine things, and verily the fancies of old women, which becauſe they have long poſſeſſed the minds of men, weakened with too much ſuperſtition, we terme them ſuperſtitious. Theſe are ſuch as we cannot truely ſay of them, wherefore and whence they have the faculties aſcribed to them: for they neither ariſe from the temperament, neither from other manifeſt qualities, neither from the whole ſubſtance, neither from a divine or magicall power, from which two laſt mentioned, all medicines beyond nature, and which are conſequently to be uſed to diſeaſes, whoſe eſſence are ſupernaturall, muſt proceed. Such like old wives medicines and ſuperſtitious remedies are written figures and characters, rings, where neither the aſſiſtance of God or Spirits is implored. Let me aske you, is it not a ſuperſtitious medicine to heale the falling ſickeneſſe, to carry in writing the names of the three Kings, *Gaſpar, Melchior*, and *Balthaſar*, who came to worſhip Chriſt? To help the tooth ache, if one whilſt Maſſe is in ſaying, touch his teeth, ſaying theſe words, *Os non comminuetis ex eo*? To ſtay vomiting with certaine ceremonies and words, which they abſent pronounce, thinking it ſufficient if that they but onely know the patients name.

It is but a deceitfull cure that is performed by the devill.

Old-wives ſuperſtitious medicines againſt divers diſeaſes.

I ſaw a certaine fellow that with murmuring a few words, and touching the part, would ſtanch blood out of what part ſoever it flowed: there be ſome who to that purpoſe ſay this, *De latere ejus exivit Sanguis & Aqua.* How many prayers or charmes are carried about to cure agues? ſome taking hold of the patients hand, ſay, *Æquè facilis tibi Febris hæc ſit, atque Mariæ virgini Chriſti partus.* Another waſheth his hands with the patient before the fit, ſaying to himſelfe that ſolemne Pſalme, *Exaltabo te Deus meus Rex*, &c. If one tell an Aſſe in his eare that hee is ſtung by a Scorpion, they ſay that the danger is immediately over.

As there are many ſuperſtitious words, ſo there are many ſuperſtitious writings alſo. To helpe ſore eyes, a paper wherein the two greeke letters, Π and Α, are written muſt bee tyed in a thred, and hanged about the necke. And for the tooth ache this ridiculous ſaying, *Strigiles, falceſque dentatæ, dentium dolorem perſanate.* Alſo oft times there is no ſmall ſuperſtition in things that are outwardly applied. Such is that of *Apollonius* in *Pliny*, to ſcarifie the gummes in the tooth ache with the tooth of one that died a violent death: to make pils of the skull of one hanged, againſt the bitings of a mad dogge: to cure the falling ſickeneſſe by eating the fleſh of a wilde beaſt, killed with the ſame iron wherewith a man was killed: that he ſhall be freed from a quartaine ague who ſhall drinke the wine whereinto the ſword that hath cut off a mans head, ſhall be put: and he, the parings of whoſe nailes ſhall be tyed in a linnen cloth to the necke of a quicke Eele, and the Eele let goe into the water againe. The paine of the Milt to be aſſwaged, if a beaſts Milt bee laid upon it, and the Phyſitian ſay that he cures or makes a medicine for the Milt. Any one to bee freed from the cough, who ſhall ſpit in the mouth of a Toad, letting her goe away alive. The halter wherein one hath beene hanged put about the temples, to helpe the head ache. This word *Abracadabra*, written on a paper, after the manner deſcribed by *Serenus*, and hanged about the necke, to help agues or feavers, eſpecially ſemitertians. What truth can bee in that which ſundry affirme, that a leafe of *Lathyris*, which is a kinde of Spurge, if it be plucked upwards, will cauſe vomit, but broken downewards, will move to ſtoole? You may alſo finde many other ſuperſtitious fictions concerning herbes, ſuch as *Galen* reports that *Andreas* and *Pamphilus* writ, as incantations, tranſformations, and herbes dedicated to conjurers and devills.

Lib. 6. de ſimp.

I had thought never in this place to have mentioned theſe and the like, but that there may bee every where found ſuch wicked perſons, who leaving the arts and means, which are appointed by God to preſerve the health of mans body, flye to the ſuperſtitious & ridiculous remedies of ſorcerers, or rather of devils, which notwithſtanding the devill ſometimes makes to performe their wiſht for effects, that ſo hee may ſtill keep them enſnared & addicted to his ſervice. Neither is it to be approved which many ſay, that it is good to be healed by any art or meanes, for that healing is a good worke. This ſaying is unworthy of a Chriſtian, and ſavours rather of him that truſts more in the devill than in God. Thoſe Empericks are not of the ſociety of Sorcerers and Magitians, who heale ſimple wounds with dry lint, or lint dipt in water: this cure is neither magicall nor miraculous, as many ſuppoſe, but wholly naturall, proceeding from the healing fountains of nature, wounds & fractures, which the Chirurgian may heale by onely taking away the impediments, that is, paine, defluxion, inflammation, an abſceſſe and gangrene, which retard and hinder the cure of ſuch diſeaſes. The following examples will ſufficiently make evident the devils maliciouſneſſe, alwaies wickedly and craftily plotting againſt our ſafety and life.

Lib. epiſt. 38. ep. A certaine woman at *Florence* (as *Langius* writes) having a maligne ulcer, and being troubled with intolerable paine at the ſtomacke, ſo that the Phyſitians could give her no eaſe: behold on a ſudden ſhee vomited up long and crooked nailes, and braſſe needles, wrapped up with wax and haires, and at length a great gobbit of fleſh, ſo bigge that a Giants jawes could ſcarce ſwallow it.

But that which happened in the yeere of our redemption 1539. in a certain town called *Fugenſtall*, in the Biſhopricke of *Eiſtet*, exceeds all credit, unleſſe there were eye-witneſſes of approved integrity yet living. In this towne, one *Ulrich Neuſeſſer* a husbandman, was tormented with grievous paine in the one ſide of his belly, hee ſodainely got hold of an iron key with his hand under the ſkinne, which was not hurt, the which the Barber-Chirurgian of the place cut out with his razour; yet for all this the paine ceaſed not, but hee grew every day worſe than other: wherefore expecting no other remedy but death, he got a knife and cut his throat. His dead body was opened, and in his ſtomacke were found a round and longiſh piece of wood, foure ſteele knives, part ſharpe, and part toothed like a ſaw, and two ſharpe peices of iron, each whereof exceeded the length of a ſpanne, there was alſo as it were a ball of haire. All theſe things were put in by the craft and deceit of the devill. Thus farre *Langius*.

Chap. XVIII.

Of the Cozenages and crafty Trickes of Beggars.

HAving treated of Monſters, it followes that wee ſpeake of thoſe things which either of themſelves, by reaſon of their nature full of admiration, have ſome kinde of monſtrouſneſſe in them; or elſe from ſome other waies, as by the craft and cozenage of men. And becauſe to the laſt mentioned crafts of the Devill, the ſubtle devices of begging companions are ſo wewhat alike, therefore I will handle them in the next place, that the Chirurgian being admoniſhed of them, may be more cautious and cunning in diſcerning them when hee meets with them.

A hiſtory of a counterfeit arme.

Anno Dom. 1525. when I was at *Anjou*, there ſtood a crafty beggar begging at the Church dore, who tying and hiding his owne arme behind his backe, ſhewed in ſteed thereof, one cut from the body of one that was hanged, and this he propped up and bound to his breaſt, and ſo laid it open to view, as if it had been all enflamed, ſo to move ſuch as paſſed by unto greater commiſeration of him. The cozenage lay hid, every one giving him mony, untill at length his counterfeit arm not being ſurely faſtened, fell upon the ground, many ſeeing and obſerving it: hee being apprehended and layed in priſon, by the appointment of the Magiſtrate, was whipped through the towne, with his falſe arme hanging before him, and ſo baniſhed.

Another of a cancrous breaſt

I had a brother called *John Parey*, a Chirurgian, who dwelt at *Vitre* in *Britany*; he once obſerved a young woman begging, who ſhewed her breaſt, as if it had a cancrous ulcer thereon, looking fearfully by reaſon of much and ſordid filth, wherewith it ſeemed to defile the cloath that lay under it. But when as hee had more diligently beheld the womans face, and the freſh colour thereof, as alſo of the places about the ulcer, and the good habite of the whole body agreeable to that colour (for ſhe was ſomewhat fat, and of a very good habite of body) he was eaſily hereby induced to ſuſpect ſome roguery and deceit. He acquainted the Magiſtrate with this his ſuſpicion, and got leave that hee might carry her home to his houſe, ſo to ſearch her more narrowly. Where opening her breaſt, he found under her arme-pit, a ſponge moiſtened with a commixture of beaſts blood and milke, and carried through an elder pipe to the hidden holes of her counterfeit cancer. Therefore he foments her breaſt with warme water, and with the moiſture thereof looſeth the skinnes of blacke, greene, and yellow frogges, laid upon it, and ſtucke together with glew, made of bole armenick, the white of an egge, and flower; and theſe being thus fetched off, he found her breaſt perfectly ſound.

A counterfeit ulcer of the leg

The beggar being caſt for this into priſon, confeſſed that ſhee was taught this tricke by a beggar that lay with her, who himſelfe alſo, by putting about his legge an oxes Milt, and perforating it in ſundry places, that ſo the forementioned liquor might drop out, counterfeited an ulcer of a monſtrous bigneſſe and malignity, covering the edges of the Milt on every ſide with a filthy cloath. This beggar was diligently enquired after, but could not bee found; and ſo ſhee was whipped and baniſhed.

Of one feigning himſelfe leprous.

Within leſſe than a yeere after there came into the ſame city another notable crafty companion, who preſently taking up the church doores, laid open his wares, to wit, a Kercher with ſome ſmall pieces of mony lying thereon, a wooden Barrell, and * Cliquets, wherewith he would ever now and then make a great noiſe: his face was ſpread over with great thicke puſtles, being of a blackiſh red colour, and made with glew like thoſe that have the Leproſie: this his ghaſty look made him to be pitied by all men, which was the cauſe that every one gave him mony. Then my brother came ſomewhat nearer him, and asked him how long hee had beene troubled with this ſo cruell diſeaſe; hee anſwered with an obſcure and hoarſe voice, that hee was borne a Leper from his mothers wombe, and that his parents both died of this wicked diſeaſe, ſo that their members fell away piece-meale. Now hee had a woollen ſwathe about his chapps, wherewith (having his left hand under his cloake) hee ſo ſtraitened his chapps, that much blacke blood roſe into his face, and made him ſo hoarſe that he could ſcarce ſpeake; yet hee could not conteine himſelfe, but that in ſpeaking hee ever now and then ſlackened the ſwathe with his hand, the freelier to draw his breath: which when my brother had obſerved, ſuſpecting ſome cozenage, he obtained leave of the Magiſtrate to ſearch and examine the man whether hee were truely leprous, or no. Firſt therefore he tooke away his ſwathe or rowler that was about his necke, then waſhed his face with warme water, ſo that the counterfeit glewed puſtles were diſſolved, and his face, free from all taintnre, ſhewed it ſelfe of a good and naturall colour and ſhape. Then he laid bare his whole body, and diligently viewed each part, and found no ſigne of a leproſie, one or other. Which

when

* Cliquets are things made ſomewhat reſembling a ſmal wool-card, but have two or three little pieces of boords ſo faſtened together with leather, that they will make a great noiſe with them, and theſe are uſed by the French beggars.

when the Magiſtrate once heard, he made him to bee put in priſon, and to be thrice whipped through the ſtreets of the city, with his barrell hanging before him, and his cliquets behind him, adding thereto the puniſhment of perpetuall baniſhment. It happened that as hee was whipped the third market day, the people cryed out to the hang-man in jeſt, that he ſhould not feare to laſh him ſoundly, for being leprous he could not feele it: the executioner incited by this cry of the people, did ſo belabour him, that the wretch died of his whipping within a ſhort while after, having a juſt reward for his wickedneſs. For theſe impoſtors, beſides that they live like drones, feigning this or that diſeaſe, and ſo being idle, enjoy the fruits of others labours; they alſo divers times conſpiring together, take away the lives and goods of honeſt and ſubſtantiall citizens, and other people: for there are ſome of them, that in an evening, as men that have no habitation, deſire lodging for a night, and it being granted them, they, when as the maſter of the houſe and his family are aſleepe, open the doores to their comrades, men as wicked as themſelves, and kill and carry away all they can.

A multitude of beggars hurtfull to the city.

Certainly we may juſtly affirme that this crafty begging is the mother and ſchoole of all diſhoneſty: for how many acts of bawdry and poiſoning every where corrupt the wells and publicke fountaines? how many places have beene burnt under the ſhew of begging? where can you get more fit ſpies? where more fit undertakers and workers of all manner of villany, than out of the crew of theſe beggars?

How to diſcover ſuch as counterfeit the Jaundiſe.

Some of them there are, who beſmeare their faces with ſoot layed in water, ſo to ſeeme to have the Jaundiſe. But you may at the firſt ſight find out the deceit, by the native whiteneſſe of the utter coat of the eye, called *Adnata*, which in ſuch as truely have the Jaundiſe, uſeth to bee died and overcaſt with a yellowiſh colour; alſo you may be more certaine thereof, if you wet a cloath in water or ſpittle, and ſo rub the face, for the adventitious yellowneſſe will quickly vaniſh, and the true native colour ſhew it ſelfe.

Some there bee, who not content to have mangled, and filthily exulcerated their limbes with cauſticke herbs, and other cauteries; or to have made their bodies more ſwolne, or elſe leane, with medicated drinks; or to have deformed themſelves ſome other way, but from good and honeſt Citizens, who have charitably relieved them, they have ſtollen children, have broken or diſlocated their armes and legges, have cut out their tongues, have depreſſed the cheſt, or whole breaſt, that with theſe, as their owne children, begging up and downe the country, they may get the more reliefe, pitifully complaining that they came by this miſchance by thunder, or lightning, or ſome other ſtrange accident.

Laſtly they part the kingdome amongſt themſelves as into Provinces, & communicate by letters one to another, what newes or new quaint deviſes there are to conceale or advance their roguery: to which purpoſe they have invented a new language onely knowne to themſelves, ſo to diſcourſe together and not bee underſtood by others. [We here vulgarly terme it *Canting*].

Of one counterfeiting the falling of the fundament.

D^{r}. *Flecelle*, a Phyſitian of *Paris*, entreated me to beare him company to his country houſe at *Champigny*, foure miles from *Paris*. Where as ſoone as wee arrived, and were walking in the Court, there came preſently to us a good luſty well fleſht manly woman, begging almes for St. *Fiacre* ſake, and taking up her coat and her ſmocke, ſhee ſhewed a great gut hanging downe ſome halfe a foot, which ſeemed as if it had hanged out of her fundament, whereout there dropped filth like unto *pus*, which had all ſtained her legges and ſmocke, moſt beaſtly and filthy to looke upon. *Flecelle* asked her how long ſhe had beene troubled with this diſeaſe: ſhe anſwered that it was foure yeeres ſince ſhe firſt had it. Hence he eaſily gathered that ſhe plaied the counterfeit: for it was not likely that ſuch abundance of purulent matter came forth of the body of ſo well fleſht and coloured a woman; for ſhe would rather have been very leane and in a conſumption. Wherefore provoked with juſt anger, by reaſon of the wickedneſſe of the deceit, he run upon her and threw her downe upon the ground, and trod her under his feet, and hit her divers blowes upon the belly, ſo that he made the gut which hung at her to, come away, and by threatning her with more grievous puniſhment, made her confeſſe the cozenage, and that it was not her gut but of an oxe, which being filled with blood and milke, and tyed at both ends, ſhee put the one of them into her fundament, and let the filth flow forth at very little holes.

Not very long agoe, a woman equally as ſhameleſſe, offered herſelfe to the overſeers of the poore of *Paris*, entreating that ſhe might be entred for one of their Penſioners, for that her wombe was fallen downe by a dangerous and difficult birth, wherefore ſhe was unable to worke for her living. Then they commanded that ſhee ſhould be tryed and examined, according to the cuſtome, by the Chirurgians which are therefore appointed. Who ſeeing how the whole buſineſſe was carried, made report ſhe was a counterfeit; for ſhe had thruſt an oxes bladder, halfe blown and beſmeared with beaſtly blood by the neck, whereto ſhe had faſtned a little ſpunge, into the necke of her wombe, for the ſpunge being filled and ſwollen up by the accuſtomed moiſture of the wombe, ſo held up the oxes bladder that hanged thereat, that ſhe might ſafely goe without any feare of the falling of it out, neither could it be pulled forth but with good force. For this her device ſhee was put into Priſon, and being firſt whipped, was after baniſhed. Their cozenage is not much unlike this, who by fitly applying a ſheepes paunch to their groine, counterfeit themſelves to bee burſten.

Of one faigning the falling down of the wombe.

Anno Dom. 1561. there came to *Paris* a luſty, ſtout, and very fat Norman woman, being about ſome thirty yeeres old, who begging from doore to doore, did caſt to meet with rich women, and very familiarly and pitifully would relate unto them her misfortune, ſaying ſhe had a ſnake in her belly, which crept in at her mouth as ſhee ſlept in an hempe-land: ſhee would let one feele her ſtirre, by putting their hand unto her belly, adding alſo that ſhe was troubled day & night with its unceſſant gnawing of her guts. The novelty of this ſad chance, moved all to pity & admiration, wherefore as much as they could, they aſſiſted her with means & counſell. Amongſt the reſt, there was a woman of great devotion and charity, who ſending for Dr. *Hollerius*, *Chevall*, and mee, asked us if this ſnake could by any meanes be gotten forth. *Hollerius* gave her a ſtrong purgation, hoping that by ſtirring up the expulſive faculty, the ſerpent might be caſt forth, together with the noxious humors. But this hope had no ſuch ſucceſſe. Wherefore when as we met againe, wee thought it fit to put a *Speculum matricis* into the necke of her wombe, ſo to ſee if we could diſcerne either her head or taile: but I making large dilatation of her womb, could ſee no ſuch thing, onely wee obſerved a certaine voluntary motion, whereof ſhee her ſelfe was the author, by contracting and dilating the muſcles of the lower belly. Which when as we had obſerved, perceiving the deceit and impoſture, we thought good ſo to terrifie her and make her confeſſe the deceit, to tell her that ſhee muſt take another, but that a more ſtrong purgation, that what wee could not doe by the former, as more gentle, we might attaine to by the latter, as farre ſtronger. She diſſembling all feare, and conſcious of her craft and diſſimulation, after wee were gone in the evening, packing up her ſtuffe, and a great deale more than her owne, ſhe ſecretly ſtole away, not bidding her hoſteſſe farewell: and thus at length the fraud was apparent, to the loſſe of the honeſt Gentlewoman. I ſaw this baggage, ſixe daies after, ſitting luſtily upon a Packe-horſe, at the gate *Mont-martre*, and laughing heartily with ſuch as brought Sea-fiſh to towne; and ſhee was returning (as it was moſt likely) into her country, ſeeing her cozenage was diſcovered here.

Of a beggar that faigned her ſelfe to have a ſnake in her belly.

Such as feigne themſelves dumbe, draw backe and double their tongues in their mouths. Such as falling downe counterfeit the falling ſickeneſſe, bind ſtraitly both their Wreſts with plates of iron, tumble and rowle themſelves in the mire, ſprinkle and defile their heads and faces with beaſts blood, and ſhake their limbes and whole body. Laſtly by putting ſope into their mouths, they foame at the mouth like thoſe that have the falling ſickeneſſe. Otherſome with floure make a kind of glew, wherewith they beſmeare their whole bodies, as if they had that Leproſie or Scab, that is vulgarly termed, *Malum ſancti manis*. Neither muſt we thinke this art of counterfeiting, and cheating begging to bee new, and of late invention, for long agoe it flouriſhed in *Aſia*, even in the time of *Hippocrates*, as may appeare by his booke *De Aëre, Locis, & Aquis*. But by how much this diſeaſe hath taken more deepe roor, and

The craft of ſuch as faigne themſelves to have the falling ſickeneſſe.

Of ſuch as faign themſelves leprous.

grown more inveterate by proceſſe of time, by ſo much it muſt more diligently and carefully bee looked to and prevented, by cruelly puniſhing ſuch counterfeits: for that by this fained begging, as the nouriſher of ſloth and ſhoppe of all diſhoneſty, that which is taken from the good is beſtowed upon the ill, and one wicked & counterfeit beggar hurts all other wretched people.

Chap. XIX.

Of ſtrange or monſtrous accidents in Diſeaſes.

Monſters happen alſo in diſeaſes.

A bullet ſhot into the belly came forth at the fundament.

WHat monſtrouſneſſe ſoever was in the laſt mentioned parties, it was made up by the craft of beggars for filthy gaine. But if there be any monſtrouſneſſe in the following narrations, it is of nature, but working, as it were, miraculouſly, by ſome ſecret and occult meanes; for thus there are oft times monſters in diſeaſes. Before the towne of St. *John de Angeley*, a ſouldier called *Francis*, of the company of Captaine *Muret*, was wounded with a Harquebuze-ſhot on the belly, betweene his navell and ſides; the bullet was not taken out, becauſe the Chirurgians, who ſearched him diligently, could not finde it: wherefore hee was troubled with grievous and tormenting paines, untill the ninth day after hee received the wound, the bullet came forth at his fundament: wherefore within three weekes after he was perfectly whole. Hee was healed by *Simon Crinay*, the Chirurgian of the French companies.

A bullet ſticking to the throat and patient recovering.

James Pope, Lord of St. *Albanes* in *Dauphine*, was wounded at the skirmiſh at *Chaſenay*, having three harquebuze bullets entring into his body, one whereof pierced under his throate, where it buncheth out as with a knot, neare to the pipe of his lungs, even to the beginning of the *vertebræ* of the necke, in which place the leaden bullet ſtuck, and as yet doth remaine. Hereupon he was afflicted with many and fearfull ſymptomes, as a feaver, and a great ſwelling of his whole necke, ſo that for ten whole daies he could ſwallow nothing but broaths and liquid things. Yet he recovered, and remaineth well at this preſent, by the cure of *James Dalam* the Chirurgian.

Lib. 3. anatom. cap. 9.

A crooked iron ſhot into the backe came forth at the fundament.

Alexander Benedictus makes mention of a certaine countrie-man, who, ſhot into the backe with a dart, drawing out the ſhaft, the head was left behinde, being in length about the breadth of two fingers, but hooked and ſharpe on the ſides. When as the Chirurgian had carefully and diligently ſought for it, and could by no meanes finde it, he healed up the wound, but two months after this crooked head came forth at his fundament.

A ſwallowed needle voided by urine.

The ſame author telleth that at *Venice* a virgin ſwallowed a needle, which ſome two yeeres after ſhe voided by urine, covered over with a ſtony matter, gathered about viſcous humours.

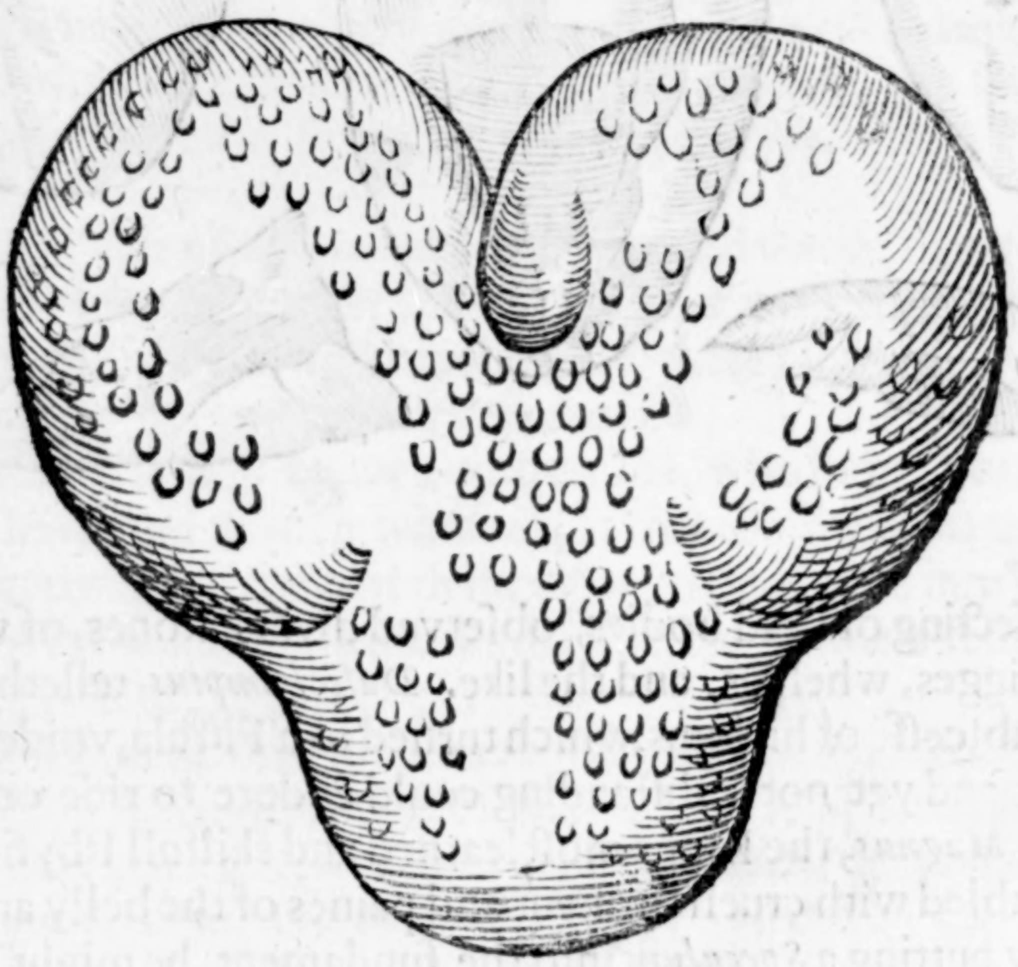
A needle running in at the buttocke came forth at the groine.

Catherine Perlan, the wife of *William Guerrier*, a Draper of *Paris*, dwelling in the Jewry, as ſhe rode on horſe-backe into the country, a needle out of her pin-cuſhion, which got under her by accident, ran ſo deepe into her right buttocke, that it could not by any art or force bee plucked forth. Foure moneths after ſhee ſent for mee to come to her, and ſhe told mee that as often as ſhe had to doe with her husband, ſhee ſuffered extreme pricking paine in her right groine; putting my hand thereto, as I felt it, my fingers met with ſomething ſharpe and hard: wherefore I uſed the matter ſo, that I drew forth the needle all ruſty: this may be counted a miracle, that ſteele, naturally heavie, ſhould riſe upwards, from the buttocke to the groine, and pierce the muſcles of the thigh, without cauſing an abſceſſe.

A needle in the midſt of a ſtone taken forth of the bladder.

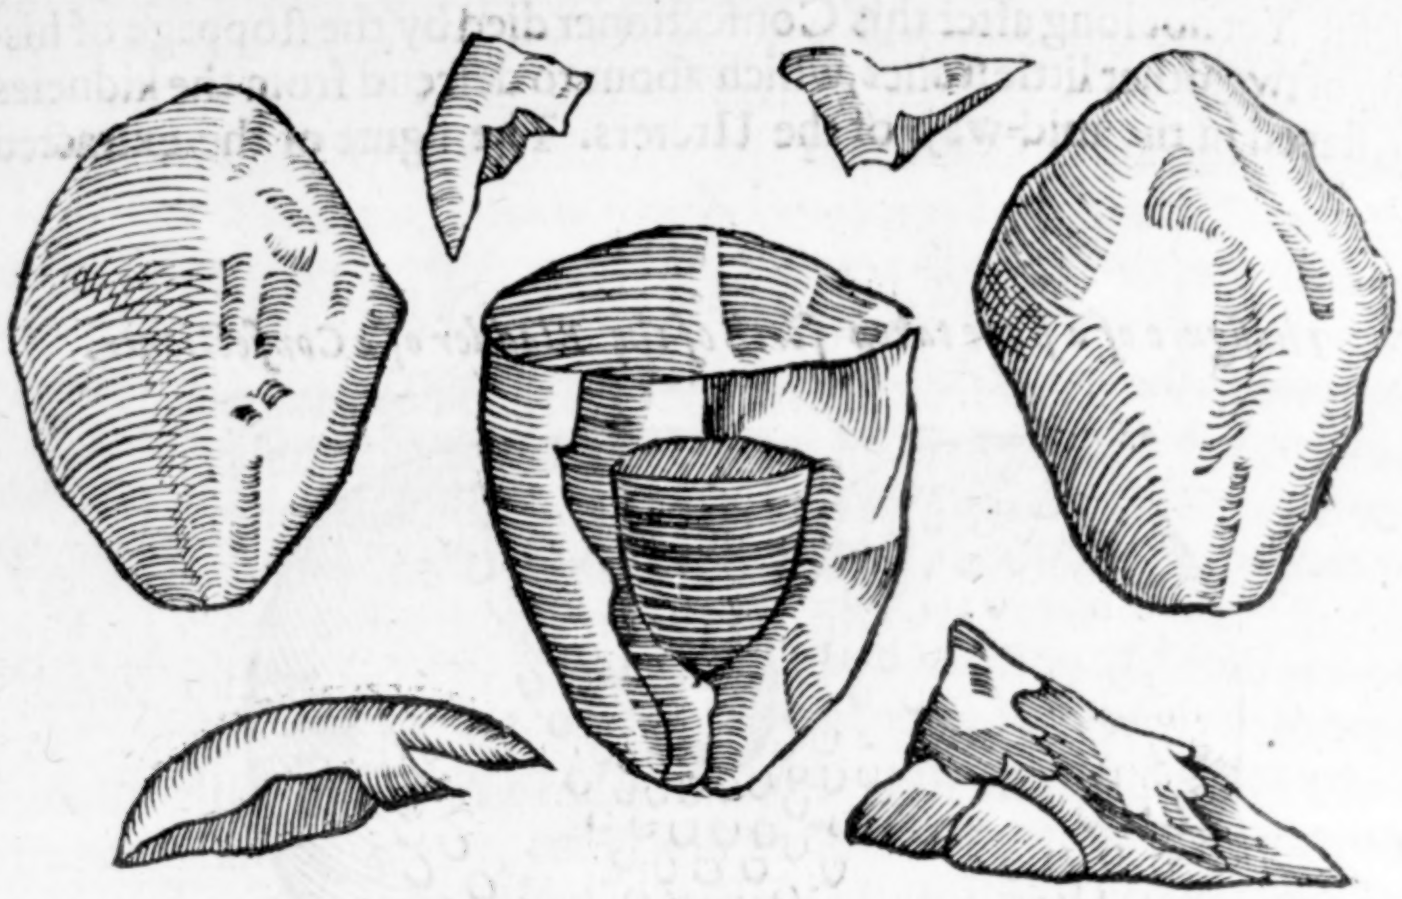
Anno Dom. 1566. the two ſonnes of *Laurence Collo* (men excellent in cutting for the ſtone) tooke forth a ſtone of the bigneſſe of a wall-nut, in the midſt whereof was a needle, juſt like thoſe that ſhooe-makers uſe: the patients name was *Peter Cocquin*, dwelling in the ſtreet *Galand*, at the place called *Maubert* at *Paris*, and I thinke hee is yet living. This ſtone was ſhewed to King *Charles* the ninth, for the monſtrouſneſſe of the thing, I being then preſent, which being given me by the Chirurgian, I preſerve amongſt my other rarities. *Anno Dom.* 1570. the Dutcheſſe of *Ferrara* at *Paris*, ſent for *John Collo*, to take a ſtone out of a Confectioner. This ſtone, though it waighed nine ounces, and was as thicke as ones fiſt, yet was it happily taken out, the patient recovering, *Francis Rouſſet*, and *Joſeph Javelle*, the Dutcheſſe Phyſitians, being preſent. Yet not long after this Confectioner died by the ſtoppage of his water, by reaſon of two other little ſtones, which about to deſcend from the kidneies to the bladder, ſtayed in the mid-way of the Ureters. The figure of the extracted ſtone was this.

The figure of a ſtone taken forth of the Bladder of a Confectioner.



Anno Dom. 1566. *Laurence Collo* the younger, tooke three ſtones out of the bladder of one dwelling at *Marly*, called commonly *Tire-vit*: becauſe being troubled with the ſtone from the tenth yeere of his age, hee continually ſcratched his yard, each of the ſtones were as bigge as an Hens egge; of colour white, they all together waighed twelve ounces. When they were preſented to King *Charles*, then lying at Saint *Maure des Fauſſez*, hee made one of them to bee broken with a hammer, and in the middeſt thereof there was found another, of a cheſnut colour, but otherwiſe much like a Peach ſtone. Theſe three ſtones, beſtowed on mee by the brethren, I have here repreſented to the life.

The effigies of the three forementioned ſtones, whereof one is broken.



I have in the diſſecting of dead bodies, obſerved divers ſtones, of various formes and figures, as of pigges, whelpes, and the like. *Dalechampius* telleth that hee ſaw a man, which by an abſceſſe of his loins, which turned to a Fiſtula, voided many ſtones out of his kidneies, and yet notwithſtanding could endure to ride on horſe-backe, or in a coach. *John Magnus*, the Kings moſt learned and skilfull Phyſitian, having in cure a woman, troubled with cruell torment and paines of the belly and fundament, ſent for me, that by putting a *Speculum* into the fundament, he might ſee if he could perceive any diſcernable cauſe of ſo great and pertinacious paine: and when as hee could ſee nothing which might further him in the finding out of the cauſe of her paine (following reaſon as a guide) by giving her often glyſters and purgations, hee brought it ſo to paſſe, that ſhee at length voided a ſtone at her fundament of the bigneſſe of a Tennis ball: which once avoided, all her paines ceaſed.

A ſtone by the force of purging medicines voided by the fundament.

5. *Epid.*

Hippocrates tells that the ſervant of *Dyſeris* in *Lariſſa*, when ſhee was young, in uſing venery was much pained, and yet ſometimes without paine, yet ſhee never conceived. But when as ſhe was ſixty yeeres old, ſhe was pained in the after-noone as if ſhe had beene in labour. When as ſhe one day before noone had eaten many leekes, afterward ſhee was taken with a moſt violent paine, farre exceeding all her former, and ſhe felt a certaine rough thing riſing up in the orifice of her wombe. But ſhe falling into a ſwoune, another woman putting in her hand, got out a ſharpe ſtone of the bigneſſe of a whirle, and then ſhe forthwith became well, and remained ſo.

A ſtone comming out of the necke of the wombe.

Lib. 1. cap. de palp. cond.

In a certaine woman, who, as *Hollerius* tells, for the ſpace of foure moneths was troubled with an incredible paine in making water, two ſtones were found in her heart, with many abſceſſes, her kidneyes and bladder being whole.

Anno Dom. 1558. I opened in *John Bourlier* a Taylour, dwelling in the ſtreet of St. *Honoré*, a watry abſceſſe in his knee, wherein I found a ſtone, white, hard, and ſmooth, of the thickeneſſe of an Almond; which being taken out, hee recovered. Certainely there is no part of the body wherein ſtones may not breed and grow.

No part of the body wherein ſtones may not bee found.

Anthony Benevenius a Florentine Phyſitian writes, that a certaine woman ſwallowed a braſſe needle without any paine, and continued a yeere after without feeling or complaining of it: but at the end thereof ſhe was moleſted with great paines in her belly; for helping of which ſhe asked the adviſe of all the Phyſitians ſhe could, making, in the interim, no mention of the ſwallowed needle. Wherefore ſhee had no benefit by all the medicines ſhe tooke; and ſhee continued in paine for the ſpace of two yeeres, untill at length the needle came forth at a little hole by her navell, and then ſhe recovered her health.

A needle ſwallowed, came forth at the navell ſome two yeeres after.

A Schollar named *Chambelant*, a native of *Bourges*, a ſtudient in *Paris*, in the Colledge of *Preſſe*, ſwallowed a ſtalke of graſſe, which came afterwards whole out betweene two of his ribbes, with the great danger of the ſchollars life. For it could not come there unleſſe by paſſing or breaking through the lungs, the encompaſſing membrane, and the intercoſtall muſcles, yet hee recovered, *Fernelius* and *Huguet* having him in cure.

A ſprig of graſs ſwallowed, came forth whole againe betweene the ribs.

Cabrolle Chirurgian to *Mounſieur*, the Marſhall of *Anville*, told mee that *Francis Guillenet* the Chirurgian of *Sommiers*, a ſmall village ſome eight miles from *Mompelier*, had in cure, and healed a certaine ſheepheard, who was forced by theeves to ſwallow a knife of the length of halfe a foot, with a horne handle of the thickeneſſe of ones thumbe: he kept it the ſpace of halfe a yeere, yet with great paine, and hee fell much away, but yet was not in a conſumption, untill at length an abſceſſe riſing in his groine, with great ſtore of very ſtinking quitture, the knife was there taken forth in the preſence of the Juſtices, and left with *Joubert* the Phyſitian of *Mompelier*.

A knife ſwallowed, came forth at an abſceſſe in the groine.

Mounſieur the Duke of *Rohan* had a Foole called *Guido*, who ſwallowed the point of a ſword of the length of three fingers, and hee voided it at his fundament on the twelfth day following, yet with much adoe: there are yet living many Gentlemen of *Britanie*, who were eye-witneſſes thereof.

The point of a ſword ſwallowed came forth at the fundament.

There have been ſundry women with childe, who have ſo caſt forth piece-meale children that have died in their wombes, as that the bones have broke themſelves a paſſage forth at the navill, but the fleſh, diſſolved as it were into quitture, flowed out by the necke of the wombe and the fundament, the mothers remaining alive, as *Dalechampius* obſerves out of *Albucraſis*.

Wonderfull excretions of infants out of the wombe.

Is it not very ſtrange that there have bin women, who troubled with a fit of the Mother, have lien three whole dayes without motion, without breathing, or pulſe that were any way apparent, and ſo have beene carried out for dead?

Women troubled with the Mother laid out for dead.

A certaine young man, as *Fernelius* tells, by ſomewhat too vehement exerciſe, was taken with ſuch a cough, that it left him not for a moment of time, untill hee therewith had caſt forth a whole impoſtume of the bigneſs of a pidgeons egg, wherein, being opened, there was found quitture exquiſitely white and equall. He ſpit blood two dayes after, had a great feaver, and was much diſtempered: yet notwithſtanding he recovered his health.

An impoſtume ſpit out, of the bigneſſe of a Pidgeons egge.

Anno Dom. 1578. *Stephana Chartier*, dwelling at St. *Maure des Fauſſez*, a widow of fourty yeeres old, being ſicke of a tertian Feaver, in the beginning of her fit vomited up a great quantity of choler, and together therewith three hairy wormes, in figure, colour, and magnitude like the wormes called Beare-wormes, yet ſomewhat blacker; they lived eight whole daies after without any food: the Chirurgian of this towne brought them to Dr. *Milot*, who ſhewed them to *Feure*, *Le Gros*, *Mareſcot* and *Courtin* Phyſitians, and to me alſo.

Worms caſt up in the fit of an Ague.

This following hiſtory, taken out of the Chronicles of *Monſtrele*, exceeds all admiration. A certaine Franck-Archer of *Meudon*, foure miles from *Paris*, was for robbery condemned to bee hanged: in the meane time it was told the King by the Phyſitians, that many in *Paris* at that time were troubled with the ſtone, and amongſt the reſt the Lord of *Boſcage*, and that it would be for the good of many, if they might view and diſcerne with their eyes the parts themſelves wherein ſo cruell a diſeaſe did breed, and that it might be done much better in a living than in a dead body, and that they might make tryall upon the body of the Franck-Archer, who had formerly beene troubled with theſe paines. The King granted their requeſt; wherefore opening his body they viewed the breathing parts, and ſatisfied themſelves as much as they deſired, and having diligently and exactly reſtored each part to its proper place, the body, by the Kings command, was ſewed up againe, and dreſſed and cured with great care. It came ſo to paſſe, that this Franck-Archer recovered in a few daies, and getting his pardon, got good ſtore of mony beſides.

This narration exceeds not onely all admiration, but alſo beliefe.

Alexander Benedictus tells that hee ſaw a woman called *Victoria*, who having loſt all her teeth, and being bald, yet had others came up in their places, when as ſhe was foureſcore yeeres old.

Pract. lib. 64. *cap.* 1.

Stephen Teſſier a Chirurgian of *Orleance*, told me that not long agoe he cured one *Charles Verguell*, a Serjeant of *Orleance*, of a wound received in his hamme, whereby the two tendons bending the ham, were quite cut inſunder. He took this order in the cure; hee cauſed the patient to bend his legge, then hee ſewed together the ends of the cut tendons, then placed the member in that ſite, and handled it with that art, that at length he healed the wound, the patient not halting at all. Truely this is a very memorable thing, and carefully and heedfully to be imitated by the young Chirurgian.

How many have I ſeen, who wounded and thruſt through the body with ſwords, arrowes, pikes, bullets, have had portion of the braine cut off by a wound of the head, an arme or legge taken away by a cannon bullet, yet have recovered? and how many on the contrary, have died of light and ſmall wounds, not worth the ſpeaking of?

5. Epidem. A certaine man was ſhot in neare to his groine with an arrow, whom we have ſeen, ſaith *Hippocrates*, and he recovered beyond all mens expectation; The arrow head was not taken forth, for it was very deep in, neither did the wound bleed very much, neither was it enſlamed, neither did he halt: but wee found the head, and tooke it forth ſixe yeeres after he was hurt. Now *Hippocrates* gives no other reaſon of its ſo long ſtay, but that he ſaith it might be ſuſpected it lay hid betweene the nerves, and that no veine nor artery was cut thereby.

CHAP. XX.

Of the wonderfull originall, or breeding of ſome creatures.

Boiſt. in hiſtor. prodig.

WEE have read in *Boiſtey*, that a certaine workeman of *Avignion*, when as hee lived in that city, opened a leaden coffin, wherein a dead body lay, that was ſo cloſely ſoudered, that the aire could not get in; and as he opened it, he was bitten by a ſerpent that lay therein, with ſo venemous and deadly a bite, that it had neere to have coſt him his life. Yet the originall of this creature is not ſo prodigious as hee ſuppoſeth, for it is an uſuall thing for a Serpent to breed of any putrefyed carcaſſe, but chiefly of a mans.

It is a common thing for a ſerpent to breed of the dead corps of a man.

A live ſerpent in a ſolide Marble.

Baptiſta Leo writes, that in the time of Pope *Martin* the fift, there was a live ſerpent found encloſed in a vaſte, but ſolid Marble, no chinke appearing in ſuch denſe ſolidity, whereby this living creature might breath.

Whileſt in my vine-yard, that is at *Meudon*, I cauſed certain huge ſtones to be broken to pieces, a Toad was found in the midſt of one of them. When as I much admired thereat, becauſe there was no ſpace wherein this creature could be generated, encreaſe or live, the Stone-cutter wiſhed mee not to marvaile thereat, for it was a common thing, and that he ſaw it almoſt every day. Certainly it may come to paſſe that from the more moiſt portion of ſtones, contained in places moiſt and under ground, and the celeſtiall heat mixing and diffuſing it ſelfe over the whole maſſe of the world, the matter may be animated for the generation of theſe creatures.

The cauſe of ſuch wonderful generations.

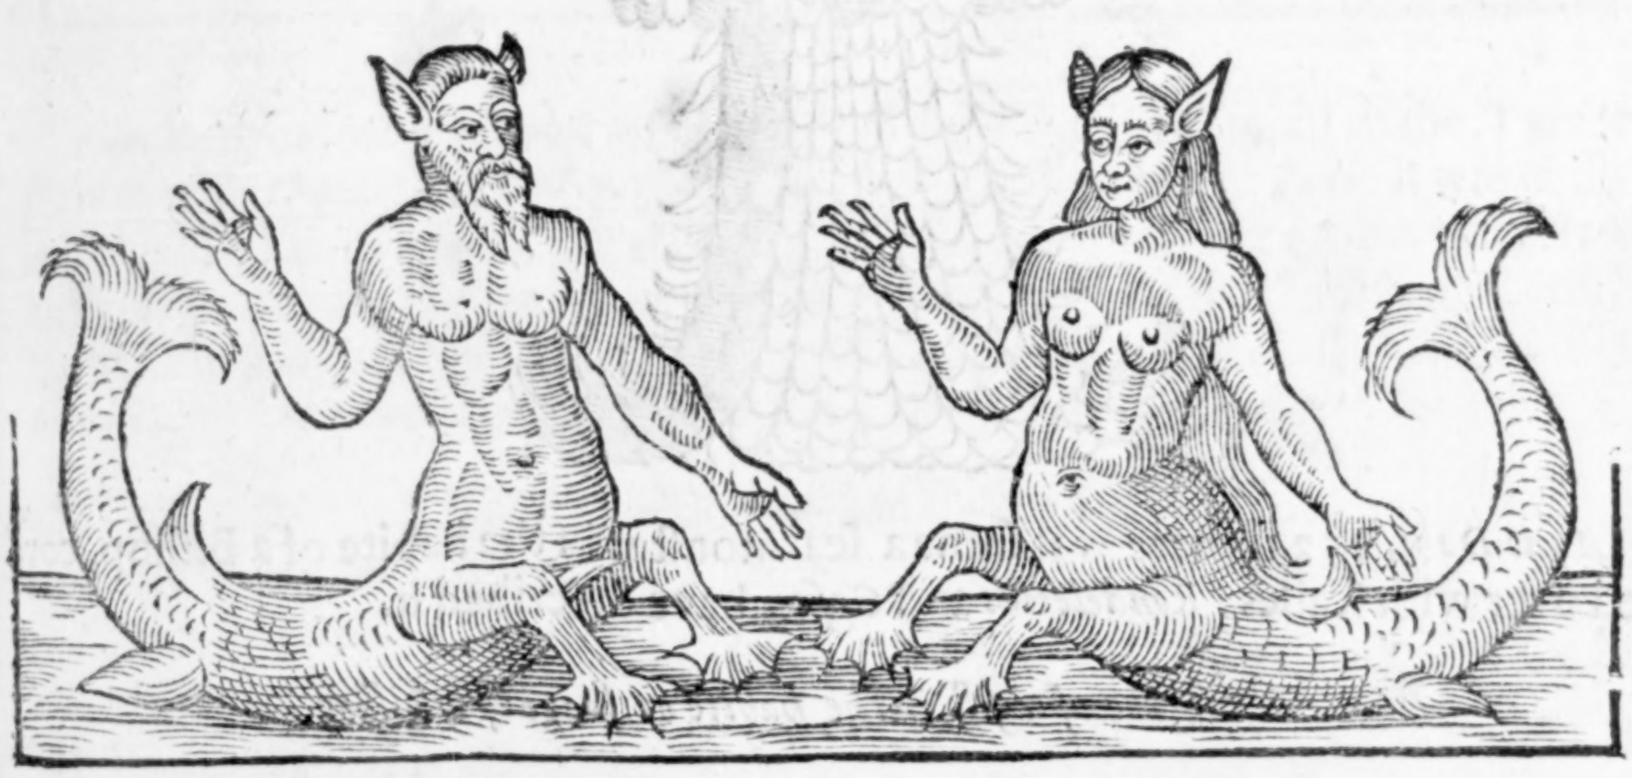
CHAP. XXI.

Of the wondrous nature of ſome marine things, and other living creatures.

THE laſt mentioned creatures were wonderfull in their originall, or rather in their growth: but theſe which follow, though they be not wonderfull of themſelves, as thoſe that conſiſt of their owne proper nature, and that working well and after an ordinary manner; yet they are wondrous to us, or rather monſtrous, for that they are not very familiar to us. For the rarity and vaſtneſſe of bodies, is in ſome ſort monſtrous. Of this ſort there are many, eſpecially in the Sea, whoſe ſecret corners and receptacles are not pervious to men: as Tritons, which from the middle upwards are reported to have the ſhape of men. And the *Sirenes, Nereïdes* or Mere-maides, who (according to *Pliny*) have the faces of women, and ſcaly bodies, yea where as they have the ſhape of man: neither yet can the forementioned confuſion and conjunction of ſeeds take any place here, for, as we lately ſaid, they conſiſt of their owne proper nature. *Lib. 9. cap. 5.*

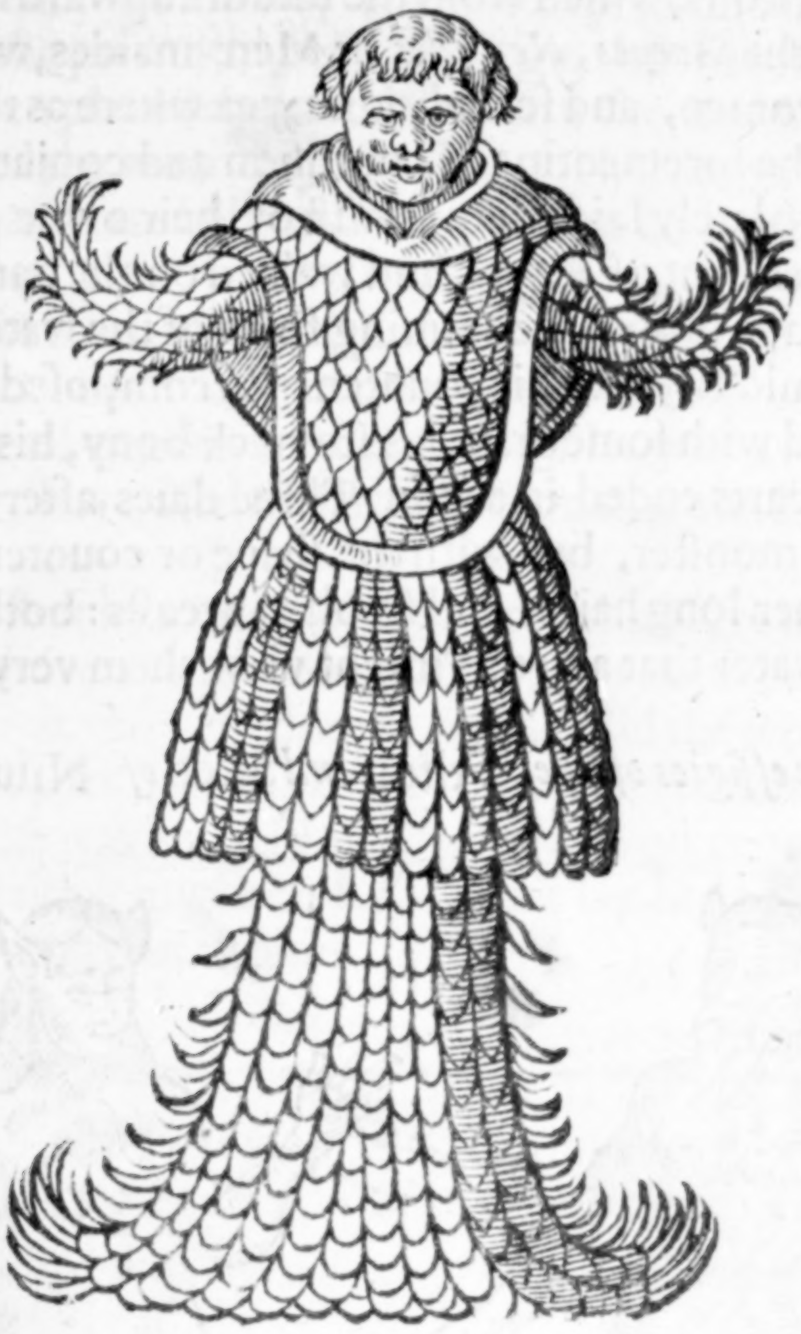
When *Mena* was Preſident of *Ægypt*, and walked on the bankes of *Nilus*, he ſaw a Sea-monſter in the ſhape of a man, comming forth of the waters: his ſhape was juſt like a man even to the middle, with his countenance compoſed to gravity, his haires yellow, yet intermixed with ſome gray, his ſtomack bony, his armes orderly made and jointed, his other parts ended in a fiſh. Three daies after in the morning there was ſeene another Sea-monſter, but with the ſhape or countenance of a woman, as appeared by her face, her long haire, and ſwollen breaſts: both theſe monſters continued ſo long above water that any one might view them very well.

The effigies of the Triton *and* Siren *of* Nilus.



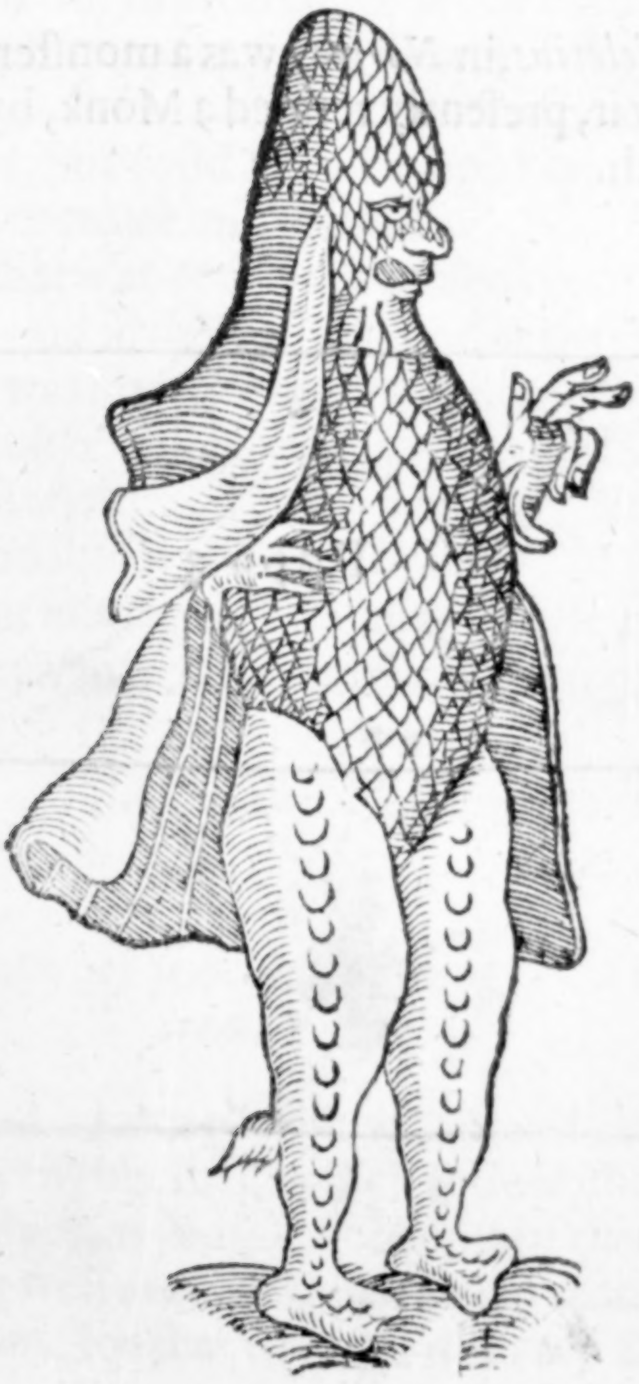
In our times, ſaith *Rondeletius*, in *Norway* was a monſter taken in a tempeſtuous ſea, the which as many as ſaw it, preſently termed a Monk, by reaſon of the ſhape which you may ſee here ſet forth.

The figure of a fiſh reſembling a Monke.



Anno Dom. 1531. there was ſeene a ſea-monſter in the habite of a Biſhop, covered over with ſcailes: *Rondeletius* and *Geſner* have deſcribed it.

The figure of a fiſh in the habite or ſhape of a Biſhop.



Geſner

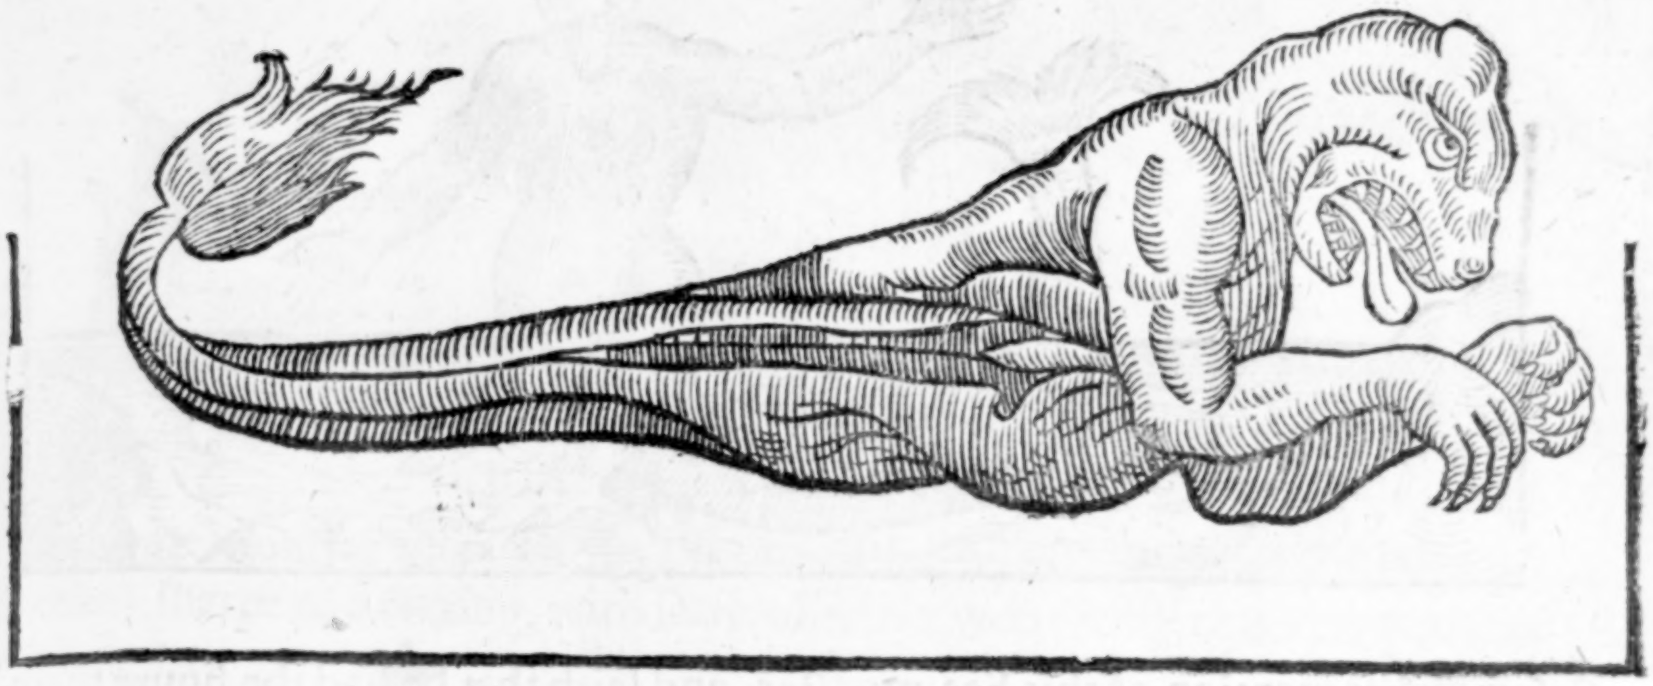
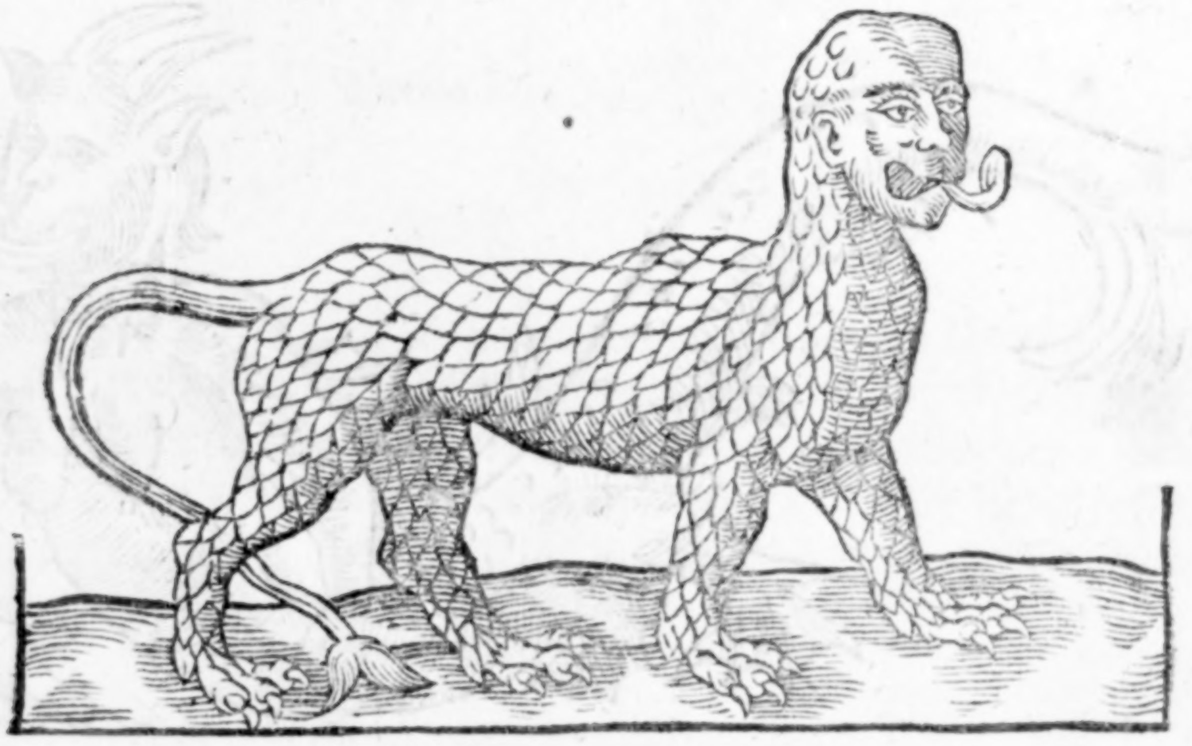
Geſner profeſſeth that hee received from *Jerome Cardane* this monſter, having the head of a Beare, the feet and hands of an Ape.

The effigies of a Sea-monſter headed like a Beare.



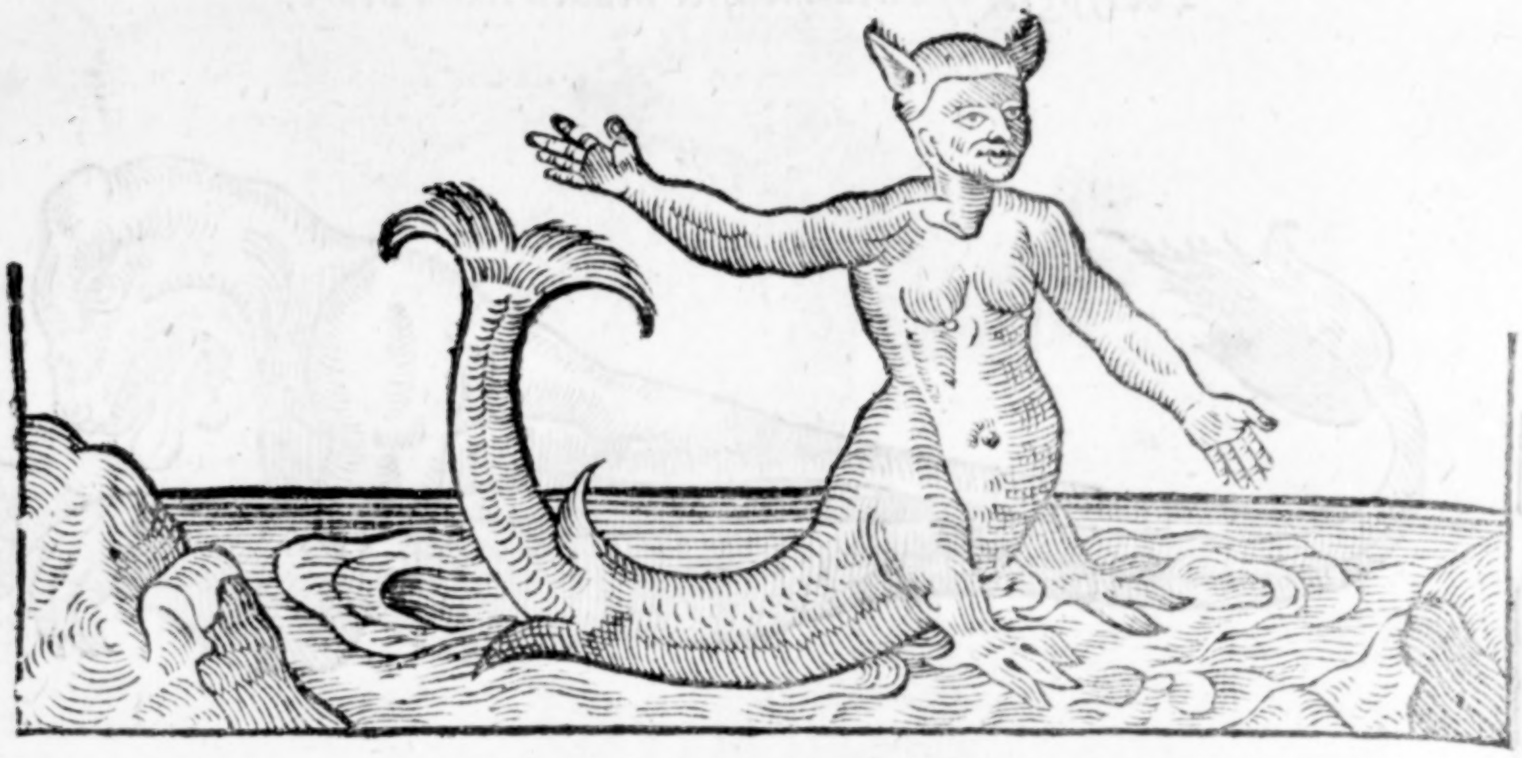
Not long before the death of Pope *Paul* the third, in the midſt of the Tyrrhene ſea, a monſter was taken, and preſented to the ſucceſſour of this *Paul*: it was in ſhape and bigneſſe like to a Lion, but all ſcaily, and the voice was like a mans voice. It was brought to *Rome* to the great admiration of all men, but it lived not long there, being deſtitute of its owne naturall place and nouriſhment, as it is reported by *Philip Forreſt*. *Lib. 5. chron.*

The effigies of a Lion-like ſcaily Sea-monſter.



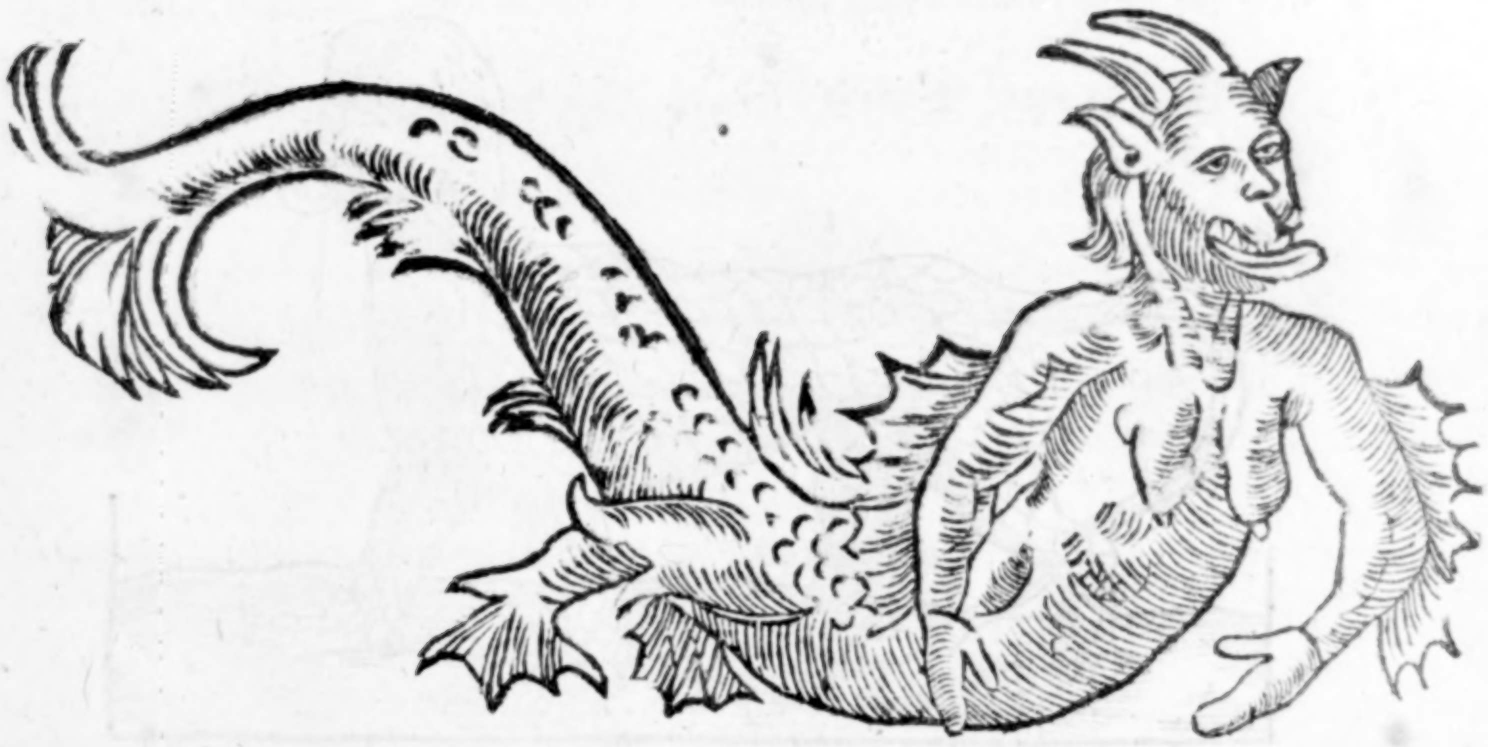
*Anno Dom.*1523. the third day of *November*, there was ſeen at *Rome* this ſea-monſter, of the bigneſſe of a child of five yeeres old, like to a man even to the navell, except the eares; in the other parts it reſembled a fiſh.

The effigies of a Sea-monſter with a mans face.



Geſner makes mention of this Sea-monſter, and ſaith that he had the figure thereof from a Painter, who tooke it from the very fiſh, which hee ſaw at *Antwerpe*. The head lookes very ghaſtly, having two hornes, pricke eares, and armes not much unlike a man, but in the other parts it was like a fiſh. It was taken in the Illyrian Sea, as it came a ſhore out of the water to catch a little child: for being hurt by ſtones caſt by fiſhermen that ſaw it, it returned a while after to the ſhore from whence it fled, and there died.

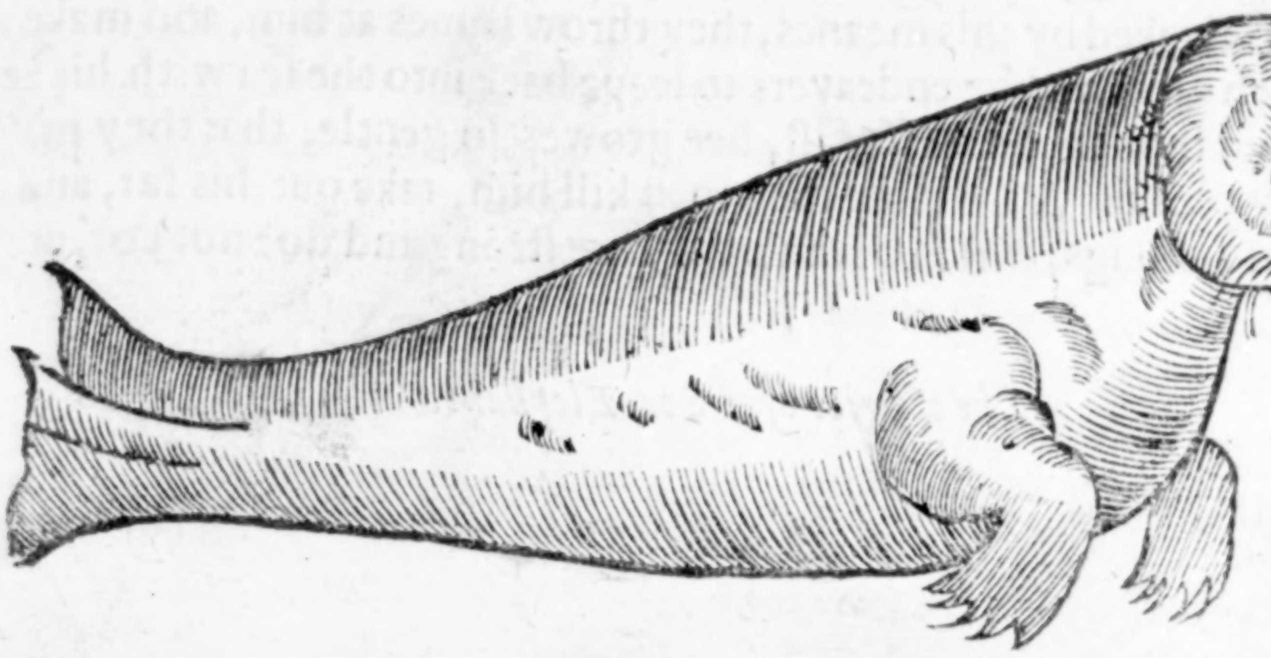
The effigies of a Sea Devill.



Geſner tells that a Sea-monſter with the head, mane, and breaſt of a horſe, and the reſt of his body like a fiſh, was ſeene and taken in the ocean Sea, brought to *Rome*, and preſented to the Pope.

Olaus Magnus tells that a Sea-monſter taken at *Bergen*, with the head and ſhape of a Calfe, was given him by a certaine Engliſh Gentleman. The like of which was preſented lately to King *Charles* the ninth, and was long kept living in the waters at *Fountaine-Bleau*, and it went oft times aſhore. This is much different from the common Sea-calfe or Seale.

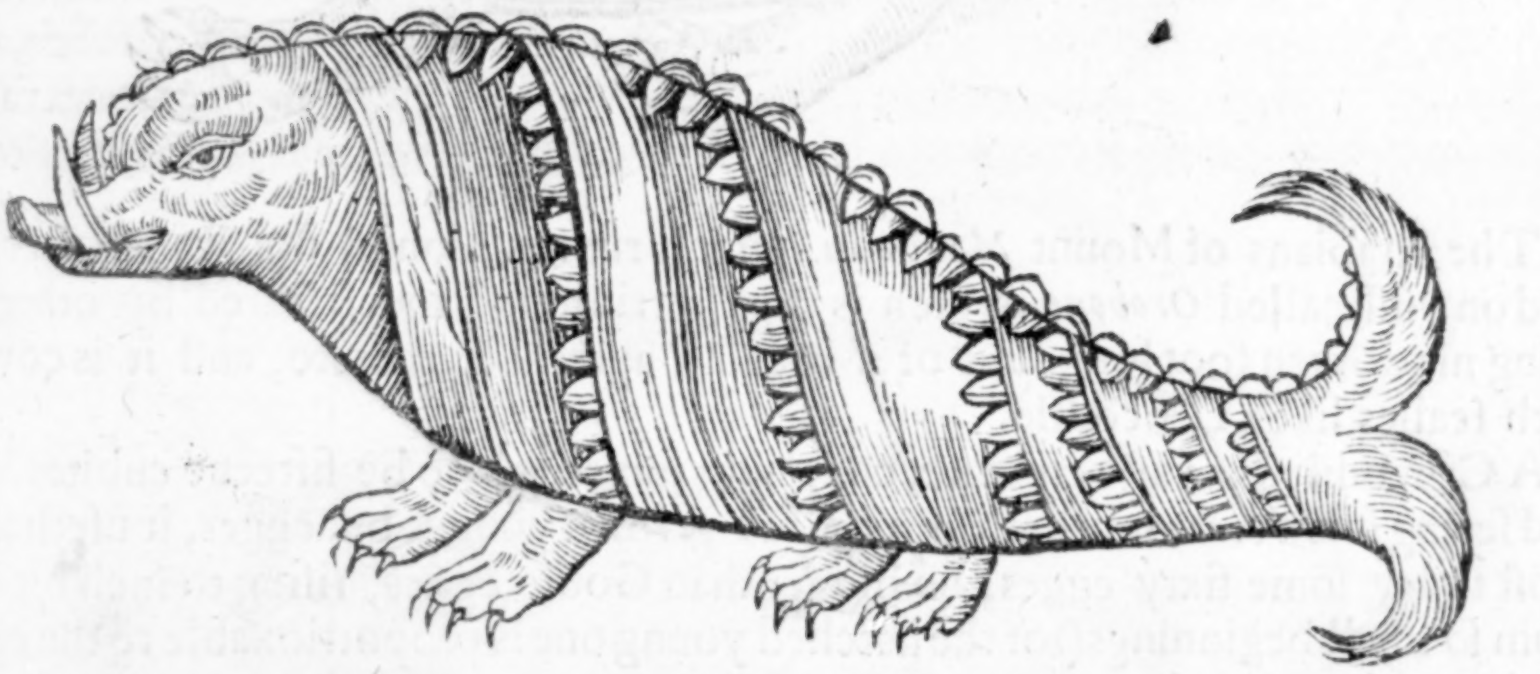
The effigies of a monſtrous Sea-calfe.*



* This here figured is the ſea-Morſe, taken commonly by our men in their Greene-land voyages: and I judge the ſea-Bore and Elephant to be the ſame, but that the Painter hath ſhewed his skill too much in the one: and the other is an old Morſe, as this here figured is a young one.

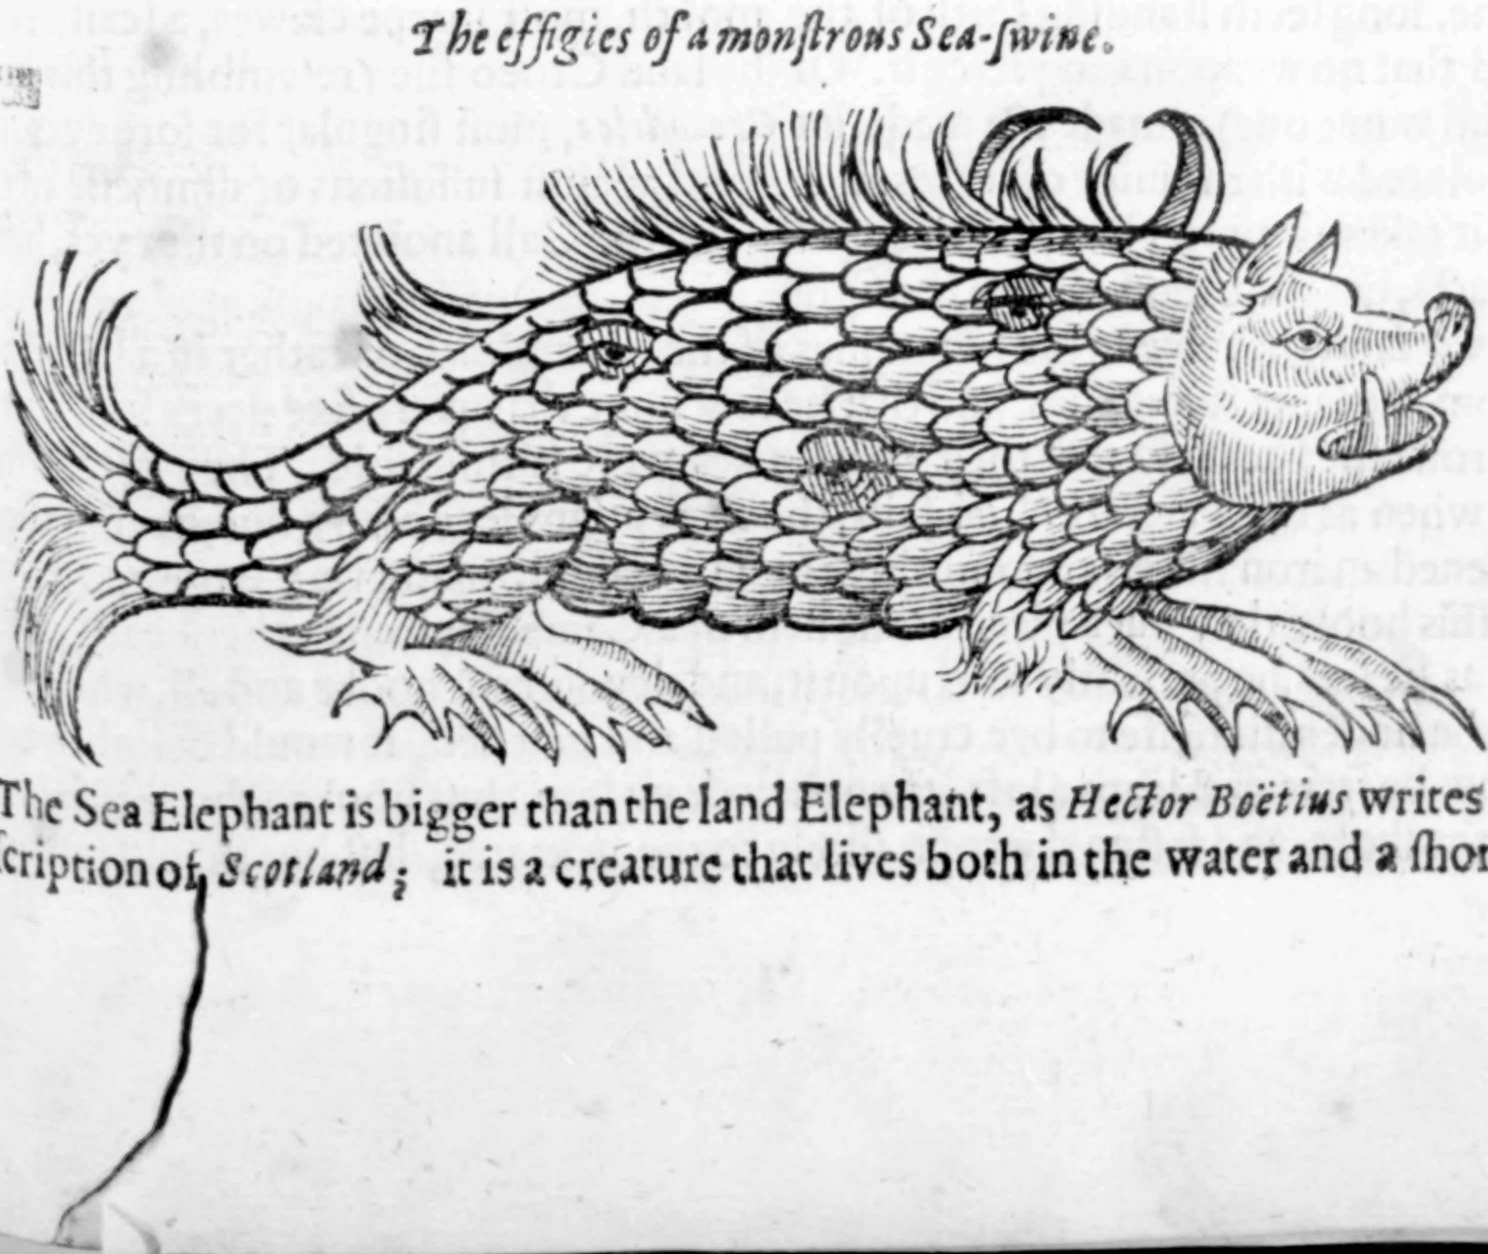
This great monſter was ſeene in the Ocean ſea, with the head of a Bore, but longer tuskes, ſharpe and cutting, with ſcailes ſet in a wonderfull order, as you may ſee by this figure.

The effigies of a Sea-bore.



Olaus Magnus writes that this monſter was taken at *Thyle* an Iland of the North, *Anno Dom.* 1538. it was of a bigneſſe almoſt incredible, as that which was ſeventy two foot long, and fourteene high, and ſeven foot betweene the eyes: now the liver was ſo large that therewith they filled five hogſheads, the head reſembled a ſwine, having as it were a halfe moone on the backe, and three eyes in the midſt of his ſides, his whole body was ſcaily.

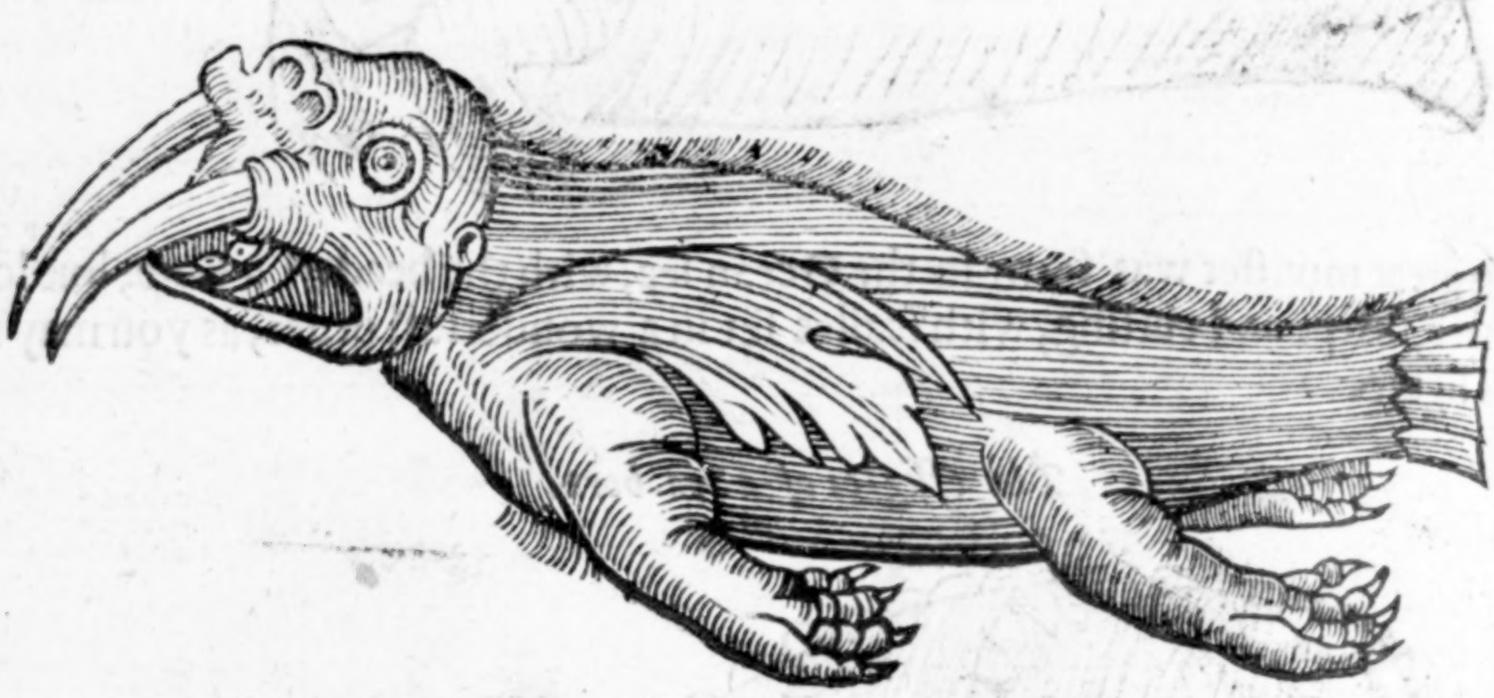
The effigies of a monſtrous Sea-ſwine.



The Sea Elephant is bigger than the land Elephant, as *Hector Boëtius* writes in his deſcription of *Scotland*; it is a creature that lives both in the water and a ſhore, having

ving two teeth like to elephants, with which as oft as hee deſires to ſleepe, he hangs himſelfe upon a rocke, and then he ſleeps ſo ſoundly, that Mariners ſeeing him at ſea, have time to come aſhore, and to bind him, by caſting ſtrong ropes about him. But when as he is not awaked by this meanes, they throw ſtones at him, and make a great noiſe, with which awakned, he endeavers to leape back into the ſea with his accuſtomed violence, but finding himſelfe faſt, hee growes ſo gentle, that they may deale with him as they pleaſe. Wherefore they then kill him, take out his fat, and divide or cut his skin into thongs, which becauſe they are ſtrong and doe not rot, are much eſteemed of.

The effigies of a Sea-Elephant.



The Arabians of Mount *Mazovan*, which runnes alongſt the Red Sea, chiefly feed on a fiſh called *Orobone*, which is very terrible and much feared by other fiſh, being nine or ten foot long, and of a breadth agreeable thereto, and it is covered with ſcailes like a Crocodile.

A Crocodile is a vaſte creature, comming ſometimes to be fifteene cubites long, and ſeeing it is a creature that doth not bring forth young, but egges, it uſeth at the moſt to lay ſome ſixty egges, no bigger than Gooſe egges, riſing to ſuch bigneſſe from ſo ſmall beginnings (for the hatched young one is proportionable to the egge): ſhe is very long lived.

The Crocodile only moves the upper jaw.

Expende diligenter Plinii locum lib. 28. cap. 8.

It hath ſo ſmall and uſeleſſe a tongue, that it may ſeeme to have none at all. Wherefore ſeeing it lives both on land and water; as it lives on land it is to bee taken for a tongue, but as it lives part of the life in the water it hath no uſe of a tongue, and therfore is not to bee reputed one. For fiſhes either wholly want tongues, or elſe have them ſo impedite and bound, that they ſerve for little uſe. The Crocodile onely of all other things moves the upper jaw, the lower remaining unmoveable: for her feet, they are neither good to take nor hold any thing; ſhe hath eyes not unlike thoſe of ſwine, long teeth ſtanding forth of the mouth, moſt ſharpe clawes, a ſcaily skin, ſo hard that no weapon can pierce it. Of the land Crocodile (reſembling this both land and water one) is made the medicine *Crocodilea*, moſt ſingular for ſore eyes, being anointed with the juice of leekes, it is good againſt ſuffuſions or dimneſſe of the ſight; it takes away freckles, puſtles, and ſpots; the Gall anointed on the eyes, helps Cataracts, but the blood cleares the ſight.

Coſmograph. tom. 1. lib. 2. cap. 8.

How they take Crocodiles.

Thevet ſaith they live in the fountaines of the river *Nilus*, or rather in a lake flowing from the ſame fountaines, and that he ſaw ſome that were ſixe paces long, and a yard croſſe the backe, ſo that their very lookes were formidable. They catch them thus; when as the water of *Nilus* falls, the Ægyptians let down a line, having thereto faſtened an iron hooke of ſome three pound waight, made very large and ſtrong, upon this hooke they put a piece of the fleſh of a Camell or ſome other beaſt; which when as he ſees, he preſently falls upon it, and devoures it hooke and all, wherewith when he findes himſelfe to bee cruelly pulled and pinched, it would delight you to ſee how he frets and leaps aloft; then they draw him thus hooked, by little and little to the ſhore, and faſten the rope ſurely to the next tree, leſt hee ſhould fall upon them that are about him; then with prongs, and ſuch things they ſo belabour his belly, where as his ſkin is ſoft and thinne, that at length they kill him, and uncaſing him, they make ready his fleſh, and eat it for delicious food. *John Lereus*, in his hiſtory of *Braſil*, writes that the Salvages of that country willingly feed upon Crocodiles, and that hee ſaw ſome who brought into their houſes young ones, wherewith the children gathering about it, would play without receiving any harme thereby.

Cap. 10.

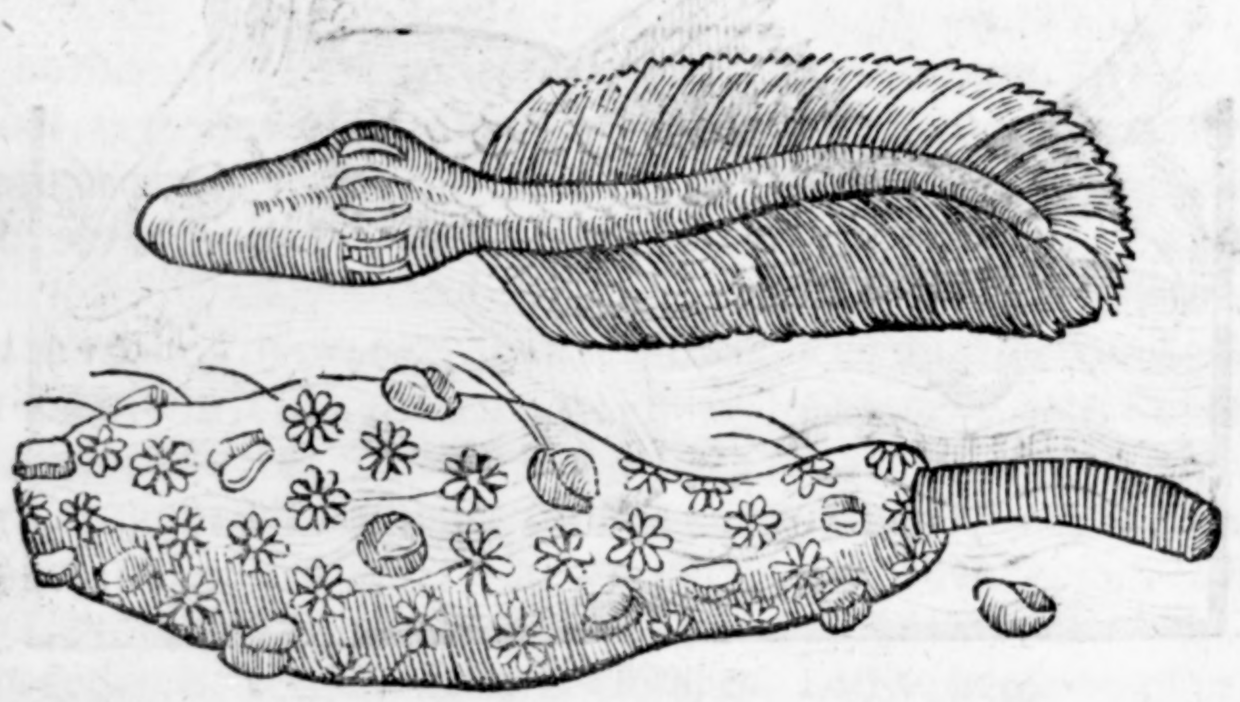
True (ſaith *Pliny*) is that common opinion, Whatſoever is brought forth in any part of Nature, that alſo is in the ſea, and many other things over and above, that are in no other place. You may perceive that there are not onely the reſemblances of living creatures, but alſo of other things; if you looke upon the ſword, ſaw, cowcumber, like in ſmell and colour to that of the earth, that you may leſſe wonder at the Sea feather and grape, whoſe figures I have here given you out of *Rondeletius*.

Lib. 9. cap. 2.

The ſea feather is like thoſe feathers of birds, which are worne in hats for ornament, after they are trimmed and dreſt for that purpoſe. The fiſhermen call them ſea-prickes, for that one end of them reſembleth the end of a mans yard, when the prepuce is drawne off it. As long as it is alive it ſwells, and becomes ſometimes bigger and ſometimes leſſer; but dead, it becomes very flaccide and lanke: it ſhines bright on the night like a ſtarre.

You may by this gather, that this which wee here expreſſe is the Grape whereof *Pliny* makes mention, becauſe in the ſurface and upper part thereof it much reſembles a faire bunch of Grapes; it is ſomewhat longiſh, like a mis-ſhapen clubbe, and hangs upon a long ſtalke. The inner parts are nothing but confuſion, ſometimes diſtinguiſhed with little glandules, like that wee have here figured alone by it ſelfe.

The figures of the Sea Feather and Grape.



In the Sea neere the Iſland *Hiſpaniola* in the Weſt Indies, there may be ſeene many monſtrous fiſhes, amongſt which *Thevet* in his Coſmography thought this moſt rare and obſervable, which in the vulgar language of the natives is termed *Aloes*. For it is juſt like a gooſe, with a long and ſtraight necke, with the head ending ſharpe, or in a Cone, not much unlike a ſugar-peare, it is no bigger than a gooſe, it wanteth ſcailes, it hath foure finnes under the belly for ſwimming, when it is above water you would ſay that it were a gooſe.

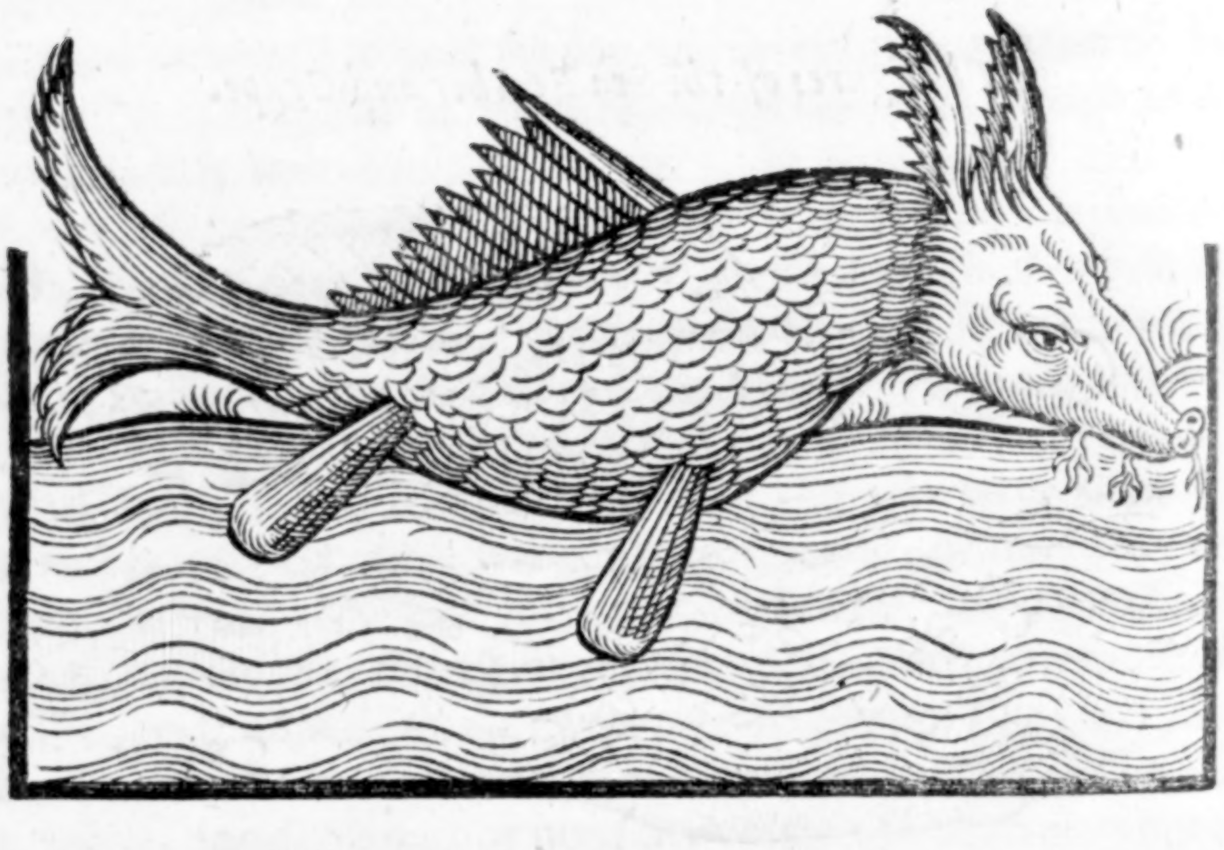
The Sarmatian, or Eaſterne Germane Ocean containes fiſhes unknowne to hot countries, and very monſtrous. Such is that which reſembling a ſnaile, equalls a barrell in magnitude of body, and a ſtag in the largeneſſe and branches of her hornes: the ends of her hornes are rounded as it were into little balls, ſhining like unto pearles, the necke is thicke, the eyes ſhining like to lighted candles, with a roundiſh noſe ſet with haires like to a cats, the mouth wide, whereunder hangs a piece of fleſh very ugly to behold. It goes on foure legges, with ſo many broad and crooked feet, the which with a long taile, and variegated like a Tiger, ſerves her for finnes to ſwim withall. This creature is ſo timerous, that though it be an *Amphibium*, that is, which lives both in the water and aſhore, yet uſually it keeps it ſelfe in the ſea, neither doth it come aſhore to feed unleſſe in a very cleare ſeaſon. The fleſh thereof is very good and gratefull meat, and the blood medicinable for ſuch as have their livers ill affected, or their lungs ulcerated, as the blood of great Tortoiſes is good for the Leproſie. *Thevet* in his Coſmography affirmeth that hee ſaw this in *Denmarke*.

The blood of great Tortoiſes good for the leproſie.

Tom. 2. lib. 20.

In a deepe lake of freſh water, upon which ſtands the great city or towne of *Themiſtitan*, in the Kingdome of *Mexico*, which is built upon piles, like as *Venice* is, there is found a fiſh of the bigneſſe of a Calfe, called by the ſoutherne Salvages, *Andura*, but by thoſe of the place, and the Spaniards the conquerers of that place, *Hoga*. It is headed and eared almoſt like a ſwine; from the chaps hang five long bearded *appendices*, of the length of ſome halfe a foot, like the beard of a Barbell. It hath fleſh very gratefull and good to eat. It bringeth forth live young like as the Whale. As it ſwimmes in the waters, it ſeemes greene, yellow, red, and of many colours, like a Chameleon: it is moſt frequently converſant about the ſhore ſides of the lake, and there it feeds upon the leaves of the tree called *Hoga*, whence alſo the fiſh hath its name. It is a fearefully toothed and fierce fiſh, killing and devouring ſuch as it meeteth withall, though they bee bigger than her ſelfe: which is the reaſon why the Fiſhermen chiefly deſire to kill her, as *Thevet* affirmeth in his Coſmography.

The monſtrous fiſh Hoga.

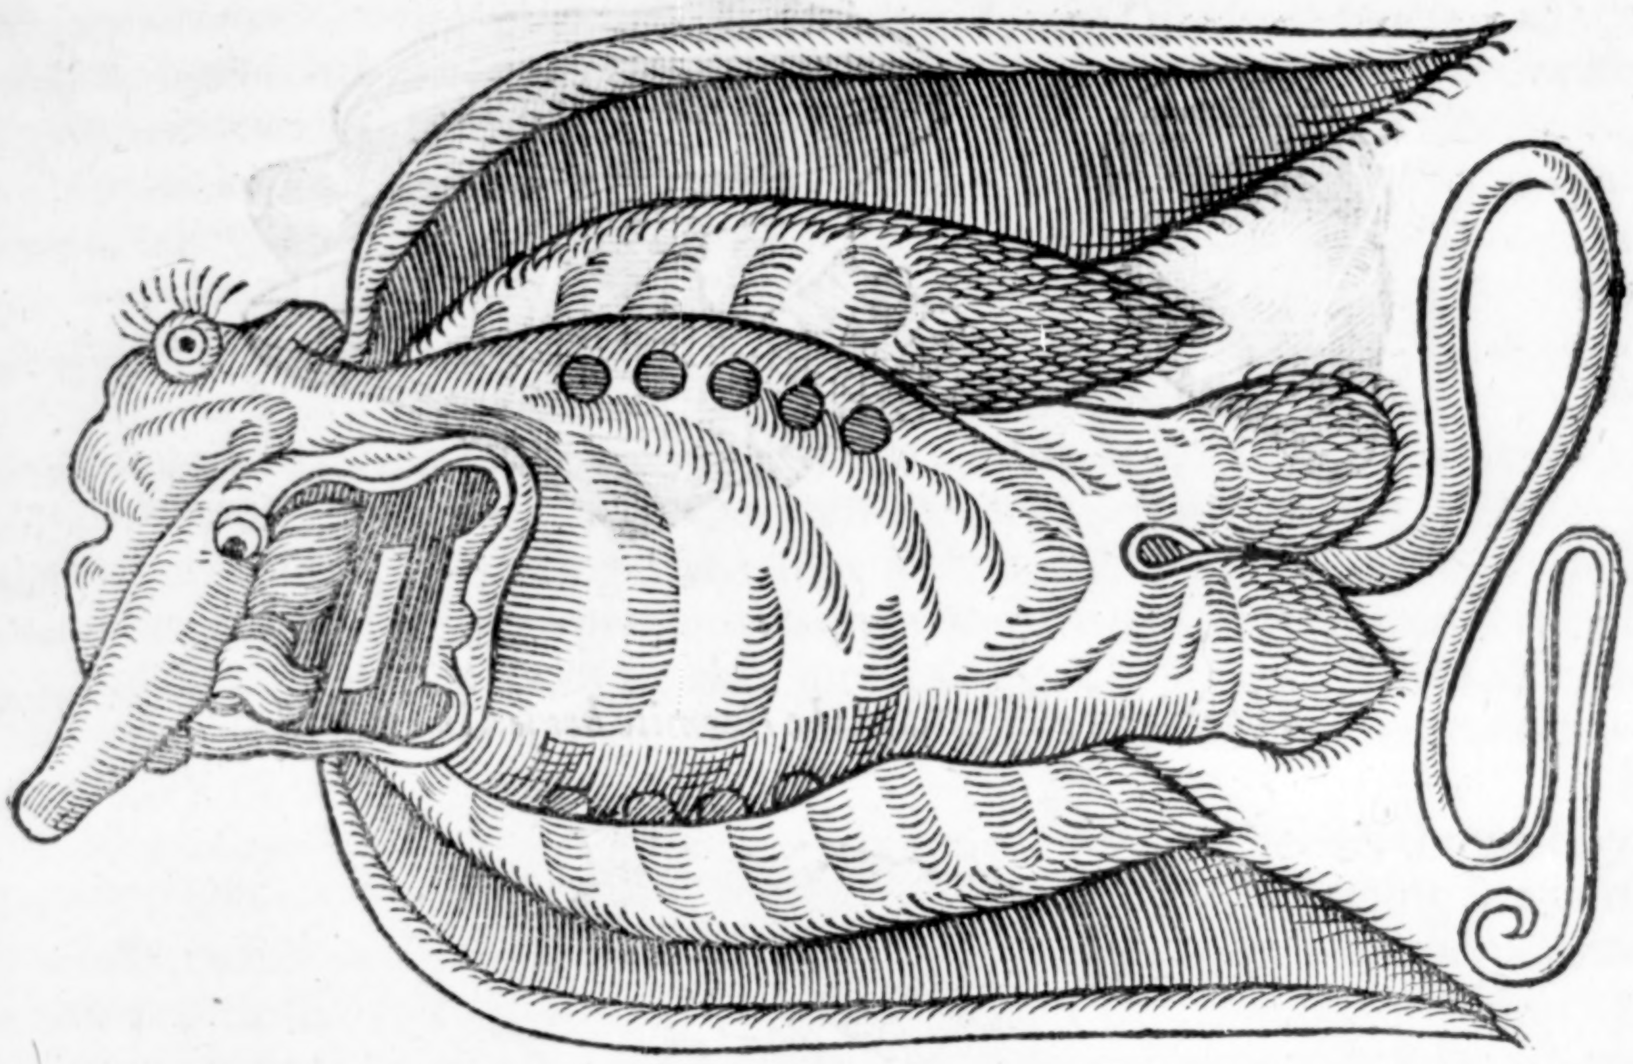


Andrew Thevet in his Coſmography writes that as he ſailed to *America*, hee ſaw infinite ſtore of flying fiſhes, called by the ſalvages *Bulampech*, who riſing out of the water, flye ſome fifty paces, eſcaping by that meanes from other greater fiſh that thinke to devoure them.

This kinde of flying fiſh exceeds not the bigneſſe of a Mackrell, is round headed, with a blewiſh backe, two wings which equall the length of almoſt all their body. They oft times flye in ſuch a multitude, that they fall foule upon the ſailes of ſhips, whileſt they hinder one anothers ſight, and by this meanes they fall upon the decks, and become a prey to the Sailers: which ſame thing we have read confirmed by *John Lereus* in his hiſtory of *Braſil*.

In the Venetian gulfe, betweene *Venice* and *Ravenna*, two miles above *Quioza*, *anno Dom.* 1550. there was taken a flying fiſh, very horrible and monſtrous, being foure foot long, it had a very great head, with two eyes ſtanding in a line, and not one againſt another, with two eares, and a double mouth, a ſnout very fleſhy and greene, two wings, five holes in her throat, like thoſe of a Lamprey, a taile an ell long, at the ſetting on whereof there were two little wings. This monſter was brought alive to *Quioza*, and preſented to the chiefe of the city, as a thing whereof the like had not beene formerly ſeene.

The figure of a monſtrous flying Fiſh.



There are ſo many and different ſorts of ſhells to be found in the Sea, that it may be truely ſaid, that Nature, the hand-maid of the Almighty, deſports it ſelfe in the framing of them. In ſo great diverſity I have chiefly made choice of three to treat of here, as thoſe that are worthy of the greateſt admiration. In theſe lye hid certain little fiſhes, as ſnailes in their ſhells, which *Ariſtotle* calls *Cancelli*, and hee affirmeth them to be the common companions of the * cruſted and ſhell fiſhes, as thoſe which in their *ſpecies* or kinde are like to Lobſters, and uſe to be bred without ſhells; but as they creepe into ſhells, and there inhabite, they are like to ſhell fiſhes. It is one of theſe that is termed the Hermite. He hath two ſomewhat long and ſlender hornes, under which are his eyes, alwaies ſtanding out of his head, as thoſe which he cannot plucke and draw in, as Crabbes can. His fore-feet have clawes upon them, wherewith he defends himſelfe, and carries meat to his mouth, having two other on each ſide, and a third being leſſer, the which he uſeth in going. The female laies egges, which hang forth at her backe part as if they were put upon a thread, being joyned together by certaine little membranes. Laſtly, in the opinion of *Ælian*, the *Cancellus* or ſmall Cray-fiſh is borne naked and without a ſhell, but within a while after, ſhe of many which ſhee findes empty, makes choice of a fit one, and when as growne bigger, ſhe cannot bee contained or dwell any longer therein, or elſe being ſtimulated with a naturall deſire of copulation, ſhe removes into a more capacious and convenient one. Theſe little Cray-fiſhes oft times fight together for their habitation, and the ſtronger carries away the empty ſhell, or elſe makes the weaker to quit poſſeſſion. Now the ſhell is either of a *Nerita*, or *Turbo*, and oft times of a ſmall Purple; and entring into poſſeſſion, ſhe carries it about, there feeds and growes, and then ſeekes a more capacious one, as *Ariſtotle* ſaith in the formerly cited place.

Some thinke that this Bernard the Hermite is that kinde of *Cancellus* which is by *Pliny* termed *Pinnoter*; but in truth the *Pinnoter* is not a kinde of *Cancellus* or Cray-fiſh, but of a little Crab. Now in *Ariſtotle* there is much difference betweene *Cancellus* and *Cancer parvus*, though *Pliny* may ſeeme to confound them; for he is bred naked, having his cruſt onely, but without a ſhell: wherefore ſeeing that by nature he wants it, he diligently ſearches for it, and dwells in it, when as he hath found it: But the *Pinnoter* is not bred by it ſelfe alone, but in *Pinnæ* and ſome others, and hee changeth not his habitation, becauſe (as *Ariſtotle* thinks) being of the kind of dwarfe Crabbes, it never growes bigge, neither dwells it in empty ſhells. Now the *Pinna*, or Pinne is a kinde of ſhell-fiſh, it breeds in muddy places, and is alwaies open, neither is it at any time without a companion, which they therefore call the *Pinnoter*, or *Pinnophylax* (*i. e.*) the Pin-keeper, as *Pliny* ſaith. Verily that theſe things are thus, you may plainely perceive by theſe words of *Athenæus*. *Chryſippus Solenſis* 5. *de Honeſt. & Volupt.* ſaith the *Pinna* and *Pinnoter* aſſiſt and further each other, neither can they live aſunder. The *Pinna* may be referred to the kinds of oyſters, but the *Pinnoter* is a dwarfe Crabbe: the *Pinna* opens her ſhell for the little fiſhes to enter thereinto; the *Pinnoter* ſtands by, obſerving if any come in, which if they doe, he gives the Pin notice thereof by biting, who preſently thereupon ſhuts her ſhell, and ſo they feed together upon that they catch by this meanes. Thus *Athenæus*. Shee is alſo for this her craft mentioned by *Plutarch* in his writings. The *Pinnoter* is ſometimes called by *Pliny*, *Cancer dapis aſſectator*.

What the *Pinnoter*, or dwarfe crab is.

What the *Pinna* is.

Lib. 9. *cap.* 42.
Lib. 3. *Deipno.*

The familiarity and craft of the *Pinna* and *Pinnoter*,

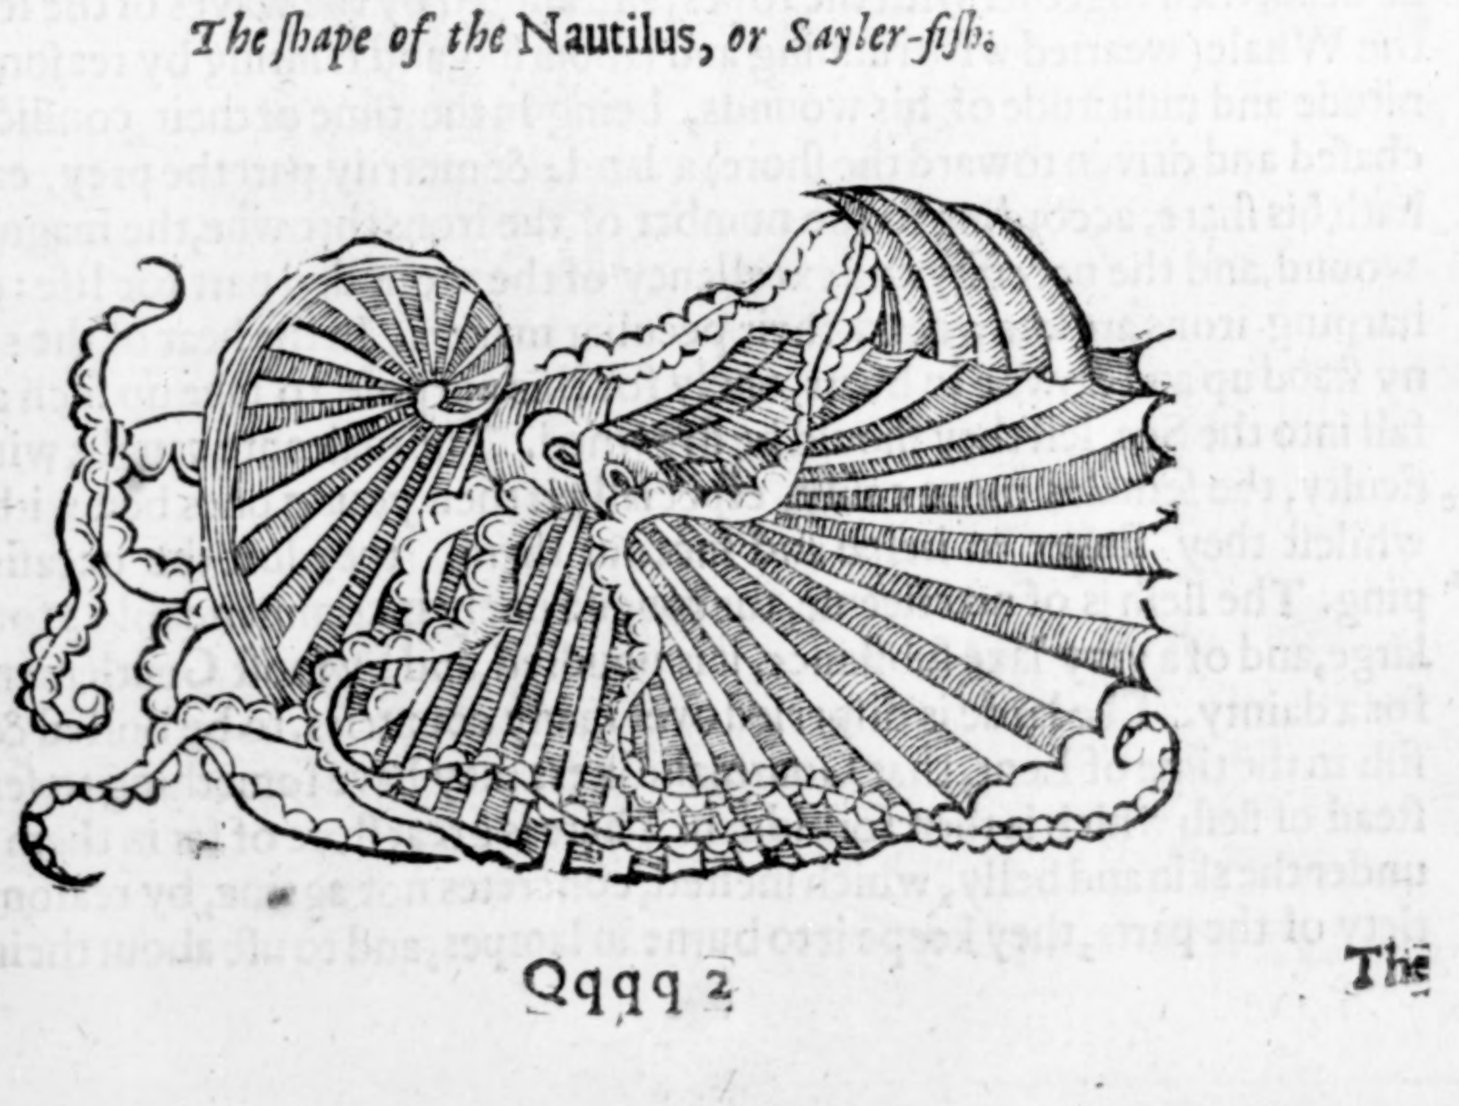
But that which by theſe authors is attributed to the dwarfe Crabbe, the ſame by *Cicero* is aſcribed to the little ſhrimpe: now the *Pinna* (ſaith hee) opening her two large ſhels, enters into confederacy with the little ſhrimp for getting of food, wherefore when little fiſhes ſwimme into her gaping ſhell, then the *Pinna*, admoniſhed by the ſhrimps biting her, ſhuts her ſhell; thus two unlike creatures get their livings together. But *Plutarch* ſeemes to make the *Pinna* to be the Pearle Oiſter, in that work of his, whereas he enquireth whether the craft of Water or Land beaſtes bee the greater.

Lib. 2. *de nat. deorum.*

But amongſt the moſt miraculous fiſhes may fitly bee placed the *Nautilos*, or Sayler, of ſome called *Pompylos* (it is thought to bee a kinde of *Polypus*) it comes with the face upwards to the toppe of the Sea, raiſing it ſelfe by little and little, that caſting forth all the water by a pipe, as if it had a Pumpe, it eaſily floats; then putting backe the two firſt tendrills or armes, it extends betweene them a membrane of wondrous fineneſs or thinneſſe, which gathering aire like as a ſaile, and ſhe rowing with the reſt of her armes, ſhe guides her ſelfe with her taile in the midſt, as a Rudder. Thus ſhee ſailes along in imitation of Pinnaces, and if any thing affright her, ſhe preſently takes in water, and ſinkes herſelfe.

Plin. lib. 9. *cap.* 29.

The ſhape of the Nautilus, *or Sayler-fiſh.*



How the Whale may be reckoned amongſt monſters.

The better to ſtore this treatiſe of Monſters, abuſing the name with the Poets, we will reckon up the whale amongſt the Sea-monſters, by reaſon of his monſtrous and wondrous magnitude. Now the Whale is the greateſt by much of all the fiſhes of the Sea, for moſt commonly this beaſt is thirty ſixe cubits long, eight high, the ſlit of his mouth is eighteene foot long, teeth they have none, but in ſtead thereof in each Jaw horny blacke excreſcences or finnes [which we vulgarly terme Whale-bones] which by little and little end in ſmall haires like to a ſwines briſtles, which comming and ſtanding out of his mouth, are in ſtead of Guides, leſt whileſt he ſwimmes with a blind and rapide violence, he might runne againſt a rocke. His eyes are diſtant one from the other the ſpace of foure elles, which outwardly appeare ſmall, but inwardly they are bigger than a mans head; wherefore they are deceived that ſay that they are no bigger than an Oxes eyes: his noſe is ſhort, but in the middle of his forehead he hath a pipe whereat hee drawes in the aire, and caſts forth a whole ſhower or river of water, that therewith he will even ſinke the veſſels or boats of the Marriners; when hee hath filled himſelfe beyond meaſure, hee cryes or roars with ſo great or ſtrong a voice, that hee may bee heard two miles off. Hee hath two very large finnes upon his ſides wherewith he ſwimmes, and under which in time of danger he hides his young; hee hath none upon his backe. His taile in ſite is like to the tailes of Dolphines, neither is it much unlike in ſhape, which when he moves, hee ſo toſſeth the Sea, that he drownes and overturnes the boats that hee toucheth. You may by diſſecting them finde that a Whale brings forth live young, and gives them ſucke; for the male hath teſticles and a yard, but the female a wombe and dugges. They are taken in divers places about winter, but chiefly about the coaſt of *Aquitaine*, at a ſmall towne which is vulgarly called *Biarris*, ſome ſixe miles diſtant from *Bayon*; whereunto I being ſent by King *Charles* the ninth when he was at *Bayon*, to cure the Prince of *Roche Sur-You*, I was an eye witneſſe how they are caught; and alſo I confirmed that which I had formerly read to that purpoſe, in that excellent and moſt true hiſtory of fiſhes ſet forth by *Rondeletius*. Now at that towne there is a little hill, in the toppe whereof there is a Tower of very great antiquity, from which as from a watch-Tower they keepe watch whether or no any Whales ſwimme that way. Wherefore the watch-men from the tower, either ſeeing, or by the horrible noiſe hearing a Whale to paſſe by that way, they give warning thereof to the inhabitants by the beating of Drums, and ringing a Bell: which ſigne once given, they all runne forthwith, as to extinguiſh the city if it were on fire, being furniſhed with weapons and all things fitting for that purpoſe. For the people of that country are very diligent and expert in catching the Whale. Wherefore in each of the boats furniſhed with all things either to aſſaile or flye, there are put ten luſty rowers, and divers others furniſhed with harping-irons to ſtrike the Whale; which being caſt and faſtened in her, they looſe out huge long ropes faſtened to them, untill ſuch time as he be dead, then together with the ropes, and aſſiſted by the waves of the ſea, they draw the Whale (wearied with running and labouring, and fainting by reaſon of the magnitude and multitude of his wounds, being in the time of their conflict diligently chaſed and driven toward the ſhore) a land; & merrily part the prey, each whereof hath his ſhare, according to the number of the irons throwne, the magnitude of the wound, and the neceſſity and excellency of the wounded part for life: each of their harping-irons are knowne by their peculiar markes. In the heat of the skirmiſh many ſtand up and downe in boats, onely for this purpoſe, to take up ſuch as chance to fall into the Sea, leſt they ſhould be drowned. The males are caught with more difficulty, the females more eaſily, eſpecially if their young ones bee with them; for whileſt they linger to helpe and ſuccour them, they loſe the occaſion of eſcaping. The fleſh is of no eſteeme, the tongue onely is commendable; for being very large, and of a very laxe ſubſtance, it is poudred, and by moſt Gentlemen accounted for a dainty. The larde is diſperſed over many countries, to be boiled & eaten with fiſh in the time of Lent, that Gourmandizers may have ſomething to ſerve them in ſtead of fleſh which is then forbidden. There is great ſtore of fat in them in the parts under the skin and belly, which melted, concretes not againe, by reaſon of the ſubtlety of the parts, they keepe it to burne in lampes, and to uſe about their ſhips. The

A whale brings forth young, & ſuckles them.

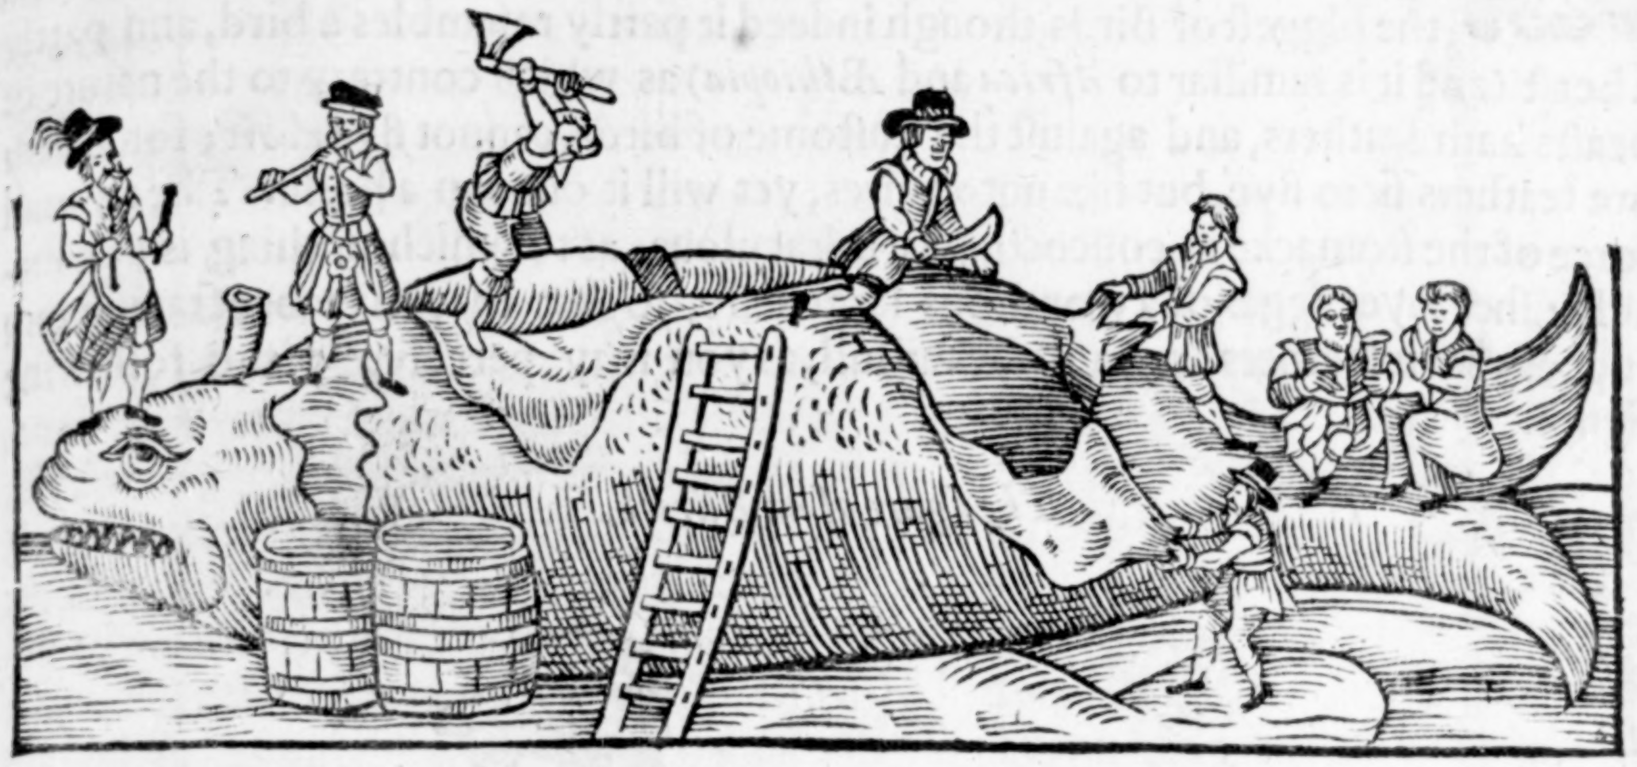
How they are caught.

Why the females are more eaſily caught than the males.

houſes of the fiſh-eaters are builded with their bones; alſo orchards in the coaſt of *Aquitaine* are fenced with theſe bones. The finnes that ſtand forth of their mouths, which are commonly called Whale-bones, being dryed and poliſhed, ſerve to make buskes for women, whip-ſtaves, and little ſtaves, as alſo to ſtiffen garments. Many make ſeats or ſtooles of the *vertebræ*, or ſpondills of the backe-bone.

Whalebone.

The manner of the cutting up of the Whale.



In the river *Scalde*, ten miles from *Antwerpe, Anno Dom.* 1577. the ſecond day of *July*, there was a Whale taken, of a blackiſh blue colour, ſhee had a ſpout hole in the top of her head, out of which ſhee caſt great ſtore of water: ſhe was fifty eight foot long, and ſixteene foot high: her taile was fourteene foot broad; from the eye to the end of her noſe was ſome ſixteene foot. Her lower jaw was ſixe foot on each ſide, ſhe had twenty five teeth, which ſhee could hide in her upper jaw, there being holes for them, it being wholly toothleſſe; for which one thing this Whale may bee judged monſtrous, for that nature hath denied them teeth, and for that in creatures that are not horned, it is ſo ordained by nature, that when they have teeth in their lower jaw, they ſhould have others alſo in the upper to anſwer to them, ſo to chaw their meat. The longeſt of theſe teeth exceeded not ſixe inches.

There is (as *Pliny* reports) a very ſmall fiſh accuſtomed to live about rocks, it is called *Echeneis*, never exceeding the length of a foot; it is thought that ſhippes goe more ſlowly if this ſtick to them: wherefore the Latines have alſo given it the name of *Remora*, for that a ſhip being under ſaile with a good wind, may by the *Echeneis* ſeazing on her as if ſhe would devoure her, be ſtayed againſt the Saylers wills, and ſtand ſtill as if ſhe were in a ſafe harbour. Wherefore ſhee is ſaid in the Actian fight to have ſtayed the ſhip of *Marcus Antonius*, haſtening to goe about and encourage his ſouldiers, ſo that he was forced to enter into another ſhip, and thereupon *Cæſars* navie came upon them too haſtily, and before they were provided.

Lib. 9. cap. 25. & lib. 32. ca. 1.

The wondrous power of the *Remora*.

Shee alſo ſtaid the ſhip of the Emperour *Caius*, comming from *Aſtura* to *Antes*, his ſhip of all the navie making no way; neither did they long wonder at this ſtay, the cauſe being preſently knowne; ſome forthwith leaping into the Sea to finde the cauſe thereof, there found her about the ſhip, even ſticking to the Rudder, and they ſhewed her to *Caius*, being wrath that this ſo ſmall a thing ſhould ſtoppe him, and countermaund the endeavour of forty Rowers.

Therefore this little fiſh tames and infringes the violence and madneſſe of the world, & that with no labour, not with holding or any other way, but only by ſticking thereto. Certainly how ever it comes to paſſe, who from this example of holding of ſhips, can doubt of any power or effect of nature, in medicines which grow naturally? Yea & without this example, the *Torpedo* out of the ſea alſo may be ſufficient, who a farre off, and at a diſtance, if it be touched with a ſpeare or rod, will benumbe even the ſtrongeſt armes, and retarde the feet, how ever nimble to runne away.

The wondrous force of the *Torpedo*.

CHAP. XXII.

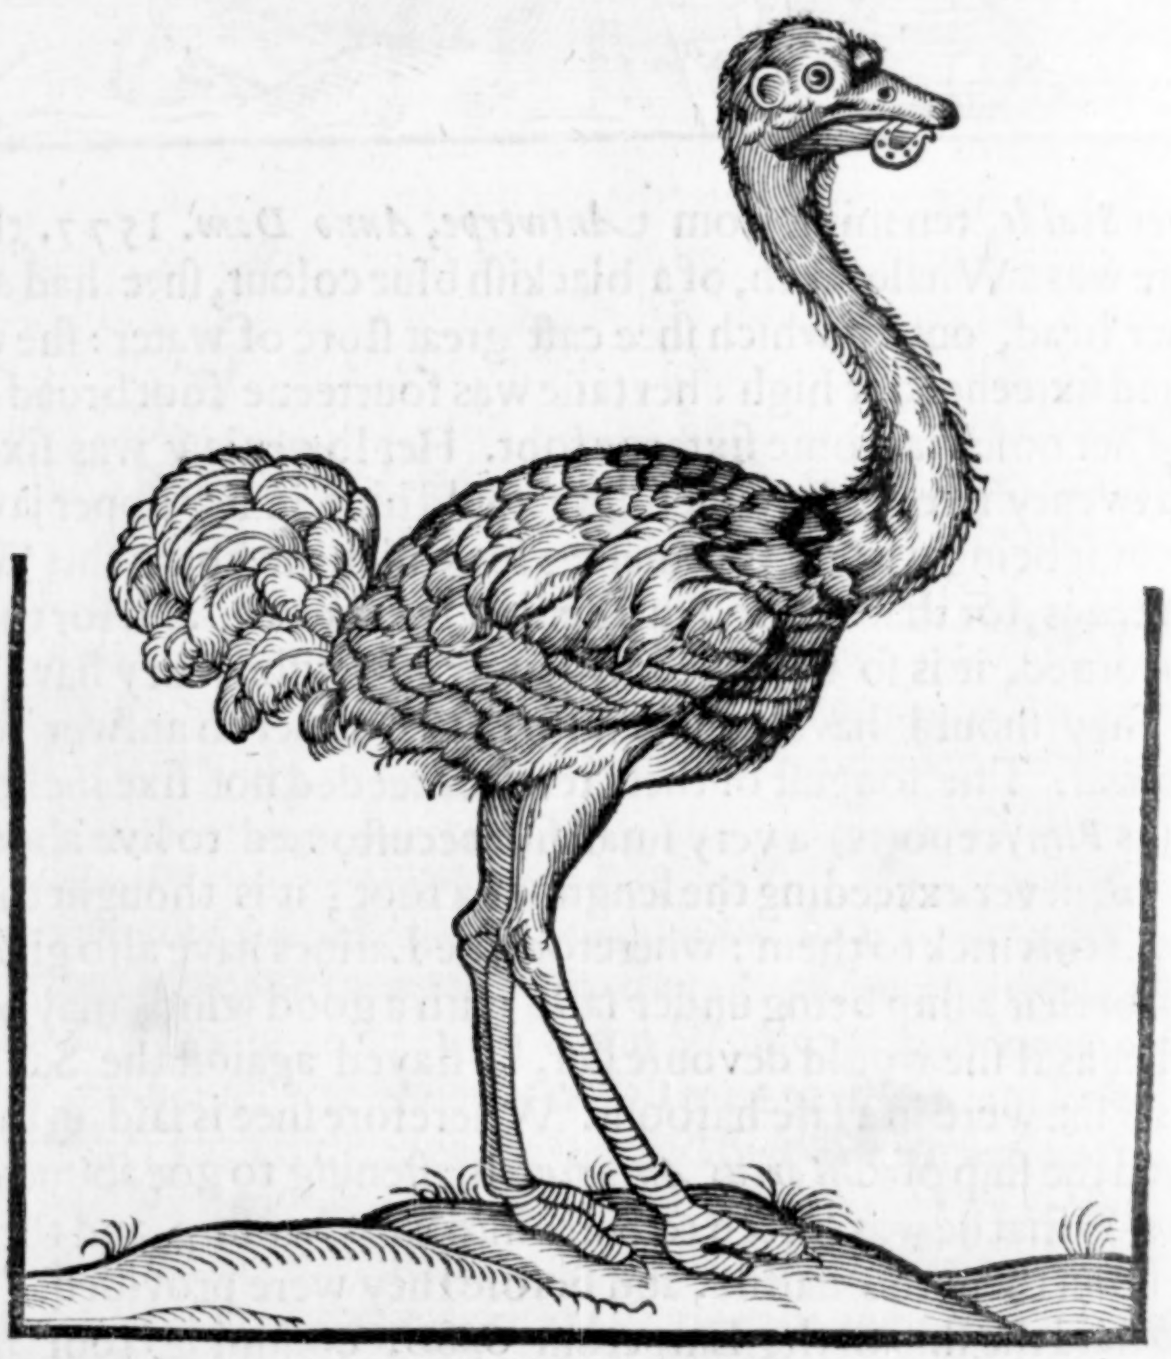
Of the admirable nature of Birds, and of ſome Beaſts.

THAT there bee divers things not onely in the Sea, but alſo in the aire, and earth, which by the wonderfull condition of their nature may equall that of Monſters, the onely Eſtrich may ſerve for a witneſſe. It is the biggeſt of Birds, though indeed it partly reſembles a bird, and partly a beaſt (and it is familiar to *Africa* and *Æthiopia*) as which contrary to the nature of beaſts hath feathers, and againſt the cuſtome of birds, cannot flye aloft; for it hath not feathers fit to flye, but like unto haires, yet will it out-run a horſe. The naturall force of the ſtomacke in concocting is miraculous, as to which nothing is untameable: ſhee layes egges of a wondrous largeneſſe, ſo that they may bee framed into cuppes: their feathers are moſt beautifull, as you may perceive by this following figure.

The Eſtrich is betweene a bird and a beaſt.

The wondrous force of her ſtomacke.

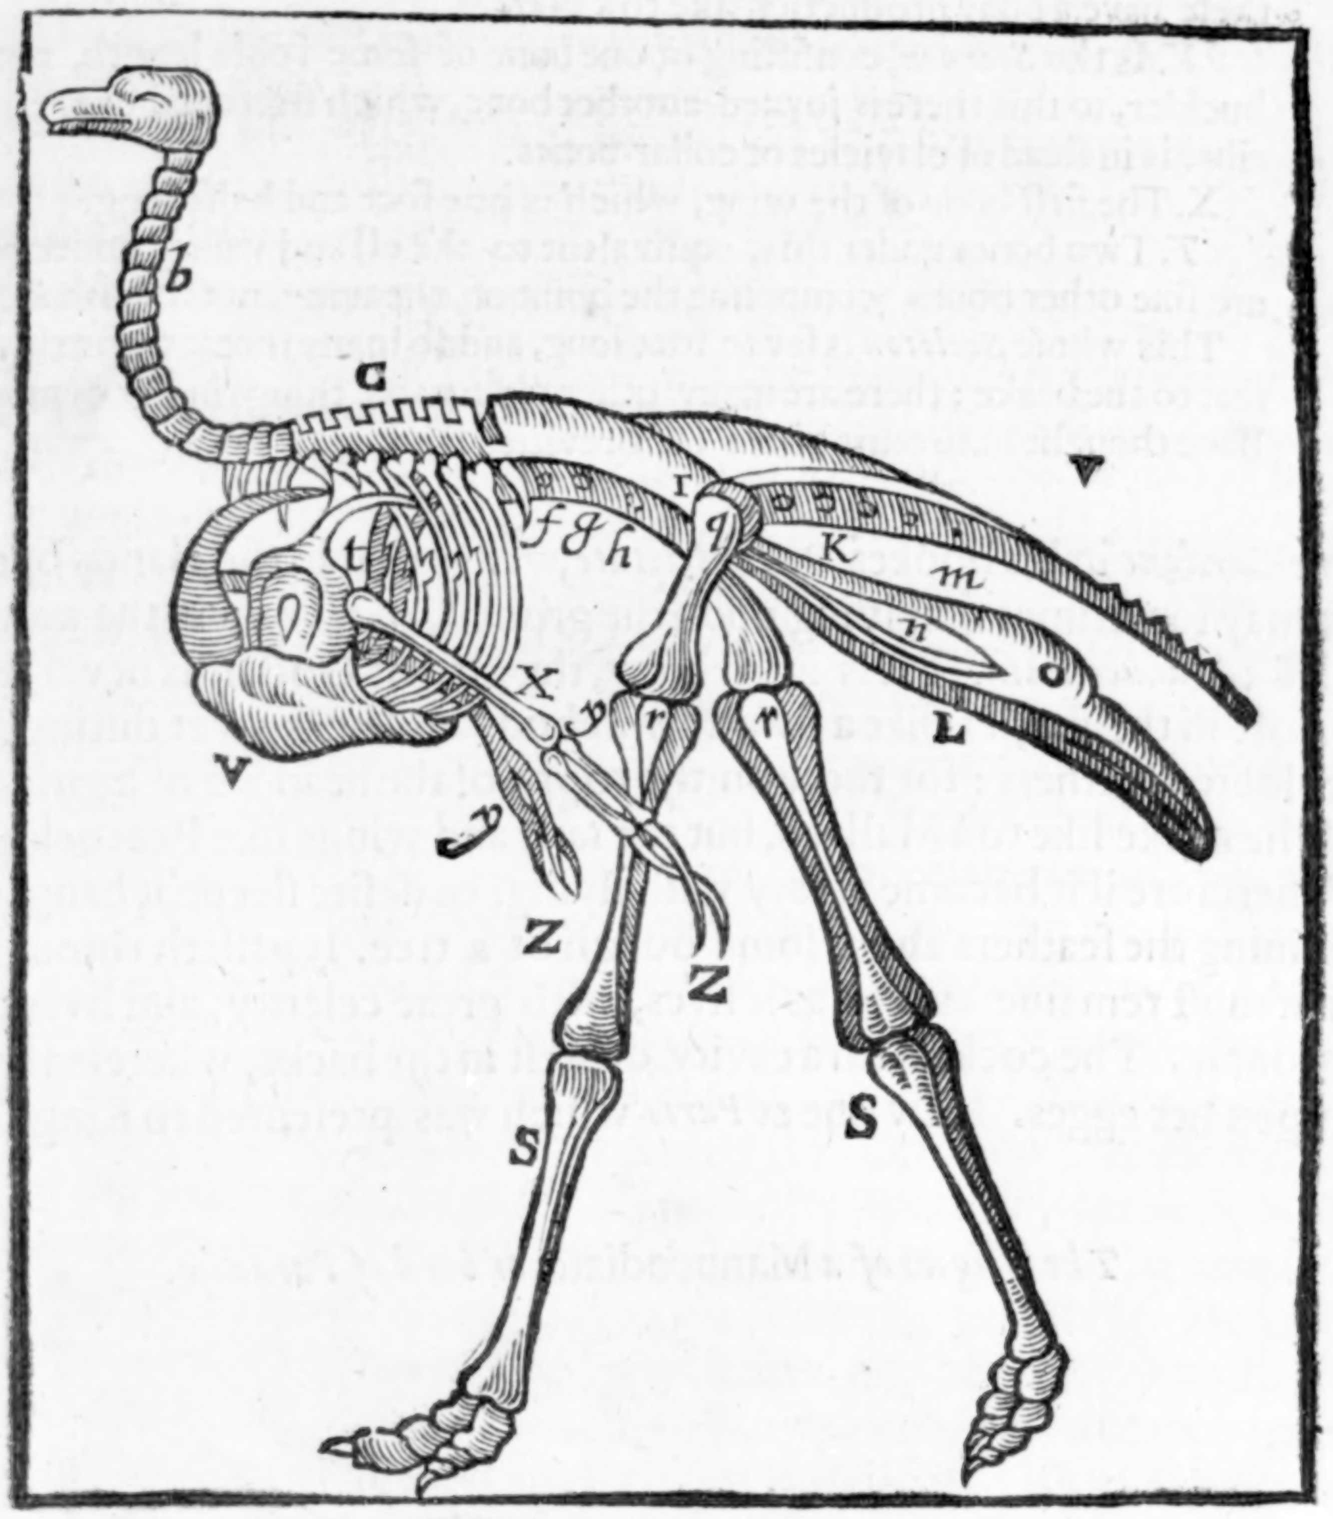
The figure of an Eſtrich.



Any one may eaſily gather of what a prodigious magnitude an Eſtrich is, by the greatneſſe of his bones. Three of theſe birds were kept at the Kings charge, by the *Mareſchall de Rets*: one whereof dying, it was beſtowed upon mee, whereof I have with great diligence made a *Sceleton*.

The

The delineation of the Sceleton of an Eſtrich.



A. Shewes the head, which was ſomewhat thicker than the head of a Crane; of the length of ones hand, plaine from the crowne even to the beake; the beake being divided to the middle region of the eye, being roundiſh at the end thereof.

B. The necke, a yard long, conſiſting of ſeventeene *vertebræ*, each whereof on each ſide is furniſhed with a tranſverſe proceſſe looking downewards, of ſome fingers length, excepting the two which are next the head, as which want theſe, and are joyned together by *Ginglymos*.

C. The backe is of a foots length, conſiſting of ſeven *Vertebræ*.

D, The holy-bone of two foot long, in whoſe top there is a tranſverſe proceſſe, under which there lyes a great hole.

E. Three more, but leſſe.

F. G. H After which there followes the cavity or ſocket, whereinto the head of the thigh-bone is received and hid. This externally and on the ſide produceth a perforated bone, noted with the letter, *I*. perforated I ſay at the beginning, for it is preſently united at the letter, *K*. then is it forked and divided into two other bones, whereof one is bigger than the other. The leſſe is noted with the letter, *L*. then are they both united at the letter *M*. each of them is halfe a foot and foure inches long. But from that part whereas they firſt begun to bee divided, to that whereas they are united, there is a hole ſome foure fingers broad, but the length of ones hand, or more, and it is noted with the letter, *N*. The reſidue of the bone is like to a pruning knife three inches broad, but ſixe in length: at the end whereunder is the letter, *O*. it is joyned by coalition.

P. The rumpe conſiſting of nine *vertebræ*, like to a mans. The thigh-bones are two, whereof that which is noted with the letter *Q*. is of the length of a foot, and of thickeneſſe equall to a horſes thigh. The other next under (which peradventure you may call the legge-bone) noted with *R*. is a foot and halfe long: it hath joyned thereto the *Fibula*, or leſſer focile of the like length, but which growes ſmaller as it comes lower.

S. Is the legge, to which the foot adheres, being one foot and a halfe long, divided at the end into two clawes, the one bigger, the other leſſe, whereof each conſiſts of three bones.

T. Eight ribbes, which are inſerted into the *Sternon*, the three middlemoſt of theſe have a bony production like to a hook.

V. Is the *Sternon*, conſiſting of one bone of ſome foots length, repreſenting a buckler, to this there is joyned another bone, which ſtretched over the three firſt ribs, is in ſtead of clavicles or collar-bones.

X. The firſt bone of the wing, which is one foot and halfe long.

Y, Two bones under this, equivalent to the ell and wand, under which there are ſixe other bones compoſing the point of the wing, noted with *Z*.

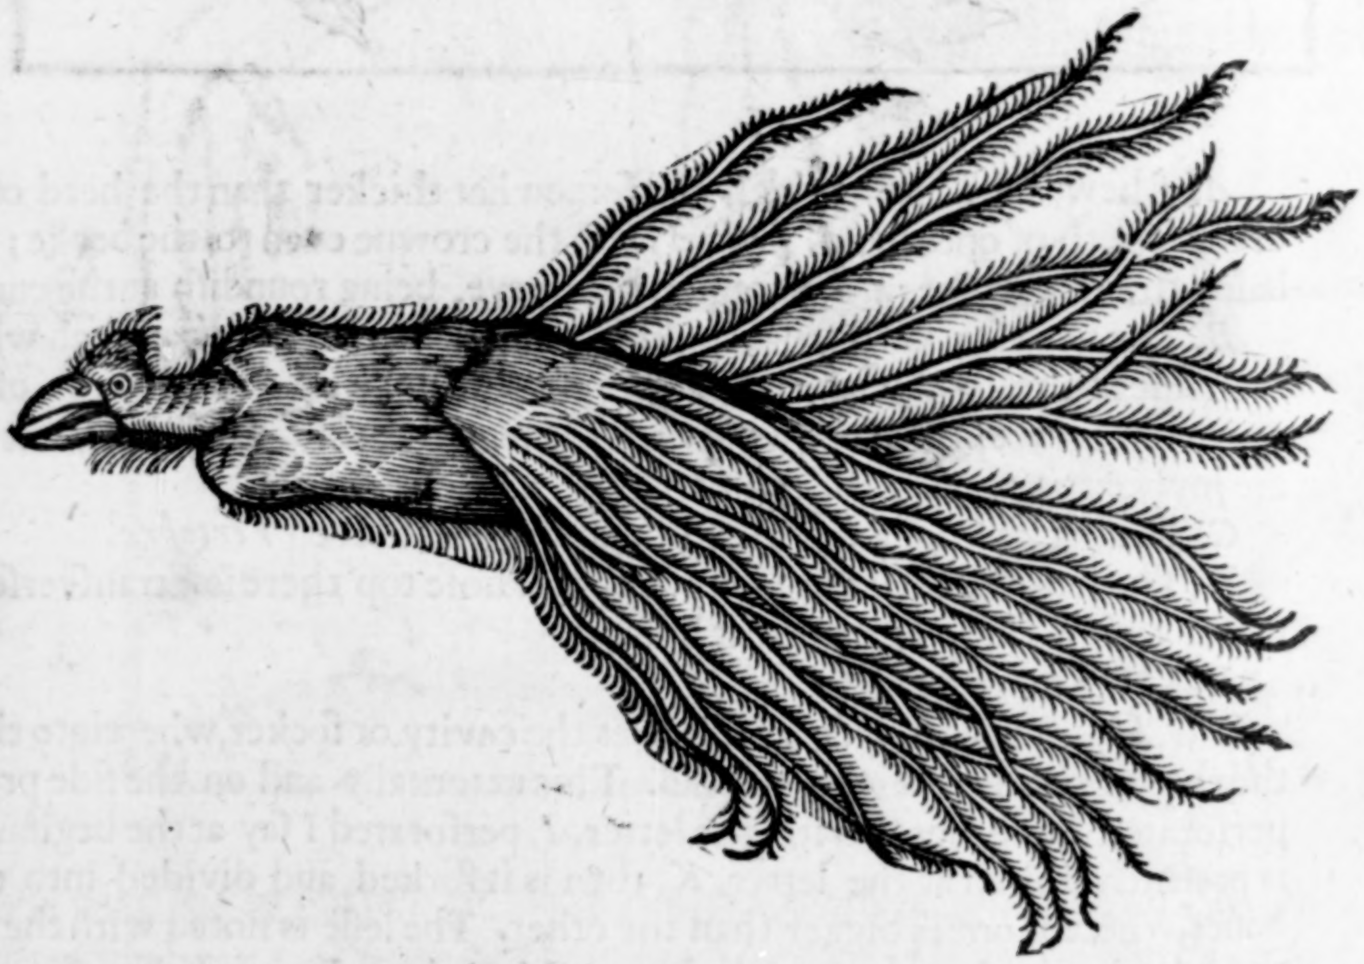
This whole *Sceleton* is ſeven foot long, and ſo many foot or more high from the feet to the beake: there are many other obſervable things in her compoſure, but I have thought fit to omit them for brevities ſake.

The deſcription of the bird of Paradiſe.

* Whoſoever deſires to know more of the truth of this bird, let him read *Cluſius* in the *Auctarium ad lib. 5. cap. 1. exoticorum.*

Jerome Cardane in his bookes *De ſubtilitate*, writes that in the Ilands of the *Molucca's*, you may ſometimes find lying upon the ground, or take up in the waters, a dead bird called a *Manucodiata*, that is in Hebrew, the bird of God, it is never ſeene alive. It lives aloft in the aire, it is like a Swallow in body and beake, yet diſtinguiſhed with divers coloured feathers: for thoſe on the toppe of the head are of a golden colour, thoſe of the necke like to a Mallard, but the taile and wings like Peacocks; * it wants feet: Wherefore if it become weary with flying, or deſire ſleepe, it hangs up the body by twining the feathers about ſome bough of a tree. It paſſeth through the aire, wherein it muſt remaine as long as it lives, with great celerity, and lives by the aire and dew onely. The cocke hath a cavity depreſt in the backe, wherein the hen laies and ſits upon her egges. I ſaw one at *Paris* which was preſented to King *Charles* the ninth.

The effigies of a Manucodiata, *or bird of Paradiſe.*



Tom. 2. lib. 21. cap. 12.

Wee have read in *Thevets* Coſmography, that he ſaw a bird in *America*, which in that country ſpeech is called *Touca*, in this very monſtrous & deformed, for that the beake in length and thickeneſſe, exceeds the bigneſſe of the reſt of the body; it feeds on pepper, as the black-birds and felfires with us do upon Ivie berries, which are not leſſe hot than pepper.

A certaine Gentleman of *Provence* brought a bird of this kinde from that country, to preſent it to King *Charles* the ninth, but dying in the way he could not preſent it alive. Wherefore the King wiſhed the *Mareſchal de Rets* to give her to me, that I might

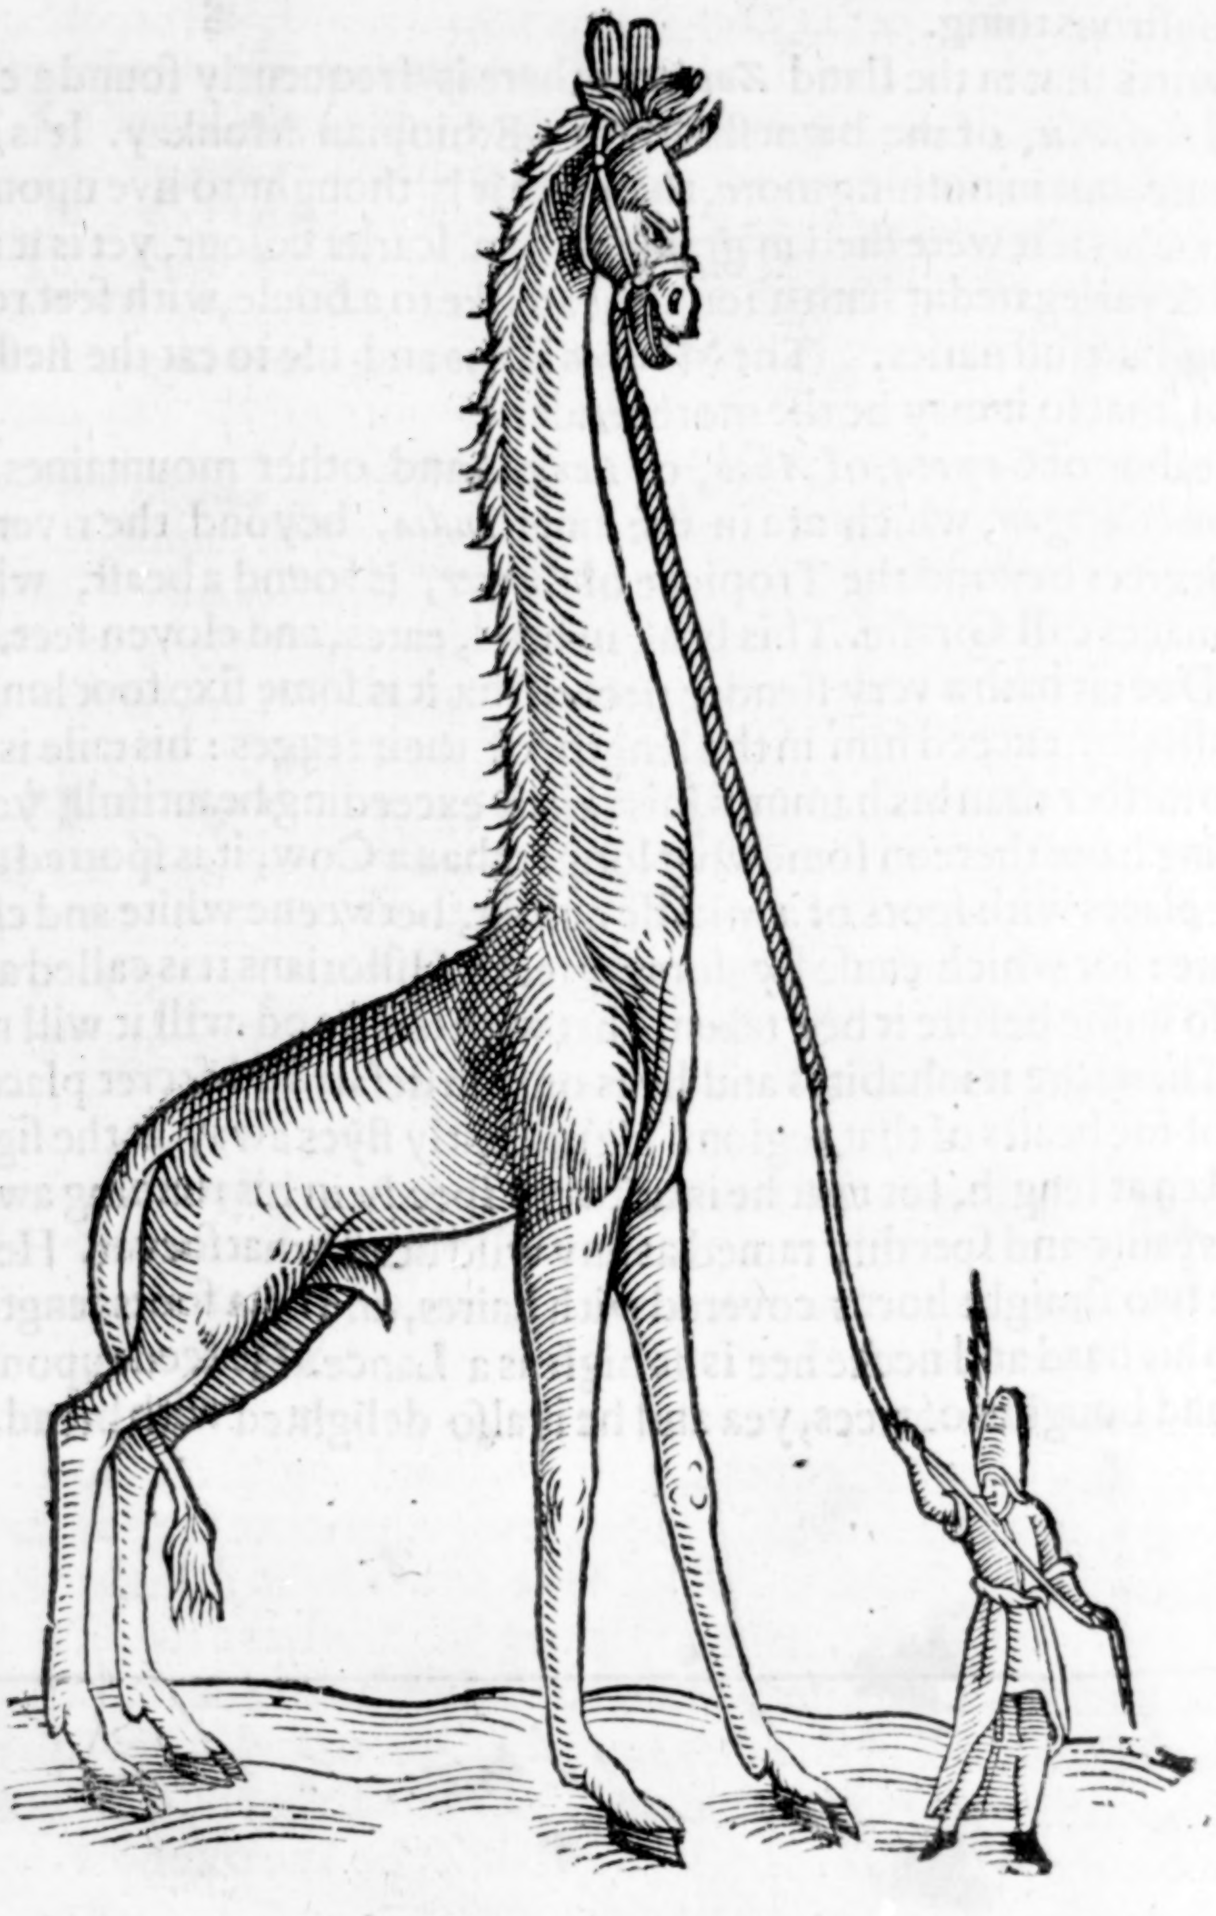
might take forth her bowells and embalme her, that ſhe might bee kept amongſt the Kings rarities. I did what I could, yet not long after ſhe rotted: ſhe reſembled a crow in body and feathers, but had a yellowiſh beake, cleere, ſmooth, and toothed like a ſaw, and of ſuch length and thickeneſſe as we formerly mentioned. I keep it yet as a certaine monſtrous thing.

Thevet writes that in the Iland *Zocotera* there is frequently found a certaine wild beaſt called *Hulpalis*, of the bigneſſe of an Æthiopian Monkey. It is a very monſtrous creature, but in nothing more, than that it is thought to live upon the aire only; the skinne, as if it were died in graine, is of a ſcarlet colour, yet is it in ſome places ſpotted & variegated: it hath a round head like to a boule, with feet round, broad, and wanting hurtfull nailes. The Moores kill it and uſe to eat the fleſh of it, being firſt bruiſed, that ſo it may be the more tender.

Tom. 1. cap. 11. lib. 4.

In the Realme of *Camota*, of *Ahob*, of *Benga*, and other mountaines of *Cangipa, Plimatiq, and Catagan*, which are in the inner *India*, beyond the river of *Ganges*, ſome five degrees beyond the Tropicke of *Cancer*, is found a beaſt, which the weſterne Germanes call Giraffe. This beaſt in head, eares, and cloven feet, is not much unlike our Doe; it hath a very ſlender necke, but it is ſome ſixe foot long, and there are few beaſts that exceed him in the length of their legges: his taile is round, but reacheth no further than his hammes, his skin is exceeding beautifull, yet ſomewhat rough, having haire thereon ſomewhat longer than a Cow, it is ſpotted and variegated in ſome places with ſpors of a middle colour, betweene white and cheſnut, ſo as Leopards are: for which cauſe by ſome greeke Hiſtorians it is called a *Cameleopardalis*: it is ſo wilde before it bee taken, that with the good-will it will not ſo much as be ſeen. Therefore it inhabites and lives only in deſart and ſecret places, unknown to the reſt of the beaſts of that region. He preſently flyes away at the ſight of a man, yet is he taken at length, for that he is not very ſpeedy in his running away; once taken, he is as eaſily and ſpeedily tamed as any wild beaſt whatſoever. He hath above his crowne two ſtraight horns covered with haires, and of a foots length. When as he holds up his head and necke hee is as high as a Lance. He feeds upon herbes, and the leaves and boughes of trees, yea and he is alſo delighted with bread.

Thevet tom. 1. lib. 11. cap. 13.



The effigies of a Giraffa.

Such as ſaile in the red ſea alongſt the coaſt of *Arabia*, meet with an Iland called by the *Arabians Cademota*; in that part thereof where the river *Plata* runnes, is found a wild beaſt, called by the barbarous inhabitants *Paraſſoupi*, being of the bigneſſe of a Mule, headed not unlike one, yet rough and haired like to a Beare, but not of ſo dark a colour, but inclining to yellow, with cloven feet like a Hart: ſhee hath two long hornes on her head, but not branched, ſomewhat reſembling thoſe ſo much magnifyed hornes of Unicornes. For the natives of the place, bitten by the venemous tooth of either beaſt or fiſh, are preſently helped and recover by drinking the water wherein ſuch hornes have beene infuſed for ſixe or ſeven dayes ſpace, as *Thevet* in his Coſmography reports.

In one of the Ilands of the *Molucca's* there is found a Beaſt living both on land and water like as a Crocodile; it is called *Camphurch*, it is of the bigneſſe of an Hart, it hath one horne in the forehead, moveable after the faſhion of the noſe of a Turkycocke: it is ſome three foot and an halfe long, and never thicker than a mans arme; his neck is covered over with haire of an aſh colour, he hath two feet like to a gooſes feet, wherwith he ſwims both in freſh and ſalt waters. His fore feet are like to a ſtags, he lives upon fiſh. Many have perſwaded themſelves that this beaſt is a kind of Unicorne, and that therefore his horne ſhould bee good againſt poyſons. The King of the Iland loves to be called by the name of this beaſt; and ſo alſo other Kings take to themſelves the names of the wilde beaſts, fiſhes, or fruits, that are moſt pretious and obſervable in their dominions, as *Thevet* reports.

Mauritania and *Æthiopia*, and that part of *Africke* that is beyond the deſarts and ſyrtes, bring forth Elephants; but thoſe of *India* are farre larger. Now although in the largeneſſe of their body they exceed all foure footed beaſts, yet may they bee more ſpeedily and eaſily tamed than other beaſts. For they may be taught to doe many things above the common nature of beaſts. Their skin is ſomewhat like to a Buffles, with little haire upon it, but that which is, is aſh coloured, his head large, his necke ſhort, his eares two handfulls broad, his noſe or trunke very long, and hanging down almoſt to the ground, hollow like as a trumpet, the which he uſeth in ſtead of an hand, his mouth is not farre from his breaſt, not much unlike a ſwines, from the upper part whereof two large teeth thruſt forth themſelves, his legges are thicke and ſtrong, not conſiſting of one bone as many formerly have falſly believed (for they kneele to admit their Rider, or to bee laden, and then riſe up againe of themſelves) his feet are round like a quoit ſome two or three hands breadth, and divided into five clefts. He hath a taile like a Buffle, but not very rough, ſome three hands breadth long, wherefore they would be much troubled with flyes and waſpes, but that nature hath recompenced the ſhortneſs of their tailes by another way; for when they finde themſelves moleſted, they contract their skin ſo ſtrongly, that they ſuffocate and kill theſe little creatures taken in the wrinkles thereof; they overtake a man running by going onely, for his legges are proportionable to the reſt of his body.

The Indian Elephants are bigger than the Africans.

How they keep flyes from them

They feed upon the leaves and fruits of trees, neither is any tree ſo ſtrong or well rooted, which they cannot throw downe and breake. They grow to bee ſixteene handfulls high, wherefore ſuch as ride upon an Elephant are as much troubled as if they went to ſea. They are of ſo unbridled a nature, that they cannot endure any head-ſtall or reines, therefore you muſt ſuffer them to take the courſe and way they pleaſe. Yet doe they obey their country men without any great trouble; for they ſeeme after ſome ſort to underſtand their ſpeech, wherefore they are eaſily governed by their knowne voices and words. They throw down a man that angers them, firſt taking him up with their Trunke and lifting him aloft, and then letting him fall, they tread him under foot, and leave him not before he bee dead. *Ariſtotle* writes that Elephants generate not before they be twenty yeeres old: they know not adultery, neither touch they any female but one, from which they alſo diligently abſtain when they know ſhe hath once conceived. It cannot be knowne how long they goe with young; the reaſon is for that their copulation is not ſeen, for they never do it but in ſecret. The females bring forth reſting upon their hinde legges, and with paine like women, they licke their young, and theſe preſently ſee and goe, and ſucke with their mouths, and not with their Trunkes. You may ſee Elephants teeth of a monſtrous and ſtupendious bigneſſe, at *Venice*, *Rome*, *Naples*, and *Paris*; they terme it Ivory, and it is uſed for Cabinets, Harps, Combes, and other ſuch like uſes.

Lib. 9. de hiſt. anim. cap. 27.

We have read in *Thevet*, that in *Florida* there are great Bulls, called in that country tongue *Beautrol*, they have hornes of a foot long, a bunch on their backe like a Camell, their haire long and yellow, the taile of a Lion; there is ſcarce any creature more fierce or wild, for it can never be tamed unleſſe it be taken from the dam. The Salvages uſe their Hides againſt the cold, and their hornes as an Antidote againſt poyſon.

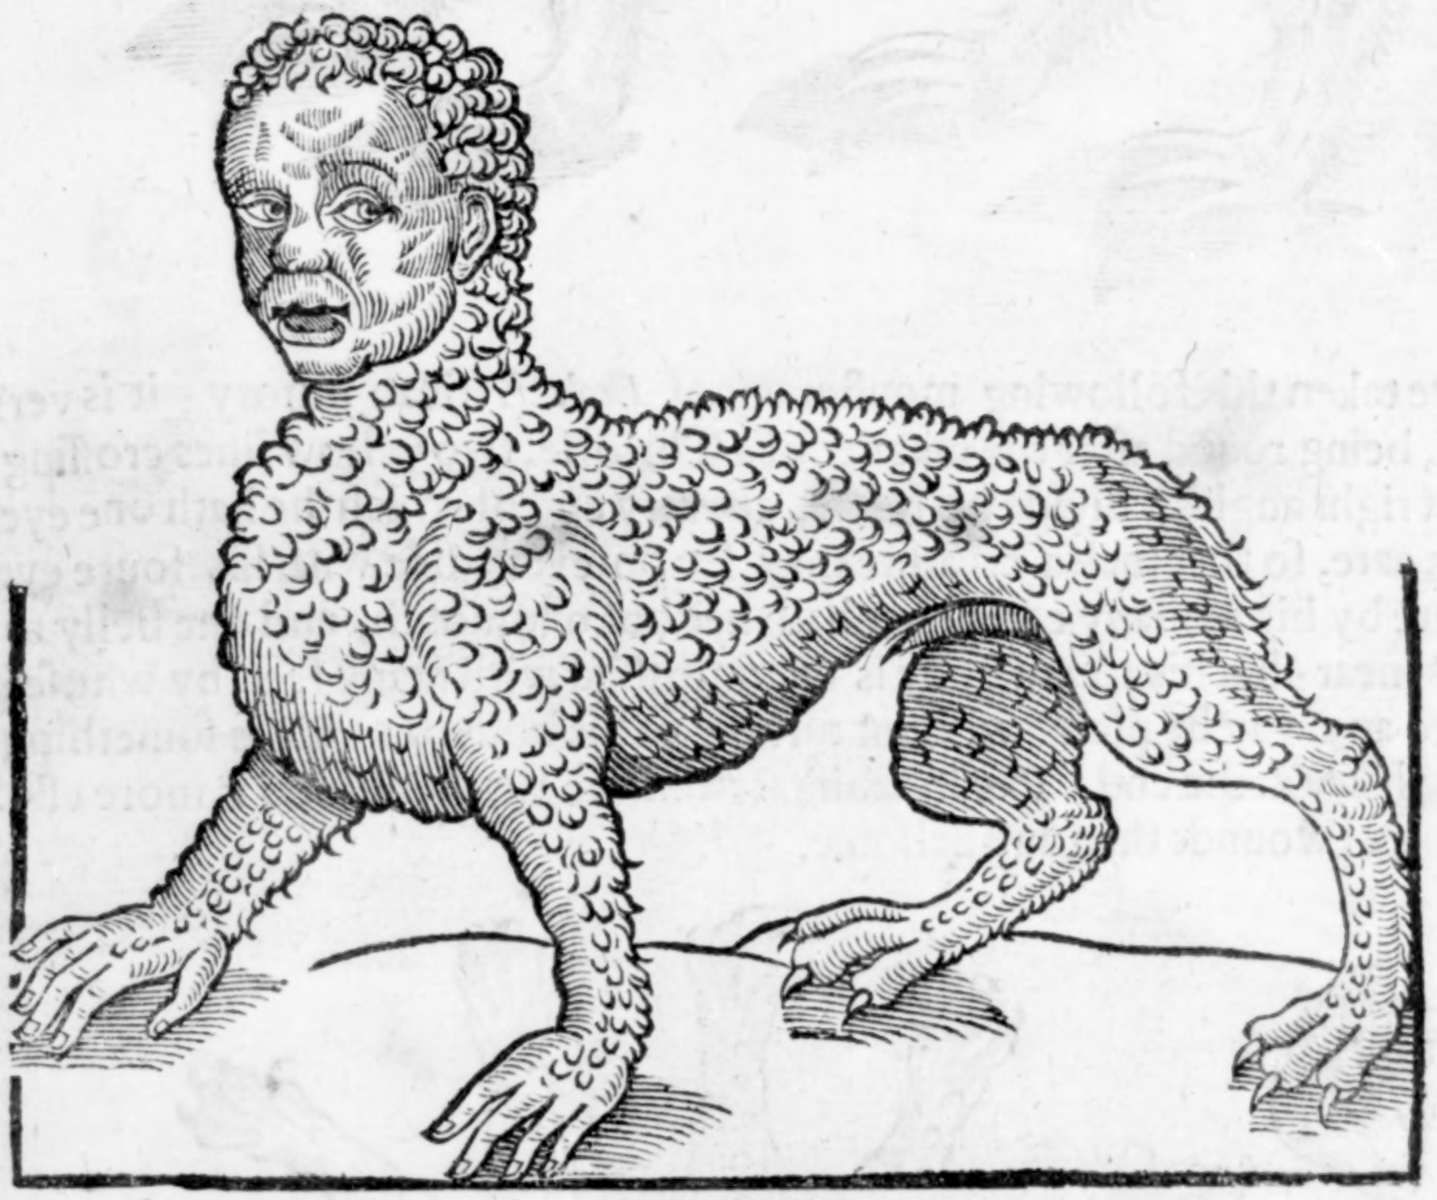
Tom. 2, lib. 23. cap. 2.

Their hornes good againſt poyſons.

Tom. 1. lib. 2. cap. 10.

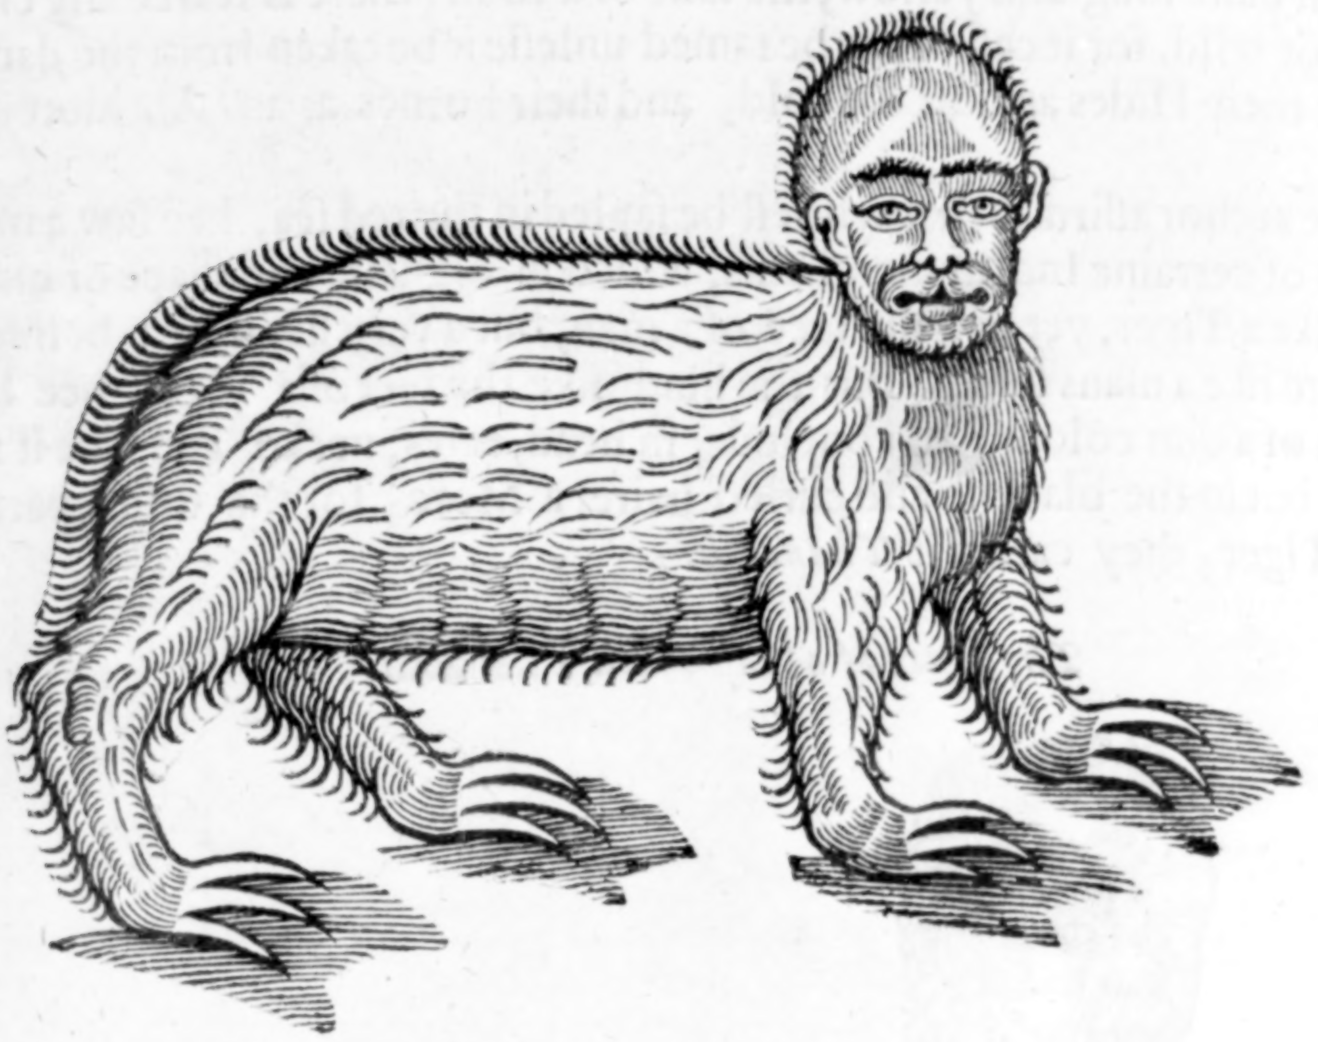
The ſame author affirmes that whileſt he ſayled in the red ſea, hee ſaw a monſter in the hands of certaine Indian merchants, which in bigneſſe and ſhape of his limbs was not unlike a Tiger, yet had the face of a man, but a very flat noſe: beſides, his fore feet were like a mans hands, but the hinde like the feet of a Tiger, hee had no taile, he was of a dun colour: to conclude, in head, eares, necke, and face it reſembled a man, but in the blackiſh and curled haire, a More; for the other parts they were like a Tiger; they called it *Thanacth*.

The figure of a beaſt called Thanacth.

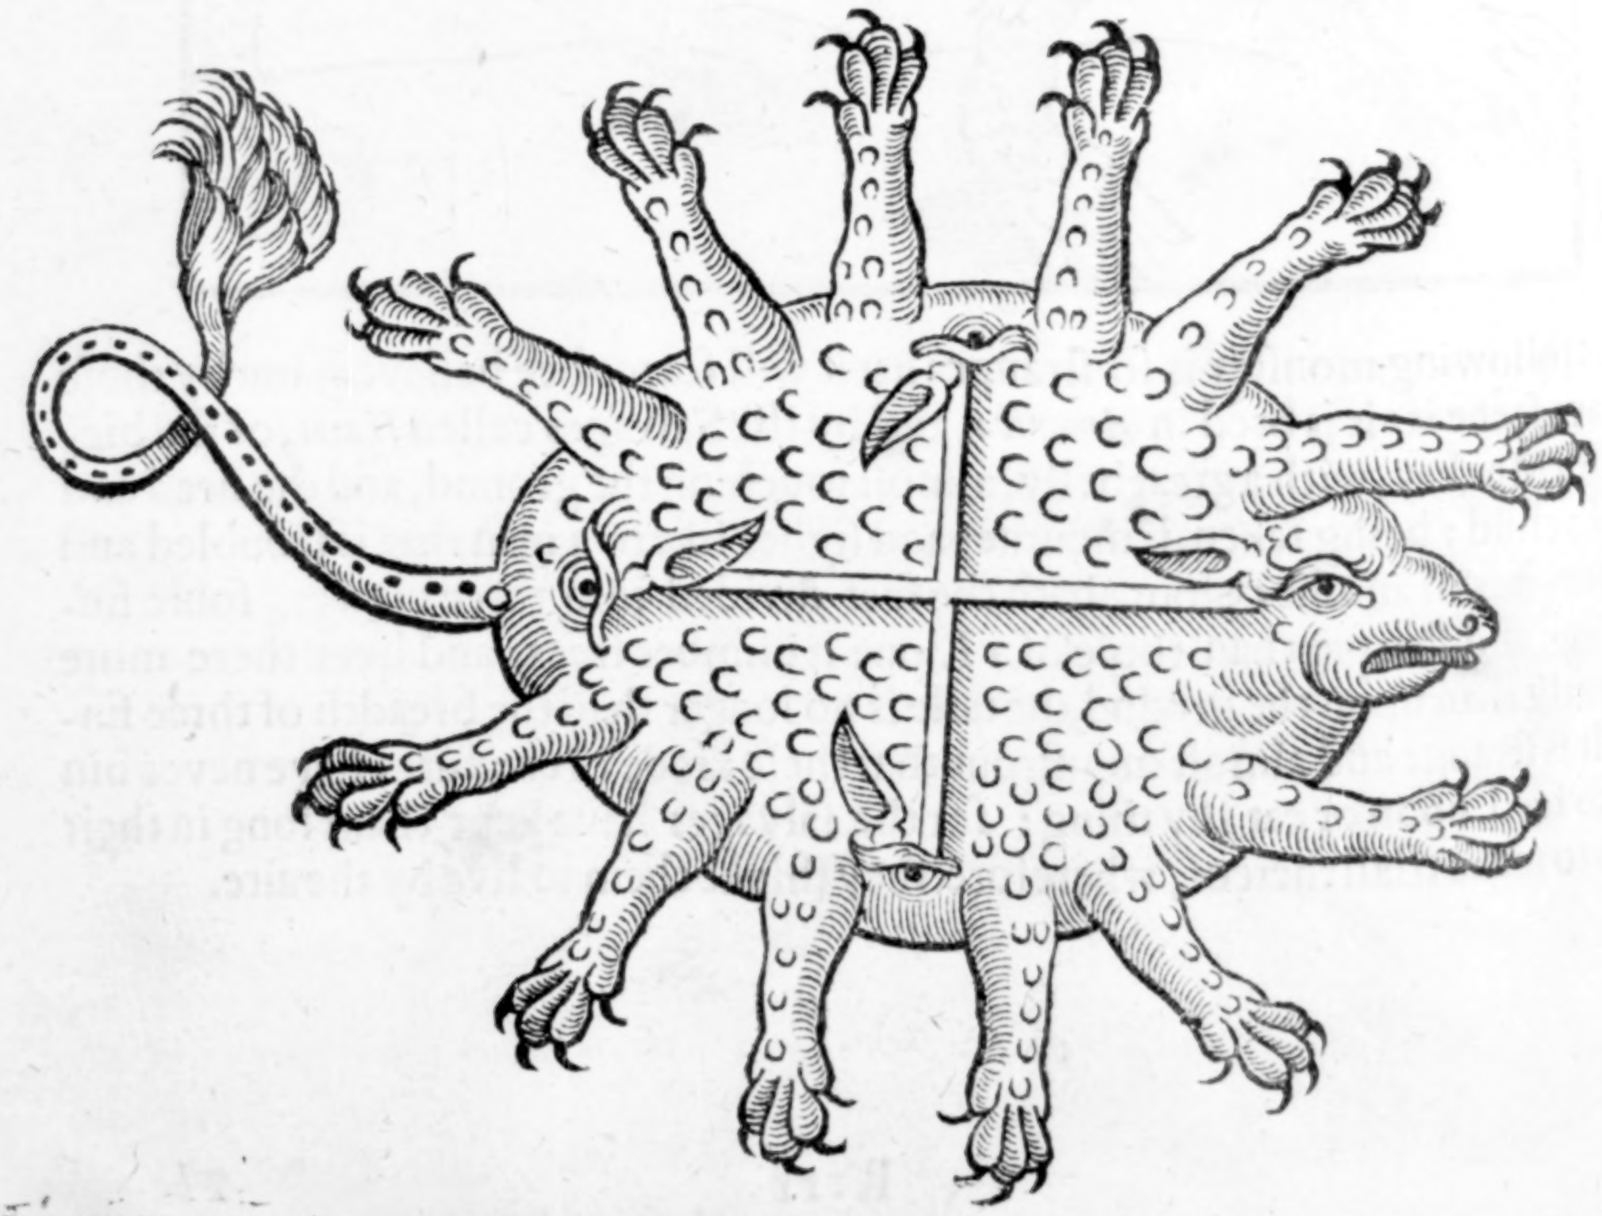


This following monſter is ſo ſtrange that it will ſcarce bee believed, but by thoſe that have ſeene it: it is bred in *America*, and by the Salvages called *Haiit*, of the bigneſſe of a Monkey, with a great belly, almoſt touching the ground, and the head and face of a child: being taken, it mournes and ſighes like to a man that is troubled and perplext; it is of an aſhe colour, hath the feet divided into three clawes, foure fingers long, and ſharper than thoſe of a Lion: it climbes trees, and lives there more frequently than upon the ground, the taile is no longer than the breadth of three fingers. It is ſtrange and almoſt monſtrous that theſe kinde of creatures have never bin ſeene to feed upon or eat any thing: for the ſalvages have kept them long in their houſes to make triall thereof, wherefore they thinke them to live by the aire.

The figure of a beaſt called Haiit.



I have taken this following monſter out of *Leo's* African hiſtory; it is very deormed, being round after the manner of a Tortoiſe, two yellow lines croſſing each fother at right angles, divide his backe, at every end of which he hath one eye, and alſo one eare, ſo that ſuch a creature may ſee on every ſide with his foure eyes, as alſo heare by his ſo many eares: yet hath hee but one mouth, and one belly to containe his meat; but his round body is encompaſſed with many feet, by whoſe helpe he can go any way he pleaſe without turning of his body, his taile is ſomething long and very hairy at the end. The inhabitants affirme that his blood is more effectuall in healing of wounds than any balſome. Blood as good as balſome.



Plin. lib. 8. *cap*, 29. It is ſtrange that the *Rhinoceros* ſhould be a born enemy to the Elephant; wherfore he whets his horne, which growes upon his noſe, upon the rockes, and ſo prepares himſelfe for fight, wherein he chiefly aſſailes the belly, as that which he knowes to be the ſofteſt: he is as long as an Elephant, but his legs are much ſhorter, he is of the colour of box, yet ſomewhat ſpotted. *Pompey* was the firſt that ſhewed one at *Rome.*

The

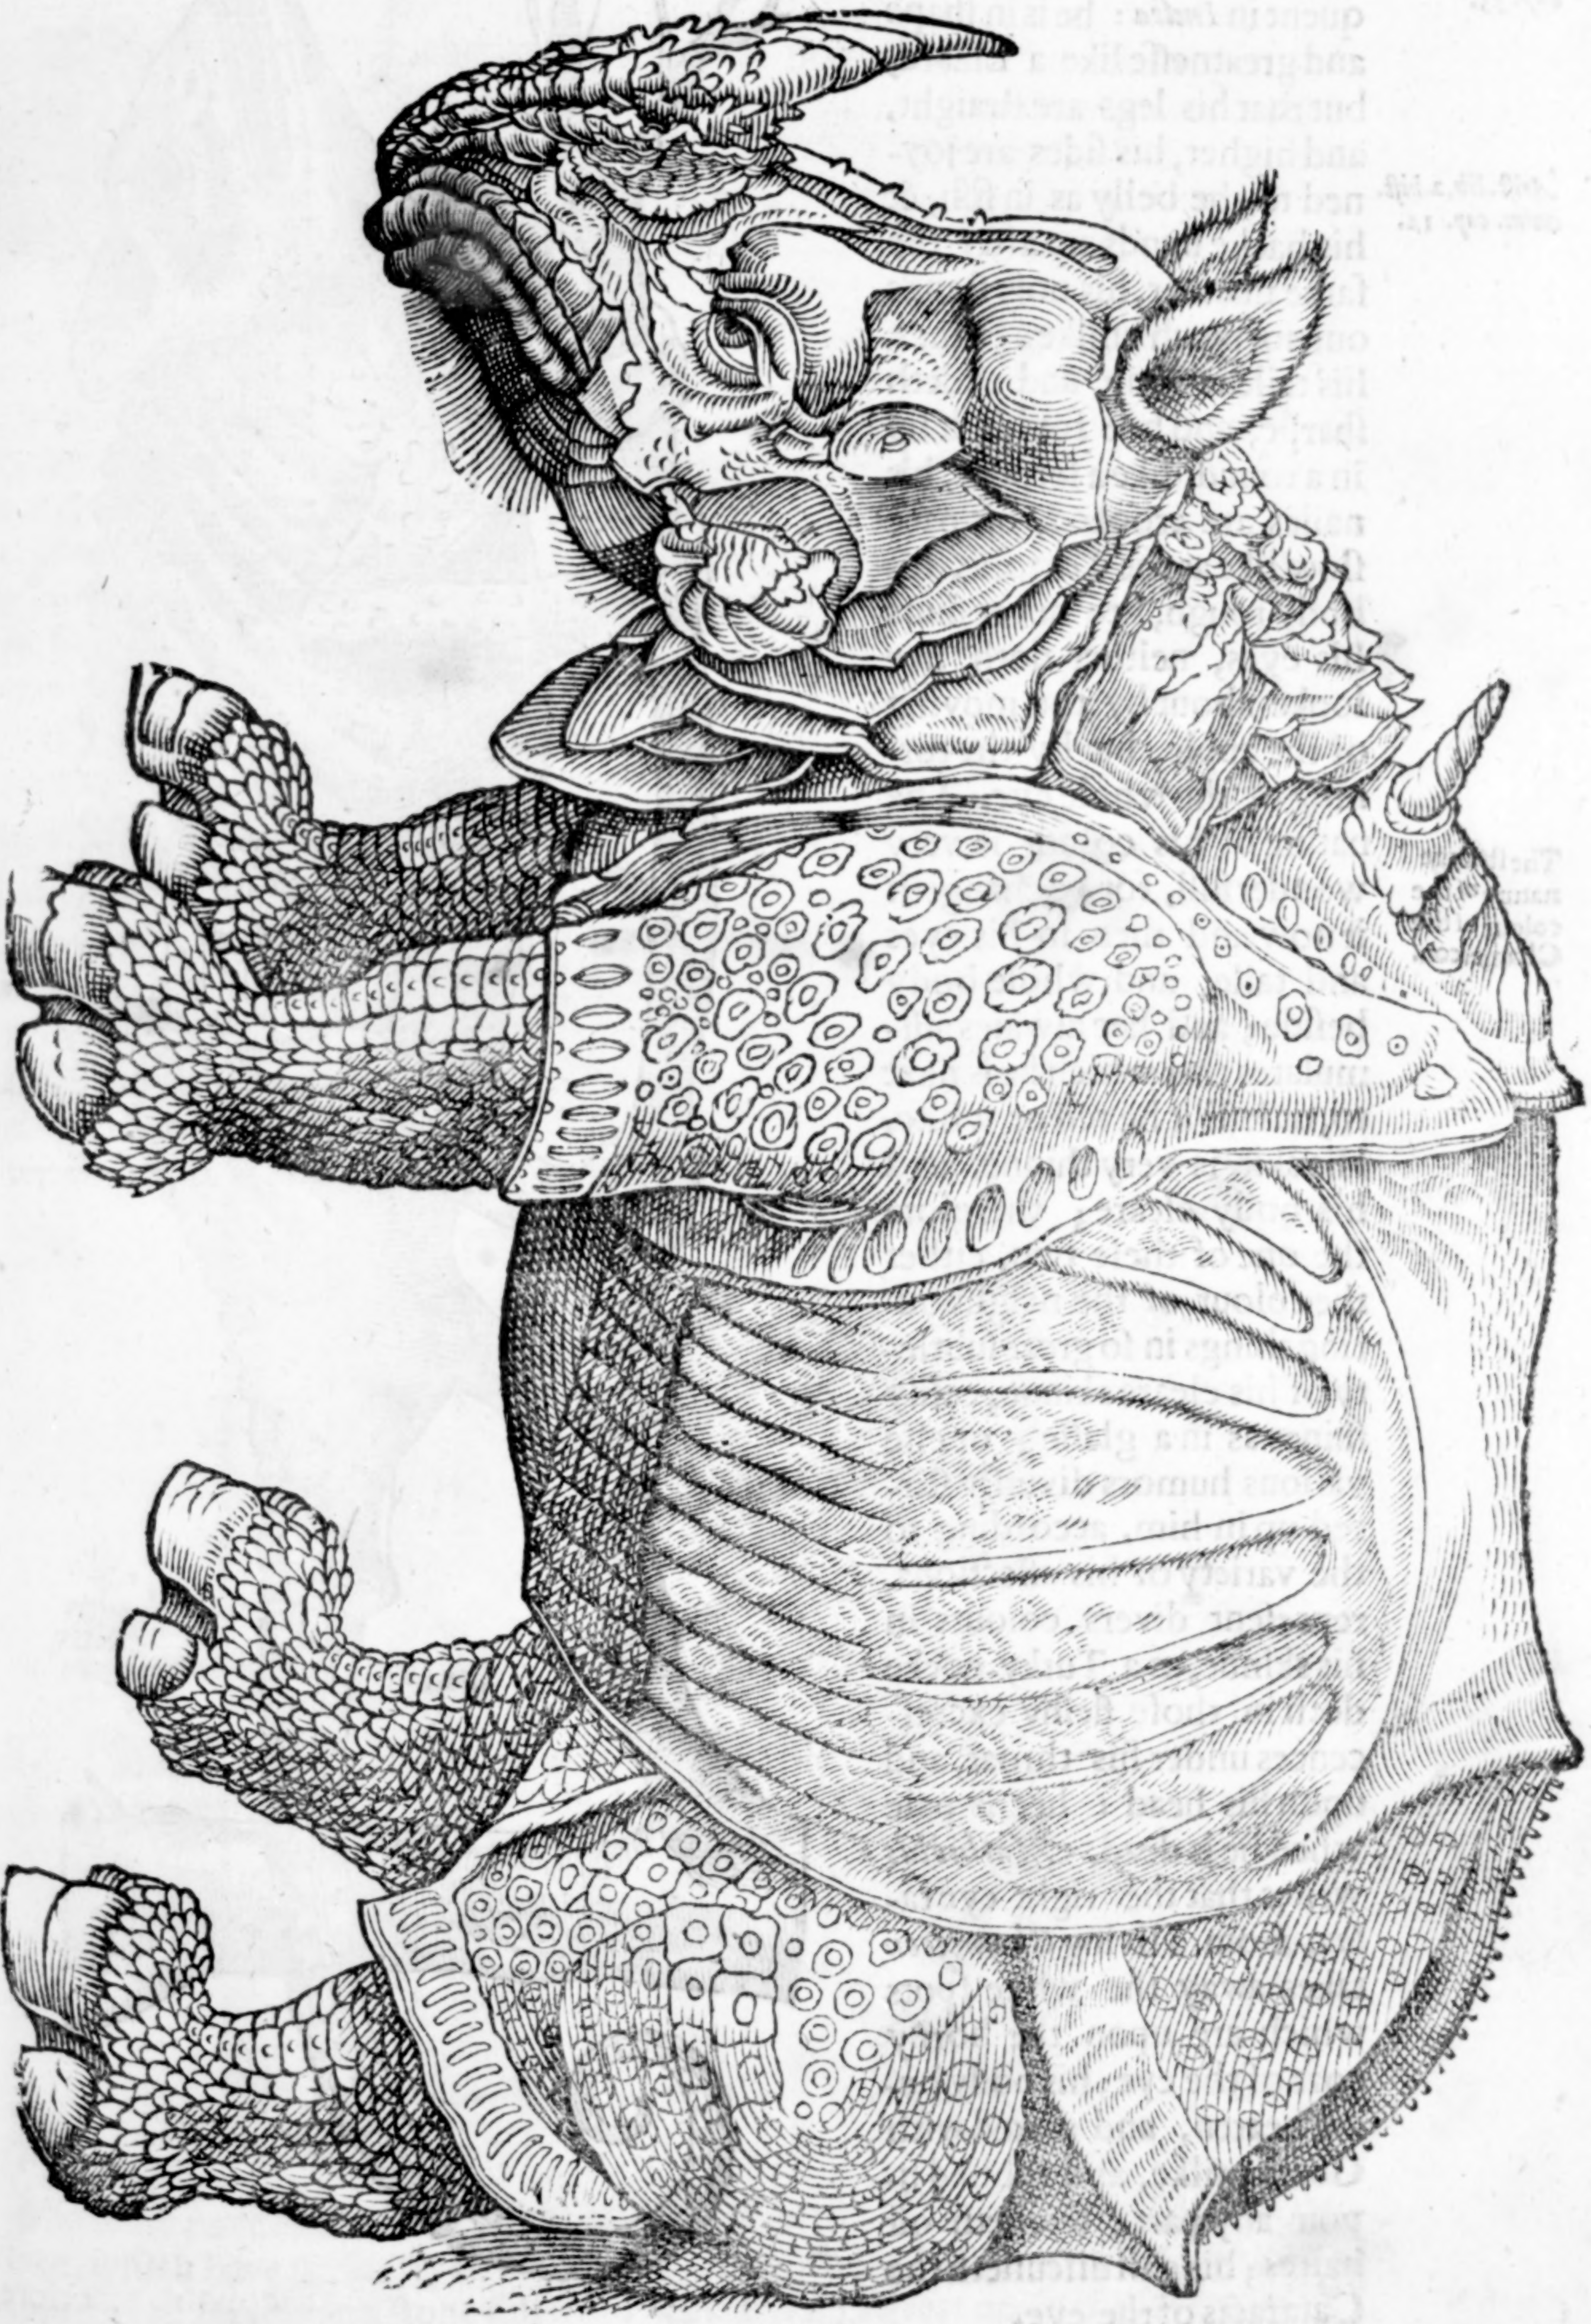
The effigies of a Rhinoceros.



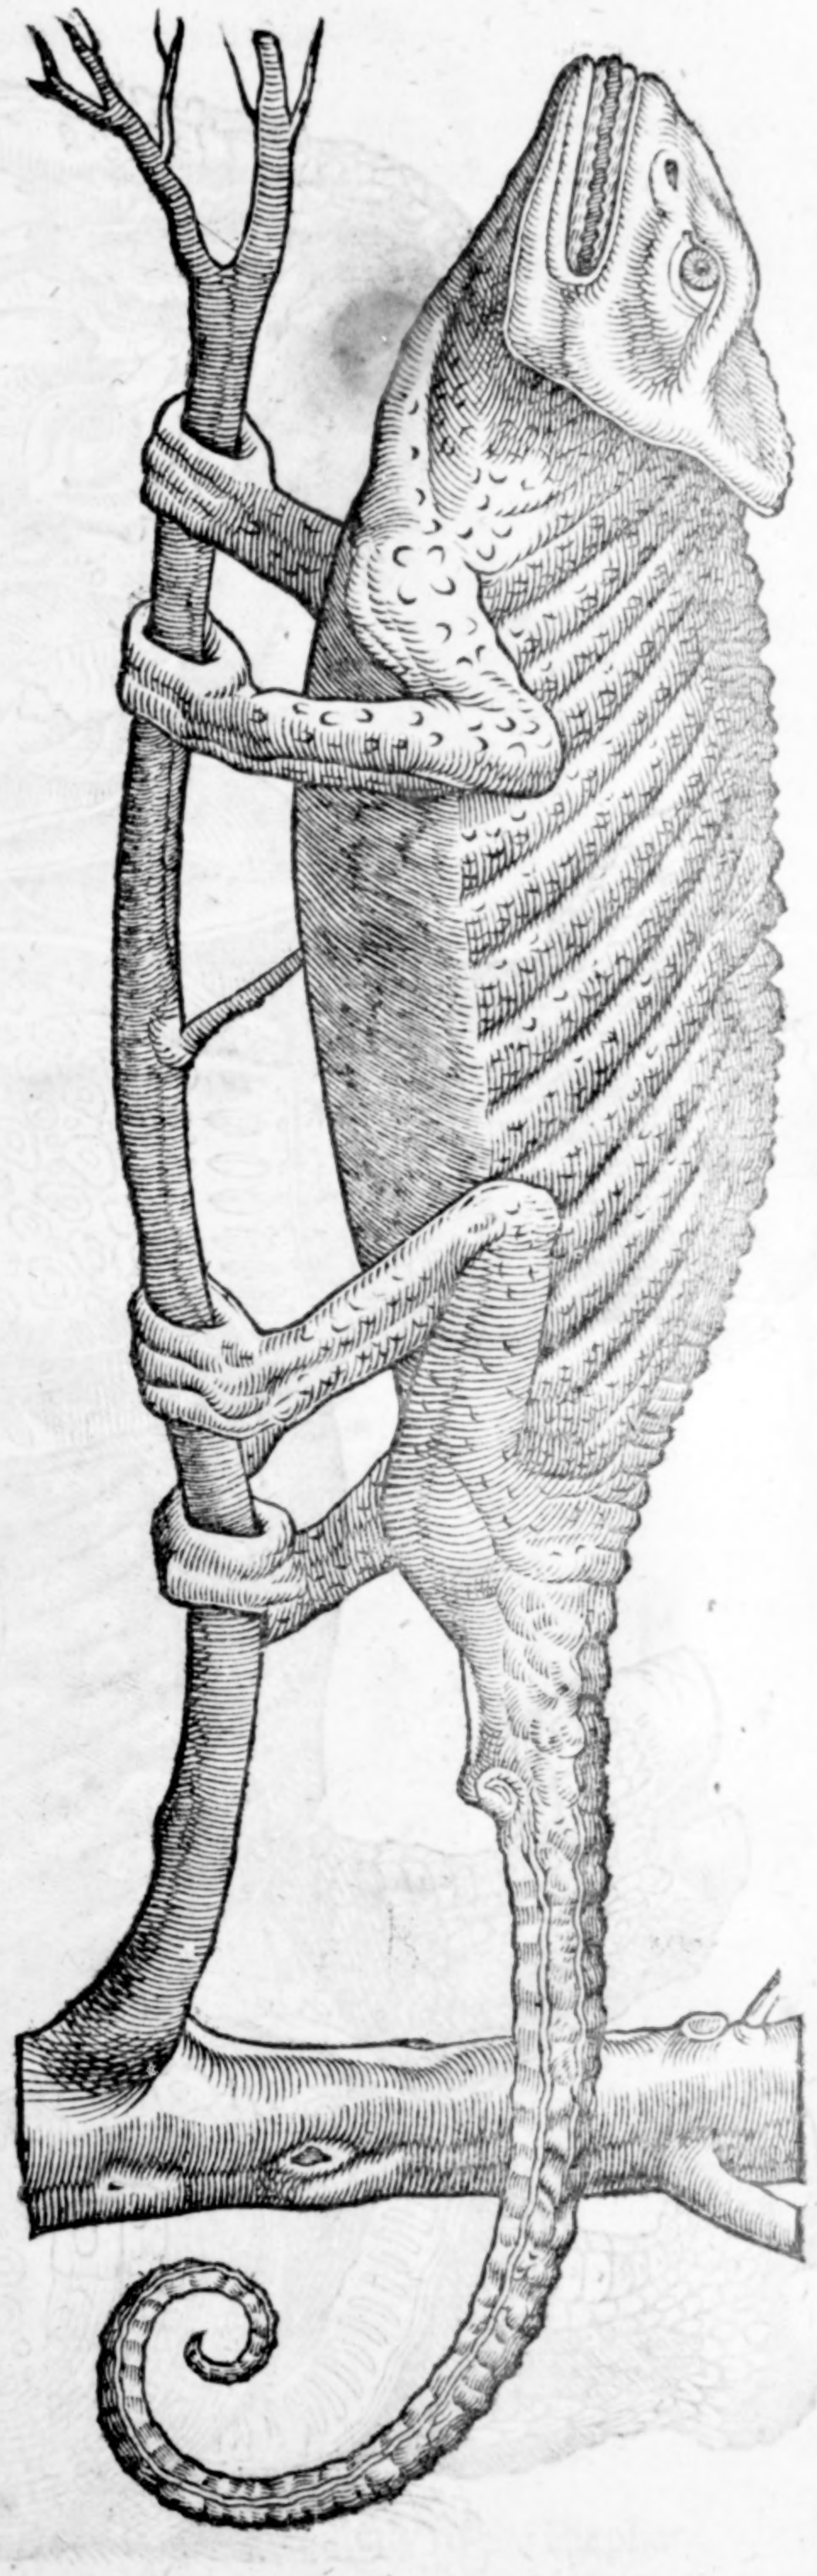
Plin. lib. 8. cap. 33.

Ariſt. lib. 2. hiſt. anim. cap. 11.

The ſtrange nature of the colour of the Chameleon.

Africa produceth the *Chameleon*, yet is it more frequent in *India*: he is in ſhape and greatneſſe like a Lizard, but that his legs are ſtraight, and higher, his ſides are joyned to the belly as in fiſh, & his backe ſtands up after the ſame manner, his noſe ſtands out not much unlike a ſwines, his taile is long, and endeth ſharpe, and hee foulds it up in a round, like a ſerpent, his nailes are crooked, his pace ſlow like as the Tortoiſe, his body rough, hee never ſhuts his eyes, neither doth hee looke about by the moving of the apple, but by the turning of the whole eye. The nature of his colour is very wonderfull, for he changeth it now and then in his eyes and taile, and whole body beſide; and hee alwaies aſſimulates that which he is next to, unleſſe it be red or white. His ſkin is very thinne, and his body cleare; therefore the one of theſe two, either the colour of the neighbouring things in ſo great ſubtlety of his cleare ſkinne, eaſily ſhines as in a glaſſe; or elſe various humors diverſly ſtirred up in him, according to the variety of his affections, repreſent divers colours in his ſkinne, as a Turky-cocke doth in thoſe fleſhy excreſcences under his throat, and upon his head: hee is pale when he is dead. *Mathiolus* writes that the right eye taken from a living *Chameleon* takes away the white ſpots which are upon the horny coat of the eye; his body being beaten, and mixed with Goats milke, and rubbed upon any part, fetcheth off haires; his gall diſcuſſeth the Cataracts of the eye.

The figure of a Chameleon.



Chap.

CHAP. XXIII.

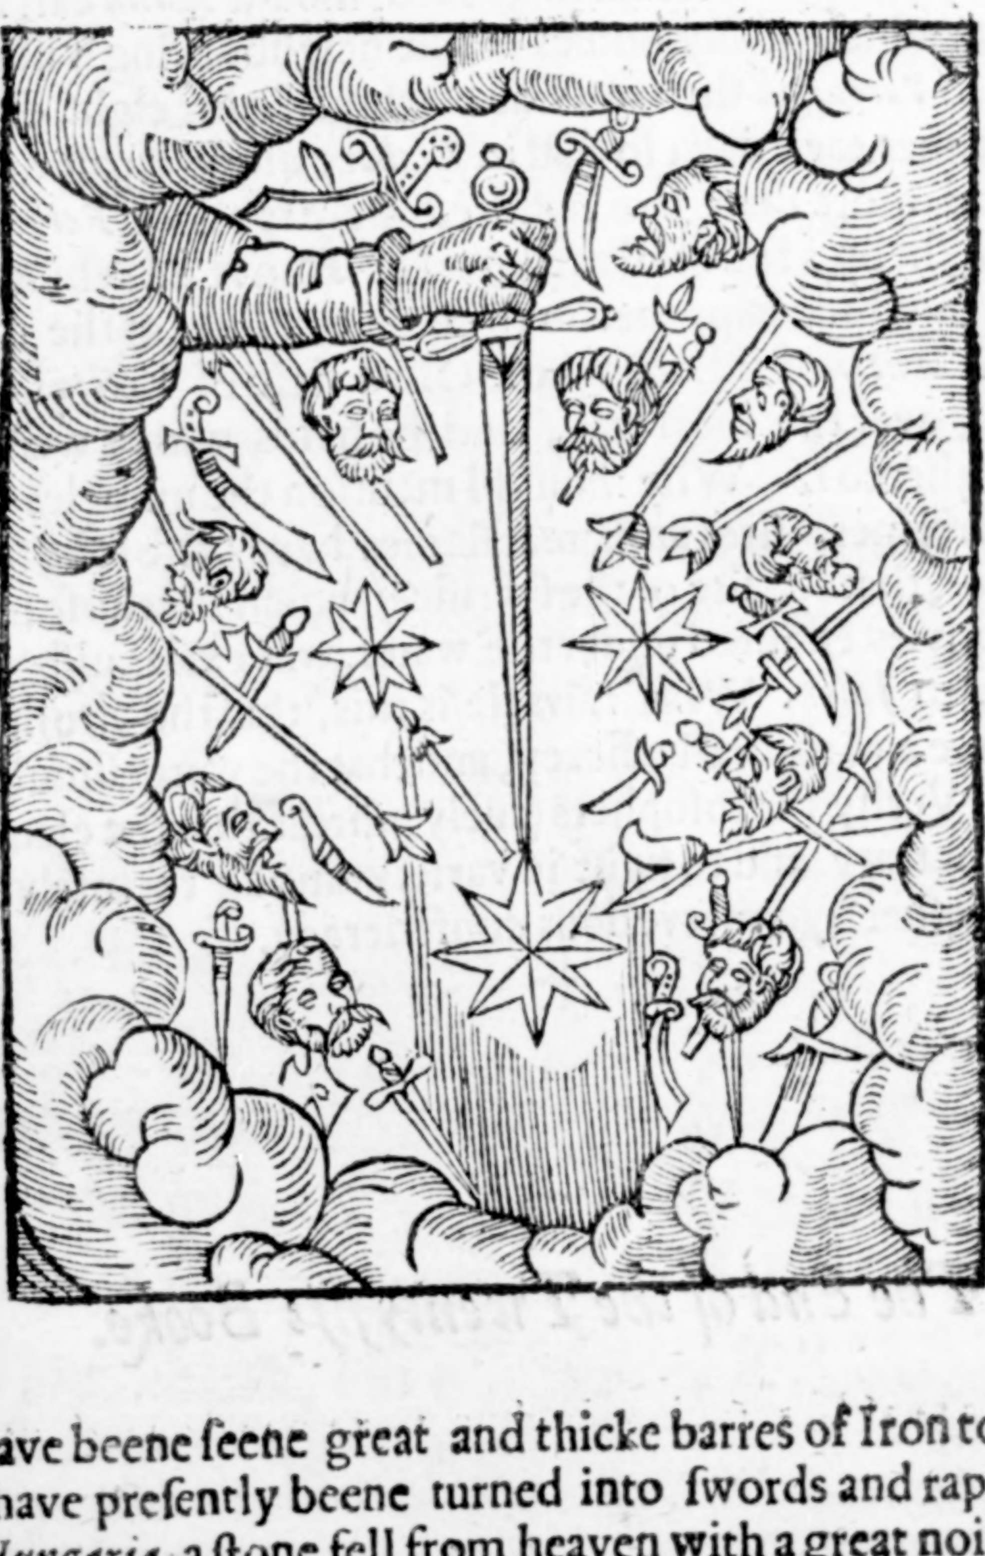
Of cœleſtiall Monſters.

PEradventure it hath not bin ſtrange that monſters have beene generated upon the earth and in the Sea: but for monſters to appeare in heaven, and in the upper region of the aire, exceeds all admiration. Yet have wee often read it written by the antients, that the face of heaven hath beene deformed, by bearded, tailed, and haired Comets; by meteors repreſenting burning Torches, and lamps, pillars, darts, ſhields, troups of clouds, hoſtilely aſſailing each other; Dragons, two Moones, Sunnes, and the like monſters and prodigies.

A Comet with bloody haire.

Antiquity hath not ſeene any thing more prodigious than that Commet which appeared with bloody haire in *Uveſtine*, upon the ninth day of *October*, 1528. for it was ſo horrible and fearefull a ſpectacle, that divers died with feare, and many fell into grievous diſeaſes; going from the Eaſt to the South, it endured no longer than one hower and a quarter: in the toppe thereof was ſeene a bending arme holding a great ſword in a threatning hand; at the end thereof appeared three ſtarres, but that over which the point of the ſword directly hanged was more bright and cleare than the reſt: on each ſide of this Comet were ſeene many ſpeares, ſwords, and other kinds of weapons died with blood, which were intermixt with mens heads, having long and terrible haire and beards, as you may ſee in the following figure.

The figure of a fearefull Comet.



Alſo there have beene ſeene great and thicke barres of Iron to have fallen from heaven, which have preſently beene turned into ſwords and rapiers. At *Sugolia* in the borders of *Hungaria*, a ſtone fell from heaven with a great noiſe, the ſeventh day of *September*, *anno Dom.* 1514. it weighed two hundred and fifty pound: the Citizens hanged it up with a great iron chaine put through it, in the midſt of the Church

Lib. 2. *cap.* 57.

Preſages of the taking of *Conſtantinople.*

Monſtrous rains

of their City, and uſed to ſhew it, as a miracle, to travellers of better note that paſt that way. *Pliny* reports that the claſhing of armour, and the ſound of a trumpet were heard from heaven often, before and after the Cimbrian warre. The ſame author alſo writes that in the the third Conſul-ſhip of *Marius*, the *Amarines* and *Tudortines* ſaw the heavenly armies comming from Eaſt and Weſt; and ſo joyning, thoſe being vanquiſhed which came from the Eaſt. Which ſame thing was ſeene in *Luſalia*, at a towne called *Jubea*, two houres after mid-night, *anno Dom.* 1535. But in *anno Dom.* 1550. upon the nineteenth day of *July*, in *Saxony*, not farre from *Wittenberg*, there appeared in the aire a great ſtagge, incompaſſed with two armed hoſts, making a great noiſe in their conflict, and at the ſame inſtant it rained blood in great abundance, the ſun ſeemed to be cloven into two pieces, and the one of them to fall upon the earth. A little before the taking of *Conſtantinople* from the Chriſtians, there appeared a great army in the aire appointed to fight, attended on with a great company of dogs and other wild beaſts. *Julius Obſequius* reports that in *anno Dom.* 458. it rained fleſh in *Italy*, in greater and leſſer pieces, part of which were devoured by the birds before they fell upon the earth: that which fell upon the earth kept long unputrefyed, and unchanged in colour and ſmell. *Anno Dom.* 989. *Otho* the third being Emperour, it rained corne in *Italy*. *Anno Dom.* 180. it rained milke and oyle in great abundance, and fruit-bearing trees brought forth corne. *Lycoſthenes* tells that in the time of *Charles* the fift, whileſt *Maidenberg* was beſieged, three ſunnes firſt appeared about ſeven a clocke in the morning, and then were ſeene for a whole day, whereof the middlemoſt was the brighteſt, the two others were reddiſh and of a bloody colour; but in the night time there appeared three moones. The ſame appeared in *Bavaria, anno Dom.* 1554.

Earthquakes.

Lib. 2, *cap.* 73.

But if ſo prodigious and ſtrange things happen in the heavens beſides the common order of nature, ſhall wee thinke it incredible that the like may happen in the earth? *Anno Dom.* 542. the whole earth quaked, mount *Ætna* caſt forth flames and ſparkes of fire, with which many houſes of the neighbouring villages were burnt. *Anno Dom.* 1531. in *Portugall* there was an earthquake for eight dayes, and it quaked ſeven or eight times each day; ſo that in *Liſbone* alone it caſt downe a thouſand and fifty houſes, and more than ſixe hundred were ſpoiled. *Ferrara* lately was almoſt wholly demoliſht by a fearefull earthquake. Above all which ever have been heard is that prodigie which happened in the time of *Pliny*, at the death of *Nero* the Emperour in the *Marucine* field, the whole Olive-field of *Vectius Marcellus* a Romane Knight going over the high way, and the fields which were againſt it comming into the place thereof. Why ſhould I mention the miracles of waters, from whoſe depth and ſtreames, fires and great flames have oft broke forth? They tell out of St. *Auguſtine*, that the fire of the ſacrifice, which for thoſe ſeventy yeeres of the Babylonian captivity endured under the water, was extinguiſhed, *Antiochus* ſelling the prieſt-hood to *Jaſon*. What miracle is this, that the fire ſhould live in the water, above its force and naturall efficacy, and that the water ſhould forget the extinguiſhing faculty! Verily Philoſophers truely affirme that the elements, which are underſtood to bee contrary, and to fight in variety among themſelves, are mutually joyned and tyed together by a marvellous confederacy.

OF THE FACULTIES OF SIMPLE MEDICINES, *AS ALSO* OF THEIR COMPOSITION and Uſe.

THE TWENTY SIXTH BOOK.

THE PREFACE.

AMongſt the cauſes which we terme healthfull, and other remedies which pertain to the health of man, and the expelling of Diſeaſes, Medicines eaſily challenge the prime place; which (as it is delivered by Solomon) *God hath produced out of the earth, and they are not to be abhorred by a wiſe man; for there is nothing in the world, which ſooner, and as by a miracle, aſſwageth the horride torments of diſeaſes. Therefore* Herophilus *called them fittingly adminiſtred, The hands of the Gods. And hence it was that ſuch Phyſitians as excelled in the knowledge of Medicines, have amongſt the Antients acquired an opinion of Divinity. It cannot by words bee expreſſed what power they have in healing. Wherefore the knowledge of them is very neceſſary not only for the prevention, but alſo for the driving away of Diſeaſes,*

The excellency of Medicines.

CHAP.

Chap. I.

What a Medicine is, and how it differeth from nouriſhment.

WEE define a medicine to bee, That which hath power to change the body according to one or more qualities; and that ſuch as cannot bee changed into our nature: contrary whereto we terme that nouriſhment which may be converted into the ſubſtance of our bodies. But we define them by the word power, becauſe they have not an abſolute nature, but as by relation and depending upon the condition of the bodies by whom they are taken. For that which is medicine to one, is meat to another, and that which is meat to this, is medicine to that. Thus for example, Hellebore is nouriſhment to the Quaile, but a medicine to man: Hemlocke is nouriſhment to a Sterling, but poiſon to a Gooſe: the *Ferula* is food to an Aſſe, but poiſon to other cattell. Now this diverſity is to be attributed to the different natures of creatures.

It is recorded in hiſtory, that the ſame by long uſe may happen in men. They report that a maide was preſented to *Alexander* the great, who, nouriſhed with *Napellus*, and other poiſons, had by long uſe made them familiar to her, ſo that the very breath ſhe breathed was deadly to the by-ſtanders. Therefore it ought to ſeeme no marvaile, if it at any time happen, that medicines turne into the nature and nouriſhment of our bodies: for we commonly may ſee birds and ſwine feed upon ſerpents and toads without any harme: and laſtly,

——Serpenti Ciconia pullos
Nutrit, & per devia rura lacerta:
Illi eadem ſumptis quærunt animalia pennis.

The Storke with Serpents and with Lizards caught,
In wayleſſe places nouriſheth her brood:
And they the ſame purſue, when as they're taught
To uſe their wing, to get their wiſh't for food.

Chap. II.

The differences of Medicines in their matter and ſubſtance.

The earth the mother of riches and medicines.

EVen as the concealed glory of worldly riches lyeth hid in the bowels of the earth, and depths of the ſea and waters, as gold, ſilver, and all ſorts of metals, gemmes and pretious ſtones, furniſht with admirable vertues; ſo we may behold the ſuperficies of this earth clothed with almoſt an infinite variety of trees, ſhrubs, and hearbs: where wee may contemplate and wonder at the innumerable diverſities of roots, leaves, flowers, fruits, gummes, their ſmells, pleaſant taſts and colours, but much more at their vertues. This ſame mother Earth, as with her breaſts, nouriſheth marvellous diſtinct kindes of living creatures, various in their ſpringing, encreaſe and ſtrength. Wherein the immenſe goodneſſe of God, the great Architect and framer of all things, doth moſt clearely appeare towards man, as who hath ſubjected to our government, as a patrimony, ſo ample and plentifull proviſion of nature for our delight in nouriſhment, and neceſſity of healing. Therefore the antient Phiſitians have rightly delivered, that all ſorts of medicines may bee abundantly had from living creatures, plants, the earth, water and aire.

what medicines taken from living creatures.

Medicines are taken from living creatures either whole and entire, or elſe the parts and excrements of them. Wee oft times uſe in Phiſicke whole creatures, as foxes, whelps, hedge-hogs, frogs, ſnailes, wormes, crabbes, and other living creatures. Wee alſo make uſe of ſome parts of them, as the liver of a wolfe or goat, the lungs of the foxe, the bone of the ſtagges heart, *Cranium humanum*, fat, blood, fleſh, marrow, the cods of the *Caſtor* or Beaver, which is therefore termed *Caſtoreum*, and ſuch other particles that are uſefull in Phyſicke. We know alſo that there are ſome medicines taken from excrements, as hornes, nailes, haires, feathers, skin; as alſo from urine, dung, ſpittle, hony, egges, waxe, milke, wooll, ſweat, and others of this kinde, under which wee may comprehend muske, civet, pearle, *œſipus*, and ſundry others of this nature.

What from plants.

Wee take medicines from plants, both whole, and alſo from their parts, whether trees, ſhrubs, or herbes. For we oft times uſe ſuccory, marſh-mallowes, mallowes, plantaine, and the like, whole: but otherwhiles onely the roots of plants, their pith, wood, barke, ſhoots, ſtalkes, leaves, flowers, ſeeds, fruits, juices, gummes, roſines, moſſes, and the like.

What from the earth.

Things taken from the earth for the uſe and matter of medicine, are either earths, ſtones, or mineralls. The ſorts of earth are Bole armenicke, *Terra ſigillata*, fullers earth, chalke, potters clay, and ſuch like. Stones are the pumice, Marchiſite of gold, ſilver, braſſe, marble, the load-ſtone, plaiſter, chalke, *ſulphur vivum, lapis ſpecularu*, and others. Metals and mineralls are gold, ſilver, tinne, lead, braſſe, iron, ſteele, antimony, ceruſſe, brimſtone, cinnaber, litharge of gold and ſilver, tutty, true *Pompholix*, verdigreece, alume, romane vitrioll, coproſe white and greene, ſalts of ſundry kinds, both the Arſenickes, and ſuch like.

What from the water.

The following medicines are from freſh water, raine water, ſpring water, river water, and all things thence ariſing, as water lentile, common flagges, water lillies, water mints, and all the creatures that live therein. From the ſalt water are taken ſalt, *Alcyonium*, all ſorts of corall, ſhels of fiſh, as alſo cuttle bones, ſponges, and all creatures of the ſea. From waters mixt of ſalt and freſh, the herbe *Androſace* (which growes in plenty in the marſhes at *Fontignan* and *Cape de Sete*) *Aſphaltum*, which is found in the dead ſea.

What from the aire.

From the aire proceeds *Manna*, therefore called *melaërium* (*i.e.*) hony of the aire, and alſo all other kindes of dew that are uſefull in Phyſicke by reaſon of the vertues they receive from the ſunne which raiſeth them up, from the aire, whereas they make ſome ſtay, as alſo from the plants, whereupon they fall and reſide.

CHAP. III.

The differences of ſimples in their qualities and effects.

ALL the mentioned ſorts of ſimples are endued with one or more of the foure faculties, whereof I now purpoſe to treat.

The firſt faculty common to all the reſt, and as it were their foundation, flowes from the foure firſt qualities of the prime bodies or elements, that is, heat, coldneſſe, dryneſſe, and moiſture, and this either ſimple or compound, as one or two of theſe prime qualities exceed in the temper of the medicine, as it may appeare by the following tables.

The ſimple quality is either to
- Heat,
- Coole,
- Humect,
- Dry.

The compound, ariſing from two joyned qualities, either
- Heats and dries,
- Heats and moiſtens,
- Cooles and dries,
- Cooles & moiſtens.

Heat, which is
- moderate,
  - Heats,
  - Attenuates,
  - Rarifyes,
  - Opens the paſſages,
  - Digeſts,
  - Suppurates.
- immoderate,
  - Inflames and burnes,
  - Bites, whence followes
    - Violent attraction,
    - Rubrification,
    - Conſumption,
    - Colliquation,
    - An eſchar,
    - Mortification.

Cold, which is
- moderate,
  - Cooleth,
  - Condenſeth,
  - Obſtructeth.
- immoderate,
  - Congeales,
  - Stupefyes,
  - Mortifyes.

Moiſture, which is
- moderate,
  - Humects,
  - Lubricates,
  - Levigates and mitigates,
  - Glues.
- immoderate,
  - Obſtructs,
  - Lifts up into a flatulent tumour, eſpecially if it be a vaporous humidity.

Dryneſſe, which is
- moderate,
  - Dryes,
  - Rarifyes,
  - Attenuates.
- immoderate,
  - Binds,
  - Contracts or ſhrinks,
  - Cauſeth chops and ſcailes.

5. *ſimp.* & 1. *de aliment.*

The effect of theſe qualities is diſtinguiſhed, and as *Galen* obſerves, digeſted into theſe orders, which wee terme Degrees; ſo that by a certaine proportion and meaſure, they may ſerve to oppugne diſeaſes, as the ſame *Galen* affirmes. For to a diſeaſe (for example) hot in the ſecond degree, no other medicine muſt bee uſed than that which is cold in the like degree: Wherefore all ſimple medicines are,

Hot, Cold, Moiſt, Dry, in the Beginning, Middle, Extreme, of the firſt, ſecond, third, fourth, degree.

The Heat, Coldneſſe, Moiſture, Dryneſſe of the firſt, ſecond, third, fourth degree, is Obſcure, Manifeſt, Vehement, Exceſſive.

Examples of the degrees of heat.

An example of heat diſtinguiſhed thus by degrees, may bee thus, Warme water is temperate; that which is a little hotter, is in the firſt degree of heat; if manifeſtly hot, it is in the ſecond degree; but if it heat more vehemently, it may be thought to come to the third; but if it ſcald, then we know that it hath arrived to the fourth degree of heate. Such alſo is the diſtinction of coldneſſe, moiſture, and drineſſe, by their degrees. Wherefore it will be worth our labour, to give you examples of certain medicines, diſtinguiſhed in their order and degree, by which you may the more eaſily give conjecture of the reſt.

Simple Medicines hot in the

First degree.

Abſinthium.
Althæa.
Amygdala dulcia.
Beta.
Braſſica.

Naſturtium.
Sinapi.
Euphorbium.

The effects of the first qualities by accident.

Thoſe we have mentioned have of themſelves and their own nature all ſuch qualities, yet doe they produce farre other effects by accident, and beſides their owne nature in our bodies, by reaſon of which they are termed accidentall cauſes. This ſhall be made manifeſt by the following examples.

Externall heat by accident refrigerates the body within, becauſe it opens the paſſages and pores, and cals forth the internall heate, together with the ſpirits and humours by ſweats: whence it followes, that the digeſtion is worſe, and the appetite is diminiſhed. The ſame encompaſſing heate alſo humects by accident, whileſt it diffuſes the humours concrete with cold: for thus Venery is thought to humect.

The like may be ſaid of Cold, for that it heates not by its proper and native, but by an adventitious force: whereof you may make tryall in Winter, when as the ambient cold, by ſhutting the pores of the body, hinders the breathing forth and diſſipation of the native heat. Whence it is inwardly doubled, and the concoction better performed, and the appetite ſtrengthened. This ſame cold alſo dries by accident, when as it by accident repercuſſes the humour that was ready to flow down into any part, and whilſt it concretes that which is gathered in the part: for thus by the immoderate uſe of repercuſſers, an œdematous tumour, proceeding from groſs and viſcide phlegme, degenerates into a *ſcirrhus*.

Drineſſe and moiſture, becauſe they are more paſſive qualities, ſhew their effects by not ſo manifeſt operations, as heate and cold doe; but in compariſon of them they are rather to be judged as matter or a ſubject.

Chap. IV.

Of the ſecond faculties of Medicines.

WEe terme thoſe the ſecond faculties of Medicines, which have dependance upon the firſt, which are formerly mentioned, as it is the part

Of Heate to	Rarefie, Attract, Open, Attenuate, Levigate, Cleanſe.	Of Cold to	Condenſe, Repercuſſe, Shut up, Incraſſate, Exaſperate, Conſtipate.
Of Moiſture to	Soften, Relaxe.	Of Drineſſe to	Harden, Stiffen.

Hence we terme that an attractive medicine, which hath an attractive faculty, as on the contrary, that a repercuſſive, that repels; a detergent, that which cleanſes viſcous matter. We call that an Emplaſticke medicine, which not only ſhuts up the pores of the body, but reduces the liquid bodies therein contained to a certaine equality of ſubſtance. Thus alſo emollients, relaxers, and the reſt, have their denominations from their effects, as we ſhall declare hereafter.

Chap. V.

Of the third faculties of Medicines.

THe third faculty of medicines depends for the moſt part upon the firſt and ſecond faculties, ſometimes conjoyned, otherwhiles ſeparate. Alſo ſometimes it followes neither of theſe faculties, but a certaine property and inexplicable quality, which is only knowne by experience. Now the operations of this third faculty are to agglutinate, to fill with fleſh, to cicatrize, to aſſwage paine, to move or ſtay the urine, milke, ſeed, the courſes, ſweats, vomits, and performe ſuch like operations in or about the body.

Thus the generation of fleſh is produced by the concourſe of two faculties, that is, of drying and cleanſing. But drineſſe and aſtriction produce a glutinating and cicatrizing faculty. A hot and attenuating faculty cauſeth ſweats, moves urine, the courſes, and the like in the body; but contrary faculties retarde and ſtop the ſame.

To mitigate paine, proceeds only from the firſt faculty, to wit, from heate, or a moderately heating faculty; to procure reſt, from cold onely, or coldneſſe joyned with ſome moiſture. But to procure vomit, proceeds neither from the firſt nor ſecond faculty, but from a certaine occult and eſſentiall property, which is naturally implanted in Agaricke, and other nauſeous and vomitory medicines.

Chap. VI.

Of the fourth faculty of Medicines.

THe fourth faculty of medicines is not of the ſame condition with thoſe that are formerly mentioned; for it depends not upon them, or any other manifeſt or elementary quality, but on an occult property of the whole ſubſtance, by meanes whereof, it workes rather upon this than that part, upon this rather than that humour. Wherefore Phyſitians cannot by any reaſon finde out this faculty, but only by experience, as we have ſaid a little before of me-

The fourth faculty of medicines depends only upon an occult propertie.

dicines procuring vomit. Hence it is, that names are given to thoſe medicines from thoſe parts that they chiefly reſpect: For they are termed Cephalicks, which reſpect the head, as Betony, Marjerome, Sage, Roſemary, *Stæchas*: Pneumonicks, which reſpect the Lungs, as Liquorice, ſweet Almonds, Orris, Elecampane. Cordials, that ſtrengthen the heart, as Saffron, Cinamon, Citrons; but chiefly their rindes, Bugloſſe, Corall, Ivory. Stomaticall, which reſpect the ſtomacke, and the orifice thereof, as Nutmegs, Mint, Aniſe, Maſticke, Pepper, Ginger. Hepaticks, which reſpect the Liver, as Wormwood, Agrimony, Spikenard, Succory, Sanders. Spleniticks, which have relation to the ſpleene, as Time, *Epithymum*, Broome flowers, Cetrach, Capers, the barke of their rootes, the barke of Tamariske. Diureticks, ſuch as reſpect the kidneyes and urenary paſſages, as the rootes of Smallage, Aſperagus, Fennell, Butchers brome, the foure greater cold ſeeds, Turpentine, Plantaine, Saxifrage. Arthniticks, or ſuch as ſtrengthen the joynts, as Cowſlips, *Chamæpytis*, Elecampane, Calaminte, Hermodactiles, and the like.

To this ranke may be referred purging medicines, which, furniſhed with a ſpecificke property, ſhew their efficacy on one humour more than another humour, and that impact more in one part than in another. For thus Agricke chiefly drawes phlegme from the head and joynts, Rubarbe drawes choller chiefly from the Liver, and hurts the kidneyes. But let us here forbeare the conſideration of ſuch things, as not appertaining to Surgery. But ſome medicines of this kinde are furniſhed with one ſimple faculty, otherſome with more, and thoſe contrary, whereof your taſte may give you ſufficient notice: for Rubarbe at the firſt touch of the tongue is found acride and hot; but when you come to chaw and throughly to taſte it, you ſhall find it to partake of an earthy aſtriction. Therefore becauſe taſtes give notice of the faculties of medicines, therefore I have thought good to treat of them briefly.

Chap. VII.

Of Taſtes.

Lib.1.ſimpl.

Differences of taſtes.

TAſte, as *Galen* delivers according to *Ariſtotle* and *Theophraſtus*, is a certaine concoction of moiſture in drineſſe, cauſed by meanes of heate, which we know or diſcerne by the tongue well tempered, and fittingly furniſhed with ſpittle and his nerves. There are nine differences of taſtes; for there are three judged hot, to wit, the acride, bitter, and ſalt: three cold, the acide, auſtere, and acerbe: three temperate, the ſweet, the oily or fat, and the inſipide. Now they are thought ſo many, according to the different degrees of concoction; for it appeares greater in hot taſtes, and as it were a certaine aſſation, but leſſe in cold, but indifferent, and as it were an elixation in things temperate: therefore Nature obſerves this order in the concoction of ſapide bodies, that at the firſt the acerbe taſte ſhould take place, then the auſtere, and laſtly, the acide; from theſe (as it were) rudiments of concoction, ariſes an inſipide, then an oily, then a ſweet perfectly concocted and temperate. This concoction exceeding the bounds of mediocrity, there ariſes a ſalt taſte, then a bitter, and then an acride with the higheſt exceſſe, of almoſt a fiery heate. Yet I would be thus underſtood, that all things that are by nature ſapide, do not alwayes aſcend to the height of ſweetneſſe by the degrees of acerbity, auſterity, and acidity, as though it were of abſolute neceſſity, that all things that are ſweete, they ſhould firſt bee acerbe, auſtere, and acide. For there are many things found, eſpecially in plants and their fruits, which when they ſhall arrive to their perfection and maturity, are acide, bitter, or ſalt, but being yet unripe, and not come to full perfection, they have a certaine ſweetneſſe, which afterwards, by a further digeſtion, or perfection and concoction, acquire a bitter, auſtere, or acide taſte. For thus bitterneſſe in Wormwood and Aloes, acrimony in Pepper or Pellitory, is a perfection of nature, a full ripeneſſe and perfect concoction, and not an exceſſe of heate in that *ſpecies*. Alſo acerbity and auſterity is a perfection of nature, and not a rudiment in Services and Cornelians; acidity or tartneſſe is alſo ſo in verjuice. But in very many things it ſo fals out, that the ſweet or fatty taſte become ſo, and acquire their perfection by concoction, as in Grapes, Figges, Peares, Apples, and almoſt all other ſuch fruits, as wee uſually feed upon. Therefore I will now treat of each of them in order, firſt beginning with the cold taſtes.

The acerbe taſte.

The acerbe taſte is cold and terreſtriall, and of a ſubſtance abſolutely groſſe, being leſſe humide than the auſtere, but much leſſe than the acide. It notably cooles and dryes, it condenſats, binds, repels, eſpecially from the ſuperficies, and it alſo exaſperates; this taſte reſides, and may be found in Pomegranate pils, Galls, *Sumach*, and Cypreſſe nuts.

The auſtere.

The auſtere is nigheſt in temper and effects to the acerbe, but ſomewhat moiſture; for the acerbe abſolutely conſiſts in a terreſtriall & cold ſubſtance. Wherefore this, increaſed by a degree of concoction, acquires more ſtore eyther of heate alone, or elſe of moiſture alone, or elſe of both together: moiſture, I ſay, and that is either ayery, or elſe watry. Therefore if theſe fruits, which before their maturity are acerbe, have an acceſſion of heate, then doe they become ſweet, as you perceive by Cheſnuts; but if there be an acceſſion of moiſture only, and that more groſſe, of acerbe they become auſtere: for both the taſtes are in the like degree of cold, but the auſtere is the moiſture. But if to the ſame frigidity remaining in fruits, a certain ſubtle humidity accrew, then is there cauſed an acide taſte. But if they have an acceſſion of a watriſh moiſture and heate, they will acquire a ſweet taſte, or elſe oily, if the humidity accrewing with the heate be ayery.

I have judged it requiſite to admoniſh you hereof, that you might know by what meanes ſapide bodies mitigated become ſweet of acerbe, as it were by theſe interpoſed degrees of auſterity, acidity, and oylineſſe, as they acquire a various acceſſion of heate and moiſture ſeparately, or conjunctly.

Now by all that wee have delivered, you may gather, that all acerbe and auſtere things are cold and dry; and as they are cold, they repell and hinder defluxions: as they are dry and terreſtriall, they condenſate, incraſſate, conſtipate, and ſtraiten the paſſages; yea, and they alſo cicatrize: but acerbe things performe this farre more powerfully, as thoſe which are abſolutely terrene, cold, and dry, not partaking of moiſture, or water. Now auſtere things conſiſt (as it were) in a middle matter, that is, in a more dilute terrene body, as it is apparent in Services, unripe Grapes, Cornelians, Medlars, Crabs, wilde Peares, and all ſorts of unripe fruits, whence it is termed a crude taſte.

The acide taſte.

The acide taſte is of a cold and watriſh nature, but moſt ſubtle, by benefit whereof it penetrates, and divides almoſt as powerfully as the acride. It incides, or divides, attenuates, bites, cleanſes, opens obſtructions, repels and dryes. For by the meanes of the deep piercing cold, it repels all defluxions; and by the drying faculty, which is ſtrong even in its watry conſiſtence, it ſtayes and ſtops all bleedings, the hæmorrhoides and dyſenteries. The force thereof is chiefly manifeſt in Vinegar, as alſo in the juice of Citrons, Sorrell, Cherries, Berberries, and the like. And this is the nature of cold taſtes, now it is time we ſpeake of ſuch as are temperate.

The inſipide.

The inſipide is unproperly termed a taſte, as that which is rather a privation of taſtes, it is in ſome ſort cold, and of a very watriſh and groſſe nature, it inſpiſſates, conſtipates, and ſtupifies. This kinde of taſte is chiefly manifeſt in water, and next in Gourds, Citruls, and many ſuch like things.

The oily.

The oily taſte is hot, humide, and ayery; therefore it humects, relaxates, mollifies, lubricates. Of this kinde are oyle, butter, fat which is not raucide by age, nor acride by nature, as that of Lyons and Foxes.

The ſweet.

The ſweet taſte is made by a moderate and well concocting heate, conſiſting in a matter more tenuious and hot than the inſipide, but in ſomewhat more groſſe than the oily, from which in the firſt qualities it doth not differ; therefore it is of a hot, ayery, and temperate nature. Therefore every ſweet thing detergeth, levigates, concocts, ripens, relaxes, and aſſwageth paine. Examples of this taſte may be had in Sugar, Honey, Manna, ſweet Almonds, Milke, and other like. Now let us come to hot taſtes.

The ſalt.

The ſalt taſte is hot and aſtringent, leſſe earthy than the bitter, as that which reſides as it were in a middle matter. For it proceeds from an earthy drineſſe, which is formerly torrified & attenuated by the force of heate in a watry humidity. Wherefore that which is ſalt contracts the pores, cuts, cleanſes, digeſts, or rather dryes up the humours by the drineſſe thereof, without any manifeſt ſenſe of heate, whence it is, that it vindicates from putrefaction. Under this kinde are contained all ſorts of ſalt, as ſalt-Peter, *niter*, *ſal Ammoniacum*, *ſal gemmæ*, common ſalt, ſea water, and ſuch other like.

The bitter.

The bitter taſte is hot, earthy, and drying; for the matter thereof is groſſe and earthy, which the abounding heate hath torrified and dryed up. Wherefore bitter things taken inwardly, purge and carry away ſuperfluous humours: and outwardly applyed, they mundifie and deterge ulcers, they open the mouthes and paſſages of the veines oft-times by their abſtergent faculty; whence it is that they move the courſes and hæmorrhoides. The principall things indued with this taſte are Aloes, Gall, Wormwood, Gentian, the leſſer Centaury, Coloquintida, Fumitory, Soot, and ſuch like.

The acride.

The acride taſte is hot, of a ſubtle and fiery nature; for it is kindled of a hot, ſubtle, and dry matter, neither can it conſiſt in any other. Therfore that which is acride, heats, prickes or bites the mouth by the acrimony, it heates, and oft-times burnes, it penetrates, opens the paſſages, attenuates, attracts and drawes forth groſſe humours, evacuates and ſends forth urine, the courſes, and ſweat: beſides it oft-times is ſepticke, bliſtering, and eſcharotick; and laſtly, burning, and cauſticke. The ſepticke & putrefactive things are ſublimate, *Chamælea*, the juice of *Thapſia*. The veſicatories are Dittander, Cantharides, Crowfoot, Muſtard, Pellitory of Spaine, *Euphorbium*. But the cauſticke and eſcharoticke are Lime, Oake aſhes, and the like.

But wee know medicines not onely by the taſte, but alſo by our other ſenſes, as touch, ſight, hearing, ſmell. And as by the taſte, ſo alſo by theſe we judge of and try the goodneſſe of medicines, and diſtinguiſh the true legitimate from the adulterate. The touch judges what are hot and cold, moiſt and dry, rough and gentle, or ſmooth, hard and ſoft, brittle or friable, glutinous and viſcide, dry or ſlippery. We approve of the goodneſſe of medicines by their colour, brightneſſe, or duskineſſe, whereof the eye is judge; for wee commend that Senna which is ſomewhat greeniſh, but diſlike the whitiſh: as alſo we like well of ſuch Caſſia as is blacke both within and without, ſhining and full, and not dry and ſhrunke up. Yet the judgement of the firſt qualities, by the colour is deceitfull, or none at all; for ſuch things as are white, or of the colour of Snow, are not therefore cold: for ſundry of them are hot, as Lime. Neither are red things to be therefore judged hot; for Roſes coole. Alſo medicines are choſen by the ſmell; for ſuch as have a good, freſh, and naturall ſmell, are commonly hot, and in their perfect vigour. On the contrary, things that want ſmell are for the moſt part cold and evanide. By hearing we diſtinguiſh things full from ſuch as are empty: thus we chooſe Caſſia, which ſhaken, makes no noyſe with the grains or ſeeds ratling in it. Hitherto we have explained the firſt, ſecond, third, and fourth faculties of medicines in generall, & have ſhewed how they may be found out: now muſt we more particularly treat of their ſecond and third faculties, becauſe by reaſon of theſe they chiefly come into uſe in Surgery: Yet let mee firſt briefly ſhew by what meanes and arts they may be prepared.

CHAP. VIII.

Of the preparation of medicines.

To prepare medicines, is nothing elſe, than by art to make them more commodious for uſe and compoſition, whereby they are eyther made

- More gentle.
- More ſtrong.
- More pleaſant.
- More wholeſome.
- More fit for mixture.

All which are performed

- By bruiſing, as when medicines are brokẽ by ſtriking and rubbing or grinding in a mortar, & that either of
  - Braſſe, Iron, Lead, Glaſſe, Wood, Marble, & other like.
  - conſidering
    - The thing which is to be beaten.
    - The ſtrength or force wherewith it muſt be performed.
    - The time or ſpace.
    - The ſituation.
    - The things to be added.
    - The conſiſtence which the thing beaten muſt be of.
- By searſing, whereby we ſeparate the pure and finer from the more impure and groſs, which is done by ſives and ſearſes, made of
  - Wood, Parchment, Horſe haire. Silke, Lawne.
  - Wherein is to bee noted, that the ſame conſideration is to bee had in searſing, as in beating; therefore ſuch things as are to bee finely powdred, muſt bee ſearſed in a finer ſearſe: ſuch as are more groſſe, in a courſer.
- By diſſolving or mollifying.
  - Which is nothing elſe but a diſſolving of a ſimple or compound medicine, of a thick or hard conſiſtence, either into a mean conſiſtence, or a little more liquid or ſoft, which is performed
    - Either by heate onely; for by heate gums and hornes are mollified: or by liquor, as by vinegar, water, wine, juice of Lemmons, &c.
- By deſiccation or hardening, which
  - Is nothing elſe, but the conſuming of the ſuperfluous and hurtfull moiſture, and this is performed, either
    - By the Sun, or By Fire.
- By infuſion, which is nothing elſe but the tempering or macerating of a medicine a little beaten or cut, in ſome liquor appropriate and fit for our purpoſe, as in Milke, Vinegar, Water, Oyle, and the like, ſo long as the nature of the medicine requires. To infuſion
  - Nutrition may bee reduced, which is nothing elſe, but as it were a certaine accreſsion of the medicine, by being moiſtened, macerated, rubbed, or ground with ſome moiſture, eſpecially wth heate.
- By burning, that is, by conſuming the humidity which is in them. And that, either that they may be the better powdred, being otherwiſe too glutinous, or that they may lay aſide their groſs eſſence, and become of a ſubtler temper; or that they may put off, or partly loſe ſome fiery quality, as acrimony, *Gal. lib. 4. cap 9. ſimplicium*. Or that they may acquire a new colour. Now all things are burnt, eyther
  - Alone, as ſuch things as have a fatty moiſture, as haires, ſweaty wooll, hornes: Or elſe with ſome combuſtible matter, as ſulphur, alome, ſalt, barley, &c.
- By boyling or elixation, which is performed by a humide heate, as burning is by a dry, & that either that wee may increaſe the weake faculties of ſuch medicines as are boyled, by boyling them with ſuch as are ſtronger; or elſe to weaken ſuch as are too ſtrong, or elſe wholly to diſſipate ſuch as are contrary: Or that one faculty may ariſe of ſundry things of different faculties being boyled together, or for the longer keeping them, or bringing them to a certaine forme or conſiſtence: all which are done, eyther by the
  - Fire, or Sun.
- By waſhing or cleanſing, wherby the impurity of the medicine is waſted away or cleanſed, and ſuch things are eyther
  - Hard, as metals, ſtones, parts of living creatures, condenſed juices, & other like: Or ſoft, as Roſines, Gums, Fats, Oyles.
  - And theſe ought firſt
    - To be finely beaten, that the water may penetrate into all their ſubſtance. Or to be diſſolved, & caſt into a veſſell filled with water, and ſo ſtirred, & then ſuffered to ſubſide; ſo that the fat may ſwim aloft: and this muſt be done ſo long that the water retaine nothing thereof in colour, ſmell, or taſte.

CHAP. IX.

Of repelling, or repercuſſive medicines.

Aſtringents are underſtood by the name of repellers.

The differences of repercuſsives

REpelling or repercuſſive medicines are cold, and of groſſe and earthy parts; by which name alſo aſtringent medicines are underſtood, becauſe they hinder the falling downe of the humours upon the part. Repercuſſives are ſuch, either of their nature and of themſelves, or elſe by accident, being not ſuch of their own nature. Theſe which of themſelves are ſuch, are of two kinds; for ſome are watriſh & moiſt, without any aſtrictive faculty, which almoſt wholly proceeds from an earthy eſſence; wherefore that faculty of repelling which they poſſeſſe, they have it wholly from coldneſſe. Of this kinde are lettuce, purſlaine, ſow-thiſtle, duckes-meat, kidney wort, cowcumbers, melons, gourds, houſe-leeke, mandrake apples, night-ſhade, henbane, and the like, which coole powerfully, and unleſſe they be taken away before the part waxe blackiſh, they extinguiſh the naturall heat. Other ſome are of an earthy eſſence, and therefore aſtrictive; but yet ſome of theſe are hot, other ſome cold. Such things as are cold of temper, and of an earthy conſiſtence, are properly and truly termed repellers. Of theſe, ſome are ſimple, other ſome compound: the ſimples are plantaine, vine leaves, leaves of roſes, oakes, brambles, cypreſſe, berberies, *ſumach*, all unripe fruits, verjuice, vinegar, red wine, the juice of ſower pomegranats, *acacia*, the juice of barberries, and quinces, *hypociſtis*, pomegranate pills, oake barke, the flowers of wilde pomegranates, the meale of barly, beanes, panicke, oats, millet, *orobus* mixed with juices in forme of a pultis, bole armenick, *ſanguis draconis*, ceruſſe, litharge, *terra ſigillata*, fullers earth, chalke, marle, the load-ſtone, lead, coralls, all marchiſites, antimony, *ſpodium*, true *pomphilix*, all ſorts of earth, and other things of the like nature.

Why things of ſubtle parts are oft times mixed with repercuſſives.

Repellers by accident.

When, and to what parts repercuſsives muſt be applied.

Now compound things are *oleum roſaceum*, *omphacinum*, *mirtillorum*, *papaveris*, *cidoniorum*, *nenupharis*, *unguentum roſatum*, *album rhaſis*, *camphoratum*, *emplaſtrum diacalcitheos*, diſſolved in vinegar and oile of roſes, *deſiccativum rubrum*, *populeon*, *emplaſtrum nigrum ſeu tetrapharmacum* of *Galens* deſcription, *empl. contra rupturam*, *de ceruſa*, *pro matrice*. All ſuch cold repercuſſives are more effectuall if they be aſſociated with tenuity of ſubſtance, either of themſelves, or by mixture with ſome other things: for to this purpoſe we often mixe vinegar, camphire, and the like things of ſubtle parts, with repercuſſives of groſſe parts, that they may ſerve as vehicles to carry in the repercuſſives faculty. Repercuſſives of groſſe parts and hot, are wormwood, centory, gentian, agrimony, ſavin, coriander, mint, bay leaves, cardamomes, *calamus aromaticus*, aloes, ſpikenard, ſaffron, nutmeg, cinamon, amber, ſalt, alome, coporoſe, *ſulphur*, *oleum abſinthinum*, *maſtichinum*, *nardinum*, *coſtinum*, *ceratum*, *Gal. ſtomachicum*, *ſantalinum*, *emplaſtrum diacalcitheos*. But ſuch things as repell by accident, are bandages, compreſſes, linnen cloaths, and rowlers of all ſorts, caſes, cauteries, blood-letting, cupping, painefull frictions in the oppoſite parts, and other ſuch like things as are properly ſaid to make revulſion. The uſe of repercuſſives is to force backe the humour which flowes from any other place into the part, and thus they mitigate the heat of ſuch inflammation as that defluxion of humors hath cauſed, yea oft times to aſſwage and helpe paine, the feaver, abſceſſe, maligne ulcers, and mortification. Such repercuſſives muſt alwaies bee ſo oppoſed to the diſeaſe, that reſpect may bee had to the temper, complection, and particular nature of the part whereto they are applied; for all parts cannot equally beare the like force of repercuſſives, as nervous & other ſpermatick and cold parts. Furthermore, there are ſome parts whereto wee may by no meanes apply repercuſſives, as the groines, arme-pits, and thoſe glandules or kernells which are behind the eares and braine, leſt the humour ſhould retire backe into ſome of the principall parts: the like reaſon is alſo of bodies, for the bodies of women, children, eunuches, cannot endure ſo ſtrong repercuſſives and the like exceſſe of cold as manly and vigorous bodies may. Beſides, every diſeaſe requires not repercuſſives, for if the body bee repleat with ill humours, if it bee ple-

thorick

thoricke, the uſe of repercuſſives, unleſſe after generall purgation, cannot be ſafe; as neither if the humour which is in motion ſhall be venenate, groſſe, acrid, criticall, or ſhall cauſe great paine in the part, for then on the contrary wee muſt rather make uſe of attractives. But now if the diſeaſe be great, weake repercuſſives will availe nothing againſt it, as lettuce againſt a great inflammation; and thou ſhalt doe ill if thou ſet upon a ſmall defluxion with powerfull repellers; for by that meanes the skin is ſtraitened, and the paſſages thereof ſtopt, whereby the inflammation is encreaſed, or elſe brought to a *ſchirrhus*. Wherefore let the Chirurgian have a care that hee temper the force of his Repercuſſives according to the magnitude of the diſeaſe.

CHAP. X.

Of attractive medicines.

What an attractive medicine is.

AN attractive medicine is contrary to the repeller; the greeks call it *Helcticum*, it is of a hot and thin ſubſtance, whereby it draweth forth into the ſuperficies of the body that which lyeth hid in the center, although ſometimes it doth it by an occult quality; other whiles alſo by accident, as by the acrimony. Thoſe things which by a manifeſt quality doe attract, are either ſimple or compound.

Attractives by a manifeſt quality.

The ſimple are *Bryonia, allium, cæpa, porrum, araſtolechia, hermodactyli, ciclamen, lilium, ſigillum beatæ Mariæ, arum, aſarum, aſphodelus, gentiana, pyrethrum, ruta, ſabina, calamentum, omnes tithymalorum ſpecies, viſcum, abrotanum, anogallis, urtica, ranunculus, ſtruthium,* and ſuch like: *ammoniacum, bdellium, gabbanum, ſagapenum, euphorbium, aſphaltum, cinis e fæce vini vel aceti, calx viva, ſulphur, ſal ammoniacum, omnes ſalis ſpecies, auripigmentum, oleum vetus, adeps leonis, urſi, canis, anſeris, viperæ, ranarum, axungia porci vetuſtate acris, aut attriturotarum. Compoſita vero, ut oleum de ſpica, philoſophorum, de terebinthina, de croco, de ſcorpionibus, rutaceum, vulpinum, laurinum, anethinum, de vitriolo, unguentum Agrippæ, aragon, ſeu auxiliare, martiatum, enulatum, theriaca, mithridatium, empl. de meliloto, diachylon magnum & parvum, oxycroceum, divinum.*

By an occult.

Thoſe things which draw by a ſecret property in nature, as are the load-ſtone, quick-ſilver, pyony, amber, all antidotes and treacles that are remedies againſt the bitings of venemous beaſts, and all purging medicines.

By accident.

Theſe which draw by accident, performe it otherwiſe than of their owne nature, they have that quality out of putrefaction and corruption, as doves dung, goats dung, cow dung, mans dung, and all kinde of dungs: alſo leven, old cheeſe, and ſuch like.

Cupping glaſſes, leaches, ſyrenges, rougher and harder frictions, ſucking, paine, ſtraight ligations, cauteries doe alſo draw, but after a different manner from them ſpoken of before.

Their uſe.

Attractive medicaments muſt neither burne nor diſcuſſe, and being very ſtrong and ſharpe, they ſhould bee tempered and mixed with oyle of roſes, and other lenitives: but to weake ones ſhould be added oyle of bayes, *calx viva*, and ſuch like to ſtrengthen them. The uſe of attractives is to draw poyſon toward the skin, & to haſten forward criticall abſceſſes; and they make thoſe parts which were benumbed and conſumed, to have life, they reſtore the refrigerated parts by drawing thither the ſpirits; they draw forth the viſcous filth of maligne ulcers that lies hid in the nerves, and hollow paſſages of them; they alſo draw out ſcailes of bones, ſplinters of wood, nailes, thornes, arrowes, and that matter which is impact in hardened inflammations.

Chap. XI.

Of reſolving medicines.

What a reſolving medicine is.
The differences thereof.

THat is called a reſolving medicine, which by heat, and the tenuity of his ſubſtance openeth the pores, attenuates the humours, diſſipates and diſcuſſeth by evaporating the unprofitable matter. There are two ſorts of theſe kindes of medicines; the one is called *Aræoticum* or rarifying; the other is termed *Diaphoreticum* or digeſting.

The *Aræoticum* by a meane heat, and not dry, and endued with a tenuity of ſubſtance, openeth and relaxeth the skinne, and draweth forth the matter ſhut up under it, whereby it may eaſe paine, like as Anodines, becauſe it doth not much depart from a temperate heat.

But the *Diaphoreticum* being much hotter, whatſoever ſticketh in the part being there impact, it doth by thin vapour inſenſibly diſſipate: therefore the acrid and hot things are in this caſe to be made uſe of rather than attractives, becauſe that cold and groſſeneſſe is more difficultly to be digeſted, and the length and involution of the waies being to be conſidered. The Aræoticke, which we may call weake reſolvers, are either ſimple or compound.

The ſimples are theſe, *biſmalva tota, parietaria, adianthum, mercurialis, ebulus, valeriana, roſmarinus, ſalvia, thymus, chamæmelum, melilotum, anethum, farina hordei, tritici, ſeminis lini, fænugræci, nigella, furfur, adeps gallinæ, anſeris, anatis, cuniculi, vituli*; almoſt all metalls unleſſe ſuch as are acrid. The compounds are *oleum chamæmolinum, anethinum, liliaceum catellorum, lumbricorum, Keirinum, de vitellis ovorum, de tritico, amygdalarum dulcium, Uuguentum de althæa, empl. diachylum, ireatum.* Diaphoretickes or digeſtives, are alſo both ſimple and compound: the ſimple are *Ariſtolochia, enula campana, iris, cæpa, ſcylla, ſigillum Salomonis, ſigillum beatæ Mariæ, bryonia, panis porcinus, dracunculus, aſphodelus, origanum, mentha, pulegium, ſabina, ſerpillum, calamentha, hyſſopus, urtica, arthemiſia, lavendula, chamepytis, aniſum, fæniculum, cuminum, piper, nux moſchata, coriandrum, baccæ lauri & juniperi, farina fabarum, lupinorum, orobi, milii, frumenti, furfur, mica panis, acetum tepidum, oxycratum, vinum vetus aut aromaticum, mel, aqua vitæ, muria, adeps tauri, equi, leonis, canis, hirci, medulla cervi, cruris bovis & arietis, ammoniacum, galbanum, opopanax, ſagapenum, myrrha, bdellium, thus, terebinthina, pix nigra, ladanum, ſtyrax, calamita, bentoinum, ſtercus caprinum, columbinum, caninum, bubulum, & aliæ ſtercorum ſpecies.*

Compound diaphoretickes are *oleum amygdalarum amararum, Juniperinum, laurinum, de ſcorpionibus, irinum, coſtinum, nardinum, de terebinthina, de croco, canabinum, raphaninum, è cucumere agreſti, vulpinum, rutaceum, philoſophorum de lateribus, de euphorbio, de tartaro, de petroleo, de kerva, ſive ricininum, unguent. Agrippæ, aragon, martiatum, enulatum, empl. de Vigo,* without addition, and with addition, *oxycroceum, diacalcitheos*, diſſolved in a digeſting oyle to the forme of a cerat.

Aræotickes are profitably uſed in the increaſe and ſtate of ſuperficiall tumours.

The uſe of diaphoreticks.

But Diaphoretickes are not to bee uſed in the encreaſe of tumours, unleſſe ſome aſtringent bee added, leſt by their more ſtrong digeſtion, they ſhould draw and increaſe the defluxion: but when the tumours decline, they are then onely to be uſed in the parts chiefly where the skinne is denſe and hard, and when the humour is cold and groſſe, and lying hid deep in the body, ſo that the vertue of medicaments can hardly come thereto: but conſideration is to bee had of the parts to which reſolutives are to be applied; for you may not apply relaxers or diaphoretickes to the liver, ſpleen, ſtomacke, or bowels, unleſſe you adde ſome aſtringents, of which a great part muſt be aromatickes.

To the parts where ſenſe is more dull, may be applied the ſtronger diaphoreticks, but thoſe parts which are endued with a more exquiſite ſenſe, as the eye and the nerves, to them we muſt apply weaker. When the matter is groſſe and cold, things cutting and attenuating, and then emollients are to be uſed, and ſo by degrees come to diaphoretickes; otherwiſe that onely is reſolved which is the moſt ſubtle of the unprofitable matter, the groſſer becomming concrete and hardened. But if the part be afflicted with a continuall defluxion, ſo that there may be danger of a gangrene or ſphacel, it is not lawfull then to make uſe of reſolvers, but you muſt in the place where the humour flowes, devide the skin by ſcarification, as it is moſt learnedly noted by ***Hollerius*** in that profitable booke of his left to poſterity, whoſe title is, *De materia Chirurgica*.

CHAP. XII.

Of ſuppuratives.

What a ſuppurative medicine is.

A Suppurative medicine is ſaid to bee that, which ſhutting the pores, and preventing tranſpiration by his emplaſticke conſiſtence, increaſeth the matter of native heat, and therefore turneth the matter caſt out of the veſſels into *pus* and *ſanies*. It is of nature hot and moiſt, and proportionable to the native heat of the part to which it is applied, and of an emplaſticke conſiſtence, that ſo it may hinder the native heat from being exhaled; in which reſpect it differeth from emollients and malactickes, of which wee ſhall ſpeake hereafter. There bee two kindes of ſuppuratives, for ſome doe it of themſelves, and by their proper qualitie; others by accident. Thoſe things which by their owne ſtrength do bring to ſuppuration, are either ſimples or compounds.

Differences of ſuppuratives.

Simples are *radix liliorum, cæpa, allium, malvarum omnium folia & ſemina, bugloſſum, acanthus, ſenecio, violæ, parietaria, crocus, caules, ficus, paſſula mundatæ*, with a decoction of theſe things, *farina tritici, farina volatilis, farina hordei excorticati, lolii, ſeminis lini & fœnugræci, galbanum, ammoniacum, ſtyrax pinguis, ladanum, viſcum aucupatorum, thus, pix, cera, reſina, colla, adeps ſuillus, vitulinus, vaccinus, caprinus, butyrum, vitellus ovi, œſipus humida, ſtercus ſuillum, columbinum, caprinum, pueri.*

Compounds are *oleum liliorum, lumbricorum, de croco, unguent. baſilicum, emplaſt. diachylon commune, magnum, de mucilaginibus.*

Suppuratives by accident.

Thoſe things doe ſuppurate by accident which worke it onely by the meanes of an emplaſticke conſiſtence: for ſo often times aſtringents, becauſe they are of earthy and thicke parts, are found to ſuppurate; ſuch are *unguentum de bolo nutritum*, and ſuch like. Such alſo are thoſe which by their coldneſſe keep the heat in, and ſhut the pores. Hence is it that the qualities of ſorrell are commended to generate *pus*: for whileſt it keepeth the heat within, it encreaſeth his effects, to the thickening of the ſuppurable matter, and the overcomming other rebellious qualities. We uſe things ripening in great inflammations, whoſe growth we cannot hinder with repellers, or increaſe with reſolvers or diſcuſſers.

CHAP. XIII.

Of mollifying things.

Gal. cap. 7. lib. 5. ſimpl.

How ſuppuratives and emollients differ.

THat is defined to bee a mollifying medicine, which by a ſtronger heat than that which is proper to ſuppuratives, without any manifeſt quality of drying or moiſtning, again malaxeth or ſofteneth hardned bodies: wherefore this differs from that which ſuppurates, becauſe that may bee hot in the firſt or ſecond degree, according to the ſeverall temper of the body, or part to which it is applied, working rather by the quantity of heat than the quality: contrariwiſe, that which mollifieth being endued with a greater heat, rather worketh by the quality of the heat, being otherwiſe in dryneſſe and moiſture temperate.

Although as many things agree together in ſome reſpects, though of a divers nature; ſo many emollients are ſuch as are hot in the firſt degree, and dry in the ſecond and third, that ſo they may the better diſperſe and diffuſe that which is congealed, by taking away a little of the humidity, which is contained within the part affected; but not by exhauſting it wholly by the violence of heate or drineſſe: for hereon would follow a greater hardneſſe.

The differences of emollients.

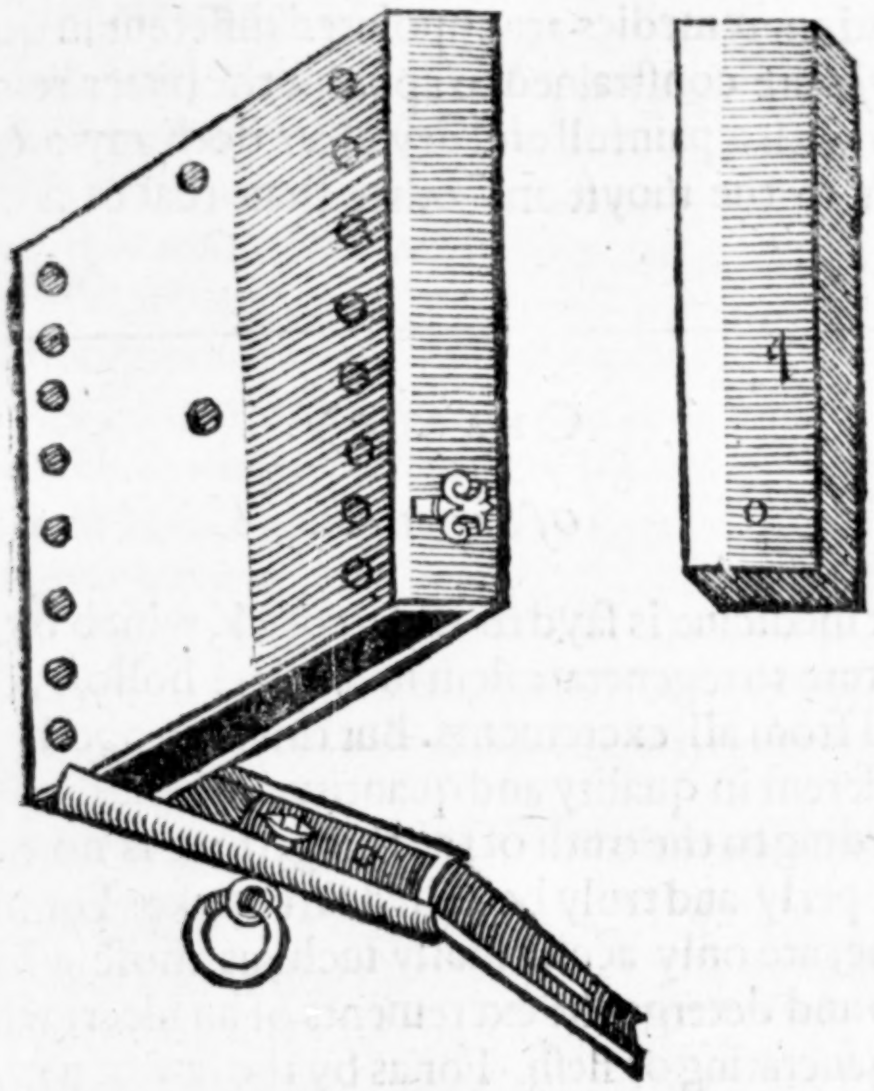
Things mollifying, are either ſimple or compound; and theſe againe ſtrong or weake. The weake are, *Radix liliorum alborum, cucumeris agreſtis, althææ, folia malvæ, biſmalvæ, liliorum, anethi ſummitates, viola, branca urſina, ſemen malvæ, biſmalvæ, lini, fænugræci, carici pingues, paſſulæ mundatæ, pedum, capitum, inteſtinorum vervecinorum decoctum, adeps ex junioribus & caſtratis, domeſticis, fæminis animalibus, adeps ſuillus, vitulinus, hædinus, caprinus, bubulus, vulpinus, gallinaceus, anſerinus, anatinus, olorinus, efficaces.* The weaker are things more gentle, as, *Butyrum, lana ſuccida, cera pinguis, vitellus ovi, medulla ex oßibus, cervina, ovilla, caprina.* The compound are oyle, wherein are boiled mollifying herbes, as, *Oleum liliorum, chamamelinum, amygdalarum dulcium.* Stronger emollients are, *Acetum, adeps taurinus, urſinus, cervinus, leoninus, pardalinus, apri, equi ſevum, pinea, picea, abietina, terebenthina, ammoniacum, bdelium, ſtyrax, galbanum, ladanum, propolis, opopanax, ung. de althæa, emp. diachylon commune & magnum, de mucilaginibus, ceroneum, oxycroceum, Joannis de vigo.*

Their uſe.

We uſe emollients in ſcirrhous tumours of the muſcles, or in the lips of ulcers, in any of the limbes, belly, glandules, bowels, by reaſon of a groſſe, cold, and viſcous matter, eyther flegmaticke, or melancholicke. Yet thoſe tumours which come of melancholy, commonly turne to cancers, which are exaſperated by mollifying things. On the contrary, ſuch as proceed from a flegmaticke matter, are brought to an equality of conſiſtence, by the uſe of emollients. Furthermore, there are three things obſervable in the uſe of emollients: the firſt is, duely to conſider how much the affected part differs from his proper and naturall temper and proportion, that ſo we may apply an equivalent remedy. The ſecond is, that wee diſtinguiſh the natures of the parts. The third is, that we artificially gather after what maner this mollifying muſt be performed, that is, whether we ſhould mingle with the emollients, deterſive or diſcuſſing medicines. For there are many deſperate ſchirrhous tumours, that is, ſuch as cannot be overcome by any emollient medicine, as thoſe which are growne ſo hard, that they have loſt their ſenſe; and thereupon are become ſmooth and without haires. Here you muſt obſerve, that the part ſometimes becomes cold in ſo great an exceſſe, that the native heate plainly appeares to languiſh, ſo that it cannot actuate any medicine. That this languiſhing heate may be reſuſcitated, an iron ſtove ſhall be ſet neere to the part, wherein a good thicke peece of iron heated red hot ſhall be incloſed, for ſo the ſtove will keep hot a long time.

Things obſervable in the uſe of emollients.

The figure of an iron ſtove.



A. *The caſſe of the ſtove.*
B. *The iron Bat to be heated.*
C. *The lidde to ſhut the ſtove.*

CHAP. XIV.

Of Deterſives, or Mundificatives.

A Deterſive is defined to be that which doth deterge or cleanſe an ulcer, and purge forth a double kinde of excrement; of the which one is thicker, which is commonly called *ſordes*, which is drawne forth from the bottome of the ulcer, by the edificatious quality of the medicine, the other is more thin and watery, which the Greekes call *Ichor*, the Latines *Sanies*, which is taken away by the drineſſe of the medicine; and therefore *Hippocrates* hath well adviſed, that every ulcer muſt be cleanſed and dryed.

Of Deterſives, ſome are ſimple, ſome compound, ſome ſtronger, ſome weaker. Detersives. The ſimple are eyther bitter, ſweet, or ſowre: the bitter are *Gentiana*, *Ariſtolochia*, *iris*, *enula*, *ſcilla*, *ſerpentaria*, *centaurinum minus*, *abſinthium*, *marrubium*, *perforata*, *abrotonon*, *apium*, *chelidonium*, *ruta*, *hyſſopus*, *ſcabioſa*, *arthemiſia*, *eupatorium*, *aloë*, *fumus terræ*, *hædera terreſtris*, a *lixivium* made with the aſhes of theſe things, *lupini*, *orobus*, *amygdala amara*, *faba*, *terebinthina*, *myrrha*, *maſtiche*, *ſagapenum*, *galbanum*, *ammoniacum*, the gals of Beaſts, *ſtercus caprinum*, *urina benè cocta*, *ſquamma æris*, *æs uſtum*, *ærugo*, *ſcoria æris*, *antimonium*, *calx*, *chalcitis*, *miſy*, *ſory*, *alumen*. The ſweet are *Viola*, *roſa*, *mellilotum*, *ficus pingues*, *dactyli*, *uvæ paſſæ*, *glycyrrhiza*, *aqua hordei*, *aqua mulſa*, *vinum dulce*, *mel*, *ſaccharum*, *ſerum lactis*, *manna*, *thus*. The ſharpe are all kinde of ſowre things, *Capreoli vitium*, *acetum*, and other acide things. The compound are *Syrupus de abſinthio*, *de fumaria*, *de marrubio*, *de eupatorio*, *de arthemiſia*, *acetoſus*, *lixivium*, *oleum de vitellis ovorum*, *de terebinthina*, *de tartaro*, *unguentum mundificativum de apio*, *apoſtolorum*, *pulvis mercurialis*. We uſe ſuch things as deterge, that the ſuperfluous matter being taken away, nature may the more conveniently regenerate fleſh to fill up the cavity: Their uſe. But in the uſe of them, conſideration is firſt to bee had of the whole body, whether it be healthy, plethoricke, or ill diſpoſed, there is conſideration to be had of the part, which is moyſter and drier, endued with a more exquiſite or duller ſenſe. But oftentimes accidents befall ulcers beſides nature, as a *callus*, a defluxion of a hot or otherwiſe maligne humour, and the like ſymptomes. Laſtly, conſideration is to be had, whether it be a new or inveterate ulcer; for from hence, according to the indication, remedies are appointed different in quantity and quality: ſo that oftentimes wee are conſtrained to appoint the bitter remedy in ſtead of the ſweet. Neither truly with a painfull and dry ulcer doth any other than a liquid deterſive agree: neither to the moyſt any other than that of a dry conſiſtence, as Powders.

Chap. XV.

Of Sarcoticks.

No medicine truly ſarcotick.

That medicine is ſayd to be ſarcotick, which by its drineſſe helpes nature to regenerate fleſh in an ulcer hollow, & diligently cleanſed from all excrements. But this is properly done by bloud indifferent in quality and quantity. Wherefore, if we muſt ſpeak according to the truth of the thing, there is no medicine which can properly and truly be called ſarcoticke: For thoſe which vulgarly goe under that name, are only accidentally ſuch; as thoſe which without biting and eroſion do dry up and deterge the excrements of an ulcer, which hinder the endeavour of nature in generating of fleſh. For as by the law of nature, from that nouriſhment which flowes to the nouriſhing of the part, there is a remaine, or a certaine thin excrement, flowing from ſome other place, called by the Greekes *Ichor*, and by the Latines *Sanies*: Thus by the corruption of the part there concretes another groſſer excrement, termed *Rypos* by the Greekes, and *Sordes* by the Latines. That makes the ulcer more moyſt, this more filthy. Hence it is, that every wound which requires reſtitution of the loſt ſubſtance, muſt be cured with two ſorts of medicines, the one to dry up and waſte the ſuperfluous humidity thereof, the other to fetch off the filth: and by how much the wound is the deeper, by ſo much it requires more liquid medicines, that ſo they may the more eaſily enter into every part thereof.

But diverſity of things ſhall be appointed according to the various temper of the part. For if the affected part ſhall be moyſt by nature, ſuch things ſhall be choſen as ſhall be leſſe dry: if on the contrary the part be dry, then ſuch things ſhall bee uſed as be more dry; but many ſorts of medicines ſhall be aſſociated with the ſarcoticks, according to the manifold complication of the affects poſſeſſing the ulcer. Therefore nature only is to be accounted the workmaſter, and the efficient cauſe in the regenerating of fleſh, and laudable bloud the matteriall cauſe, and the medicine the helping or aſſiſting cauſe, or rather the cauſe without which it cannot be: as, that by cleanſing and moderately drying without any vehement heat, takes away all hinderances of incarnation and orders, and fits the bloud to receive the forme of fleſh. This kinde of medicine, according to *Galen*, ought to be dry only in the firſt degree, leſt by too much drineſſe, it might drink up the bloud and matter of the future fleſh, which notwithſtanding is to be underſtood of ſarcoticks, which are to bee applyed to a delicate and temperate body. For if the ulcer be more moyſt, or the body more hard than is fit, we may aſcend to ſuch things as are dry, even in the third degree. And hence it is, that ſuch drying medicines may firſt be called deterſives, and then preſently ſarcoticks. A ſarcoticke medicine is eyther ſimple or compound, ſtronger or weaker.

Simple Sarcotickes.

Simple ſarcoticke medicines are, *Ariſtolochia utraque, iris, acorus, dracunculus, aſarum, ſymphyti omnia genera, betonica, ſanicula, millefolium, lingua canis, verbena, ſcabioſa, pinpinella, hypericon, ſcordium, plantago, rubia major & minor, eorumq; ſucci. Terebinthina lota & non lota, reſina pini, gummi arabicum, ſarcocolla, maſtiche, colophonia, manna thuris, cortex ejuſdem, aloë, olibanum, myrrha, mel, vinum, ſanguis draconis, lythargyros auri, ſpodium, pompholix, tutia, plumbum uſtum lotum, ſcoria ferri.*

Compound Sarcotickes.

The compound ſarcoticks are, *Oleum hypericonis, ol. ovorum, maſtichinum, & catera olea, quæ balſami nomine appellantur, unguentum aureum, emp. de betonica, vigonis,*

gonis, de janua, Emp. gratia Dei, Emp. nigrum. We uſe not ſarcoticks before that the ulcer be cleanſed and freed from paine, defluxion, inflammation, hardneſſe, and diſtemper. In uſing theſe things we conſider the temper of the body, and the affected part: For oft-times a part otherwiſe leſſe dry by nature, requires a more powerfull drying medicine, and ſtronger ſarcotick, than another part which is more dry, and this for ſome other reaſon, which ought to come into our conſideration: For example, the glans would be more dryed than the prepuce, although it be of a temper leſſe dry, becauſe it is the paſſage of the urine. Wherefore wee muſt diligently obſerve the condition of the affected parts, and thence taking indication, make choice of more ſtrong ſarcoticks. For both that which is too little, and that which is too much ſarcoticke, makes a ſordid ulcer: the firſt, becauſe it dries not ſufficiently; the latter, for that by its acrimony it cauſeth defluxion. Therefore diligent care muſt bee uſed in the examination hereof.

CHAP. XVI.

Of Epuloticks, or ſkinning medicines.

AN Epuloticke medicine is that which covereth the part with skin: it is ſaid to bee ſuch as by drineſſe and aſtriction without biting deſiccates, bindes, and condenſates the fleſh into a certain callous ſubſtance, like to the skinne, which we commonly call a cicatrize or ſcarre: yet this, as the generating of fleſh, is the worke of nature. A medicine therefore is ſaid to be Epuloticke, for that it aſſiſts nature in ſubſtituting and generating a ſcarre, in ſtead of the true skinne, whileſt it conſumes the ſuperfluous humidities, condenſates, incraſſates, and binds the next adjacent fleſh; therefore it ought to dry more powerfully than a ſarcoticke. Epuloticke medicines are of three kindes: the firſt is the true epulotick, which only dries and binds. The ſecond is an acride and biting epuloticke, which, for that it waſtes the proud fleſh, is called ſo; and this muſt bee ſparingly uſed, and that only to hard and ruſticke bodies. The third is that which onely dries without aſtriction. The things whereof they conſiſt are theſe: *Ariſtolochia utraque, gentiana, iris, centaurium majus, pentaphyllon, ſymphitum majus, chamædrys, betonica, cauda equina, eupatorium, verbenaca, plantaginis & ſymphyti folia, gallæ, baccæ myrti, glandes & earum calices, balauſtia, cupreſſi nuces, malicorium, cortex quercus, cortex tamaricis, cortex ligni aloës, acacia, colophonia, ſarcocolla, ſanguis draconis, ladanum, lithargyros auri, argenti, ceruſa, plumbum uſtum, alumen uſtum, tuthia, ſquamma æris & ferri, & eorum ſcoria, ærugo, flos æris, æs uſtum & lotum, ſulphur vivum, chryſocolla, corali, bolus armenus, terra ſigillata, cineres buccinarum, oſtreorum, ſilicis, oſſa uſta & ſiccata, caries lignorum, ung. diapompholygos, ung. alb. rhaſis, deſiccativum rubrum, emp. de ceruſa, de betonica, diacalcitheos, emp. nigrum.*

Three ſorts of Epuloticks.

We uſe Epuloticks when as the ulcer is almoſt filled up, and equall to the adjacent skinne. In the uſe of theſe we muſt alſo have reſpect to the tenderneſſe and hardneſſe of the body; for ſuch things as are corroſives to tender and delicate bodies, are epuloticke to hard and ruſticke bodies. Alſo wee muſt have regard, whether the body be plethoricke or replete with ill humours, for ſuch do not eaſily admit cicatrization. Alſo it is moſt worthy of your obſervation, to marke whether the ulcer that is to be cicatrized, be fed or nouriſhed by the preſent defect of any part, as the liver, ſpleene, lungs, or a *varix* lying about it. For it cannot be cicatrized before theſe impediments (if any ſuch be) be taken away. Laſtly, the callous lips of an ulcer, unleſſe they be ſcarified or ſoftened, hinder cicatrization. Therefore all ſuch defaults muſt be taken away, and then ſuch an epuloticke applyed, as may not by the too much drineſſe leave the ſcarre too hollow, or the too little, leave it too high.

Their uſe.

CHAP. XVII.

Of Agglutinatives.

AGlutinating or agglutinative medicine is of a middle nature, between the ſarcoticke and epuloticke, more ſtrong than the former, and weaker than the latter, for it is dry to the ſecond degree. It by the drying and aſtrictive faculty, voide of all deterſion, conjoynes parts that are diſtant, or rather lends helping hands to nature the principall agent in this work. Glutinatives, whether they be ſtrongly or weakly ſuch, doe agglutinate either by their proper or accidentall nature: Of this ſort are *Plantaginis omnes ſpecies, conſolida utraque, bugloſſa, millefolium, verbena, pimpinella, piloſella, cauda equina, ſempervivum, telephium, ſanicula, atractilis, folia quercus & dracunculi, ſalix, ebulus, ſambucus, pentaphyllon, veronica, cortex pini, ulmi, palma quercus, Aqua vitis, aq. è folliculis ulmi, ſuccus calaminthæ, vinum auſterum, terebinthina, myrrha, ſanguis draconis, bolus armenus, terra ſigillata, omnia denique acerba.*

Agglutinative medicines.

Glutinatives by accident.

Glutinatives by accident are thoſe that hinder defluxion, and binde the part, as Sutures, Bandages, reſt, rowlers, and the like. We uſe glutinatives in greene, and as yet bloudy wounds, whence the Greekes call a glutinative medicine *Enæma*, although ſometimes they are uſed to inveterate, maligne, fiſtulous and ſinuous ulcers; for they hinder the defluxion from comming to the lips of ulcers. You muſt conſider, when as you intend to apply them, whether the skinne be whole or no: For ulcers knit together, or heale more difficultly, if the skinne be rubbed off, or cut, or otherwiſe loſt. Neither ought you to be unmindfull of the fore-mentioned cautions and indications drawne from the ſexe, the tenderneſſe or hardneſſe of the affected body, the continuance and magnitude of the ulcer: for hence indication muſt bee taken, what the quantity and quality of the medicine ought to be.

CHAP. XVIII.

Of Pyrotickes, or cauſticke Medicines.

THat medicine is ſaid to be Pyroticke or Cauſticke, which by its acrimony and biting, commonly conſiſting in an earthy conſiſtence, either ſuperficially corrodes, or more deeply eates and putrefies, or laſtly, burnes and conſumes the skin and fleſh, ſo that it even pierces into callous and hard bodies. Therefore there are three degrees of Pyrotickes; for ſome are termed cathæreticke or corroding, for that they waſte the proud fleſh of an ulcerated or any other part, and theſe are judged the weaker ſort of the Pyrotickes. Otherſome are termed Septicke or putrefying, as thoſe which deſtroy and diſſolve the tender and new ſprung up fleſh, and raiſe bliſters in the skinne, and theſe are more powerfull than the cathæretickes. Laſtly, there are otherſome termed moſt powerfull Eſcharotickes, which by their fiery and terreſtriall quality cauſe eſchars or cruſts; whereupon they are alſo termed *Ruptoria*, & potentiall Cauteries: Now all theſe differences are taken from that they are more or leſſe powerfull. For it oft-times happens, that according to the different temper and conſiſtence of the parts, according to the longer or ſhorter ſtay, a Cathæreticke may penetrate as farre as a Septicke, and on the contrary, an Eſcharoticke may enter no farther than a Septicke.

Three degrees of Cauſticks.

Cathæreticks.

Theſe are judged Cathæretickes, *Spongia uſta, alumen uſtum & non uſtum, vitriolum uſtum, calx mediocriter lota, ærugo, chalcanthum, ſquamma æris, oleum de vitriolo, trochiſci andronis, phaſionis, aſphodelorum, ung. Ægyptiacum, apoſtolorum, pulvis mercurii, arſenicum ſublimatum.*

Septickes and Veſicatories.

Septickes and Veſicatories are, *Radix ſcillæ, bryoniæ, ſigill. beatæ Mariæ, bugloſſa, radix ranunculi, panis porcini, apium, riſus, lac tithymallorum, lac fici, euphorbium, ana-*

cardus, ſinapi, cantharides, arſenicum ſublimatum: For all theſe weaken the native temper and conſiſtence of the part, and draw thereunto humours plainly contrary to nature.

Eſcharoticks.

Eſcharotickes or Cauſtickes are, *Calx viva, fæx vini cremata, & præcipuè aceti, ignis*, whereto are referred all Cauteries, as well actuall as potentiall, whereof wee ſhall treat hereafter.

Their uſe.

Wee uſe Cathæretickes in tender bodies and diſeaſes not very contumacious; therefore by how much they are leſſe acride & painfull, by ſo much oft-times they penetrate the deeper, for that they are leſſe troubleſome by delay; but we uſe Septickes, and ſometimes Eſcharotickes in ulcers that are callous, putride, and of inexhauſted humidity, but principally in cancers, carbuncles, and exceſſive hæmorrhagies. When as we make uſe of theſe, the patient muſt have a convenient dyet appointed, muſt abſtaine from wine: laſtly, they muſt not be uſed but with great diſcretion; for otherwiſe they may cauſe feavers, great inflammations, intolerable paines, ſwounings, gangrenes, and ſphacels. Cauteries heedfully uſed, ſtrengthen and dry the part, amend an untameable diſtemper, dull the force of poyſon, bridle putrefaction and mortification, and bring ſundry other benefits.

CHAP. XIX.

Of Anodynes, or ſuch as mitigate or aſſwage paine.

What paine is.

Before we treat of Anodyne medicines, we thinke it fit to ſpeake of the nature of paine. Now paine is a ſorrowfull and troubleſome ſenſe, cauſed by ſome ſodaine diſtemper, or ſolution of continuity. There are three things neceſſary to cauſe pain; The efficient cauſe, that is, a ſodain departure from a naturall temper or union: the ſenſibleneſſe of the body receiving the dolorificke cauſe: laſtly, the apprehenſion of this induced change, cauſed either by diſtemper or union; for otherwiſe with how exquiſite ſoever ſenſe the body receiving the cauſe is indued with, unleſſe it apprehend and marke it, there is no paine preſent. Hence is that Aphoriſme of *Hippocrates*, *Quicunq; parte aliqua corporis dolentes dolorem omninò non ſentiunt, his mens ægrotat*, that is, Whoſoever pained in any part of their bodies doe wholly feele no paine, their underſtanding is ill affected and depraved. Heat, cold, moiſture, and drineſſe, induce a ſodain change of temper; and heate and cold cauſe ſharpe paine, drineſſe moderate, but moiſture ſcarce any at all: for moiſture cauſeth not paine ſo much by its quality, as it doth by the quantity. Both the fore-mentioned qualities, eſpecially aſſociated with matter, as alſo certaine externall cauſes too violently aſſailing, ſuch as theſe that may cauſe contuſion, cut, pricke, or too much extend. Wherefore paine is a ſymptome of the touch, accompanying almoſt all diſeaſes; therefore oft-times leaving theſe, they turn the councell of the Phyſitian to mitigate them, wch is performed either by mitigating the efficient cauſes of paine, or dulling the ſenſe of the part. Hereupon they make three differences of Anodynes: For ſome ſerve to cure the diſeaſe, otherſome to mitigate it, otherſome ſtupefie, and are narcotick. We terme ſuch curative of the diſeaſes, which reſiſt, and are contrary to the cauſes of diſeaſes. Thus paine, cauſed by a hot diſtemper, is taken away by oyle of Roſes, Oxycrate, and other ſuch like things, which amend and take away the cauſe of paine, to wit, the exceſſe of heate. Paine cauſed by a cold diſtemper, is amended by *Oleum Laurinum*, *Nardinum*, *de Caſtoreo*. Paine occaſioned by too much drineſſe, is helped by *Hydræleum*, a bath of freſh and warme water. Laſtly, by this word Anodyne, taken in the largeſt ſenſe, we underſtand all purging medicines, Phlebotomy, Scarification, Cauteries, Cuppings, Glyſters, and other ſuch like things as evacuate any ſtore of the dolorificke matter. But ſuch as are properly termed Anodynes, are of two ſorts: for ſome are temperate, others hot and moiſt in the firſt degree, and conſequently, neere to thoſe that are temperate: theſe preſerve the native heate in the proper integrity, thus they amend all diſtemperatures; of this kinde are accounted Sallade oyle, oyle of ſweete

What properly termed Anodynes are.

almonds, the yolks of egs, and a few other ſuch like things, theſe ſtrengthen the native heat, that thus encreaſed in ſubſtance, it may with the more facility orecome the cauſe of paine: beſides alſo, they rarifie, attenuate, digeſt, and conſequently evacuate both groſſe and viſcide humours, as alſo cloudy flatulencies hindred from paſſing forth: ſuch are *flores chamæmeli, meliloti, crocus, oleum chamæmelinum, anethinum, oleum lini, oleum ex ſemine althææ, lumbricorum, ovorum, ex tritico, butyrum, lana ſuccida, ſuillus adeps, vitulinus, gallinaceus, anſerinus, humanus, ex anguilla, cunicula, & aliis. Lac muliebre, & vaccinum, mucago ſeminis lini, fænugræci, althææ, malvæ, vel eiuſmodi ſeminum decoctum*: as alſo *Decoctum liliorum, violariæ, capitis, pedum, & inteſtinorum arietis & hædi.*

Narcoticks improperly termed anodines.

Narcotickes, or ſtupefying medicines, improperly termed Anodines, are cold in the fourth degree, therefore by their exceſſe of cold, they intercept or hinder the paſſage of the animall ſpirit to the part, whence it is that they take away ſenſe: of this ſort are *hyoſcyamus, cicuta, ſolanum manicum, mandragora, papaver, opium, arctiſſima vincula.*

The uſe of them.

You may make uſe of the firſt ſort of Anodynes in all diſeaſes, which are cured by the oppoſition of their contraries: but of the ſecond, to expugne paines that are not very contumacious, that by their application wee may reſiſt defluxion, inflammation, the feaver, and other ſymptomes. But whereas the bitterneſſe of paine is ſo exceſſive great that it will not ſtoop to other medicines, then at the length muſt wee come to the third ſort of anodynes. Yet oft times the bitterneſſe of paine is ſo great that very narcoticks muſt be applied in the firſt place, if we would have the part and the whole man to be in ſafety. Yet the too frequent uſe of them, eſpecially alone without the addition of ſaffron, myrrh, *caſtoreum*, or ſome ſuch like thing, uſeth to be very dangerous: for they extinguiſh the native heat, and cauſe mortification, manifeſted by the blackeneſſe of the part. But intolerable paines, to wit, ſuch as are occaſioned by the exceſſe of inflammation and gangrenes, may bee ſooner mitigated by opening a veine, purging and ſcarifying the part affected, than either by properly termed anodines or narcotickes, to wit, that paine may bee the remedy of paine. By purgers we here underſtand not onely ſuch, as taken by the mouth, produce that effect, but alſo ſuch as outwardly applied performe the ſame, as thoſe whereof *Aetius* makes mention. As,

Tetrab. 1. ſem. 3. cap. 35.

Purgatives to bee externally applied.

℞. *pulpæ ſeu medul. colocynth. ſemin. eruc. rut. ſylveſt. elaterii, gr. cindii, lathyrid. expurgatar. galban. nitri, ceræ, ſingulorum,* ℥ iiii. *opopan.* ʒ ii. *terebinth.* ʒ vi. *terendaterito, & taurino felle paulatim irrigato, donec apte imbibantur.* Then apply it about the navill even to the ſhare, for thus it will purge by ſtoole; if on the contrary you apply it to the bottome of the ſtomacke, it will cauſe vomit. Another; ℞. *elaterii,* ʒ iii. *colocynth. ſcammon. ſquammæ æris, radic. cucumer. agreſt. lathyrid. an.* ʒ i. *aut pro lathyrid. tithymal. ſuccum terito & cribrato, ac cum oleo plurimum ſalis habente ſubigito; magnam inde pilam e lana confertam hoc medicamento illitam, umbilico aut lumbis applicato.* Or, ℞. *fellis taurin.* ʒ i. *gr. cindii virid.* ℥ iv. *ſucci lupinor. virid.* ℥ ii. *euphorb.* ℥ i. *pulp. colocynth. tantundem adip. vulpin. recent.* ℥ ii. *adip. viper.* ℥ ii ß. *ſtercor. muris,* ℥ iv. *ſucci pæon. caſtor. ſingulor.* ʒ iv. *ol. liguſtrin.* ℥ vi. *ol. antiq.* ℥ i. *fiat unguentum vel oleum.* It purgeth without trouble, and beſides the other commodities it alſo is good againſt diſtraction or madneſſe. Two ſpoonefulls is the greateſt quantity to be uſed at one time, for in ſome one is ſufficient: anoint with it the navill and thereabouts, and a juſt purgation will enſue thereupon, which if it ſhall flye out beyond your expectation, you may foment the belly with a ſponge moiſtened in warm wine and preſſed forth againe, and it will be preſently ſtayed. Moreover *Fernelius lib. 7. methodi*, makes mention of a laxative ointment.

The compoſition of a purging oile and ointment.

CHAP.

CHAP. XX.

Of the compoſition and uſe of Medicines.

Hitherto wee have ſpoken of the faculties of ſimple medicines, now wee thinke good to ſay ſomething of the compounding of them: for ſo by the Architect are had & known every thing apart, and then he ſettles the workemen to the building, the conceived forme of which hath beene in his minde ever ſince hee did enterpriſe it. Therefore the compoſition of divers medicaments with their qualities and effects, is a mingling appointed by the art of the Phyſitian. Hence therefore *rheum, aloe, roſa, abſinthium*, although they have divers ſubſtances and faculties, yet are notwithſtanding called ſimple medicines, becauſe they have that variety from nature, not from art. But we many times call ſimple ſuch things as are compounded by art, as *oxym. ſimpl. oxyſacch. ſimplex*, as compared to greater compoſitions. And therefore often times wee uſe compound medicines, becauſe alwaies the ſimple medicine alone, hath not ſtrength enough to oppugne the diſeaſe. For many times the ſicke labour with manifold, and not ſimple affects, from which there being taken a various indication, we gather contrary ſimple medicines, to apply to every affect, in one compoſition. But often times the nature of the part of the patient, or of the body affected, requireth another kind of medicament which may bee proper for the removing that diſeaſe; wherefore it is ſo made to oppugne the diſeaſe and not offend the body: and we mingle many other together, whoſe effects may temper one another. Moreover, the compoſition of medicines was neceſſary, that becauſe thoſe things which have not a good taſte, colour, or ſmell, by art or compoſition might be made more gratefull. Compound medicines of which we intend to ſpeak, are Glyſters, Suppoſitories, *Noduli*, Peſſaries, Oiles, Liniments, Ointments, Emplaſters, Cerats, Pultiſſes, Cataplaſmes, Fomentations, Embrocations, Epithemaes, Veſicatories, Cauteries, *Collyria, Errhina*, Sneeſing powders, Maſticatories, Gargariſmes, Dentifrices, Bags, Fumigations, Semicupiums, Baths. But firſt it is expedient that I ſay ſomething of weights and meaſures, with their notes, by which medicines commonly are meaſured and noted by Phyſitians.

Gal. 2. ſimp. 4. de ſanit. tuend.

The neceſſity of compound medicines.

CHAP. XXI.

Of weights and meaſures, and the notes of both of them.

Every weight ariſeth from a beginning and foundation, as it were; for as our bodies doe ariſe of the foure firſt ſimple bodies or elements, into which they are often reſolved: ſo all weights do ariſe from the graine, which is as it were the beginning and end of the reſt. Now hereby is underſtood a barly corne or graine, and that ſuch as is neither too dry, or overgrowne with mouldineſſe, or rancide, but well conditioned, and of an indifferent bigneſſe.

A graine the beginning of all weight.

What is meant by a graine.

Ten graines of theſe make an *Obolus*; two Oboli, or twenty graines make a ſcruple, three ſcruples, or ſixty graines make a dramme, eight drammes make one ounce, twelve ounces make one pound medicinall, which is for the moſt part the greateſt waight uſed by Phyſitians, and which they ſeldome exceed; and it is reſolved into ounces, drammes, ſcruples, *oboli* and graines, which is the leaſt weight. To expreſſe theſe weights we uſe certaine notes, the pound is expreſſed by this note, ℔. the ounce by this, ℥. the dramme thus, ʒ. the ſcruple thus, ℈. the *obolus* with the beginning letter thus, *obol.* the graine with his beginning letter thus, g. But ſometimes we meaſure the quantity of medicines by meaſures and not alwaies by weights; and therefore we expreſſe a handfull by this note, m. a pugill thus, p. number thus, n. and the halfe part of every weight and meaſure is expreſſed by this note, ß. put after every note of the aforeſaid weights and meaſures of the ſame ſort, as the halfe pound,

Obolus.
A ſcruple.
A dramme.
An ounce.
A pound.

℔ ß. the halfe ounce, ℥ ß. and ſo of the reſt. Moreover, in deſcribing the ſame medicament wee uſe the notes ſometimes of weights, ſometimes of meaſures; and therefore it is to bee noted that herbes, greene or dry, are ſigned with theſe notes, m. p. but thoſe which are dry and be brought to powder, with theſe notes, ℥. ʒ. p.

Roots,	by theſe notes,	℥. ʒ. p. m.
Barks,		℥. ʒ.
Seeds,		℥. ʒ.
Fruits,		an. p. ℥. ʒ. ℈.
Flowers,		p. m. ℥. ʒ.
Pulſes,		p. ℥. ʒ.

All other medicaments either dry or liquid, are deſcribed with theſe notes, ℔. ℥. ʒ. ℈. obol. g.

The neceſſity of compound medicines. Having expounded theſe things, let us come to the deſcription of compound medicines, beginning with glyſters firſt, as the remedy which is moſt common and familiar, and almoſt chiefly neceſſary of all others.

Chap. XXII.

Of Glyſters.

What a glyſter is. A Glyſter is an injection prepared firſt and properly for the groſſe inteſtines and fundament; for ſometimes glyſters are uſed & made for the ſtomack, ſpleen, reines, bladder, wombe, meſentery, and alſo for the head, from whence often times by ſharpe glyſters, the hurtfull matter is brought downewards, as we ſee in Apoplexies. Therefore there is no part of the body which receives not ſome benefit by glyſters, but more or leſſe according to the vicinity they have with the belly, and the ſtrength of the glyſter: Differences of glyſters. for there are divers ſorts of glyſters, ſome emollients, other evacuating, ſome anodines, ſome aſtringents, ſome cleanſing, ſome ſarcoticke, and epuloticke, and ſome may bee ſaid to nouriſh. The materials of glyſters. They are all made of the parts of plants or beaſts, with compound medicines either ſolutive or altering, and others according to the adviſe of the Phyſitian. The parts of plants which are uſed to this purpoſe, are roots, ſeedes, leaves, flowers, fruits, ſhouts, juices, mucilages. Parts of beaſts are yelkes of egges and whites, honey, chickens, capons, old cockes well beaten, heads and feet of ſheepe, the inteſtines, whey, milke, ſewet, axungia, and ſuch like in decoctions, wherein wee mingle and diſſolve ſimple and compound medicines. Wee ſometimes uſe without any other medicament, to make a glyſter with oyle alone, as oile of nuts for the Cholicke, of whey alone, the decoction of the head and feet of the ſheepe alone, and of the decoction of Cicers and barly do we prepare glyſters.

Their quantity. The quantity of a glyſter is ſometimes leſſe according to the divers diſpoſition of men and their diſeaſes: for weake children the quantity is leſſe: for women with child, and in the cholicke, dyſentery, lyentery, or when much hardened excrement is within. But when wee would abundantly move the excrement, and there is nothing that may hinder, the doſe of a glyſter for the moſt part is halfe a pound, one pound, or three quarters of a pound. The glyſter muſt bee injected warme or hot, more or leſſe, according to the nature or condition of the ſicke; for being cold it offends the inteſtines, and the neighbouring nervous parts, which are cold of themſelves. It muſt bee given by degrees, for being injected ſodainely, the winde which is uſually in the guts will beat it backe againe, whence comes intolerable pain. But this will bee more cleere by that wee ſhall teach concerning the differences of glyſters, whereof there ſhall be ſufficient examples-

An emollient glyſter. ℞. *malv. violar. biſmalv. acanth. an.* m i. *radic. alth. lilior. an.* ℥ i. *paſſul. ficuum ping.* ℥ ß. *fiat decoctio ad* ℔ i. *in qua diſſolve caſſ. butyr. recent. an.* ℥ i. *ol. viol.* ℥ iii. *fiat clyſter.*

A Glyſter to evacuate a cold phlegmaticke humour.

Glyſters, that doe evacuate, are prepared by the councell of the Phyſitian, and of divers Simples, being boyled for ſeverall purpoſes. Therefore if the humours bee cold which are to bee evacuated, the Glyſter ſhall be after this manner: ℞.*Salviæ, origani, abrotoni, chamæm.melilot.an.*m.ß.*ſeminum aniſi, fœnic.cumini, an.*ʒiii.*ſemin. carthar.*ʒii. Make a decoction of them, wherein diſſolve *Diaphon.Hier.Simpl.an.*℥ß.*ol.aneth.chamæm.an.*℥i.ß.*Mellis Antho.ſach.rub.an.*℥.i.*fiat Clyſter.*

To evacuate Cholericke matter, prepare a Glyſter after this manner.

℞.*quat.remollient.pariet:Cichor:endi.an.*m.ß.*Semin.quat.frigid. Major.an.*ʒiii.*hordei integri* p.i. Make a decoction of them, and diſſolve in it *Caſſ.*℥.i.*Ol.viol.mellis viol.an.*℥ii.*fiat Clyſter.*

To evacuate melancholy, this Glyſter following will be uſefull.

℞.*Fumiter.Centaur.minoris, Mercurialis, an.*m.i. *Polyp. Qu.folicul.ſennæ, an.*ʒiii. *ſeminis agni caſti, Thymi, an.*ʒii. Make a decoction, and diſſolve therein, *Confect.Hamech.*℥ß.*Caſſ.recens extract.*ʒiii.*olei violati, lilior.an.*℥ß.*Sach.rub.mellis viol.an.*℥iß.*ſalis*, ʒi. And thoſe Glyſters doe not only evacuate the humours that offend, but alſo correct the diſtemper of the bowels and inward parts. For the Glyſters deſcribed againſt pituitous and melancholy matter, helpe the cold diſtemper; but that which is for choler, the hot diſtemper. Purging medicines, which are diſſolved in the decoctions of Glyſters, are very ſtrong, as, *Confect.Hamech.Benedicta, Diaprun. Solutivum, Diaphænicon*, being uſed from ʒ.vi.to ℥i.at moſt: but the weaker and more gentle are *Catholicon. Caſſia, Hiera ſimplex*, from ʒvi.to ℥ii.at moſt.

An Anodyne Glyſter is uſually made without ſuch things as
purge or evacuate: as,

An Anodyne Glyſter.

℞.*Flor.Chamæm.melil.Aneth.an.*p.i.*rad.Biſmal.*℥.i. boyle them in Milke, and to the decoction adde *Mucaginis ſeminis lini fœnugræci extractæ in aqua Malvæ* ℥ ii.*ſachari albi, olei anethi, chamæmeli, an.*℥i.*vitellos ovorum duos, fiat Clyſter.* Theſe Glyſters ſhould be kept longer in the body, that ſo they may more eaſily mitigate paine.

The example of an aſtringent Glyſter.

An aſtringent Glyſters.

℞.*Equiſeti, plantag.poligani.an.*m.i. boyle them *in lacte uſtulato*, to ℥xii.to the decoction ſtrained adde *Boli armeni, ſanguinis draconis, an.*ʒii.*olei roſati*, ℥ii.*album. ovorum duorum, fiat Clyſter.* We uſe theſe kinde of Glyſters in Dyſenteries, and in the immoderate fluxe of the Hemoroid veines, having firſt evacuated the uſuall excrements. Glyſters, which be ſarcoticke, epuloticke, and cleanſers of the greater guts, and fit for the curing of ulcers, are to be prepared of ſuch medicines as are deſcribed before in their proper Chapters.

Nouriſhing Glyſters.

Alimentary Glyſters are made of the decoction of Chickens, Capons, Cockes, being boyled to a gelly, and ſtrongly preſt forth. They are alſo prepared of Marrow, gelly, which are not altogether ſo ſtrong as thoſe which are commonly taken by the mouth, becauſe the faculty of concoction in the guts, is much weaker than that of the ſtomacke. Oftentimes alſo the matter of theſe kinde of Glyſters are prepared in wine, where there is no paine of the head or feaver, but more frequently in the decoction of Barley, and in Milke, adding the yelkes of Egges, and ſome ſmall quantity of white Sugar, leſt by the cleanſing faculty it move the guts to excretion. And therefore Sugar of Roſes is thought better, which is conceived to bee ſomewhat binding. Here you may have examples of ſuch Glyſters. ℞.*Decoctionis Capi perfectè cocti* ℔.i.ß.*ſachari albi*, ℥ß.*miſce, fiat Clyſter.* ℞.*Decocti Pulli & Galatinæ, an.* ℔ ß. *vini opt.*℥iv.*fiat Clyſter.* ℞.*Decocti hordei mundati, & in cremorem redacti* ℔.ß.*lactis boni* ℔.i.*Vitellos ovorum duos, fiat Clyſter.* We uſe theſe kinde of Glyſters to ſtreng-

Their uſe.

then

Their Argument that deny Glyſters to nouriſh. Confuted firſt by reaſon.

Secondly, by experience.

then children, old and weake men, and bodies which are in a Conſumption. But in the uſe of theſe there are three things to be obſerved: Firſt, that the fæculent excrements be taken away, either by ſtrength of nature, or by art, as by a ſuppoſitory, or an emollient Glyſter, leſt the alimentary matter, being mingled with them, ſhould ſo be infected and corrupted. The other is, that there be great quantity given, that ſo ſome may aſcend to the upper guts. The third is, that the ſicke ſleep after the taking of it; for ſo it is more eaſily converted into nouriſhment, and the alimentary matter is better kept: for ſleep hindereth evacuations. In Glyſters of this kinde wee muſt beware of Salt, Honey, and Oyle; for the two firſt provoke excretion by their acrimony, and the laſt by his humidity doth relaxate and lubricate. They, who thinke no kinde of Glyſter can nouriſh or ſuſtaine the body, relye upon this reaſon: That it is neceſſary whatſoever nouriſheth, ſhould have a triple commutation or concoction in the body: firſt, in the ſtomacke; ſecondly, in the liver: thirdly, in all the members. But this opinion is repugnant to reaſon and experience: to reaſon, for that a certaine ſenſe of ſuch things as are defective, is implanted in all and every of the naturall parts of our body. Therefore ſeeing nutrition is a repletion of that which is empty, without doubt the empty and hungry parts will draw from any place that nouriſhment which is fit and convenient for them, and in defect thereof, whatſoever they meet with, which by any familiarity may aſſwage and ſatisfie their deſire. But the alimentary Glyſters, by us deſcribed, conſiſt of things which agree very well with the nature of our bodies, and ſuch as are boyled and ordered with much art, ſo to ſupply the chylification to bee performed in the ſtomacke. Therefore they may be drawne in by the meſeraicke veines of the guts, which, according to *Galen*, have a certaine attractive faculty. And thence they may bee eaſily carried through the gate veine, liver, and ſo over the whole body. And experience teacheth, that many ſick people, when they could take nothing by the mouth, have bin ſuſtained many daies by the helpe of theſe kinde of Glyſters. What is more to bee ſaid? We have ſeen thoſe who have taken a Suppoſitory by the fundament, and vomited it at the mouth; by which it alſo appeareth, that ſomething may flow without danger of the ſicke from the guts into the ſtomacke.

Commonly they give Glyſters any houre of the day, without any reſpect of time, but it ſhould not be done unleſſe a great while after meales, otherwiſe the meate, being hindered from digeſtion, will be drawne out of the ſtomacke by the Glyſter.

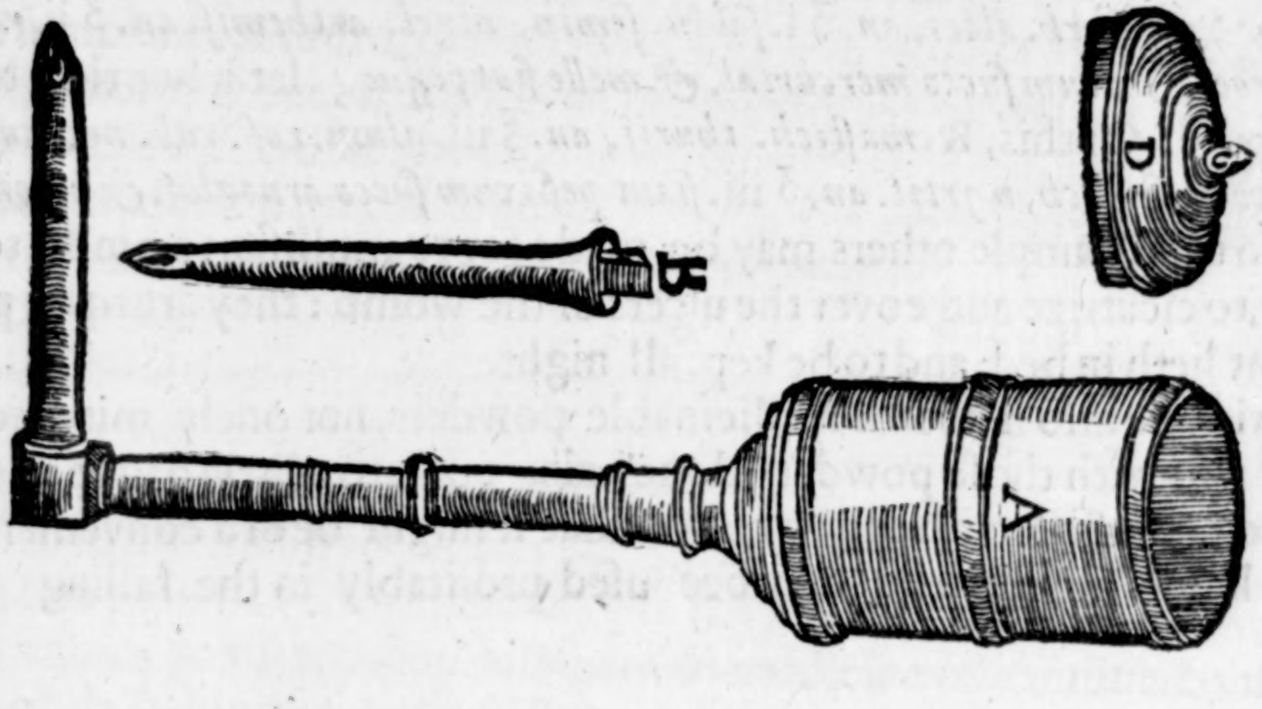
The common uſe of Glyſters.

The ſicke, having received the Glyſter, muſt turne to the ſide grieved.

Glyſters are uſed to helpe the weaker expulſive faculty of the guts, and by conſequence alſo of the other parts, both that ſuch as through want of age, and old people, and ſuch as by reaſon of great imbecility by ſickneſſe cannot admit of a purging medicine, may by this meanes at leaſt eaſe themſelves of the trouble and burden of hurtfull humours. *Galen* hath attributed to Storkes the invention of Glyſters, which with their bils, having drunke Sea water, which from ſaltneſſe hath a purging quality, waſh themſelves by that part, whereby they uſe to bring away the excrements of their meates, and of the body. But a Glyſter is fitly taken after this maner: whileſt the Syrenge is expreſſed, let the patient hold open his mouth; for by this means all the muſcles of the *Abdomen*, which helpe by compreſſion the excretion of the guts, are relaxed. Let him weare nothing that may gird in his belly, let him lye upon his right ſide, bending in a ſemicircular figure; and ſo the Glyſter will the more eaſily paſſe to the upper guts, and (as it were) by an overflowing, wet and waſh all the guts and excrements. It hapneth otherwiſe to thoſe who lye upon their left ſide; for the Glyſter being ſo injected, is conceived to abide, and (as it were) to ſtop in the *Inteſtinum rectum*, or *Colon*, becauſe in this ſite theſe two Inteſtines are oppreſſed, and as it were ſhut up with the weight of the upper guts. A little while he may lye upon his backe after hee have received the Glyſter, and preſently after hee may turne himſelfe on either ſide. And if there be paine in any part, ſo long as he is able he may incline to that ſide. Moreover, becauſe there are many, who cannot by any reaſon bee perſwaded to ſhew their buttockes to him that ſhould adminiſter the Glyſter, a fooliſh ſhamefaſtneſſe hindering them: therefore I thought good in this place to give the figure of an Inſtrument, with which one may give a Glyſter

ſter to himſelfe, by putting up the pipe into the fundament, lifting the buttockes a little up. The pipe is marked with this Letter *A*. The body of the Syrenge, whereinto the Glyſter muſt be put, with this Letter *B*.

The figure of a Glyſter pipe and Syrenge, by benefit whereof a man may give himſelfe a Glyſter.



CHAP. XXIII.

Of Suppoſitories, Nodules, and Peſſaries.

A Suppoſitory is a certaine medicament, formed like unto a tent, or gobbet of paſte, ſuch as is commonly uſed to fat Fowle. It is put up into the fundament, that it might excite the ſphincter muſcle to ſend forth thoſe excrements which are kept in the guts. Antiently it had the forme of an Acorne, whence it is called to this day *Glans*. The Suppoſitories we now uſually make have the forme of a Peſſary, that is, round and longiſh, in the forme of a waxe Candle. They are either weake, ſtronger, or ſharpe; the weake are made of the ſtalkes or the rootes of Beets, of Lard, boiled Honey with Salt, or of Caſtle-ſope. The ſtronger of purging powders, as, *Hiera* with Salt and Honey. The ſharp with Scammony, *Euphorbium, Coloquintida*, and like things powdred, and with Honey, or the juices of ſharpe herbes, or mingled with the gals of Beaſts. It is commonly made thus: as, ℞. *Mellis* ℥i. *Salis aut pulveris alterius irritantis* ʒi.

The differences.

The forme.

℞. *Mellis cocti* ℥i. *pul. Colocynthidos* ℈ß. *Salis gemmæ.* ℈i. *fiat Suppoſitorium.* Wee uſe Suppoſitories, when the ſicke by his infirmity is unwilling, or not able to beare or away with a Glyſter, as in burning Feavers: or, when as one being injected, is ſlow, and reſteth in the guts. And we uſe the ſharper Suppoſitories in ſeporiferous affects of the head, that they might provoke the dull faculty of the guts to expulſion. As alſo, when the condition of the diſeaſe is ſuch, that by the uſe of Glyſters there is manifeſt hurt; as, in an *Enterocele*, where the gut ſo ſwels, that over and above it be filled by the glyſter infuſed, it would the more preſſe the *Peritonæum*, ſo that ſtraightwaies by the relaxed or broken part it might eaſily be devolved into the Codde.

The uſe.

Nodules have the ſame uſe with Suppoſitories, and are oftentimes ſubſtituted in ſtead of Glyſters. They are made of gentle medicines, as the yelkes of Egges with a little Salt and Butter, or of Gall and Honey tyed up in a cloth in the forme of a Filbert, the ſtring of it may hang forth, whereby the Nodule in the fundament may be drawne forth. This deſcription may be an example of Nodules: ℞. *Vitellum unius ovi, cui adde ſalis modicum, fellis vervecis, mellis an.* ℥ß. *butyri* ℥iii. *miſce, fiant Noduli filo appenſi.*

The forme of a Nodule.

A Peſſary is groſſer than a Suppoſitory, and is appointed for the wombe, being made with Cotton-wooll or Silke ſteeped in ſome medicament, and then put into the necke of the wombe.

Peſſaries.

A Peſſary

Their uſe. A peſſary is uſed either to ulcers of the necke of the wombe, or for the procuring, or ſtopping of the *Menſtrua*, or againſt ſordide and hurtfull humours of the wombe cauſing hyſtericall paſſions, and therefore to be waſted away and evacuated. Therefore in the compoſition of peſſaries are uſed gummes, juices, ſeeds of herbes, roots, and many other things, according to the adviſe of the Phiſitian; they are alſo made of a ſolide conſiſtence, the bigneſſe of a finger, that they may enter into the necke of the wombe; theſe being tyed with a ſtring, which muſt hang forth to plucke it out withall when occaſion ſerves. This following may be an example of their deſcription. ♃. *myrrh. aloes, an.* ʒ i. *ſabin. ſemin. nigel. arthemiſ. an.* ʒ ii. *radic. ellebor. nig.* ʒ i. *croci*, ℈ i. *cum ſucco mercurial. & melle fiat peſſus*; let it bee tied to the thigh with a thread. Or this, ℞. *maſtich. thurii, an.* ℥ iii. *alum. roſ. rub. nuc. cupreſ. an.* ʒ ii. *ladan. hypoci. ſumach, myrtil. an.* ʒ iii. *fiant peſſi cum ſucco arnogloſ. & cotoniorum.* According to this example others may be made for to mollifie, to binde, to cleanſe, to incarnate, to cicatrize and cover the ulcers of the womb: they are to be put up when the patient lieth in bed, and to be kept all night.

Peſſaries are alſo made of medicinable powders, not onely mingled with ſome juice, but alſo with thoſe powders alone being put into a little bagge of ſome thinne matter, being ſtuffed with a little cotton that it might be of a convenient ſtiffeneſſe, and this kinde of peſſaries may bee uſed profitably in the falling of the mother.

An example of onē mentioned by Rondeletius *in his booke of inward Medicines, is as followeth.*

Againſt the ſuffocation of the Mother. ℞. *Benioini, ſtyracis, caryoph. an.* ʒ i. *gal. moſch.* ℥ ß. *moſchi*, gr. vi. *fiat pulvis*; this being made up with cotton may be put up into the body.

CHAP. XXIV.

Of Oyles.

PRoperly and commonly we call oile that juice which is preſſed forth of Olives; but the word is uſed more largely, for we call every juice of a fluxible, unctuous, and aiery ſubſtance, Oyle. There are three differences of theſe oleaginous juices: The firſt is of thoſe things which yeeld oile by expreſſion, as well fruits as ſeeds being bruiſed, that by beating the oily juice may be preſſed forth; ſome are drawn without fire, as oile of ſweet and bitter almonds, oyle of nuts, of *palma Chriſti*. Others are made to runne by the helpe of fire, by which meanes is gotten oile of baies, linſeed oyle, rape oyle, oile of hempe, and ſuch like: The manner of drawing oile from ſeeds is ſet downe by *Meſue* in his third booke.

The making oiles by infuſion. The ſecond ſort is of thoſe oyles which are made by the infuſion of ſimple medicines in oyle, wherein they leave their qualities: and this is done three ſeverall waies, the firſt is by boyling of roots, leaves, tops of flowers, fruits, ſeeds, gummes, whole beaſtes, with wine, water, or ſome other juice, with common, or any other oile, untill the wine, water, or juice bee conſumed, which you may perceive to bee perfectly done, if you caſt a droppe of the oyle into the fire, and it maketh no noiſe but burneth. It is to be remembred that ſometimes the ſeeds or fruits are for a certaine time to be macerated before they are ſet to the fire; but it muſt bee boiled in a double veſſell, leſt the oyle partake of the fire.

After this manner is made *oleum coſtinum, rutaceum, de croco, cydoniorum, myrtillorum, maſtichinum, de euphorbio, vulpinum, de ſcorpionibus*, and many others. The ſecond is by a certaine time of maceration, ſome upon hot aſhes, others in horſe dung, that by that moderate heat the oile might draw forth the effects of the infuſed medicines into it ſelfe. The third is by inſolation, that is, when theſe or theſe flowers, being infuſed in oile, are expoſed to the ſunne, that by the heat thereof the oile may change, and draw into him ſelfe the faculty of the flowers which are infuſed: of this kinde are oile of roſes, chamomile, dill, lillies, of water lillies, violets, and others, as you may ſee in *Meſue*.

The third kinde is properly that of the Chimiſts, and is done by reſolution made after divers manners, and of this ſort there are divers admirable qualities of divers oleaginous juices, whether they be made by the ſunne or fire, or putrefaction, as we ſhall ſpeake in his place hereafter.

The manner of oiles by reſolution.

Wee uſe oiles when wee would have the vertue of the medicament to pierce deepe, or the ſubſtance of the medicines mingled with the oile to bee ſoft and gentle. Moreover, when wee prepare oiles that ſhould be of a cooling quality, the common oile of the unripe Olive is to be uſed: of that ſhould the oile of roſes be made.

Againe, when we would prepare oiles of heating qualities, ſuch as are *Oleum philoſophorum*, or of Tiles, ſweet and ripe oile is to be choſen.

CHAP. XXV.

Of Liniments.

A Liniment is an externall medicine of a meane conſiſtence, between an oile and an ointment, for it is thicker than an oile; for beſides oile it is compounded with butter, axungia, and ſuch like, which is the reaſon why a liniment is more efficacious in ripening and mitigating paine, than ſimple oile. The varieties of liniments is drawn from their effects, ſome coole, others heat, ſome humect, ſome ripen, others by compoſition are made for divers uſes. The matter whereof they are uſually made, is oile, axungia, ſewet, butter, all thoſe things which have an oily ſubſtance or conſiſtence, as *ſtyrax liquida*, turpentine, the mucilages of fenugreeke, marſh-mallowes, marrow, and other like. To theſe are ſometimes added powders of rootes, ſeedes, flowers, rindes, metals, but ſparingly, that the liniment may be of a liquid conſiſtence.

What a liniment is.

An example of a liniment that is good to attenuate, heat, and digeſt, is this that followeth.

℞. *ol. amygd. amar. lilior. an.* ℥ i. *axung. anat. gallin. an.* ℥ ß. *butyr. ſal. expert.* ℥ i. *mucag. ſem. alth. fœnugr. extract. in aq. hyſſop. an.* ʒ ß. *pulver. croci, ireos, an.* ℈ i. *fiat linimentum.*

This may be an example of a liniment to humect and mollifie.

℞. *ol. amygd. dulc.* ℥ ii. *axung. human.* ʒ ß. *mucag. ſemin. malv. extract. in aq. parietar.* ℥ ß. *fiat linimentum*: you may adde a little ſaffron. There bee many others like theſe which may be made for divers affects. They are eaſily applied to every part of the body, becauſe they are not ſo liquid as oiles: the reaſon is, they are more agreeable to any of the parts. If they be to enter into any crooked narrow paſſage, ſuch as the eare, they muſt be more liquid, and have more oile: if they be to ſticke on the part, they will admit of more axungia and ſewet.

They are deceived who thinke that the difference betweene liniments and ointments is, that there is no waxe in liniments as there is in unguents; for there be ſome unguents which admit not any waxe to bee added, as *ægyptiacum*, and all ſuch as are uſed in gangrenes, and all ſorts of putride ulcers; becauſe to theſe kinds of diſeaſes all fatty things, as oiles, fats, roſines, and waxe, are enemies. Therefore wee ſubſtitute in the place of them in *ægyptiacum*, hony and verdigreace; for of theſe it hath his conſiſtence, and his quality of cleanſing.

CHAP.

Chap. XXVI.

Of Ointments.

Oyntments & their differences.

OYntments are of a more ſolid conſiſtence than Liniments, and are therefore of more force. Their differences are partly taken from their effects; for ſome heate, others coole, ſome dry, and ſome humect, ſome cleanſe, ſome corroborate, ſome waſte dead fleſh, and others cicatrize, partly from the variety of colours, partly from the firſt invertors, as, *Album rhaſis, Deſiccativum rubrum*: partly from the number of the ſimple medicaments whereof they bee made, as, *Tetrapharmacum, Tripharmacum*, or *Nutritum*: partly from that medicament which is principall in the compoſition, hence are they called, *Unguentum de Lythargyro, de Minio, Diapompholigos*, and ſuch like. They are compounded of herbes, rootes, ſeedes, fruits, mettals, and parts of Beaſts; the juices and other liquid things being conſumed away by boyling, as we have ſaid in the Chapter of compound Oyles. Herbes, and the parts of them, if they be dry, muſt be powdred, and alſo mettals; but being greene, they are boyled and ſtrained forth, and the juice ſo preſſed is waſted by boyling. Gums and Roſins ſome are powdred, others being put to ſome convenient liquor are diſſolved by fire: So Waxe is diſſolved in the Oyle. In the compoſition of unguents this proportion is uſually obſerved, that for one ounce of powder, two ounces of Waxe, and eight of Oyle is added: notwithſtanding for that Waxe ſerveth onely to the conſiſtence of the oyntment, it is better to leave the quantity to the will of the Apothecary; but he may be more ſparing in adding Waxe to the oyntments in the Summer than in Winter: for the heate of Summer, drying them, addeth to the conſiſtence; by examples propounded, theſe common preceps will more plainly appeare.

Unguentum adſtringens.

℞. *Olei roſ.*℥iv. *pil. lepor. bol. armen. terræ ſigil. an.*ʒi. *bal. Gallar. an.*ʒß. *tritis terendis, & ſimul mixtis, addita cera quod ſufficit, fiat unguentum.* Here wee muſt obſerve, that there bee three waies of making Oyntments: The firſt is of thoſe which are made only by ſtirring or grinding in the Mortar without any fire, and ſo is made *Unguentum nutritum*. The ſecond is, when we diſſolve Waxe in Oyle, Fat, or ſome ſuch ſubſtance with fire: and being all diſſolved, wee mingle the powders according to the proportion we noted before. After which manner are made *Unguentum Aureum, Baſilicon, Diapompholigos, Deſiccativum rubrum, Enulatum.* The third ſort is, when we bruiſe herbes with a Peſtell, and mingle them with Axungy, boyling them together, and then ſtraining them, and the Oyntment is that which is ſtrained. Therefore let us proceed to explaine this by examples.

Unguentum nutritum.

℞. *Lythar. auri triti & loti* ℔ß. *olei roſ.*℔.i. *aceti roſ.*℥iv. *fiat Unguentum.* Firſt, wee put the Lytharge into the Mortar, powring in a little Oyle, and working it with a Peſtell, that it may grow thicke, then with the Oyle we put a little Vinegar, continually working, untill they mingle into one body, now and then betweene whiles adding ſometimes a little Oyle, ſometimes a little Vinegar, untill the whole bee brought to the conſiſtence of an Oyntment. If of an Oyntment of this kinde thou wouldſt make a blacke plaſter, by degrees conſume all the Vinegar, ſo ſhall the plaſter ſhine and grow blacke.

Unguentum aureum.

℞. *Ceræ citr.*℥vi. *olei boni* ℔.ii. *tereb.*℥ii. *reſin. & coloph. an.*℥iß. *olib. maſtich. an.*℥i. *croci*, ʒi. *fiat Unguentum.* Firſt, diſſolve the Waxe with a good part of the Oyle, then adde the Roſin and Colophony broken ſmall. Theſe being diſſolved, take the compoſition from the fire, and then adde the Turpentine; when the whole is ſomewhat cooled, adde the *Olibanum* and Maſticke being finely powdred, then the Saffron, which ſhall be macerated in the reſt of the Oyle.

Ung. Tetrapharmacum, ſeu Baſilicum.

Tetrapharmacon is ſo called, becauſe it is made of foure ſimple medicines, Waxe, Roſin, Pitch, Tallow, of each a like quantity, and ſo equally mixed.

℞. *Reſin. picis nigr. adip. vituli. & ceræ an.*℥ii.ß. *Olei veteris olivarum maturarum*, ℔iß. or if you would have it harder, ℔i. that oyntment alſo is called *Baſilicon*, the

Waxe being cut ſmall and diſſolved in Oyle, then adde the reſt of the things, which being diſſolved, thou ſhalt have the deſired oyntment.

Ung. Diapompholygos.

℞. *Olei roſ.*℥ix.*cer.alb.*℥iii.*ſucci ſolani hortenſis*, ℥iv. *Ceruſ.lot* ℥i. **Pompholygos**, *plumbi uſti & loti, olib.puri, an.*℥ß.*fiat Unguentum.* Diſſolve the Waxe in the Oyle with a gentle fire, then you ſhall take it from the fire, and adde to the reſt of the ingredients, working them together in a ſtone Mortar, powring on the juice by degrees, at leaſt ſo much of it as will incorporate.

Vng. deſiccativum rubrum.

℞. *Lap.calam.ter.ſig.an.*℥ii.*Litharg.auri, ceruſ.an.*ʒiß. *Camphor.* ʒß. *ceræ*, ℥iiß. *Olei roſat.viol.an.*℥iii.*fiat Unguentum.* Diſſolve the Waxe in the Oyle, then ſet it to coole, and worke in the powders with a ſpatter, and at laſt adde the Camphor diſſolved in a little Oyle of Roſes, or Roſewater.

Ung. Enulatum.

℞. *Rad.enul.campan.coct.cum aceto & contuſ.ut decet* ℔ß. *Axung.porci, olei commu. an.*℥iß.*argen.vivi extincti, & tereb.lot.an.*ʒi.*ſal.commu.pulverati*, ʒii. incorporate them according to art. The boyled rootes muſt be drawne through a Sieve, which being boyled by a gentle fire with the *Axungia*, muſt bee continually ſtirred, then put to the Salt with Oyle & Waxe: when you ſet it from the fire to coole, then adde the Quickſilver, being killed with a little *Axungia* and Turpentine.

Vng. album Rhaſis.

℞. *Olei roſat.* ℥ix. *ceruſ.alb.*℥iii.*cer.alb.*℥ii. make it thus: Let the Ceruſſe bee finely powdred, and put into the Oyle and Waxe whilſt it is hot, and ſo worke the whole together, untill they ſhall be brought into a body.

De Althæa.

℞. *Rad. Ath.*℔i.*ſemi.lini, fænugr.an.*℔ß.*Scillæ* ℥iii. *Olei com.*℔ii.*cer.*℔ß. *terebinth. gum.heder.galb.an.*℥i.*coloph & reſin.*℥iii. The rootes and ſeeds being bruiſed, are infuſed for three dayes in five pintes of water; boyle them untill three ounces be conſumed, and then draw forth the Mucilage, and boyle it with the Oile, then adde Waxe cut ſmall: theſe being taken from the fire, the *Galbanum* being diſſolved with Vinegar, & mingled with the Turpentine, muſt be added together with the Gumme *Hederæ*, Colophony, and Roſin.

Vng. Populeum.

℞. *Ocul.populi arb.*℔iß.*fol.papaveris nigr. Mandrag. hyoſcyami, lactucæ, ſempervivi parvi & magni, violæ nigræ, ſolani, umbilici veneris, ſeu cymbalar. bardanæ, an.*℥ß. (*Cordus, Fernelius, & Nicolaus ſingulorum* ℥iii.*præſcribunt*) *Adipis ſuilli recentis ſalis expertis*, ℔ii.*vini boni*, ℔i. *fiat Unguentum.* The Poplar buds and Violet leaves muſt be bruiſed and macerated in the *Axungia* for the ſpace of two moneths, that is, untill the reſt of the herbes be ready; for they cannot bee gathered before the Summer time, but the Poplar buds and Violets may be had in March. They muſt be bruiſed and mingled very well, and ſet in a warme place for eight dayes; then adde one pinte of ſtrong Vinegar, and boyle them till it be conſumed, which may bee perceived by caſting a little of it into the fire, then ſtraine it forth, and put up the Oyntment.

Vng. Apoſtolorum.

℞. *Tereb.cer.alb.reſ.an.*ʒxiv. *Opopanacis, floris, ſeu viridis æris* (*nam hic flos æris non propriè accipitur pro granulis, quæ ſcintillarum inſtar ab ære exiliunt dum à fabris ferrariis aqua tingitur: ſed pro viridi æris uſurpatur, cujus contra maligna ulcera notæ ſunt vires, contra quæ omninò id Unguentum eſt comparatum*) *an.*ʒii.*ammon.*℥xiv.*ariſtol.lon. thuris maſculi an.*ʒvi.*myrrhæ & galbani an.*ʒiii.*bdellii*, ʒvi. *Litharg.*ʒix. *olei*, ℔ii. *fiat Unguentum.* The Litharge is to be mingled with two ounces of Oyle for the ſpace of five houres, and with a gentle fire to be boyled untill it come to the conſiſtence of Honey, and be alwayes ſtirring, leſt it burne: being taken from the fire and warme, the Waxe and the Roſin, being diſſolved, with the reſt of the Oyle, muſt be added. Then put to it, when it is cooling, the Gummes diſſolved in Vinegar, boyled and incorporated with the Turpentine. Then the *Ariſtolochia*, Myrrhe, and Frankinſenſe are to be mingled, and laſt of all the Verdigreaſe, being in fine powder, and ſprinkled in: and ſo the unguent is made.

Comitiſſæ.

℞. *Cortic.median.caſtan. cortic.median.querc. cortic.median. gland. mirtil.equeſ.cortic. fabar. acinor.uvar. ſorbor. ſiccor. immatur.meſpillor.immaturor.rad.chelidon.folior. prunor. ſilveſt.an.*ʒiß. *Aquæ plantaginis*, ℔viii. *cer.nov.* ℥viiiß. *olei myrtillor.*℔iiß. Then theſe things which follow, being finely powdred, are to be ſprinkled in.

℞. *Pulveris corticis mediani caſtan. corticis mediani gland. cortic. median. arb. gland. id eſt, querc. gallar. an.*℥i. *Cineris oſſ. cruris bovis, myrtill. acinor. uvar. ſorbor. ſiccor. an.*℥ß.

Trochiſcorum de carabe, ℥ii. *fiat Unguentum.* First, make a decoction *corticis mediani arboris quercus, acini uvar. rad. chelid. meſpil. ſorbor. equiſ. ſeminis myrtil. folior. pruni ſylveſtris, cort. fabar. cortic. mediani gland. cortic. caſtan. & gallar.* in the Plantaine water for the ſpace of two houres, then ſtraine it, and divide the liquor into nine parts, waſhing the Waxe, diſſolved with the Oyle of Myrtils ſeven times; the liquor being all ſpent, and the Waxe and Oyle being melted, then inſperge the powders, *Cruris bovis, oſſium, cortic. median. querc. median. cortic. gland. caſtan. gallar. ſorbor. meſpil. ſeminum myrtil. acinor. uvar.* and at laſt the Trochiſces *carab.* after this manner ſhall you make this Oyntment.

Ung. pro ſtomacho. ℞. *Olei abſinth. maſtich. de ſpic. roſat. an.* ℥ß. *pulver. abſinth. roſ. major. menth. an.* ʒi. *Caryoph. cinam. maſtich. galang. an.* ʒi. Powder thoſe things which are to bee powdred, and with a ſufficient quantity of Waxe make a ſoft oyntment, wherewith let the ſtomacke be annointed one houre before meales continually.

Ung. ad morſus rubioſos, ex li. 1. Gal. de comp. ſec. genera. ℞. *Cer. alb* ℔ii. *ceruſ. litharg. auri, an.* ℔i. *myrrh. medull. cervi, an.* ʒii. *thuris,* ℥i. *olei,* ℔ß. Boyle the Litharge in the oyle to a meane conſiſtence, then adde to the Waxe & Ceruſſe, and when it will not ſticke to the fingers, take it from the fire, and put in the *Medulla*, when it beginneth to coole, the *Myrrha* and *Thus*, being finely powdred, muſt be caſt in by little and little, and the oyntment may be put up for uſe. The chops of the fundament, and remollient Peſſaries are likewiſe made of it, and it is very good againſt the bitings of madde Dogges, and the punctures of nerves and tendons, keeping wounds ſo that they doe not agglutinate.

3. De comp. med. ſec. gen. ℞. *Picis pinguis,* ℔i. *Opopanacis in aceto forti, oleo liliorum, & veteri porci axungia cocti,* ℥iii. *fiat Unguentum. Oleum ex ſinapi* is good againſt thoſe bitings of mad beaſts and punctured nerves: for it doth open wounds when they are cicatrized. Oyntments are uſed to overcome the contumacy of a ſtubborne evill by their firme and cloſe ſticking to, eſpecially if there ſhall need no medicine to goe further into the body.

CHAP. XXVII.

Of Cerats and Emplaſters.

What a Cerat is. *The differences.* Such affinity there is in the compoſition of a Cerat and Emplaſter, that oftentimes the one is taken for the other, as is uſually done in Oyntments and Liniments. A Cerat is a compoſition more ſolide and hard than an oyntment, and ſofter than a plaſter, having his name from Waxe, which taking away the fluidneſs of the oyle, bringeth him to his conſiſtence. The differences of Cerats are taken ſome from the parts by which they are called, as *Ceratum ſtomachicum*: ſome from the effects, as *Ceratum refrigerans Galeni*: Others from the ſimple medicaments which are the chiefe in the compoſition, as, *Ceratum Santalinum.* The proper matter of Cerats is, new Waxe & Oyles, being appropriated to the griefe of theſe, or thoſe parts; ſo that Liniments & Oyntments doe ſcarce differ from Cerats, if they admit of Waxe: for if oyntment of Roſes ſhould have Waxe added to it, it were no longer an oyntment, but a Cerat.

Cerats, which are made with Roſins, Gummes, and Metals, doe rather deſerve the names of Emplaſters than Cerats. And therefore *Ceratum ad Hernias*, we commonly call *Emplaſtrum contra Rupturam.* If that paine or inflammation do grieve any part, we make Cerats of plaſter, diſſolved with Oyle, leſt that the more hard and heavie conſiſtence of the Emplaſter ſhould be troubleſome to the part, and hinder perſpiration: and therefore laying aſide the compoſition of Cerats, let us ſpeake of Emplaſters.

Emplaſters. An Emplaſter is a compoſition which is made up of all kinde of medicines, eſpecially of fat and dry things, agreeing in one groſſe, viſcous, ſolid, and hard body ſticking to the fingers. The differences of Emplaſters are taken from thoſe things, which the variety of oyntments are taken from. Of thoſe things which goe into the compoſition of an Emplaſter, ſome are only uſed for their quality and faculty, as

Wine, Vinegar, Juices. Others to make the conſiſtence, as Litharge (which, according to *Galen*, is the proper matter of Emplaſters) Waxe, Oyle, and Roſin. Others be uſefull for both, as, Gums, Metals, parts of beaſts, Roſin, as Turpentine to digeſt, to cleanſe, and dry. Of Emplaſters, ſome are made by boyling, ſome are brought into a forme without boyling; thoſe which bee made without fire, doe ſodainly dry, nor are they viſcous: they are made with meale and powder, with ſome juice, or with ſome humid matter mingled with them. But plaſters of this kind may rather bee called hard oyntments, or cataplaſmes: for plaſters properly ſo called are boyled, ſome of them longer, ſome ſhorter, according to the nature of thoſe things which make to the compoſition of the Emplaſter: Therefore it will bee worth our labour to know what Emplaſters doe aske more, or which leſſe boyling. For roots, woods, leaves, ſtalkes, flowers, ſeeds, being dryed, and brought into powder, are to be added laſt, when the plaſter is boyled as it were, and taken from the fire, leſt the vertue of theſe things be loſt. But if greene things are to be uſed in a compoſition, they are to be boyled in ſome liquor, and being preſſed forth, that which is ſtrained to be mingled with the reſt of the compoſition; or if there be juice to be uſed, it is to be bruiſed and preſſed forth, which is ſo to be boyled with the other things, that nothing but the quality is to remaine with the mixture, as wee uſe to doe in *Empl. de Janua, ſeu Betonica, & Gratia Dei.* The ſame is to bee done with Mucilages, but that by their clammineſſe they do more reſiſt the fire. But there doth much of oyle and honey remaine in plaſters when they are made. Thoſe juices which are hardned by concretion, as, *Aloës, Hypocyſtis, Acacia*, when they are uſed in the compoſition of a plaſter, and be yet new, they muſt be macerated and diſſolved in ſome proper liquor, and then they are to bee boyled to the conſumption of that liquor. Gums, as, *Opopanax, Galbanum, Sagapænum, Ammoniacum*, muſt be diſſolved in Wine, Vinegar, or *Aqua vitæ*, then ſtrained and boyled to the conſumption of the liquor, aud then mixed with the reſt of the plaſter. And that they may have the exact quantity of Gums and Pitch, it is neceſſary that firſt they bee diſſolved, ſtrained, and boyled, becauſe of the ſtickes and ſordid matter which are mingled with them. You muſt have reſpect alſo to the liquor you uſe to diſſolve them in; for Vinegar of the beſt Wine doth more powerfully penetrate, than that which is of weake and bad Wine.

Other Gums, which are drier, are to be powdred, and are to bee mingled with plaſters laſt of all. Metals, as, *Æs uſtum, Chalcitis, Magnes, Bolus Armenus, Sulphur, Auripigmentum*, and others, which may bee brought to powder, muſt bee mingled laſt, unleſſe advice be given by long boyling to dull the fierce qualities of them. The like conſideration is to be had of Roſin, Pitch, and Turpentine, which muſt be put in after the Waxe, and may not be boyled but very gently; but the fats are mingled whilſt the other things are boyling. The Litharge is to be boyled with the oyle to a juſt conſiſtence, if wee would have the plaſter dry without biting. Ceruſſe may endure as long boyling, but then the plaſter ſhall not bee white, neither will the Litharge of ſilver make a plaſter with ſo good a colour as Litharge of gold. Moreover, this order muſt bee obſerved in boyling up of plaſters: the Litharge muſt bee boyled to his conſiſtence; juices or mucilages are to be boyled away, then adde the fats, then the dry Roſin, Waxe, Gums, Turpentine, and after them the powders: You ſhall know the plaſter is boyled enough by his conſiſtence, groſſe, hard, glutinous, and ſticking to the fingers, being cooled in the ayre, water, or upon a ſtone. Alſo you ſhall know it by his exact mixtion, if that all the things become one maſſe hard to be broken.

Signes of a plaſter perfectly boyled.

The quantity of things to be put into plaſters.

The quantity of things which are to be put into a plaſter can hardly be deſcribed, but an artificiall conjecture may be given, by conſidering the medicaments, which make the plaſter ſtiffe, and of a conſiſtence, and the juſt hardneſſe and ſoftneſſe they make being boyled. Waxe is not put into ſuch plaſters wherein is *Labdanum*; for that is in ſtead of Waxe. For if there ſhall be in the compoſition of a plaſter ſome emplaſticke medicaments, the Waxe ſhall be the leſſe: Contrariwiſe, if they ſhall bee almoſt all liquid things, the Waxe ſhall be increaſed ſo much as ſhall be neceſſary for the conſiſtence of the plaſter. The quantity of the Waxe alſo muſt bee altered according to the time, or the aire; therefore it is fit to leave this to the art and judgement of the Apothecarie. Emplaſters are ſometimes made of ointments by the addition of waxe, or dry roſine, or ſome other hard or ſolide matter. Some would that a handfull of medicaments poudred, ſhould be mingled with one ounce, or an ounce and an halfe of oile, or ſome ſuch liquor, but for this thing nothing can certainely bee determined: Onely in plaſters deſcribed by the Antients there muſt bee great care had, wherein hee muſt bee very well verſed, who will not erre in the deſcribing the doſe of them; and therefore wee will here give you the more common formes of plaſters.

Empl. de Vigo with Mercury.

℞. *ol. chamæm. aneth. de ſpica, liliacei, an.* ℥ ii. *ol. de croco,* ℥ i. *pingued. porci,* ℔ i. *pingued. vitul.* ℔ ß. *euphorb.* ʒ v. *thuris,* ʒ x. *ol. lauri,* ℥ i ß. *ranas viv.* nu. vi. *pingued. viper. vel ejus loco human.* ℥ ii ß. *lumbricor. lotor. in vino,* ℥ iii ß. *ſucci ebuli, enul. ana,* ℥ ii. *ſchœnanthi, ſtæchados, matricar. an.* m ii. *vini oderiferi,* ℔ ii. *litharg. auri,* ℔ i. *terebinth. claræ,* ℥ ii. *ſtyracis liquid.* ℥ i ß. *argenti vivi extincti,* ſo much as the preſent occaſion ſhall require, and the ſicke ſhall be able to beare, and make up the plaiſter. To one pound of the plaſter they doe commonly adde foure ounces of quick-ſilver, yet for the moſt part they doe encreaſe the doſe, as they deſire the plaſter ſhould be ſtronger: the wormes muſt be waſhed with faire water, and then with a little wine to cleanſe them from their earthie filth, of which they are full, and ſo the frogs are to be waſht and macerated in wine, and ſo boiled together to the conſumption of a third part; then the ſquinanth muſt bee bruiſed, the feverfew and the ſtæchas cut ſmall, and they being added, to be boiled to the conſumption of one pint, and being boiled ſufficiently, the decoction being cooled ſhall bee ſtrained and kept; and the Letharge is to be infuſed for twelve houres in the oile of chamomile, dill, lillies, ſaffron, and the axungies above ſpoken of. Then boile them all with a gentle fire, by and by taking it from the fire, and adde one quart of the decoction above ſpoken of, then ſet it to the fire againe that the decoction may bee conſumed, and then by degrees adde to the reſt of the decoction: the oile of ſpike ſhall bee reſerved unto the laſt, which may give the plaſter a good ſmell. Then are added the juices of walwort and enula, which muſt bee boiled untill they bee waſted away. Afterwards it being taken from the fire, to the compoſition is added the frankincenſe and euphorbium, and white wax as much as ſhall ſuffice. When the whole maſſe ſhall coole, then at laſt is mingled the quick-ſilver extinct, turpentine, oile of bitter almonds, baies, ſpike, of line, ſtyrax and axungia, being continually ſtirred, and it ſhall bee made up upon a ſtone into rolls. Unleſſe the quick-ſilver be well extinguiſhed, it will runne all into one place, and unleſſe you tarrie untill the compoſition coole, it will vapour away in fume.

Ceratum œſipi ex Philagrio.

℞. *croci,* ʒ ii. *bdellii, maſtich. ammon. ſtyrac. liquid. an.* ℥ ß. *ceræ alb.* ℔ ß. *tereb.* ℥ vi. *medul. cruris vaccæ, adipis anſerini, an.* ℥ i. *æſypi, vel ſi deſit, axung. gallin.* ℥ ix. *olei nard. quantum ſatis ad magdaleones formandos, expreſſionis ſcillæ,* ℥ i ß. *olibani, ſevi vitul.* ℥ i. The *æſypus, ſepum, adeps, medulla, cera,* are to bee diſſolved together; when they coole, adde the *ammoniacum* diſſolved in the decoction of fænugreeke and chamomile, halfe an ounce, and ſo much juice of ſquils, then put to the ſtyrax and turpentine, ſtirring them continually; then adde the *bdellium, olibanum,* maſtich, aloes, brought into fine powder, and when they are perfectly incorporated into a maſſe, let them bee made up with *oleum nardinum* into rolls.

De gratia Dei.

♃. *terebinth.* ℔ ß. *reſin.* ℔ i. *cer. alb.* ℥ iv. *maſtich.* ℥ i. *fol. verben. betonic. pimpinel. an.* m i. The herbes being greene, the tops are to bee cut and bruiſed in a ſtone mortar, and boiled in red wine to the conſumption of one third part. To the ſtrained liquor adde waxe cut into ſmall pieces, and being diſſolved by the fire; the liquor being conſumed put to the roſine, when it ſhall coole adde the Maſtick powdred, working it with your hands, by which it may bee incorporated with the reſt of the things.

De Janua ſeu de Betonica.

℞. *ſucci beton. plantag. apii, an.* ℔ i. *ceræ, picis, reſin. tereb. an.* ℔ ß. *fiat empl.* the juices are to bee mingled with the waxe being diſſolved, and boiling them untill three parts be conſumed, adde the roſine and pitch, which being diſſolved and hot, muſt be ſtrained, and then adde the Turpentine, and make up the plaſter.

℞.

Emplaſtrum oxycroceum.

♃. *croci, picis com.* (or rather *picis navalis*, becauſe this emplaſter is uſed to diſcuſſe and draw forth the matter which cauſeth the paine of the joints) *coloph. ceræ, an.* ℥ ii. *tereb. galb. ammon. thuris, myrrhæ, maſtich. an.* ʒ v ß. The *cera, pix*, and *colophonia* are by little and little to bee diſſolved, to which adde the gummes diſſolved according to art, and mingled with the terebinth; and taking it from the fire adde the *thus, myrrha*, and at laſt the *crocus* in fine powder, and then make it up into rowles with oyle of wormes.

De ceruſa.

♃. *ol. com.* ℔ ii. *ceruſ. ſubtiliſ.* ℔ i. boile them together with a gentle fire, ſtirring them continually untill they come to the body of an emplaſter: if you would have the plaſter whiter, take but ℥ ix. of the oile.

Tripharmacum, ſeu nigrum.

℞. *lytharg. triti, acet. fortiſ. an.* ℔ ß. *ol. antiq.* ℔ i. *fiat emplaſtrum*: let the oile bee mingled with the litharge for the ſpace of twelve houres, then boile them untill they come to a good conſiſtence, putting in the vinegar by little and little; but you ſhall not take it from the fire untill the vinegar be quite waſted away.

Diapalma, ſeu diachalciteos.

♃. *ol. vet.* ℔ iii. *axung. vet. ſine ſale*, ℔ ii. *lytharg. trit.* ℔ iii. *vitriol.* ℥ iv. let the oyle bee mingled with the lytharge for the ſpace of twelve houres, and boile them to a good conſiſtence, then adde to the axungia, ſtirring them continually with a ſpatter made of the palme tree, reed, or willow, and being ſufficiently boiled, take it from the fire, and adde the vitrioll in fine powder.

Contra rupturam.

℞. *picis naval. aloes, an.* ℥ iii. *lytharg. ceræ, coloph. galban. ammoniac. an.* ℥ ii. *viſci querni*, ℥ vi. *gypſi uſt. utriuſque ariſtoloch. ana*, ℥ iv. *myrrhæ, thuris, an.* ℥ vi. *tereb.* ℥ ii. *pulveris vermium terreſtrium, gallar. utriuſq. conſolid. bol. arm. an.* ℥ iv. *ſang. humani*, ℔ i. *fiat emplaſt.* If you would have it of a very good conſiſtence, you may add of the oile of myrtills or maſtich, ℔ ß. you ſhall make it thus: Take the skinne of a Ramme cut in pieces, and boyle it in an hundred pints of water and vinegar untill it come to a glew or ſtiffe gelly, in which you ſhall diſſolve the *viſc. quer.* then adde the pitch and waxe broken into ſmall pieces, and if you will you may adde the oile with them, afterwards the *galban.* and *ammoniac.* diſſolved in vinegar, being mingled with the terebinth, may be added. Then adde the litharge, *gypſum, bol. ariſtoloch. conſolida, vermes, & ſang. human.* At laſt the myrrhe, *thus, colophon*, and *aloe*, ſtirring them continually; and that they may bee the better mingled, worke the plaſter with a hot peſtell in a mortar.

De mucaginibus.

♃. *mucag. ſem. lini, rad. alth. fœnug. median. corticis ulmi, an.* ℥ iv. *olei liliacei, cham. aneth. an.* ℥ i ß. *ammon. opopanac. ſagap. ana* ℥ ß. *croci*, ʒ ii. *ceræ nov.* ℔ ß. *tereb.* ℥ ß. *fiat empl.* *Fernelius* hath ℥ xx. of wax: the wax being cut ſmall muſt be mingled with the oiles and the mucilages, ſtirring them continually with a wooden ſpatter till the liquor be conſumed. Then the gummes diſſolved and mingled with the terebinthina muſt be added, and laſt of all the ſaffron finely poudered.

De minio.

♃. *ol. roſ. myrtil. ung. populeon, ana*, ℥ iv. *pinguedinis gallin.* ℥ ii. *ſebi arietis caſtrati, ſepi vaccini, an.* ℥ vi. *pingued. porci*, ℥ x. *lytharg. auri, argenti, an.* ℥ iii. *ceruſ.* ℥ iv. *minii*, ℥ iii. *tereb.* ℥ iv. *ceræ, q. ſ. fiat emplaſtrum vel ceratum molle.* The *lithargiros, ceruſa*, and *minium* are to be brought into fine powder, ſeverally being ſprinkled with a little roſe water, leſt the fineſt of it ſhould flye away; theſe being mingled with the oile of roſes and myrtles, with a gentle fire may bee boiled untill they come to the conſiſtence of hony; then adde the axungia's, and boile them till the whole grow black, after adde the ſebum, and that being diſſolved take it from the fire, and then adde the *unguentum populeon*, and ſome waxe if there be need, and ſo bring it to the forme of a plaſter.

Diachylon magnum.

℞. *litharg. puri pul.* ℥ xii. *ol. irin. chamæm. aneth. an.* ℥ viii. *mucag. ſem. lini, fœnug. rad. alth. ficuum ping. uvar. paſſar. ſucci ireos, ſcillæ, æſipi, icthyocollæ, an.* ʒ xii ß. *tereb.* ℥ iii. *reſ. pini, ceræ flavæ, an.* ℥ ii. *fiat emplaſtrum*: The litharge is to be mingled with the oyle before it be ſet to the fire, then by a gentle fire it is to be boiled to a juſt conſiſtence; after the mucilage by degrees muſt bee put in, which being conſumed the juices muſt bee added and the icthyocolla, and they being waſted too, then put to the waxe and roſine, then taking the whole from the fire, add the œſipus and terebinthina.

The uſe of plaſters.

We uſe plaſters when wee would have the remedy ſticke longer and firmer to the part, and would not have the ſtrength of the medicament to flye away or exhale too ſuddenly.

CHAP. XXVIII.

Of Cataplaſmes and Pultiſſes.

The matter of cataplaſmes.

Cataplaſmes are not much unlike to emplaſters leſſe properly ſo called, for they may be ſpred upon linnen cloaths and ſtoupes like them, and ſo applied to the grieved parts. They are compoſed of roots, leaves, fruits, flowers, ſeeds, herbes, juices, oiles, fats, marrowes, meales, roſines. Of theſe ſome muſt bee boiled, others crude. The boiled are made of herbes boiled tender, and ſo drawne through an haire ſearſe, adding oiles and axungia's thereto. The crude are made of herbes beaten, or their juices mixed with oile and flower, or other powders appropriate to the part or diſeaſe, as the Phyſitian ſhall thinke fit. The quantity of medicines entring theſe compoſitions can ſcarce be defined, for that they muſt be varied as we would have the compoſition of a ſofter or harder body. Verily they ought to be more groſſe and denſe when as we deſire to ripen any thing, but more ſoft and liquid when wee endeavour to diſcuſſe.

Their uſe.

We uſe cataplaſmes to aſſwage paine, digeſt, diſcuſſe and reſolve unnaturall tumors and flatulencies. They ought to be moderately hot and of ſubtle parts, ſo to attract and draw forth; yet their uſe is ſuſpected the body being not yet purged, for thus they draw downe more matter into the affected part. Neither muſt wee uſe theſe when as the matter that is to be diſcuſſed is more groſſe and earthy, for thus the ſubtler parts will be onely diſcuſſed, and the groſſe remaine impact in the part unleſſe your cataplaſme be made of an equall mixture of things, not only diſcuſſing, but alſo emollient, as it is largely handled by *Galen.*

Lib. 2. ad glauc. ubi de ſchirrho.

An anodine cataplaſme

A ripening cataplaſme.

A diſcuſsing caplaſme.

How pultiſſes differ from caplaſmes.

This ſhall be largely illuſtrated by examples. As, ℞. *medul. panis,* ℔ ß. *decoquantur in lacte pingui, adde olei chamæm.* ℥ ß. *axung. galin.* ℥ i. *fiat cataplaſma.* Or, ℞. *rad. alth.* ℥ iii. *fol. malv. ſenecionis, an.* m i. *ſem. lini, fænug. an.* ʒ ii. *ficus, ping.* nu. vi. *decoquantar in aqua, & per ſetaceum tranſmittantur, addendo olei lilior.* ℥ i. *far. hord.* ℥ ii. *axung. porcin.* ℥ i ß. *fiat cataplaſma.* Or, ℞. *far. fab. & orob. an.* ℥ ii. *pulv. chamæm. & melil. an.* ʒ iii. *ol. irin. & amygd. amar. an.* ℥ i. *ſucci rut.* ℥ ß. *fiat cataplaſma.* Pultiſſes differ not from cataplaſmes, but that they uſually conſiſt of meales boiled in oile, water, hony, or axungia. Pultiſſes for the ripening of tumours are made of the floure of barly, wheat, and milke, eſpecially in the affects of the entralles; or elſe to dry and binde, of the meale of rice, lentiles, or *Orobus* with vinegar; or to cleanſe, and they are made of hony, the floure of beanes and lupines, adding thereto ſome old oile, or any other oile of hot quality, and ſo make a diſcuſſing pultis. Alſo anodine pultiſſes may bee made with milke; as thus for example, ℞. *farin. triticeæ,* ʒ ii. *mica panis puriſsimi,* ℥ iii. *decoquantur in lacte, & fiat pulticula.*

A ripening cataplaſme.

℞. *farin. hordei & fab. an.* ℥ ii. *far. orob.* ℥ iii. *decoquantur in hydromelete, addendo mellis* quart. i. *olei amyg. amar.* ℥ ii. *fiat pulticula.* Wee uſe pultiſſes for the ſame purpoſe as wee doe cataplaſmes, to the affects both of the internall and externall parts. Wee ſometimes uſe them for the killing of wormes, and ſuch are made of the meale of lupines boiled in vinegar, with an Oxes gall, or in a decoction of Worme-wood, and other ſuch like bitter things.

CHAP. XXIX.

Of Fomentations.

A *Fotus* or fomentation is an evaporation or hot lotion, chiefly uſed to mollifie, relaxe and aſſwage paine, conſiſting of medicines having theſe faculties. A fomentation commonly uſeth to be moiſt, being uſually made of the ſame things as embrocations, to wit, of roots, ſeeds, flowers, boiled in water or wine. The roots here uſed are commonly of mallowes, marſh-mallowes, and lillies. The ſeedes are of mallowes, marſh-mallowes, parſly, ſmallage, line, fenugreeke. Flowers are of chamomile, melilote, figges, raiſons, and the like: all which are to bee boiled in wine, water, or lye, to the conſumption of the third part or the halfe: as,

℞. *Rad. alth. & lilil. an.* ℥ii. *ſem. lini, fœnug. cumin. an.* ʒiii. *flo. cham. melil. & aneth. an* p.i. *ſummit. orig.* m. ß. *bulliant in æquis partibus aquæ & vini, aut in duabus partibus aquæ, & una vini, aut in Lixivio cineris ſarmentorum, ad tertiæ partis conſumptionem, fiat fotus.* In imitation hereof you may eaſily deſcribe other fomentations, as occaſion and neceſſity ſhall require.

Their uſe. We uſe fomentations before we apply cataplaſmes, oyntments or plaſters to the part, that ſo we may open the breathing places or pores of the skin, relaxe the parts, attenuate the humour, that thus the way may be the more open to the following medicines. The body being firſt purged, fomentations may be uſed to what parts you pleaſe. They may be applyed with a female ſpunge, for it is gentler and ſofter than the male; with felt, woollen clothes, or the like dipped in the warme decoction wrung out, and often renued; otherwiſe, you may fill a Swines bladder halfe full (eſpecially in paines of the ſides) of the decoction, or elſe a ſtone bottle, ſo to keep hot the longer; yet ſo, that the bottle bee wrapped in cotton, wooll, or the like ſoft thing, that ſo it may not by the hardneſſe and roughneſſe offend the part, according to *Hippocrates*. 2. *De victu in acutis.*

CHAP. XXX.

Of Embrocations.

What an Embrocation is. AN *Embroche*, or Embrocation is a watering, when as from on high wee (as it were) ſhowre downe ſome moiſture upon any part. This kinde of remedy is chiefly uſed in the parts of the head, and it is uſed to the coronall ſuture, for that the skull is more thin in that part, ſo that by the *ſpiracula* or breathing places of this ſuture, more open than thoſe of the other ſutures, the force of the medicine may more eaſily penetrate unto the *Meninges*, or membranes of the braine. The matter of Embrocations is roots, leaves, flowers, ſeeds, fruits, and other things, according to the intention and will of the Phyſitian. They are boyled in water and wine, to the halfe or third part. Embrocations may alſo be made of Lye or Brine againſt the cold and humide affects of the braine. Sometimes of oyle and vinegar, otherwhiles of oyle onely. ℞. *fol. plantag. & ſolan. an.* m. i. *ſem. portul. & cucurb. an.* ʒii. *myrtil.* ʒi. *flor. nymph. & roſ. an.* p. ß. *fiat decoct. ad* ℔i. *cum aceti* ℥ii. *ſi altè ſubeundum ſit, ex qua irrigetur pars inflammata.* In affects of the braine, when we would repercuſſe, we often and with good ſucceſſe uſe oyle of Roſes, with a fourth part of vinegar.

Their uſe. We uſe Embrocations, that together with the ayre drawne into the body by the *Diaſtole* of the arteries, the ſubtler part of the humour may penetrate, and ſo coole the inflamed part: for the chiefe uſe of embrocations is in hot affects. Alſo wee uſe embrocations, when as for feare of an hæmorrhagie, or the flying aſunder of a broken or diſlocated member, we dare not looſe the bandages wherewith the member is bound. For then wee drop downe ſome decoction or oyle from high upon the bandages, that by theſe the force of the medicine may enter into the affected member.

CHAP. XXXI.

Of Epithemes.

What an Epitheme is.

Epithema, or an Epitheme, is a compoſition uſed in the diſeaſes of the parts of the lower and middle belly, like to a fomentation, and not much unlike an embrocation. They are made of waters, juices, and powders, by means whereof they are uſed to the heart, cheſt, liver, and other parts. Wine is added to them for the more or leſſe penetration, as the condition of the hot or cold affect ſhall ſeeme to require; for if you deſire to heate, more wine muſt bee added, as in ſwouning by the clotting of bloud, by the corruption of ſeed, by drinking ſome cold poyſon: the contrary is to be done in a fainting by diſſipation of the ſpirits by feaveriſh heates, alſo vinegar may bee added. The matter of medicines proper to the entrailes is formerly deſcribed, yet we commonly uſe the *ſpecies* of electuaries, as the *ſpecies elect. triaſantali* the liver being affected, and Diamargariton in affects of the heart. The proportion of the juices or liquors to the powders, uſes to be this, to every pinte of them ℥i. or ℥i ß. of theſe, of wine or elſe of vinegar ℥i. You may gather this by the following example.

In the ſixth Chapter.

A cordiall Epitheme.

℞. *aqu. roſ. bugl. borag. an.* ℥iii. *ſucci ſcabioſ.* ℥ii. *pul. elect. diamarg. frigid.* ʒii. *cort. citri ſicci* ʒi. *coral. raſ. ebor. an.* ʒß. *ſem. citri & card. ben. an.* ʒiiß. *croci & moſchi an. gra.* 5. *addendo vini albi* ℥ii. *fiat Epithema pro corde.*

Their uſe.

Epithemes are profitably applyed in hecticke and burning feavers to the liver, heart, and cheſt, if ſo be that they be rather applyed to the region of the lungs, than of the heart; for the heate of the lungs being by this meanes tempered, the drawn in ayre becomes leſſe hot in peſtilent and drying feavers. They are prepared of humecting, refrigerating, and cordiall things, ſo to temper the heate, and recreate the vitall faculty. Sometimes alſo we uſe Epithemes to ſtrengthen the heart, and drive there-hence venenate exhalations, lifted or raiſed up from any part which is gangrenate or ſphacelate. Some cotton, or the like, ſteeped or moiſtened with ſuch liquors and powders warmed, is now and then to be applyed to the affected entraile; this kinde of remedy, as alſo all other topick and particular medicines, ought not to be uſed, unleſſe you have firſt premiſed generall things.

CHAP. XXXII.

Of potentiall Cauteries.

The uſe of potentiall cauteries.

That kinde of Pyroticke, which is termed a Potentiall Cautery, burnes, and cauſeth an eſchar. The uſe of theſe kindes of Cauteries is to make evacuation, derivation, revulſion, or attraction of the humours by thoſe parts whereto they are applyed. Wherefore they are often and with good ſucceſſe uſed in the punctures and bites of venemous beaſts, in a venenous, as alſo in a peſtilent *Bubo* and Carbuncle, unleſſe the inflammation be great: for the fire doth not only open the part, but alſo retunds the force of the poyſon, cals forth and plentifully evacuates the conjunct matter. Alſo they are good in phlegmaticke and contumacious tumours; for by their heate they take away the force and endeavours of our weake heate. Alſo they are profitably applyed to ſtanch bleeding, to eate or waſte the ſuperfluous fleſh of ulcers and wens, to bring downe the callous lips of ulcers, and other things too long here to inſiſt upon.

The matter of them.

The materials of theſe Cauteries are Oake aſhes, Pot aſhes, the aſhes of Tartar, of Tithymals or ſpurges, the Figge-tree, the ſtalkes of Colewort and Beanes, cuttings of Vines, as alſo *ſal ammoniacum, alkali, axungia vitri, ſal nitrum,* Romane Vitrioll, and the like; for of theſe things there is made a ſalt, which by its heate is cauſticke and eſcharoticke, like to an hot iron and burning coale: Therefore it violently looſes the continuity by eating into the skinne, together with the fleſh there-under. I have thought good here to give you divers formes of them.

The formes of them. Take of unquencht Lime extinguiſhed in a bowle of Barbers Lye three pounds: When the Lye is ſettled, let it be ſtrained, and into the ſtraining put of *Axungia vitri,* or Sandiver, calcined Argol, of each two pounds, of *Sal nitrum & ammoniacum,* of each foure ounces, theſe things muſt be beaten into a groſſe powder, then muſt they be boyled over the fire, and after the boyling let them remaine in the Lye for foure and twenty houres ſpace, being often ſtirred about, and then ſtrained through a thicke and double linnen cloth, leſt any of the earthy droſſe get thorow together with the liquor. This ſtrained liquor, which is as cleare as water, they call *Capitellum,* and they put it in a braſen Baſon, ſuch as Barbers uſe, and ſo ſet it upon the fire, and as ſoone as it boyles, they keep it with continuall ſtirring, leſt the ſalt ſhould adhere to the Baſon; the *Capitellum* being halfe boyled away, they put in two ounces of powdred vitrioll, ſo to haſten the falling of the eſchar, and ſo they keep the baſon over the fire untill all the liquor be almoſt waſted away. Then they cut into peeces the ſalt or that earthy matter, which remains after the boyling away of the *Capitellum,* & with a knife or hot iron ſpatula forme them into cauteries of ſuch figure and magnitude as they thinke fitting, and ſo they lay them up, or keep them for uſe in a violl or glaſſe cloſly ſtopped, that the ayre get not in: Or,

Take a bundle or ſufficient quantity of Beane ſtalkes or huskes, of Colewort ſtalks two little bundles, of cuttings of Vines foure bundles, burn them all to aſhes, which put into a veſſell of river water, ſo let them infuſe for a dayes ſpace, being ſtirred ever now and then; to this adde two pounds of unquencht lime, of *Axungia vitri* halfe a pound, of calcined Tartar two pounds, of *Sal niter* foure ounces, infuſe all theſe, being made into powder, in the foreſaid Lye for two or three dayes ſpace, often ſtirring it, then ſtraine the *Capitellum* or liquor through a thicke cloth untill it become cleare. Put it into a baſon, and ſet it over the fire, and when as the moiſture is almoſt wholly ſpent, let two or three ounces of vitrioll be added, when the moiſture is ſufficiently evaporated, make cauteries of that which remaines, after the formerly mentioned manner.

Take of the aſhes of ſound, knotty, old Oake as much as you pleaſe, make thereof a Lye; powre this Lye againe upon other freſh aſhes of the ſame wood, let this bee done three or foure times, then quench ſome lime in this Lye, & of theſe two make a *Capitellum,* whereof you may make moſt approved cauteries. For ſuch aſhes are hot in the fourth degree; and in like ſort the ſtones, whereof the lime by burning becomes fiery and hot to the fourth degree: Verily, I have made cauteries of Oake aſhes only, which have wrought quickly and powerfully. The *Capitellum* or Lye is thought ſufficiently ſtrong, if that an Egge will ſwimme therein without ſinking. The ſigne of good *Capitellum.*

Or, Take of the aſhes of Bean ſtalkes three pounds, of unquencht lime, Argoll, of the aſhes of Oake wood, being all well burnt, of each two pounds. Let them for two dayes ſpace be infuſed in a veſſell full of Lye made of the aſhes of Oake wood, and be often ſtirred up and downe. Let this Lye then be put into another veſſell, having many holes in the bottome thereof, covered with ſtrums or ſtraw pipes, that the *Capitellum* flowing through theſe ſtrait paſſages may become more cleare. Let it be put twice or thrice upon the aſhes, that ſo it may the better extract the heate and cauſticke quality of the aſhes. Then putting it into a Barbers baſon, ſet it over the fire, and when it ſhall begin to grow thicke, the fire muſt be increaſed, and cauteries made of this concreating matter.

The faculty of the ſilken Cautery. The following cauteries are the beſt that ever I made tryall of, as thoſe that applyed to the arme in the bigneſſe of a Peaſe, in the ſpace of halfe an houre without paine, eſpecially if the part of it ſelfe be painleſſe and free from inflammation, eate into the skinne and fleſh even to the bone, and make an ulcer of the bigneſſe of ones fingers end, and they leave an eſchar ſo moyſt and humide, that within foure or five dayes ſpace it will fall away of it ſelfe without any ſcarification. I have thought good to call theſe cauteries Silken or Velvet ones, not onely for that they are like Silke, gentle and without paine, but chiefly becauſe I obtained the deſcription of them of a certaine Chymiſt, who kept it as a great ſecret, for ſome Velvet and much entreaty: Their deſcription is this,

The cauſe of the name.

Their deſcription.

Take of the aſhes of Beane ſtalkes, of the aſhes of Oake wood well burnt, of each three pounds, let them bee infuſed in a pretty quantity of river water, and bee often ſtirred up and down, then adde thereto of unquencht lime foure pounds, which being quencht, ſtirre it now and then together for two daies ſpace, that the *Capitellum* may become the ſtronger, then ſtraine it through a thick & ſtrong linnen cloth, & thus ſtrained, put it three or foure times upon the aſhes, that ſo it may draw more of the cauſticke faculties from them, then boyle it in a Barbers baſon, or elſe an earthen one well leaded, upon a good Char-cole fire, untill it become thicke. But a great part of the ſecret or art conſiſts in the manner and limit of this boyling; for this *Capitellum* becomming thicke and concreating into ſalt, muſt not bee kept ſo long upon the fire, untill all the moyſture ſhall bee vaniſhed and ſpent by the heate thereof: for thus alſo the force of the foreſaid medicines, which alſo conſiſts in a ſpirituous ſubſtance, will bee much diſſipated and weakened; therefore before it be come to extreme drineſſe, it ſhall be taken off from the fire, to wit, when as yet there ſhall ſome thicke moyſture remaine, which may not hinder the cauteries from being made up into a forme. The made up cauteries ſhall bee put up into a glaſſe moſt cloſely luted up or ſtopped, that the ayre may not diſſolve them, and ſo they ſhall be laid up and kept in a dry place. Now, becauſe the powder of Mercury is neere to cauteries in the effects and faculty thereof, which therefore is termed *Pulvis Angelicus* for the excellency; therefore I have thought good to give you the deſcription thereof, which is thus:

The deſcription of Mercury, or Angelicall powder.

℞. *Auripigmenti citrini, floris æris, an.* ℥ii. *ſalis nitri,* ℔ i ß. *alumin. rochæ,* ℔ii. *vitrioli rom.* ℔iii. Let them all bee powdred, and put into a Retort, having a large receiver well luted put thereto. Then ſet the Retort over a Fornace, and let the diſtillation be made firſt with a gentle fire, then increaſed by little and little, ſo that the receiver may waxe a little reddiſh.

℞. *Argenti vivi,* ℔ß. *aquæ fortis,* ℔i. *ponantur in phiala, & fiat pulvis, ut ſequitur.*

Take a large earthen pot, whereinto put the violl or bolt head wherein the *Argentum vivum* and *Aqua fortis* are contained, ſetting it in aſhes up to the necke thereof, then ſet the pot over a fornace, or upon hot coales, ſo that it may boyle and evapourate away the *Aqua fortis*: neither in the *interim* will the glaſſe bee in any danger of breaking, when all the water is vaniſhed away, which you may know is done when as it leaves ſmoaking; ſuffer it to become cold, then take it forth of the aſhes, and you ſhall finde calcined Mercury in the bottome, of the colour of red Lead, ſeparated from the white, yellow or blacke excrement; for the white that concretes in the toppe is called Sublimate, which if it ſhould remaine with the calcined Mercury, would make it more painfull in the operation. Wherefore ſeparating this calcined Mercury, you ſhall make it into powder, and put it in a braſſe veſſell upon ſome coales, ſtirring or turning it with a *ſpatula* for the ſpace of an houre or two: for thus it will loſe a great part of the acrimony and biting, whence it will become leſſe painfull in the operation.

Chap. XXXIII.

Of Veſicatories.

What veſicatorie and rubrifiing medicines are.

VEſicatorie and rubrifying ointments, cataplaſmes, or plaſters are made of acride medicines, which have power to draw forth to the ſuperficies of the body ſuch humours as lye deepe, by exulcerating the skin and cauſing bliſters. Their matter is the ſame with ſepticke medicines, as *ſinapi, anacardus, cantharides, euphorb. radices ſcillæ, bryon.* and the like, which with hony, turpentine, leaven, gum, or roſine, may be made into cataplaſmes, ointments, or plaſters; therefore the compoſure of veſicatories, or rather their conſiſtence differs not from that of hard or ſoft unguents. Therefore I will give you one example or deſcription of them, which is thus.

The deſcription of a veſicatory.

℞. *cantharid. euphorbii, ſinapi, an.* ʒ ß. *mellis anacardini,* ʒ i. *modico aceti, & fermenti quod ſit ſatis excipiantur, & fiat veſicatorium.* Some of the antients thinke it better to make up theſe medicines with water rather than with vinegar, becauſe experience teacheth that vinegar abates the ſtrength of muſtard. Wee uſe this kinde of medicine in long diſeaſes, when as wee cannot any thing prevaile with other remedies; eſpecially in the head-ache, megrime, epilepſie, *ſciatica*, gout, the bites and punctures of venemous creatures, peſtilent carbuncles, and other inveterate and contumacious diſeaſes.

Their uſe.

Alſo we uſe them when as wee would reſtore life and ſtrength to a dead or decayed part, for thus they are drawne backe together with the heat; for which purpoſe wee muſt make choice of more gentle veſicatories, as ſuch which onely rubrifie, ſo that the part may onely become red, and not be burnt: the part muſt firſt be ſtrongly rubbed, that the decaied and dull heat may bee rowzed and ſtirred up, the pores of the skin more opened, that the force of the medicine may enter the deeper into the body.

Chap. XXXIV.

Of Collyria.

What a *collyrium* is.

A *Collyrium* is a medicine proper for the eyes, made of powder finely levigated and ground into the forme of *Alcohol*, as the Arabians and our Alchymiſts terme it: yet the word in a more generall acception is uſed for any liquide medicine, made with liquors and powders, and applied or uſed to any part. Wherefore *collyria* are of three kindes, ſome are moiſt or liquid, which are properly called *collyria*; others dry, which are of the ſame conſiſtence with Trochiſces; others have the conſiſtence of hony, or a liniment. The liquid ſerve for the greater and leſſer corners of the eyes; thoſe of the conſiſtence of hony are meet for the apple of the eye; but the dry are to be made into powder, and ſo blowne into the eyes: alſo ſometimes they are to be diſſolved in ſome juice, or other convenient liquor, that ſo they may be made into moiſt *collyria.*

The differences of them.

Their uſes.

Therefore *collyria* have divers uſes, and are applied to ſeverall parts according to the intention and counſell of the Phyſitian: for liquid *collyria* put into the corners of the eyes doe more readily mitigate the heate of their inflammation, by reaſon they enter more eaſily by the tenuity of their ſubſtance, ſuch things as have a more firme conſiſtence adhere more tenaciouſly, and worke more certainely. Moiſt *collyria* are made of juices, mucilages, waters of herbes, flowers, ſeeds, metalline bodies, galles, and other ſuch like medicines, which are repercuſſives, reſolvers, detergents, anodines, and the like, according to the nature of the preſent diſeaſe.

Their matter.

Sometimes they are made of juices and diſtilled waters onely, otherwhiles powders, or dry *collyria* made into powder, are mixed with them, together with the white of an egge. Powders are preſcribed to ʒ ii. and liquors to ℥ iv. or ℥ v. in medicines for the eyes; but for other parts, as when it is to be injected into the urenary paſſage, they may be preſcribed to the quantity of a pinte. Dry *Collyria* are made of powders exceeding finely beaten or ground, and incorporated with ſome juice, whence it is that they differ little from Trochiſces. Wherefore the *collyrium album Rhaſis* is now uſually termed a Trochiſce, and kept with them. Cathæreticke powders are not applied in the forme of a moiſt *collyrium*, but in the forme of a liniment, that is, incorporated with fat or oile. All theſe things ſhall be made more plaine by the following examples,

A repercuſsive *collyrium.* An anodine. A detergent.

℞. *aq. plant. & roſar. an.* ℥ ii. *album. ovi unum, bene agitatum, miſce, fiat collyrium.* ♃. *aq. roſar. & viol. an.* ℥ iii. *trochiſ. alb. Rhaſ. cum opio,* ʒ ii. *fiat collyrium.* Or, ℞. *decoct. fœnug.* ℥ iii. *mucag. ſem. lini,* ℥ ii. *ſacchar. cand.* ʒ i. *croci,* ℈ i. *fiat collyr.* ℞. *thuris, myrrh. an.* ℈ ii. *tut. prepar. & antimon. lot. an.* ʒ ii. *cum ſucco chelidon. fiat collyrium in umbra ſiccand.* ℞. *fellis perdic. aut lepor.* ʒ ß. *ſucci fœnicul.* ʒ i. *ſacchar. cand.* ʒ ii. *ſyrup. roſ. excipiantur, fiat collyrium.*

Wee uſe *collyria* in wounds, ulcers, fiſtula's, ſuffuſions, inflammations, and other diſeaſes of the eyes.

CHAP. XXXV.

Of Errhines and Sternutatories.

What an errhine is. Their differences.

ERrhines are medicines appointed to bee put into the noſe to purge the braine of its excrementitious humours by the noſtrills, or to deterge ſuch excrements as are therein, by reaſon of an *ozana, polypus,* or the like diſeaſe. Errhines are either liquid or dry, or elſe hard, and of the conſiſtence of an emplaſter. Liquid errhines, which uſually are to purge the head, are made of the juices of herbes, as beets, coleworts, marjoram, pimpernell, hyſſope or balme, or of their decoctions taken alone, or mixed with wine, or ſyrupe, as *oxymel ſcilliticum,* ſyrupe of hyſſope, roſes, or *mel anthoſatum*: ſometimes powders are mixed with theſe liquors, as of pepper, *euphorbium,* pellitory of Spaine, hore-hound, *nigella romana, caſtoreum,* myrrhe, white ellebore, ſow-bread, and other like, in a ſmall quantity, to wit, to ʒ i. little more or leſſe according to the vehemency of the diſeaſe. Wee will make this more plaine by examples.

The forme of one.

℞. *ſucci betæ, majoran, braßic. an.* ℥ i. *depurentur, & modice bulliant cum vini albi,* ℥ ii. *oxymelit. ſcillit.* ℥ ß. *fiat errhinum.* When as you deſire to attract more powerfully from the braine, you may diſſolve in errhines ſome purging medicines, as agaricke, *diaphœnicon, ſenna, carthamus,* and the like: hence doth ariſe the diſtinction of errhines into ſuch as are meet to purge phlegme, choler, and melancholy. This following example is ſet downe by *Rondeletius.* ℞. *rad. pyreth. irid. an.* ʒ i. *puleg. calam. origon. an.* m i. *agar. trochiſc.* ʒ iii. *flor. anthos & ſtæchad. an.* p i. *fiat decoctio in colatur.* ℔ i. *diſſolve mellis anthoſati & ſcillit. an.* ʒ iii. *fiat caputpurgium.* But it is better to this purpoſe to make uſe of purging ſimples, as agarick, turbeth, coloquintida, and the like, than of compoſitions, as *diaphænicon,* for theſe make the decoction more thick, and leſſe fit to enter the paſſages of the noſtrils, and the ſieve-like bones, but apt rather there to cauſe obſtruction, and intercept the freedome of reſpiration.

An errhine purging phlegme.

An errhine with powders.

℞. *ſucci betæ,* ʒ i. *aq. ſalv. & beton. an.* ʒ ii ß. *pul. caſtor.* ℈ ß. *piper. & pyreth. an.* ℈ i. *fiat caputpurgium.* Dry errhines that are termed ſternutatories, for that they cauſe ſneeſing, are made of powders onely, to which purpoſe the laſt mentioned things are uſed; as alſo aromaticke things in a ſmall quantity, as to ʒ ii. at the moſt: as,

A ſternutatory.

℞. *major. nigel. caryoph. zinzib. an.* ℈ i. *acor. pyreth. & panis porcin. an.* ℈ ß. *euphorb.* ℈ i. *terantur diligenter, & in nares mittantur, aut inſufflentur.* Errhines of the conſiſtence of emplaſters, by the Latines vulgarly called *Naſalia,* are made of the deſcribed powders or gums diſſolved in the juice of ſome of the forementioned herbs,

incorporated

The matter of ſolid errhines.

Their uſe.

The manner of uſing them.

To whom they are hurtfull.

incorporated with turpentine and waxe, that ſo they may the better be made into a pyramidall forme to bee put into the noſtrills. As, ℞. *majoran. ſalv. nigel.* ℈ ii. *pip. alb. caryoph. galang. an.* ℈ i. *pyreth. euphorb. an.* ʒ ß. *panis porcin. ellebor. alb. an.* ℈ i. *terantur, & in pulverem redigantur*. And then with turpentine and waxe as much as ſhall be ſufficient, make them up into *Naſalia* of a pyramidall or taper faſhion. Wee uſe errhines in inveterate diſeaſes of the braine, as the epilepſie, feare of blindnſſe, an apoplexie, lethargie, convulſion, the loſt ſenſe of ſmelling: yet we firſt uſe generall remedies and evacuations, leſt by ſneeſing and the like concuſſion of the brain for the excluſion of that which is offenſive thereto, there ſhould be made a greater attraction of impurity from the ſubjacent parts. Liquid things muſt be drawn up into the noſtrils warme out of the palme of the hand, to the quantity of ℥ ß. the mouth being in the interim filled with water, leſt the attracted liquor ſhould fall upon the pallat, and ſo upon the lungs: dry errhines are to be blown into the noſe with a pipe or quill: ſolid ones muſt be faſtned to a thred, that they may be drawn forth as need requires, when as they are put up into the noſtrils. The morning (the belly being empty) is the fitteſt time for the uſe of errhines. If by their uſe the noſe ſhall be troubled with an itching, the paine thereof muſt bee mitigated with womans milke, or oyle of violets. The uſe of attractive errhines is hurtfull to ſuch as are troubled with diſeaſes of the eyes, or ulcers in the noſe, as it oft times falls out in the *Lues venerea*: wherefore in this caſe it will bee beſt to uſe Apophlegmatiſmes, which may divert the matter from the noſe.

CHAP. XXXVI.

Of Apophlegmatiſmes, or Maſticatories.

What an apophlegmatiſm is.

The differences.

Apophlegmatiſmoi in Greeke, and *Maſticatoria* in Latine, are medicines which kept or held in the mouth and ſomewhat chawed, doe draw by the mouth forth of the braine excrementitious humours, eſpecially phlegme: now they are chiefly made foure manner of waies; the firſt is when as the medicines are received in hony or waxe, and formed into pills, and ſo given to chaw upon. The ſecond is when as the ſame things are bound up in a fine linnen cloath, ſo to be held in the mouth. The third is when as a decoction of acride medicines is kept in the mouth for a pretty ſpace. The fourth is when as ſome acride medicine, or otherwiſe drawing flegme, as pellitory of Spaine, maſtich, and the like, is taken of it ſelfe to the quantity of a haſell nut, and ſo chawed in the mouth for ſome ſpace. The matter of maſticatories is of the kinde of acrid medicines, as of pepper, muſtard, hyſſope, ginger, pellitory of Spaine, and the like; amongſt which you muſt make choice chiefly of ſuch as are not troubleſome by any ingrate taſte, that ſo they may be the longer kept in the mouth with the leſſe offence & loathing. Yet maſticatories are ſometimes made of harſh or acerbe medicines, as of berberies, the ſtones of prunes or cherries, which held for ſome ſpace in the mouth, draw no leſſe ſtore of flegme than acrid things; for the very motion and rowling them up and down the mouth attracts, becauſe it heats, compreſſes, & expreſſes: the quantity of the medicine ought to bee from ℥ ß. to ℥ i ß.: as, ℞. *pyreth. ſtaphiſag. an.* ʒ i ß. *maſtich.* ʒ ß. *pulverentur & involventur nodulis in maſticatoria.* Or, ℞. *Zinzib. ſinap. an.* ʒ i. *euphorb.* ℈ ii. *piper.* ʒ ß. *excipiantur melle, & fiant paſtilli pro maſticatoriis.* ℞. *hyſſop. thym. origan. ſalv. an.* p i. boile them in water to waſh the mouth withall. Or, ℞. *Zinzib. caryoph. an.* ʒ i. *pyreth. pip. an.* ʒ ß. *ſtaphiſagr.* ʒ ii. *maſtiches,* ℥ ß. *excipiantur, fiant paſtilli pro maſticatoriis.* We uſe maſticatories in old diſeaſes of the braine, dimneſſe of the ſight, deafneſſe, puſtles of the head and face, and ſometimes to divert the excrements which runne to the noſe being ulcerated.

The uſe of maſticatories.

To whom hurtfull.

Maſticatories are very hurtfull to ſuch as have their mouths or throats ulcerated, as alſo to them whoſe lungs are ſubject to inflammations, deſtillations and ulcers; for then errhines are more profitable to derive the matter of the diſeaſe by the noſtrils.

For though the humour drawn from the braine into the mouth by the meanes of the maſticatory, may bee thence caſt forth by coughing and ſpitting, yet in the interim nature will bee ſo inured to that paſſage for the humour, ſo that it will run that way when as wee ſleepe, and fall downe upon the parts thereunder, weake either by nature or by accident.

The time fitteſt for the uſe of Apophlegmatiſmes is the morning, the body being firſt purged: if any ingratefull taſte remain in the mouth, or adhere to the tongue by uſing of maſticatories, you ſhall take it away by waſhing the mouth with warm water, or a decoction of liquorice and barly.

CHAP. XXXVII.

Of Gargariſmes.

What a gargle is.

The differences thereof.

A Gargle or gargariſme is a liquid compoſition fit for to waſh the mouth and all the parts thereof, to hinder defluxion and inflammation, to heale the ulcers which are in thoſe parts, to aſſwage paine. Their compoſition is twofold, the firſt is of a decoction of roots, leaves, flowers, fruits, and ſeeds fit for the diſeaſe; now the decoction is to be made either in faire water alone, or with the admixture of white or red wine, or in the decoction of liquorice and barly, or of pectorall things, as the intention of the Phyſitian is to repell, coole, or hinder inflammation, as in the tooth-ache cauſed by matter which is yet in motion; to diſcuſſe, as in the tooth-ache already at the height; or to cleanſe, as in the ulcers of the mouth; or to dry and binde, as when it is fit to heale the ulcers already cleanſed.

Their matter.

The other way of making of gargariſmes is without decoction, which is, when as wee make them either of diſtilled waters onely, or by mixing them with ſyrupes, mucilages, milke, the whey of Goats milke carefully ſtrained. There are mixed ſometimes with a decoction, diſtilled waters and mucilages, *mel roſatum*, *oxymel ſimplex*, *diamoron*, *dianucum*, *hiera picra*, *oxyſacchara*, *ſyrup. de roſis ſiccis*, *ſyrupus acetoſus*, and other things, as the preſent caſe ſhall ſeem to require, as alome, *balauſtia*, myrrhe, *olibanum*, ginger, pepper, cinamon, dry roſes, and many ſuch things, even ſo that oft times there enter into gargles ſuch medicines as have force to draw from the braine, as pellitory of Spaine, carthamus, turbith, and ſuch things as have no bitterneſſe, which is the cauſe that neither agrick nor coloquintida ought to enter into gargariſmes.

The quantity of liquor for a gargariſme is commonly from ℔ ß. to ℔ i. mixe therewith ſome ℥ ii. of ſyrupes, but put in powders ſparingly, as ſome ʒ iii. Alome may ſometimes bee put in to ʒ vi. let mucilages be extracted out of ʒ ii. of ſeeds: let theſe ſerve for ſome examples.

An aſtringent gargle.

℞. *plant. polygon. oxalidis, an.* m i. *roſar. rub.* p ß. *hordei,* p i. *fiat decoctio ad* ℥ viii. *in qua diſſolve ſyrupi myrtillorum,* ʒ vi. *dianucum,* ℥ ß. *fiat gargariſma.* Or,

An anodine gargle.

℞. *cham. melil. aneth. an.* p i. *roſ. rub.* p ß. *paſſul. mund. & ficuum, an.* p iii. *decoquantur in æquis partibus vini & aquæ, ad* ℥ vi. *addendo mucag. ſem. lini, & fœnugr. an.* ℥ ii. *fiat gargariſma.*

A deterſive.

Or elſe, ℞. *aq. plantag. liguſt. abſinth. an* ℥ ii. *mellis roſati colati,* ʒ vi. *ſyrupi roſar. ſiccar. & de abſinth. an.* ʒ vi. *fiat gargariſma.*

We uſe gargles in the morning faſting after generall purgations; they are ſometimes taken or uſed cold, when as a maligne, acride, and thinne humour fals downe, ſometimes warme, but let theſe things bee done according as the Phyſitian ſhall adviſe.

CHAP.

CHAP. XXXVIII.

Of Dentifrices.

What a dentifrice is.

The differences

The matter whereof they conſiſt.

Dentifrices are medicines prepared and ſerving divers waies for to cleanſe, whiten, and faſten the teeth; for from their uſe they take their name. Of theſe ſome are dry, otherſome moiſt: of the dry ſome have the forme of opiats, others of pouders groſſely beaten, but the moiſt are commonly made by diſtillation: the matter of dry dentifrices is taken from detergent and drying things, ſuch as are corall white and red, harts-horne, ſcuttle bones, alome, cryſtall, pumice, ſal nitre, myrrhe, frankincenſe, *balauſtia*, acornes, all ſorts of ſhels of fiſhes: all theſe are to bee made into powder either by burning, or without it, for ſcuttle bones burnt caſt forth a ſtinking and unpleaſant ſmell. To theſe for ſmell ſake are added certaine aromaticke things, as cinamon, cloves, nutmegs, and the like: ſuch powders if mixed with ſome ſyrupe, as *oxymel ſcilliticum*, or with mucilage of gum arabicke and tragacanth, will become opiates, to be made into a pyramidall forme of ſome fingers length, round or ſquare, and ſharpe pointed, that dryed they may ſerve for dentifrices.

Sometimes emollient roots are boiled with ſalt or alome, that dryed againe they may be uſed for dentrifices: moiſt ones are made of drying herbs, diſtilled together with drying and aſtringent things.

A powder for a Dentifrice.

All the differences ſhall appeare by the following examples. ℞. *lapidis ſpong. pumicis, & cornu cervi uſt. an.* ʒ ii. *coral. rub. & cryſtal. an.* ʒ i. *alum. & ſal. uſt. an.* ʒ i ß. *cinamom. & caryoph. roſar. rub. pulver. an.* ℈ ii. *fiat pulvis pro dentifricio.* Or, ♃. *oſsis ſepiæ,* ʒ ß. *maſtiches, coralli rubri uſti, an.* ʒ ii. *cornu cervi uſti,* ʒ i ß. *aluminis, carbonis, roriſmarini, an.* ʒ i. *cinamomi,* ʒ ii. *fiat pulvis pro dentifricio.* Or, ♃. *oſsis ſapiæ, alum. & ſalis uſti, an.* ʒ i. *cryſtalli, glandium, myrrhæ, thuris, an.* ℈ ii. *corticis granatorum, macis, cinamomi, an.* ℈ i. *fiat pulvis qui excipiatur mucagine gummi tragacanth. & formentur pyramides longæ, ſiccand. pro dentifricio.* Or, ℞. *rad. malvæ junioris, & biſmalvæ, an.* ℥ ii. *coquantur in aqua ſalſa aut aluminoſa, deinde ſiccentur in furno pro dentifricio.* ℞. *ſalis,* ℥ vi. *alumin.* ʒ iii. *thuris, maſtiches, ſang. dracon. an.* ʒ ß. *aquæ roſ.* ℥ vi. *diſtillentur in alembico vitreo pro dentifricio.*

Their uſe.

Dentrifices are not onely good to poliſh, cleanſe, and ſtrengthen the teeth; but wee alſo oft times uſe them for the tooth-ache, the diſeaſes of the mouth, and ulcers of the gummes. You may uſe them in the morning, before and after meat.

The antients, of lentiſke wood made themſelves tooth-picks, and ſuch devices to ſtrengthen their looſe teeth, which alſo at this day is in uſe with thoſe of *Languedock*, with whom this wood is plentifull, ſo that it may be brought thence for the uſe of Noblemen and Gentlemen; myrrhe may alſo ſerve for this ſame uſe, and any other aſtringent wood.

Our people commonly uſe the ſtalks of fennell, yet have they no faculty to faſten the teeth, but their ſmell is gratefull.

CHAP. XXXIX.

Of Bagges or Quilts.

What a bag or quilt is.

Their differences.

Phyſitians terme a bagge or *ſacculus*, the compoſition or mixture of dry and powdred medicines put in a bagge, therefore it is as it were a dry fomentation. Their differences are not drawne from any other thing than from the variety of the parts whereto they are applied: ſuch as are for the head muſt be made into the faſhion of a cap, thoſe which bee for the whole ventricle muſt be made into the forme of a citherne; thoſe for the ſpleene, like to an oxes tongue: laſtly, ſuch as are for the liver, heart and other parts muſt be made according to the figure of thoſe parts. Their matter is uſually taken from whole ſeeds fryed in a frying-pan, or made into powder; there are ſometimes added roots, flowers, fruits, rinds, cordiall powders, and other dry medicines, which may bee eaſily brought into powder, and conduce to the grieved parts; the quantity is different according to the magnitude of the affected parts; In the books of practiſers it is commonly found preſcribed from ℥iii. to ℥viß. ſometimes flowers, and dry herbs are preſcribed by handfulls and pugils: and here there is need of an artificiall conjecture to conceive and appoint a fit quantity of powders: but let us give you ſome examples.

A quilt for the ſtomacke.

♃. *roſar. rub.* p i. *maſtich.* ℥ ß. *coralli rub.* ʒ iii. *ſem. aniſi, & fænic. an.* ʒ ii. *nucis moſchat.* ʒ i. *ſummitat. abſinth. & menth. an.* m i. *tritis omnibus, fiat ſacculus conſutus & compunctus pro ventriculo.*

A cap for a cold head.

℞. *furfuris macri,* p i. *milii,* ℥ i. *ſalis,* ʒ ii. *roſar. rub. flor. roriſmarini, ſtæchados, caryoph. an.* m ii. *fol. beton. & ſalv. an.* ʒ iii. *tritis omnibus fiat cucupha, interſuta & calefacta fumo thuris, & ſandarachæ exuſtorum, capiti apponatur.*

A quilt for the heart.

♃. *flor. borag. bugloſ. & violar. an.* p ii. *cortic. citri ſicci, macis, ligni aloes, raſuræ eboris, an.* ʒ i. *oſsis de corde cervi, croci, an.* ℈ ii. *fol. meliſ.* m ß. *pulveris diambræ,* ʒ ß. *contritis omnibus fiat ſacculus è ſerico pro corde, irrorandus aqua ſcabioſæ.*

Their uſe.

Wee uſe bagges for the ſtrengthening of the noble parts, as the braine, heart, liver, as alſo for thoſe leſſe noble, as the ſtomacke, ſpleene, breaſt; laſtly for diſcuſſing flatulencies in what part ſoever, as in the collicke, and in a baſtard pleuriſie proceeding from flatulencies. The powders muſt bee ſtrawed upon carded bombaſt, that they runne not together, and then they muſt bee ſewed up or quilted in a bagge of linnen or taffaty.

Wee often times moiſten theſe bagges in wine or diſtilled water, and ſometimes not with the ſubſtance thereof, but by the vapour only of ſuch liquors put into a hot diſh: thus oft times the bagges are heated by the vapour onely, and oft times at the fire in a diſh by often turning them. Theſe, if intended for the heart, ought to bee of crimſon or skarlet ſilke, becauſe the skarlet berry, called by the Arabians *Kermes,* is ſaid to refreſh and recreate the heart. Certainly they muſt alwaies be made of ſome fine thing, whether it be linnen or ſilke.

CHAP. XL.

Of Fumigations.

What a fumigation is.

Their differences and matter.

A *Suffitus* or fumigation is an evaporation of medicines having ſome viſcous and fatty moiſture: of fumigations ſome are dry, otherſome moiſt, the dry have the form of trochiſces or pills: their matter ought to be fatty and viſcous, ſo that it may ſend forth a ſmoake by being burnt: ſuch are *ladanum,* myrrhe, maſticke, pitch, waxe, roſine, turpentine, *caſtoreum, ſtyrax,* frankincenſe, *olibanum,* and other gummes, which may bee mixed with convenient powders: for they yeeld them a body and firme conſiſtence; the fumigations that are made of powders only, yeeld neither ſo ſtrong nor long a fume.

A cephalicke fume.

The quantity of the powders muſt bee from ℥ ß. to ℥ i ß. but the gummes to ℥ ii. as, ℞. *ſandarachæ, maſtiches, roſar. an.* ʒ i. *benioini, galang. an.* ʒ iii. *terebinthina excipiantur, & fiant trochiſci, quibus incenſis ſuffumigentur tegumenta capitis.* ♃. *marcaſitæ,* ℥ ii. *bdellii, myrrhæ, ſtyracis, an.* ℥ i ß. *ceræ flavæ, & terebinth. quod ſufficit, fiant formulæ pro ſuffumigio.*

For the hardneſſe of the ſinewes.

♃. *cinnabaris,* ℥ ii. *ſtyracis & benzoini, an.* ℥ ii. *cum terebinth. fiant trochiſci pro ſuffumigio per embotum.*

For the relicks of the *Lues venerea.*

Wee uſe fumigations in great obſtructions of the braine, ulcers of the lungs, the *aſthma,* an old cough, paines of the ſides, wombe, and the diſeaſes of ſome other parts; ſometimes the whole body is fumigated, as in the cure of the *Lues venerea* to procure ſweat; ſometimes onely ſome one part whereto ſome reliques of the *Lues* adheres; ſuch fumigations are made of *cinnabaris*, wherein there is much *hydrargyrum*. The fume muſt be received by a funnell, that ſo it may not bee diſperſed, but may all be carried unto the part affected, as is uſually done in the affects of the womb and eares.

The manner of uſing them.

In fumigations for the braine and cheſt, the vapour would be received with open mouth; which thence may paſſe by the weazon into the cheſt, by the palate and noſtrils into the braine: but in the interim let the head bee vailed, that none of the vapour may flye away. Moiſt fumigations are made ſomewhiles of the decoction of herbes, otherwhiles of ſome one ſimple medicine boiled in oile, ſometimes a hot fire-ſtone is quencht in vinegar, wine, *aqua vitæ*, or the like liquor, ſo to raiſe a humide vapour. We oft times uſe this kinde of fumigation in overcomming ſcirrhous affects, when as we would cut, diſcuſſe, penetrate deep, and dry: take this as an example thereof.

℞. *laterem unum ſatis craſſum, aut marchaſitam ponderis* ℔ i. heat it red hot, and then let it bee quencht in ſharpe vinegar, powring thereon in the meane while a little *aqua vitæ*, make a fumigation for the grieved part.

The manner of a moiſt fumigation.

Fumes of the decoction of herbes doe very little differ from fomentations properly ſo called; for they differ not in the manner of their compoſure, but onely in the application to the affected parts: therefore let this be an example of a humide fumigation.

℞. *abſinth. ſalv. rut. origan. an.* p i. *rad. bryon. & aſar. an.* ℥ ß. *ſem. ſinap. & cumin. an.* ʒ ii. *decoquantur in duabus partibus aquæ, & una vini pro ſuffitu auris cum emboto*: and oft times ſuch fumigations are made for the whole body, whereof we ſhall treat hereafter.

A moiſt fume for the eares.

Chap. XLI.

Of a particular, or halfe-Bath.

A *Semicupium* or halfe-bath is a bath for the one halfe of the body, that is, for the parts from the belly downewards; it is called alſo an *inſeſsio*, becauſe the patient ſitteth to bathe in the decoction of herbes: in which forme and reſpect a *ſemicupium* differs from a fomentation; for it is compoſed of the ſame matter, to wit, a decoction of herbes, roots, ſeedes, fruits, but in this the quantity of the decoction is the greater, as wee ſhall teach by the following example.

What an *inſeſsio* is.

The matter.

℞. *malv. biſmalv. cum toto, an.* m i ß. *beton. ſaxifrag. pariet. an.* m i. *ſem. melon. milii ſolis, alkekengi, an.* ʒ iii. *cicer. rub.* p ii. *rad. apii, graminis, fœniculi, eryngii, an.* ʒ i. *decoquantur in ſufficienti quantitate aquæ pro inſeſſu.*

A halfe bath for the ſtone in the kidneies.

Wee uſe theſe halfe-baths in affects of the kidneyes, bladder, wombe, fundament, and lower belly, or otherwiſe when as the patient by reaſon of weakneſſe and feare of diſſipating the ſpirits, cannot ſuffer or away with a whole bath. The manner of uſing it is thus; fill ſome bagges with the boiled herbes, or other parts of plants, and cauſe the patient to ſit upon them; yet in the interim keepe the vapours from the head, leſt they ſhould offend it, by caſting over it a linnen cloath, or elſe let him not enter thereinto untill the vapour be exhaled.

The uſe.

The manner of uſing it.

Chap.

Chap. XLII.

Of Bathes.

The faculties of Bathes.

Their differences.

Naturall Baths.

Bathes are nothing elſe than as it were a fomentation of the whole body, both for preſerving health, and the cure of diſeaſes: this is a very commodious form of medicine, and among other externall medicines much celebrated by the Greeke, Arabian, and Latine Phyſitians. For a bath, beſides that it digeſts the acrid humors, and ſooty excrements lying under the skin, mitigates paines and wearineſſe, and corrects all exceſſe of diſtemper: moreover, in the cure of feavers, and many other contumacious and inveterate diſeaſes it is the chiefe and laſt remedy, and as it were the refuge of health, ſtored with pleaſing delight. Bathes are of two ſorts, ſome naturall, others artificiall: naturall, are thoſe which of their owne accord, without the operation or help of art, prevaile or excell in any medicinall quality. For the water which of it ſelfe is devoide of all quality that is perceivable by the taſte, if it chance to be ſtrained through the veines of metals, it furniſhes and impregnates it ſelfe with their qualities and effects: hence it is that all ſuch water excells in a drying faculty, ſometimes with cooling and aſtriction, and otherwhiles with heate and a diſcuſſing quality. The bathes whoſe waters being hot or warm, doe boile up, take their heat from the cavities of the earth and mines filled with fire; which thing is of much admiration whence this fire ſhould ariſe in ſubterrene places, what may kindle it, what feed or nouriſh it for ſo many yeeres, and keep it from being extinct. Some Philoſophers would have it kindled by the beames of the ſunne, others by the force of lightnings penetrating the bowels of the earth, others by the violence of the aire vehemently or violently agitated, no otherwiſe than fire is ſtrucke by the colliſion of a flint and ſteele. Yet it is better to referre the cauſe of ſo great an effect unto God the maker of the Univerſe, whoſe providence piercing every way into all parts of the World, enters and governes the ſecret parts and paſſages thereof. Notwithſtanding they ſeeme to have come neereſt the truth, who referre the cauſe of heat in waters unto the ſtore of brimſtone conteined in certaine places of the earth, becauſe amongſt all minerals it hath moſt fire and matter fitteſt for the nouriſhing thereof. Therefore to it they attribute the flames of fire which the Sicilian mountaine *Ætna* continually ſends forth. Hence alſo it is that the moſt part of ſuch waters ſmell of Sulphur, yet others ſmell of Alom, others of nitre, others of Tarre, and ſome of Coproſſe.

How to know whence the Bathes have their efficacy.

Now you may know from the admixture of what metalline bodies the waters acquire their faculties by their taſte, ſent, colour, mud, which adheres to the channels through which the water runnes, as alſo by an artificiall ſeparation of the more terreſtriall parts from the more ſubtle. For the earthy droſſe which ſubſides or remaines by the boiling of ſuch waters, will retaine the faculties and ſubſtance of Brimſtone, Alume, and the like minerals: beſides alſo, by the effects and the cure of theſe or theſe diſeaſes you may alſo gather of what nature they are. Wherefore wee will deſcribe each of theſe kinds of waters by their effects, beginning firſt with the ſulphureous.

The condition of naturall ſulphureous waters.

Sulphureous waters powerfully heat, dry, reſolve, open, and draw from the center unto the ſurface of the body; they cleanſe the skin troubled with ſcabs & tettars; they ceaſe the itching of ulcers, and digeſt & exhauſt the cauſes of the gout, they help paines of the collicke and hardened ſpleenes. But they are not good to be drunk, not onely by reaſon of their ungratefull ſmell and taſte, but alſo by reaſon of the malitiouſneſſe of their ſubſtance, offenſive to the inner parts of the body, but chiefly to the liver.

Of aluminous waters.

Aluminous waters taſte very aſtrictively, therefore they dry powerfully, they have no ſuch manifeſt heat, yet drunke, they looſe the belly: I believe by reaſon of their heat and nitrous quality they cleanſe and ſtay defluxions, and the courſes flowing too immoderately; they alſo are good againſt the tooth-ache, eating ulcers, and the hidden abſceſſes of the other parts of the mouth.

Salt

Of ſalt and nitrous.

Salt and nitrous waters ſhew themſelves ſufficiently by their heat: they heat, dry, bind, cleanſe, diſcuſſe, attenuate, reſiſt putrefaction, take away the blackeneſſe comming of bruiſes, heale ſcabby and maligne ulcers, and helpe all œdematous tumors.

Of bituminous.

Bituminous waters heate, digeſt, and by long continuance ſoften the hardened ſinewes; they are different according to the various conditions of the bitumen that they waſh, and partake of the qualities thereof.

Of braſen.

Braſen waters, that is, ſuch as retaine the qualities of braſſe, heat, dry, cleanſe, digeſt, cut, binde, are good againſt eating ulcers, fiſtula's, the hardneſſe of the eyelids, and they waſte and eat away the fleſhy excreſcences of the noſe and fundament.

Of iron.

Iron waters coole, dry, and bind powerfully, therefore they helpe abſceſſes, hardened milts, the weakneſſes of the ſtomacke and ventricle, the unvoluntary ſhedding of the urine, and the too much flowing termes, as alſo the hot diſtemper of the liver and kidneyes. Some ſuch are in the Lucan territory in *Italy*.

Of leaden.

Leaden waters refrigerate, dry, and performe ſuch other operations as lead doth: the like may bee ſaid of thoſe waters that flow by chalke, plaſter, and other ſuch mineralls, as which all of them take and performe the qualities of the bodies by which they paſſe.

Of hot baths.

Hot waters or bathes helpe cold and moiſt diſeaſes, as the Palſie, convulſion, the ſtiffeneſſe and attraction of the nerves, trembling palpitations, cold diſtillations upon the joints, the inflation of the members by a dropſie, the jaundiſe by obſtruction of a groſſe, tough, and cold humour, the paines of the ſides, collick, and kidneies, barrenneſſe in women, the ſuppreſſion of their courſes, the ſuffocation of the womb, cauſeleſſe wearineſſe, thoſe diſeaſes that ſpoile the ſkinne, as tettars, the leproſie of both ſorts, the ſcabbe, and other diſeaſes ariſing from a groſſe, cold and obſtructing humour, for they provoke ſweats.

To whom hurtfull.

The faculties of cold baths.

The Spaw.

Yet ſuch muſt ſhunne them as are of a cholericke nature, and have a hot liver, for they would cauſe a *cachexia* and dropſie by overheating the liver. Cold waters or baths heale the hot diſtemper of the whole body & each of the parts therof, and they are more frequently taken inwardly than applied outwardly; they help the laxneſſe of the bowels, as the reſolution of the retentive faculty of the ſtomacke, entralls, kidneies, bladder, and they alſo adde ſtrength to them. Wherefore they both temper the heat of the liver, and alſo ſtrengthen it, they ſtay the *Diarrhæa*, Dyſentery, Courſes, unvoluntary ſhedding of urine, the *Gonnorrhæa*, Sweats, and Bleedings. In this kinde are chiefly commendable the waters of the Spaw in the country of *Liege*, which inwardly and outwardly have almoſt the ſame faculty, and bring much benefit without any inconvenience, as thoſe that are commonly uſed in the drinks and broaths of the inhabitants.

Of artificiall baths.

In imitation of naturall baths, there may in want of them be made artificiall ones, by the infuſing and mixing the powders of the formerly deſcribed mineralls; as, Brimſtone, Alume, Nitre, *Bitumen*: alſo you may many times quench in common or raine water, iron, braſſe, ſilver and gold heated red hot, and ſo give them to be drunk by the patient, for ſuch waters doe oft times retain the qualities and faculties of the metals quenched in them, as you may perceive by the happy ſucceſſe of ſuch as have uſed them againſt the Dyſentery.

The faculty of a bath of warme water.

Beſides theſe there are alſo other bathes made by art of ſimple water, ſometimes without the admixture of any other thing, but otherwhiles with medicinall things mixed therewith, and boiled therein. But after what manner ſoever theſe bee made, they ought to be warme, for warm water humects, relaxes, mollifies the ſolid parts, if at any time they bee too dry, hard, and tenſe; by the aſcititious heat it opens the pores of the ſkinne, digeſts, attracts, and diſcuſſes fuliginous and acrid excrements remaining betweene the fleſh and the skin. It is good againſt ſun-burning and wearineſſe, whereby the ſimilar parts are dried more than is fit. To conclude, whether we be too hot or cold, or too dry, or be nauſeous, we find manifeſt profit by baths made of ſweet or warme water, as thoſe that may ſupply the defect of frictions and exerciſes: for they bring the body to a mediocrity of temper, they encreaſe and ſtrengthen the native colour, and by procuring ſweat diſcuſſe flatulencies; therefore they are very uſefull in hecticke feavers, and in the declenſion of all feavers, and againſt raving and talking idely, for they procure ſleep. But becauſe water alone cannot long adhere to the body, let oile bee mixed or put in them, which may hold in the water, and keep it longer to the skinne.

Why we put oile into baths.

Theſe bathes are good againſt the inflammations of the lungs and ſides, for they mitigate pain, and help forward that which is ſuppurated to excluſion, when as generall remedies according to art have preceded, for otherwiſe they will cauſe a greater defluxion on the afflicted parts: for a bath (in *Galens* opinion) is profitably uſed to diſeaſes when as the morbifick matter is concocted. To this purpoſe is choſen rain water, then river water, ſo that it be not muddy, and then fountaine water; the water of ſtanding lakes and fennes is not approved of, for it is fit that the water which is made choice of for a bath of ſweet water, ſhould bee light and of ſubtle parts, for baths of waters which are more than moderately hot or cold yeeld no ſuch commodity; but verily they hurt in this, that they ſhut up or cloſe the pores of the body, and keepe in the fuliginous excrements under the skinne; other bathes of ſweet or freſh water conſiſt of the ſame matter as fomentations doe, whence it is that ſome of them relaxe, others mitigate paine, others cleanſe, and otherſome procure the courſes, that is compounded of a decoction of ingredients or plants having ſuch operations. To theſe there is ſometimes added wine, other whiles oile, ſometimes freſh butter or milke, as when the urine is ſtopped, when nephriticke paines are violent, when the nerves are contracted, when the habite of the body waſtes and wrinkles with a hecticke dryneſſe, for this corrugation is amended by relaxing things, but it is watred, and as it were fatted by humecting things, which may penetrate & transfuſe the oily or fatty humidity into the body thus rarified and opened by the warmneſſe of a bath.

Anodine bathes are made of a decoction of medicines of a middle nature, ſuch as are temperate and relaxing things, with which wee may alſo ſometimes mixe reſolving things; they are boiled in water and wine, eſpecially in paines of the collicke proceeding from vitreous phlegme, or groſſe and thicke flatulencies conteined or ſhut up in the belly, kidneyes, or wombe. In ſuch bathes it is not fit to ſweat, but onely to ſit in them ſo long untill the bitterneſſe of the paine be aſſwaged or mitigated, leſt the powers weakened by paine, ſhould bee more reſolved by the breaking forth of ſweat: emollients are ſometimes mixed with gentle detergents, when as the skin is rough and cold, or when the ſcailes or cruſt of ſcabs is more hard than uſuall, then in concluſion we muſt come to ſtrong deterſives and driers, laſtly to drying and ſomewhat aſtrictive medicines, ſo to ſtrengthen the skinne, that it may not yeeld it ſelfe ſo eaſie and open to receive defluxions. By giving you one example the whole manner of preſcribing a bath may apppeare.

Why we muſt not continue in the bath till we ſweat.

A mollifying & anodine bath.

℞. *rad. lilior. albor. biſmalv. an.* ℔ ii. *malv. pariet. violar. an.* m ß. *ſem. lini, fænug. biſmalv. an.* ℔ i. *flor. cham. melil. aneth. an.* p vi. *fiat decoctio in ſufficienti aquæ quantitate, cui permiſcito olei liliorum & lini, ana,* ℔ ii. *fiat balneum in quo diutius natet æger.*

Cautions to be obſerved in the uſe of baths.

Bathes though noble remedies approved by uſe and reaſon, yet unleſſe they bee fitly and diſcreetly uſed in time, plenty, and quality, they doe much harme; for they cauſe ſhakings and chilneſſe, paines, denſity of the skinne, or too much rarefaction thereof, and oft times a reſolution of all the faculties. Wherefore a man muſt bee mindfull of theſe cautions before he enter a bath: firſt, that there be no weakneſſe of any noble and principall bowell, for the weak parts eaſily receive the humors which the bath hath diffuſed and rarified, the waies lying open which tend from the whole body to the principall parts. Neither muſt there be any plenty of crude humours in the firſt region, for ſo they ſhould be attracted and diffuſed over all the body: therefore it is not onely fit that generall purgations ſhould precede, but alſo particular by the belly and urine: beſides, the patient ſhould bee ſtrong that can faſting endure a bath as long as it is needfull. Laſtly, the bath ought to be in a warme and ſilent place, leſt any cold aire by its blowing, or the water by its cold appulſe, cauſe a ſhivering or ſhaking of the body, whence a feaver may enſue.

The morning is a fit time for bathing, the ſtomacke being faſting and empty, or ſixe hours after meat, if it be requiſite that the patient ſhould bath twice a day, otherwiſe the meat yet crude would bee ſnatched by the heate of the bath out of the ſtomacke into the veines and habite of the body. Many, of all the ſeaſons of the yeere make choice of the ſpring and end of ſummer, and in theſe times they chuſe a cleare day, neither troubled with ſtormy windes, nor too ſharpe an aire. As long as the patient is in the bath, it is fit that he take no meate, unleſſe peradventure to comfort him hee take a little bread moiſtened in wine, or the juice of an orange, or ſome damaske prunes to quench his thirſt: his ſtrength will ſhew how long it is fit that he ſhould ſtay in, for he muſt not ſtay there to the reſolution of his powers, for in baths the humide and ſpirituous ſubſtance is much diſſipated. Comming forth of the bath, they muſt preſently get them to bed, and be well covered, that by ſweating, the excrements, drawne unto the skinne by the heat of the bath, may breake out: the ſweat cleanſed, let him uſe gentle frictions, or walking, then let him feede upon meat of good juice and eaſie digeſtion, by reaſon that the ſtomacke cannot but be weakened in ſome ſort by the bath.

The fitteſt time for bathing.

How to order the patient comming forth of the bath.

That quantity of meat is judged moderate, the weight whereof ſhall not oppreſſe the ſtomacke: venery after bathing muſt not bee uſed, becauſe to the reſolution of the ſpirits by the bath, it addes another new cauſe of further ſpending or diſſipating them. Some wiſh thoſe that uſe the bath by reaſon of ſome contraction, paine, or other affects of the nerves, preſently after bathing, to dawbe or beſmeare the affected nervous parts with the clay or mudde of the bathe, that by making it up as it were in this paſte, the vertue of the bath may worke more effectually, and may more throughly enter into the affected part.

Theſe cautions being diligently obſerved, there is no doubt but the profit by bathes will be great & wonderfull: the ſame things are to be obſerved in the uſe of Stoves or Hot-houſes, for the uſe and effect of baths and hot-houſes is almoſt the ſame, which the antients therefore uſed by turne, ſo that comming forth of the bath they entred a ſtove, and called it alſo by the name of a bath, as you may gather from ſundry places of *Galen* in his *Methodus med.* wherefore I thinke it fit in the next to ſpeake of them.

CHAP. XLIII.

Of Stoves or Hot-houſes.

STOVES are either dry or moiſt: Dry, by raiſing a hot and dry aëry exhalation, ſo to imprint their faculties in the body, that it thereby waxeth hot, and the pores being opened, runnes down with ſweat. There are ſundry waies to raiſe ſuch an exhalation: at *Paris*, and whereſoever there are ſtoves or publicke hot-houſes, they are raiſed by a cleere fire put under a vaulted fornace, whence it being preſently diffuſed, heats the whole roome. Yet every one may make himſelfe ſuch a ſtove as he ſhall judge beſt and fitteſt.

The differences of Stoves.

How made.

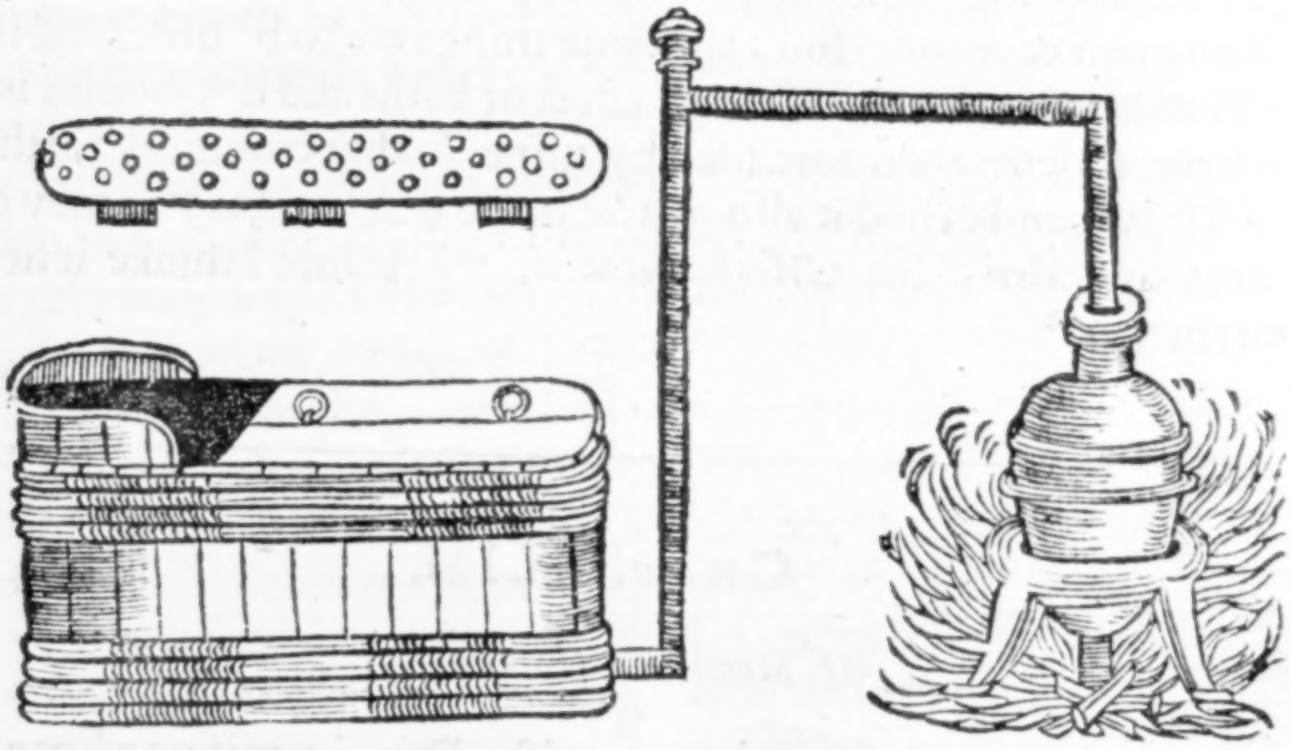
Alſo you may put red hot cogle ſtones or bricks into a tubbe, having firſt laid the bottome thereof with brickes or iron plates, and ſo ſet a ſeat in the midſt thereof, wherein the patient ſitting, well covered with a canopy drawne over him, may receive the exhalation ariſing from the ſtones that are about him, & ſo have the benefit ſweating: but in this caſe we muſt oft looke to and ſee the patient, for it ſometimes happens that ſome, neglected by their keepers otherwiſe employed, becomming faint, and their ſenſe failing them by the diſſipation of their ſpirits by the force of the hot exhalation, have ſunke down with all their bodies upon the ſtones lying under them, and ſo have beene carried halfe dead and burnt into their beds. Some alſo take the benefit of ſweating in a fornace or oven, as ſoone as bread is drawne out thereof. But I doe not much approve of this kinde of ſweating, becauſe the patient cannot as he will, much leſſe as he pleaſeth, lye or turne himſelfe therein.

Humide

A vaporous ſtove or bath.

Humid ſtoves or ſudatories are thoſe wherein ſweat is cauſed by a vapour or moiſt heat: this vapour muſt be raiſed from a decoction of roots, leaves, flowers, and ſeeds, which are thought fit for this purpoſe; the decoction is to be made in water or wine, or both together. Therefore let them all be put into a great veſſell well luted, from the top of whoſe cover iron or tinne pipes may come into the bathing tub ſtanding neere thereto, betweene the two bottomes thereof, by meanes whereof the hot vapour may enter thereinto, and diffuſe it ſelfe therein. Now it is fit the bathing tub ſhould bee furniſhed with a double bottome, the one below and whole, the other ſomewhat higher and perforated with many holes, whereupon the patient ſitting may receive a ſudorificke vapour over all his body: now this vapour, if at any time it become too hot, muſt bee tempered by opening the hole, which muſt for the ſame purpoſe be made in the top of the pipe, that ſo it may be opened and ſhut at pleaſure. In the interim the tub ſhall bee cloſely covered wherein the patient ſits, hee putting forth onely his head, that ſo hee may draw in the coole aire. In defect of ſuch pipes, the herbs ſhall bee boiled by themſelves in a caldron or kettle, and this ſhall bee ſet thus hot into the bathing tubbe at the patients feet, and ſo by caſting into it heated ſtones, a great and ſudorificke vapour ſhall be raiſed.

The delineation of a bathing Tubbe, having a double bottome, with a veſſell neare thereto, with pipes comming therefrom, and entring betweene the two bottomes of the Tubbe.



Chap. XLIV.

Of Fuci, *that is, waſhes, and ſuch things for the ſmoothing and beautifying of the ſkinne.*

This following diſcourſe is not intended for thoſe women which addicted to filthy luſt, ſeek to beautifie their faces, as baits and allurements to filthy pleaſures: but it is intended for thoſe onely, which the better to reſtraine the wandring luſts of their husbands, may endevour by art to take away thoſe ſpots and deformities which have happened to fall on their faces either by accident or age.

As the colour of the skin is, ſuch is the humour that is thereunder.

The colour that appeares in the face, either laudible or illaudible, abundantly ſhewes the temper both of the body, as alſo of thoſe humours that have the chiefe dominion therein: for every humour dyes the ſkinne of the whole body, but chiefly of the face, with the colour thereof: for choler bearing ſway in the body, the face lookes yellowiſh; phlegme ruling, it lookes whitiſh or pale; if melancholy exceed, then blackiſh or ſwart; but if blood have the dominion, the colour is freſh and red. Yet there are other things happening externally which change the native colour of the face, as ſun-burning, cold, pleaſure, ſorrow, feare, watching, faſting, paine, old diſeaſes, the corruption of meats and drinks: for the flouriſhing colour of the cheeks is not onely extinguiſhed by the too immoderate uſe of vinegar, but by the drinking of corrupt waters the face becomes ſwolne and pale.

On the contrary, laudible meats and drinks make the body to bee well coloured and comely, for that they yeeld good juice, and conſequently a good habite. Therefore if the ſpots of the face proceed from the plenitude and ill diſpoſition of humours, the body ſhall bee evacuated by blood-letting: if from the infirmity of any principall bowell, that muſt firſt of all bee ſtrengthened; but the care of all theſe things belongs to the Phyſitian: we here onely ſeek after particular remedies which may ſmooth the face, and take away the ſpots, and other defects thereof, and give it a laudible colour.

Waters wherewith to waſh the face.

Firſt the face ſhall be waſhed with the water of lilly flowers, of bean flowers, water lillies, of diſtilled milke, or elſe with the water wherein ſome barly or ſtarch hath bin ſteeped. The dryed face ſhall be anointed with the ointments preſently to be deſcribed; for ſuch waſhing cleanſeth and prepareth the face to receive the force of the ointments, no otherwiſe than an alumed lye prepares the haires to drinke up and retaine the colour that wee deſire. Therefore the face being thus cleanſed and prepared, you may uſe the following medicines, as thoſe that have a faculty to beautifie, extend, and ſmooth the ſkinne: as,

Compound liquors wherewith to waſh the face.

Virgins milke.

℞. *gum. tragacanth. conquaſſ.* ʒ ii. *diſtemperentur in vaſe vitrio cum* ℔ ii. *aquæ communis, ſic gummi diſſolventur, inde albeſcet aqua.* Or elſe, ℞. *lithargyri auri,* ℥ ii. *ceruſ. & ſalis com. an.* ℥ ß. *aceti, aquæ plantag. an.* ℥ ii. *caphur.* ʒ ß. *macerentur lithargyros & ceruſa in aceto ſeorſim per tres aut quatuor horas, ſal vero & camphora in aqua quam inſtituto tuo aptam delegeris:* then filter them both ſeverall, and mixe them together being ſo filtred, when as you would uſe them.

℞. *lactis vaccini,* ℔ ii. *aranciorum & limon. an.* nu. iv. *ſacchari albiſſimi, & alum. roch. an.* ʒ i. *diſtillentur omnia ſimul:* let the lemmons and oranges bee cut into ſlices, and then be infuſed in milk, adding thereto the ſugar and alome; then let the mall be diſtilled together in *balneo Mariæ*; the water that comes thereof will make the face ſmooth and lovely. Therefore about bed time it will be good to cover the face with linnen cloaths dipped therein. A water alſo diſtilled of ſnailes gathered in a vineyard, juice of lemmons, the flowres of white mullaine, mixed together in equall proportion, with a like quantity of the liquor contained in the bladders of elme leaves, is very good for the ſame purpoſe. Alſo this,

℞. *micæ panis albi,* ℔ iv. *flor. fabar. roſar. alb. flor. nænuph. lilior. & ireos, an.* ℔ ii. *lactis vaccini,* ℔ vi. *ova.* nu. viii. *aceti opt.* ℔ i. *diſtillentur omnia ſimul in alembico vitreo, & fiat aqua ad faciei & manuum lotionem.* Or, ℞. *olei de tartaro,* ℥ iii. *mucag. ſem. pſilii,* ℥ i. *ceruſ. in oleo roſ. diſſolut.* ℥ i ß. *borac. ſal. gem. an.* ʒ i. *fiat linimentum pro facie.* Or. ℞. *caponem vivum, & caſeum ex lacte caprino recenter confectum, limon.* nu. iv. *ovor.* nu. vi. *ceruſ. lot. in aq. roſar.* ℥ ii. *boracis,* ℥ i ß. *camph.* ʒ ii. *aq. flor. fabar.* ℔ iv. *fiat omnium infuſio per* xxiv. *horas, poſtea diſtillentur in alembico vitreo.*

The marrow of ſheeps bones good to ſmooth the face.

There is a moſt excellent *fucus* made of the marrow of ſheepes-bones, which ſmooths the roughneſſe of the ſkinne, beautifies the face; now it muſt be thus extracted. Take the bones, ſevered from the fleſh by boyling, beat them, and ſo boyle them in water, when they are well boyled, take them from the fire, and when the water is cold, gather the fat that ſwimmes upon it, and therewith anoint your face when as you goe to bed, and waſh it in the morning with the formerly preſcribed water.

How to make *Salceruſſæ*,

℞. *ſalis ceruſſ.* ʒ ii. *ung. citrin. vel ſpermat. ceti,* ℥ i. *malaxentur ſimul, & fiat linimentum, addendo olei ovor.* ʒ ii. The *Sal ceruſſæ* is thus made, grinde Ceruſſe into very fine powder, and infuſe ℔ i. thereof in a pottle of diſtilled vinegar for foure or five dayes, then filter it, then ſet that you have filtred in a glaſed earthen veſſell over a gentle fire untill it concrete into ſalt, juſt as you doe the *capitellum* in making of Cauteries.

℞. *excrementi lacert. oſſis ſepiæ, tartari, vini albi, raſur. corn. cerv. farin. oriz. an. partes æquales, fiat pulvis, infundatur in aqua diſtillata amygdalarum dulcium, limacum* *vinealium, flor. nenuph. huic addito mellis albi par pondus* : let them be all incorporated in a marble mortar, and kept in a glaſſe or ſilver veſſell, and at night anoint the face herewith; it wonderfully prevailes againſt the redneſſe of the face, if after the anointing it you ſhall cover the face with a linnen cloath moiſtened in the formerly deſcribed water.

℞. *ſublim.* ʒ i. *argent. viv. ſaliv. extinct.* ʒ ii. *margarit. non perforat.* ʒ i. *caph.* ʒ iß. *incorporentur ſimul in mortario marmoreo, cum piſtillo ligneo, per tres horas ducantur & fricentur, reducanturque in tenuiſſimum pulverem, confectus pulvis abluatur aqua myrti & deſiccetur, ſerveturq; ad uſum, adde foliorum auri & argenti,* nu. x. When as you would uſe this powder, put into the palme of your hand a little oile of maſtick, or of ſweet almonds, then preſently in that oyle diſſolve a little of the deſcribed powder, and ſo work it into an ointment, wherewith let the face be anointed at bed-time: but it is fit firſt to waſh the face with the formerly deſcribed waters, and againe in the morning when you riſe.

How to paint the face.

When the face is freed from wrinkles and ſpots, then may you paint the cheekes with a roſie and flouriſhing colour; for of the commixture of white and red ariſeth a native and beautifull colour: for this purpoſe take as much as you ſhall thinke fit of braſill, and alchunet; ſteep them in alume water, and therewith touch the cheeks and lips, and ſo ſuffer it to dry in: there is alſo ſpaniſh red made for this purpoſe; others rub the mentioned parts with a ſheeps ſkinne died red: moreover the friction that is made by the hand onely, cauſeth a pleaſing redneſſe in the face, by drawing thither the blood and ſpirits.

CHAP. XLV.

Of the Gutta Roſacea, *or a fiery face.*

THis treatiſe of *Fuci* puts me in minde to ſay ſomething in this place of helping the preternaturall redneſſe which poſſeſſeth the noſe and cheekes, and oft times all the face beſides, one while with a tumour, other whiles without, ſometimes with puſtles and ſcabs, by reaſon of the admixtion of a nitrous and aduſt humor. Practitioners have termed it *Gutta roſacea.* This ſhewes both more and more ugly in winter than in ſummer, becauſe the cold cloſeth the pores of the ſkinne, ſo that the matter contained thereunder is pent up for want of tranſpiration, whence it becomes acrid and biting, ſo that as it were boiling up, it lifts or raiſeth the ſkinne into puſtles and ſcabs; it is a contumacious diſeaſe, and oft times not to be helped by medicine.

Why worſe in winter than in ſummer.

Diet.

For the generall method of curing this diſeaſe, it is fit that the patient abſtaine from wine, and from all things in generall that by their heat inflame the blood, and diffuſe it by their vaporous ſubſtance: he ſhall ſhunne hot and very cold places, and ſhall procure that his belly may be ſoluble, either by nature or art. Let blood firſt be drawn out of the *baſilica*, then from the *vena frontis*, and laſtly from the vein of the noſe. Let leaches be applied to ſundry places of the face, and cupping glaſſes with ſcarification to the ſhoulders.

Remedies.

For particular or proper remedies, if the diſeaſe be inveterate, the hardneſſe ſhall firſt be ſoftned with emollient things, then aſſaulted with the following ointments, which ſhall be uſed or changed by the Chirurgian as the Phyſitian ſhall thinke fit.

An approved ointment.

℞. *ſucci citri,* ℥ iii. *ceruſ. quantum ſufficit ad eum inſpiſſandum, argenti vivi cum ſaliva & ſulphure vivo extincti,* ʒ ß. *incorporentur ſimul, & fiat unguentum.*

℞. *boracis,* ʒ ii. *farin. cicer. & fabar. an.* ʒ i ß. *caph.* ʒ i. *cum melle & ſucco cepæ fiant trochiſci* : when you would uſe them, diſſolve them in roſe and plantaine water, and ſpread them upon linnen cloaths, and ſo apply them on the night time to the affected parts, and ſo let them be oft times renued.

℞. *unguenti citrini recenter diſpenſati,* ℥ ii. *ſulphuris vivi,* ℥ ß. *cum modico olei ſem. cucurb. & ſucci limonum, fiat unguentum*; with this let the face be anointed when you goe to bed, in the morning let it bee waſhed away with roſe water, being white by reaſon of bran infuſed therein: moreover, ſharp vinegar boyled with branne and roſe water, and applied as before, powerfully takes away the redneſſe of the face.

℞. *ceruſ. & litharg. auri, ſulphuris vivi pulveriſati, an.* ℥ ß. *ponantur in phiala cum aceto & aqua roſarum:* linnen cloaths dipped herein ſhall be applied to the face on the night, and it ſhall bee waſhed in the morning with the water of the infuſion of bran: this kinde of medicine ſhall be continued for a moneth.

℞. *ſanguinis tauri,* ℔ i. *butyri recentis,* ℔ ß. *fiat diſtillatio, utatur.* The liquor which is diſtilled for the firſt daies is troubled and ſtinking, but theſe paſſed, it becommeth cleare and well ſmelling. Some boile bran in vinegar and the water of water lillies, and in this decoction they diſſolve of *ſulphur* and camphire a fit proportion to the quantity of the decoction, and they apply cloaths moiſtened in this medicine to the face in the evening.

To dry up the puſtles.

♃. *album. ovor.* nu. ii. *aquæ roſ.* ℥ i ß. *ſucci plantag. & lapath. acut. an.* ℥ i ß. *ſublimati,* ℈ i. *incorporentur in mortario marmoreo.* ℞. *axung. porci decies in aceto lotæ,* ℥ iv. *argenti vivi,* ℥ i. *aluminis, ſulphuris vivi, an.* ʒ i. *piſtentur omnia diu in mortario plumbeo, & fiat unguentum; argentum vivum non debet niſi extremo loco affundi.* ℞. *rad. lapath. acut. & aſphodel. an.* ℥ ii. *coquantur in aceto ſcillitico, poſtea tundantur, & ſetaceo trajiciantur, addendo auripigmenti,* ʒ ii. *ſulphuris vivi,* ʒ x. let them be incorporated and make an ointment to be uſed to dry up the puſtles.

♃. *rad. liliorum ſub cineribus coctorum,* ℥ iv. *piſtillo tuſis, & ſetaceo trajectis, adde butyri recentis, & axung. porci, lotæ in aceto, an.* ℥ i. *ſulphuris vivi,* ʒ iii. *camphor.* ℈ iii. *ſucci limonum quantum ſufficit, malaxentur ſimul & fiat unguentum.* ℞. *lactis virginalis,* ℔ ß. *aluminis,* ℥ ß. *ſulphuris vivi,* ℥ i. *ſucci limonum,* ℥ vi. *ſalis com.* ʒ ß. let them all be diſtilled in a glaſſe alembicke, and the water kept for the forementioned uſes.

℞. *lapath. acut. plantagin. & aſphodel. an.* ℥ i ß. *olei vitel. ovor.* ℥ i. *terebinth. venet.* ℥ ß. *ſucci limonum,* ʒ iii. *aluminis combuſt.* ʒ i. *argenti vivi extinct.* ℥ i. *olei liliorum,* ℥ ß. *tundantur omnia in mortario plumbeo, addendo ſub finem argent. viv. ne mortario adhæreſcat.* The juice of onions beaten with ſalt, or the yelkes of egges are good for the ſame purpoſe.

To kill tettars.

For ſtaying and killing of Ring-wormes and Tettars, the leaves of hellebore beaten with vinegar are good, the milke of the fig-tree is good of it ſelfe, as alſo that of the ſpurges, or muſtard diſſolved in ſtrong vinegar with a little ſulphur. Or,

♃. *ſulphuris, calcanthi, & aluminis, an.* ʒ i. *macerentur in aceto forti, trajiciantur per linteum,* apply the expreſſed juice. Others macerate an egge in ſharpe vinegar, with coporoſe and *ſulphur vivum* beaten into fine powder, then they ſtraine or preſſe it through a linnen cloath.

But ſeeing the forementioned medicines are acride, and for the moſt part eating and corroding, it cannot bee but that they muſt make the ſkinne harſh and rough, therefore to ſmooth and levigate it againe, you ſhall make uſe of the following ointment.

To ſmooth the ſkinne.

℞. *tereb. ven. tam diu lotæ, ut acrimoniam nullam habeat, butyri ſalis expertis, an.* ℥ i ß. *olei vitel. ovor.* ℥ i. *axung. porci in aqua roſarum lotæ,* ℥ ß. *ceræ parum, fiat linimentum ad uſum.* To the ſame purpoſe you may alſo make uſe of ſome of the forementioned medicines.

CHAP. XLVI.

To blacke the haire.

AT firſt the haires, (to take the *fucus* or tincture, and to retaine it) muſt be prepared with Lye, wherein a little roche Alome is diſſolved. Thus the fatty ſcales may be waſhed and taken away, which hinder, and (as it were) keep away the *fucus*, that it cannot adhere or penetrate into the body of the haire. Then muſt we come to particular or proper & fitting medicines, What things are fit to dy the haire.

for this purpoſe. Theſe ought to be aromaticke and cephalicke, and ſomewhat ſtiptick, that by their odoriferous and aſtringent power they may ſtrengthen the animal faculty: Furthermore, they muſt be of ſubtle parts, that they may enter even into the inner rootes of the haires.

℞. *Sulphuris, vitrioli, gallarum, calcis vivæ, lithargyri, an.* ʒii. *ſcoriæ ferri,* ʒß. *in pollinem reducantur, & cum aq. communi incorporentur, ut inde fiat maſſa*: with this at bed time let the haires bee rubbed, and in the morning let them bee ſmoothed with the ſame.

℞. *calcis lotæ,* ℥i. *lithargyri utriuſq;* ℥ß. *cum decocto gallarum, corticum, nucum, fiat maſſa, addendo olei chamem.* ʒ ii. ℞. *lytharg. auri,* ℥ ii. *ciner. clavellat.* ℥ i ſß. *calcis viv.* ʒ i. *diſſolve omnia cum urena hominis donec acquirant conſiſtentiam unguenti pro unctione capillorum.* ♃. *calcis lotæ,* ℥ iv. *lithargyri utriuſq; an.* ℥ ii. *cum decoct. ſalv. & cort. granat. fiat paſta ad formam pultis ſatis liquidæ*: let the haire at bed time bee died herewith, and waſhed in the morning with wine and water.

How to waſh Lime.

Now the manner of waſhing lime is thus: Infuſe in ten or twelve pints of faire water one pound of lime, then poure out the water by ſtooping the veſſell, putting more in the ſtead thereof; the third time in ſtead of common water powre thereon the water of the decoction of ſage and galls, let the lime lye therein for ſo many houres, then in like manner powre it off by ſtooping the veſſell; and thus you ſhall have your lime well waſhed. There is alſo found a way how to die or black the haire by only powring of ſome liquor thereon: as, ♃. *argenti puriſſimi,* ʒ ii. *reducantur in tenuiſſimas laminas, ponantur in ampulla vitrea cum* ʒii. *aquæ ſeparationis auri & argenti, & aquæ roſar.* ʒ vi. The preparing of this water is thus, put into a violl the water of ſeparation and the ſilver, and ſet it upon hot coales ſo to diſſolve the ſilver, which being done then take it from the fire, and when it is cold, adde thereto the roſe water. But if you would black it more deeply, adde more ſilver thereto, if leſſe, then a ſmaller quantity; to uſe it, you muſt ſteepe the combe wherewith you combe your head in this water.

A water to black the haire.

℞. *plumbi uſti,* ℥ ii. *gallarum non perforat. cortic. nucum, an.* ℥ iii. *terræ ſigil. ferret. hiſpan. an.* ℥ ii. *vitriol. rom.* ℥ vi. *ſalis gem.* ℥ i ß. *caryoph. nucis moſch. an.* ℥ i. *ſalis ammon. aloes, an.* ʒ ß. *fiat pulvis ſubtiliſſimus*: let this powder be macerated in vinegar for three daies ſpace, then diſtill it all in an alembick, the water that comes therefrom is good for the foreſaid uſe. The following medicine is good to make the haires of a flaxen colour. ♃. *flor. geniſt. ſtæchad. & cardamom. an.* ℥ i. *lupinor. conquaſſat. raſur. buxi, corticis citri, rad. gentian. & berber. an.* ℥ i ß. *cum aqua vitri fiat lenta decoctio*: herewith bathe and moiſten the haires for many dayes.

To make the haire of a flaxen colour.

Chap. XLVII.

Of Pſilothra, *or Depilatories: and alſo of Sweet waters.*

A depilatory.

Medicines to fetch off haire, which by the Greeks are termed *Pſilothra*, and *Depilatoria* in latine vulgarly, are made as you may learn by theſe following examples. ℞. *calcis vivæ,* ℥ iii. *auripigmenti,* ℥i. let the lime bee quencht in faire water, and then the orpiment added with ſome aromaticke thing: have a care that the medicine lye not too long upon the part, otherwiſe it will burne; and this medicine muſt bee made to the conſiſtence of a pultis and applied warme, firſt fomenting the part with warme water; for then the haire will fall off by gentle rubbing or waſhing it with warme water: but if there happen any excoriation thereupon, you may helpe it by the uſe of *unguentum roſatum*, or ſome other of the like faculty.

Another.

℞. *calcis viv. aurip. citrin. an.* ℥i. *amyl. ſpumæ argent. an.* ℥ ß. *terantur & incorporentur cum aq. com. & bulliant ſimul*: you ſhall certainly know that it is ſufficiently boiled, if putting thereinto a gooſes quill, the feathers come preſently off: ſome make into powder equall parts of unquencht lime and orpiment, they tye them up in a cloath, with which being ſteeped in water they beſmear the part, and within a while after by gently ſtroaking the head, the haire falls away of it ſelfe. The following waters are very fitting for to waſh the hands, face, and whole body, as alſo linnen, becauſe they yeeld a gratefull ſmell: the firſt is lavander water thus to be made. ℞. *flor. lavend.* ℔ iv. *aq. roſar. & vini alb. an.* ℔ ii. *aq. vitæ*, ℥ iv. *miſceantur omnia ſimul, & fiat diſtillatio in balneo Mariæ:* this ſame water may alſo bee had without diſtillation, if you put ſome lavander flowers in faire water, and ſo ſet them to ſunne in a glaſſe, or put them in *balneo*, adding a little oile of ſpike and muske. Clove water is thus made: ℞. *caryoph.* ℥ ii. *aq. roſar.* ℔ ii. *macerentur ſpatio* xxiv. *horarum, & diſtillentur in balneo Mariæ.* Sweet water commonly ſo called, is made of divers odoriferous things put together; as thus, ℞. *menthæ, majoranæ, hyſſopi, ſalviæ, roriſmarini, lavendulæ, an.* m ii. *radicis ireos*, ℥ ii. *caryophylorum, cinamomi, nucis moſchatæ, ana*, ℥ ß. *limonum*, num. iv. *macerentur omnia in aqua roſarum, ſpatio viginti quatuor horarum, diſtillentur in balneo Mariæ, addendo Moſchi*, ℈ ß.

Sweet waters.

Lavander water.

Clove water.

CHAP. I.

What Diſtillation is, and how many kinds thereof there be.

HAving finiſht the Treatiſe of the faculties of medicines, it now ſeemes requiſite that we ſpeake ſomewhat of Chymiſtry and ſuch medicines as are extracted by fire. Theſe are ſuch as conſiſt of a certaine fift eſſence ſeparated from their earthy inpurity by Diſtillation, in which there is a ſingular, and almoſt divine efficacy in the cure of diſeaſes. So that of ſo great an aboundance of the medicines there is ſcarſe any which at this day Chymiſts doe not diſtill, or otherwiſe make them more ſtrong and effectuall than they were before. Now Diſtillation is a certaine art or way by which the liquor or humid part of things, by the vertue and force of fire or ſome ſemblable heate (as the matter ſhall ſeeme to require) is extracted and drawne, being firſt reſolved into vapour and then condens'd againe by cold. Some call this art *Sublimation* or ſubliming, which ſignifies nothing elſe but to ſeparate the pure from the unpure; the parts that are more ſubtle and delicate, from thoſe that are more corpulent, groſſe and excrementitious; as alſo to make thoſe matters whoſe ſubſtance is more groſſe, to become more pure and ſincere, eyther for that the terreſtriall parts are ill united and conjoyned, or otherwiſe confuſed into the whole and diſperſed by the heate and ſo carried up, the other groſſer parts remaining together in the bottome of the veſſell. Or a diſtillation is the extraction or effuſion of moiſture diſtilling drop by drop from the noſe of the Alembecke or any ſuch like veſſells. Before this effuſion or falling downe of the liquor there goes a certaine concoction performed by the vertue of heate; which ſeparates the ſubſtances of one kind from thoſe of another that were confuſedly mixed together in one body, and ſo brings them into one certaine forme or body, which may be good and profitable for divers diſeaſes. Some things require the heate of a cleare fire, others a flame, others the heate of the Sunne, others of Aſhes or ſand or the filings of Iron; others horſe dung, or boyling water or the oiely vapour or ſteame thereof. In all theſe kinds of fires, there are foure conſiderable degrees of heate. The firſt is conteined in the limits of warmth, and ſuch is warme water, or the vapour of hot water. The ſecond is a little hotter, but yet ſo as the hand may abide it without any harme, ſuch is the heate of Aſhes. The third exceeds the vehemency of the ſecond, wherefore the hand cannot long endure this without hurt, and ſuch is the heate of ſand. The fourth is ſo violent, that it burneth any thing that commeth neare, and ſuch are the filings of Iron.

What diſtillation is.

Foure degrees of heate.

The firſt degree is moſt convenient to diſtill ſuch things as are ſubtle and moiſt as flowers. The ſecond ſuch as are ſubtle and dry as thoſe things which are odoriferous and aromaticall, as Cinnamon, Ginger, Cloves. The third is fitteſt to diſtill ſuch things are of a more denſe ſubſtance and fuller of juice; ſuch as are ſome Roots, and

What heate fitteſt for what things.

gummes. The fourth is fit for mettalls and mineralls as, Allum, Vitrioll, Amber, Iet, &c. In like manner you may alſo diſtill without heate; as wee uſe to doe in thoſe things which are diſtilled by ſtraining, as when the more pure is drawne and ſeparated from that which is moſt unpure and earthy, as wee doe in *Lac Virginale*, and other things which are ſtrained through an hypocras bag, or with a peece of cloath cut in the forme of a tongue, or by ſetling, or by a veſſell made of Ivy wood: ſometimes alſo ſomethings may bee diſtilled, by coldneſſe and humidity, and ſo we make the oile of Tartar, Myrrhe and Vitriolls, by laying them upon a marble in a cold and moiſt place.

Chap. II.

Of the matter and forme of Fornaces.

The matter the beſt for Fornaces.

THe matter and forme of Fornaces uſes to bee divers. For ſome Fornaces uſe to bee made of brickes and clay, otherſome of clay onely, which are the better and more laſting, if ſo bee the clay bee fat and well tempered with whites of Egges and haire. Yet in ſuddaine occaſions when there is preſent neceſſity of diſtillation, fornaces may be made of bricks, ſo laid together that the joynts may not agree, but be unequall, for ſo the ſtructure will be the ſtronger. The beſt and fitteſt forme of a Fornace for diſtillation is round; for ſo the heate of the fire carried up equally diffuſes it ſelfe every way, which happens not in a Fornace of another figure, as ſquare or triangular, for the corners diſperſe and ſeparate the force of the fire. Their magnitude muſt bee ſuch as ſhall bee fit for the receiving of the veſſell. For their thickneſſe, ſo great as neceſſity ſhall ſeeme to require. They muſt be made with two bottomes, diſtinguiſht as it were into two forges, one below which may receive the aſhes of the coales or the like other fuell, the other above to containe the burning coales or fire. The bottome of this upper muſt eyther bee an iron grate, or elſe it muſt bee perforated with many holes, that ſo the aſhes may the more eaſily fall downe into the bottome, which otherwiſe would extinguiſh the fire; yet ſome Fornaces have three partitions, as the Fornace for reverberation. In the firſt and loweſt the aſhes are received, in the ſecond the coales are put, & in the third the matter which is calcin'd or elſe diſtilled. The third ought to have a ſemicircular cover, that ſo the heate or flame may bee reflected upon the contained matter. The lower partition ſhall have one or more dores, by which the fallen downe aſhes may bee taken forth. But the upper muſt have but one, whereby the coales or wood may be put in. But in the top or upper part of the Fornace where it ſhall ſeeme moſt fit, there ſhall be two or three holes made, that by them you may blow the fire and that the ſmoake may more freely paſſe out. But theſe forementioned dores muſt have their ſhutters, juſt like an ovens mouth. But in defect of a fornace or fit matter to build one withall, wee may uſe a kettle, ſet upon a trefoote after the manner that wee ſhall preſently declare when wee come to ſpeake of that diſtillation which is to bee made by *Balneum Mariæ*.

A round forme the beſt for Fornaces.

Chap. III.

Of veſſells fit for Diſtillation.

VEſſells for Diſtillation conſiſt of different matter and forme, for they are eyther of Lead, Tinne or Braſſe, or elſe earthen veſſells and theſe are ſometimes leaded, ſometimes not: or elſe they are of Gold, ſilver,

ſilver or glaſſe. Now for leaden veſſells they are worſe than the reſt, and utterly to be refuſed, eſpecially when as the liquors which are drawne by them are to bee taken into the body by the mouth, by reaſon of the maligne qualities which are ſaid to be in Lead; by which occaſion, *Galen* condemnes thoſe waters which runne, and are contained in Leaden pipes, which by reaſon of their ſaltiſhneſſe and acrimony which ſavours of quickſilver, they cauſe dyſenteries. Therefore you may perceive ſuch waters as are diſtilled through a leaden head to bee endued with a more acrid and violent piercing vapour, by reaſon the portion of that ſaltiſhneſſe diſſolved in them, & as it were ſhaved from the top of the Alembecke or head, defiles the diſtilled liquors, and whitens and turnes them into a milky ſubſtance: but copper or braſſe heads are more hurtfull than Lead, for they make the waters that come through them to ſavour or participate of braſſe. Thoſe that are of gold and ſilver are leſſe hurtfull; but the greatneſſe of the coſt hinders us from making heads of ſuch mettalls; therefore we muſt have a care that our veſſells for diſtillation be eyther of potters mettall leaded, or elſe of braſſe, or of that jugge mettall which is commonly called *terra betovacenſis*, and theſe rather than of Lead, or any other mettall. Verily glaſſes are thought the beſt; and next to them, earthen veſſells leaded, then of jugge mettall, and laſtly theſe of tinne. There is great variety of veſſells for diſtillation in forme and figure; for ſome are of an ovall or cilindricall figure, that is, of a round and longiſh; others are twined and crooked, others of other ſhapes, as you may ſee in the beakes of the Chimicks. Of this almoſt infinite variety of figures I will in fit place give you the delineation and uſe of ſuch as ſhall ſeeme to bee moſt neceſſary.

Leaden veſſells ill.

Braſſe worſe.

The beſt veſſells for diſtillation.

CHAP. IIII.

What things are to be conſidered in diſtillation.

FIrſt make choyſe of a fit place in your houſe for the fornace, ſo that it may neither hinder any thing, nor be in danger of the falling of any thing that ſhall lye over it. When you ſhall diſtill any thing of a maligne or venenate quality, ye ſhall ſtand by it as little as you may, leaſt the vapour ſhould doe you any harme: when you provide glaſſe veſſells for diſtillation, make choice of ſuch, as are exquiſitely baked, without flawes or crackes, and ſuch as are every where ſmooth. Let not the fire at firſt be very violent, not onely for feare of breaking the veſſells, but alſo for that the firſt fire in diſtillation muſt be gentle, and ſo increaſed by little and little. The things to be diſtilled, ought not to be put in too great quantity into the body of the ſtill, leaſt they ſhould riſe up or fly over. Hot things, that they may be more effectuall muſt bee twice or thriſe diſtilled, by powring upon them their owne diſtilled water or other freſh materialls, or elſe by diſtilling them ſeverally and by themſelves: of this kind are gummes, waxe, fatts, or oyles.

Hot things muſt bee often diſtilled.

But in each other repeated diſtillations you muſt ſomething leſſen the force of the fire, for the matter attenuated by the former diſtillation cannot afterward indure ſo great heate: but aromaticke things, as Cloves, Cinnamon, &c. as alſo the chimicall oyles of Sage, Roſemary, Time, &c. ought not to bee diſtilled or rectified over againe, for that we muſt preſently after the firſt diſtillation have a diligent care to ſeparate them from the phlegme, that is, the more watry ſubſtance of the whole liquor, to which purpoſe we muſt have regard to that which is diſtilled, for there are ſome things which firſt ſend over their phlegme as Vinegar, others, wherein it comes laſt, as * *aqua vita*.

* By *Aqua vita* in this and moſt other places is meant nothing but the ſpirit of wine.

If you would give to things to bee diſtilled another taſte or ſmell than that which they have naturally, you may mixe with them ſome odoriferous thing, as Cinnamon, Camphire, or Muske, or the like, as you pleaſe, and ſo diſtill them together. The diſtilled liquors which are drawne by the heate of aſhes or ſand, ſavour of and retaine a certaine *empyreuma*, or ſmatch of the fire; for the helping of which, you ſhall put them into glaſſes very cloſe ſtopt, and ſo expoſe them to the ſunne, and now and then open the glaſſes that this fiery impreſſion may exhale, and the *phlegmon* be conſumed, if that there ſhall be any. But though in all diſtillation, there are many things to be obſerved, yet are there two things, chiefly worthy of note. The firſt is, the matter that is to be diſtilled and wrought upon, that is, of what kind it is, and what the nature thereof may doe and ſuffer. The other is the Fornace, which ought to bee provided of a convenient matter and figure for that which is to be diſtilled: for you cannot draw any thing of any matter, neither of every mixture being diſtilled can you rightly expect oyle or water. For mixt bodies doe not conſiſt of an equall portion of the foure Elements, but ſome are more aiery, others more fiery, ſome participate more of the water, others more of the earth, and that preſently from their firſt originall. Therefore as watry things yeeld more water, ſo aiery and fiery things yeeld more oyle when they are diſtilled; neither are all inſtruments fit for the extracting of every liquor. Moreover you muſt note, that the watery liquor ſometimes comes forth in the firſt place, and preſently after by the helpe of a ſtronger fire followes the oilely, which we finde happens as often as the plant or parts of the plants which are diſtilled, are of a cold temperament; for in hot things it happens otherwiſe, for the firſt liquor which comes forth is oilely, and the following wateriſh.

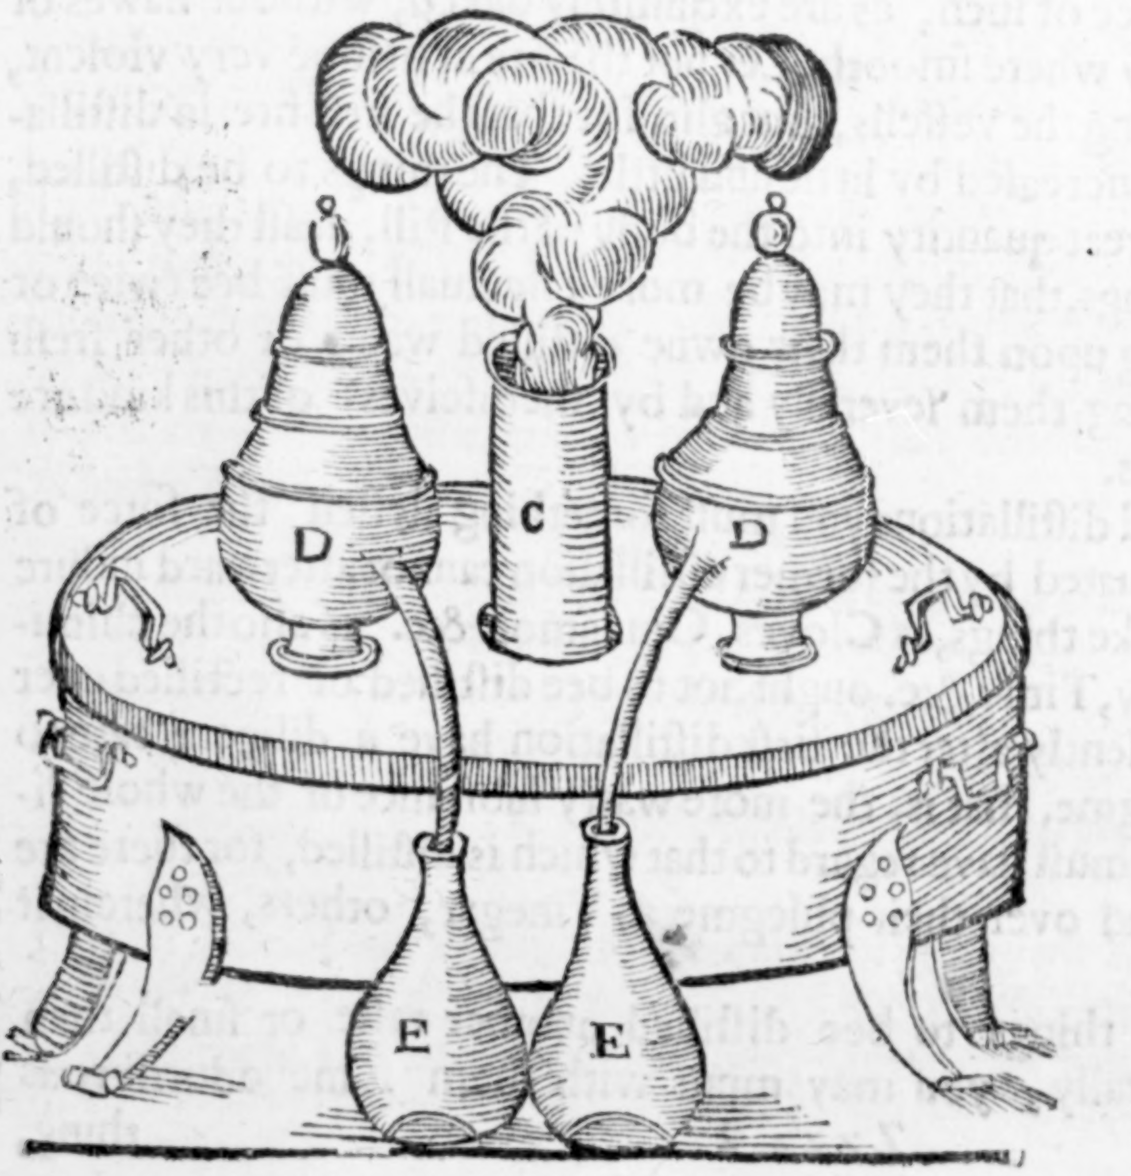
CHAP. V.

Of what faſhion the veſſells for the diſtilling of waters ought to be.

The parts of an Alembecke.

FOr the diſtilling of any kind of waters, two kind of veſſells are neceſſary, which are comprehended under this one generall name of an Alembecke. They call one of them the body, or containing veſſell, the other the head, that is, the cap or top wherein the aſcending vapours are condenſated or turned into water. It is called the head, becauſe it ſtands over the body, like as an head; from the head there comes out a pipe or noſe whereby the diſtilled liquor flowes drop by drop into the receiver, as you may ſee by the following figure:

The Fornace for a Balneum Mariæ *with the Alembeck, and their receivers.*



A. *Shewes a braſſe kettle full of water.*

B. *The cover of the kettle perforated in two places, to give paſſage forth to the Veſſells.*

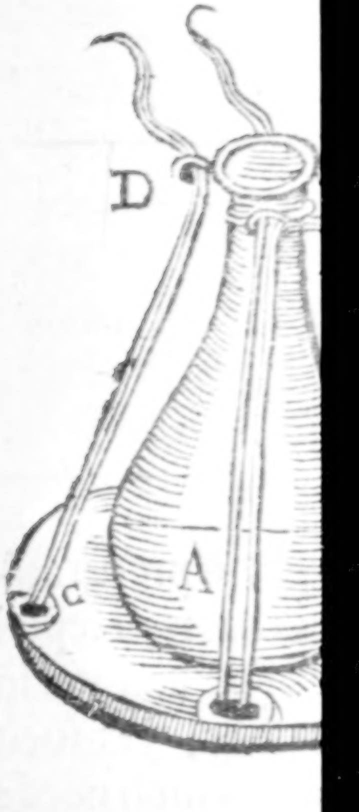
C. *A pipe or Chimney added to the kettle, wherein the fire is contained to heate the water.*

D. *The Alembecke conſiſting of his body and head.*

E. *The receiver whereinto the diſtilled liquor runs.*

The

The effigies

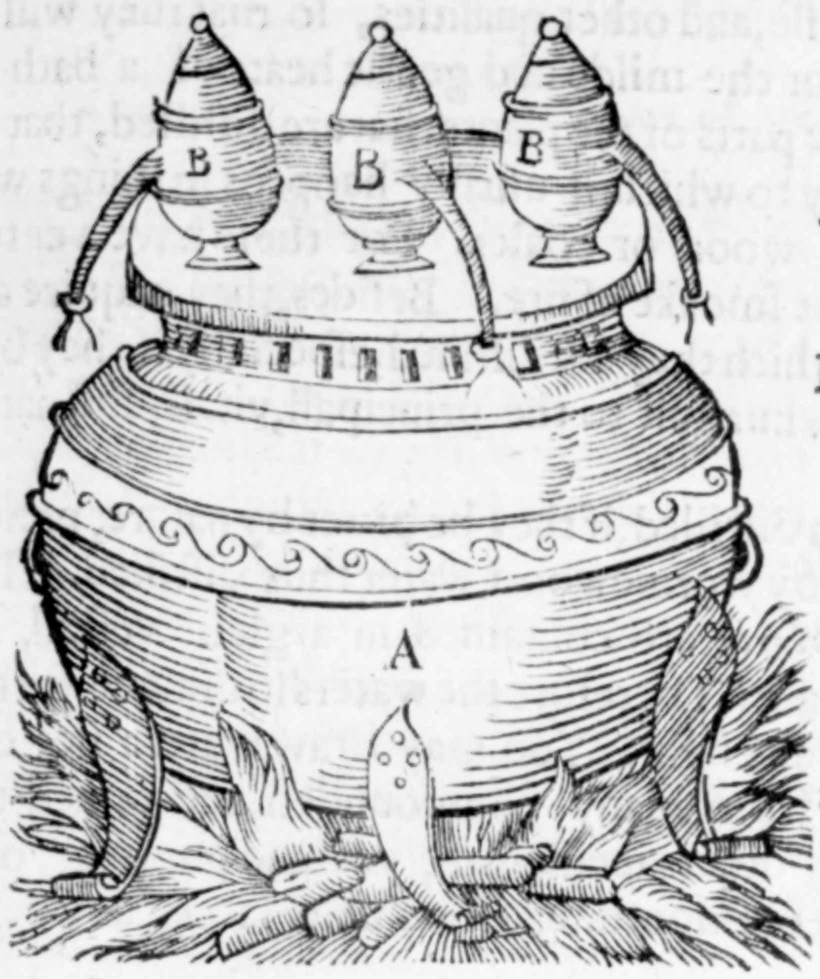


A Forna

Now for the

in *balne Maria*

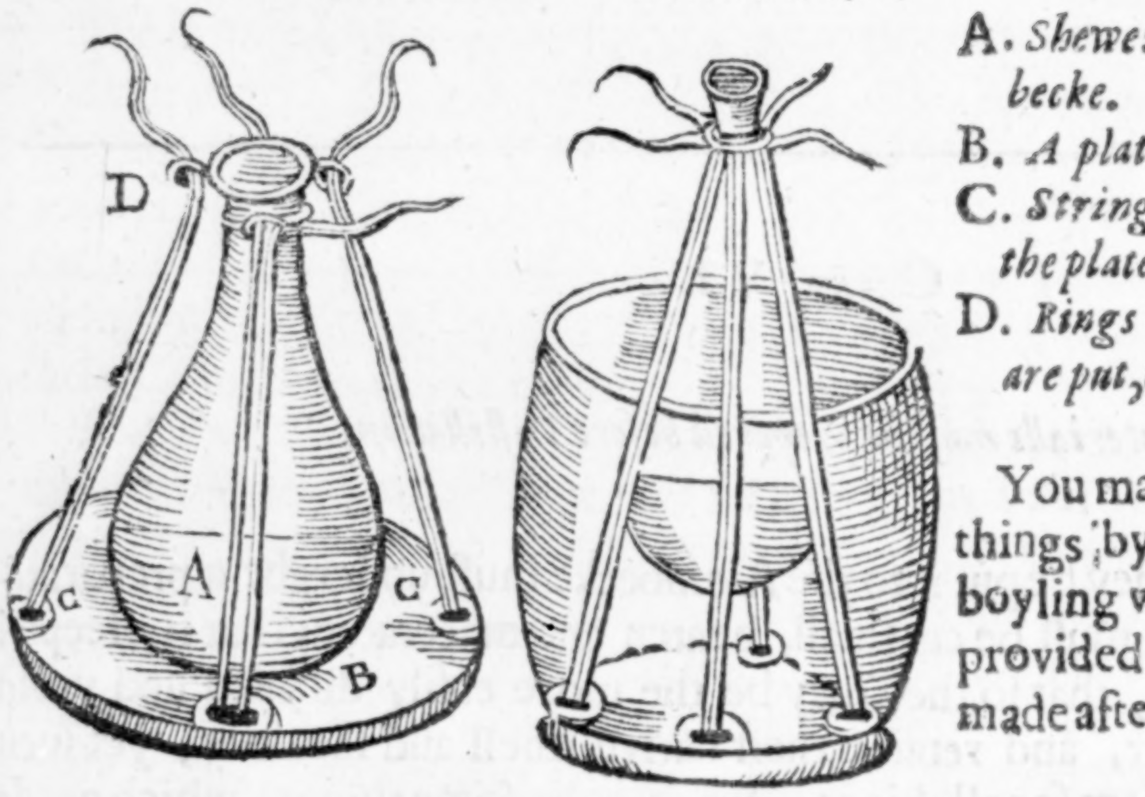
The effigies of another balneum Mariæ, *not ſo eaſy to be remooved as the former.*



A. *Shewes the veſſell or Copper that containes the water.*

B. *The Alembecke ſet in water.*

But leaſt the bottome of the Alembicke being halfe full, ſhould floate up and downe in the water, and ſo ſticke againſt the ſides of the Kettle; I have thought good to ſhew you the way and meanes to prevent that danger.



A. *Shewes the Veſſell or glaſſe Alembecke.*

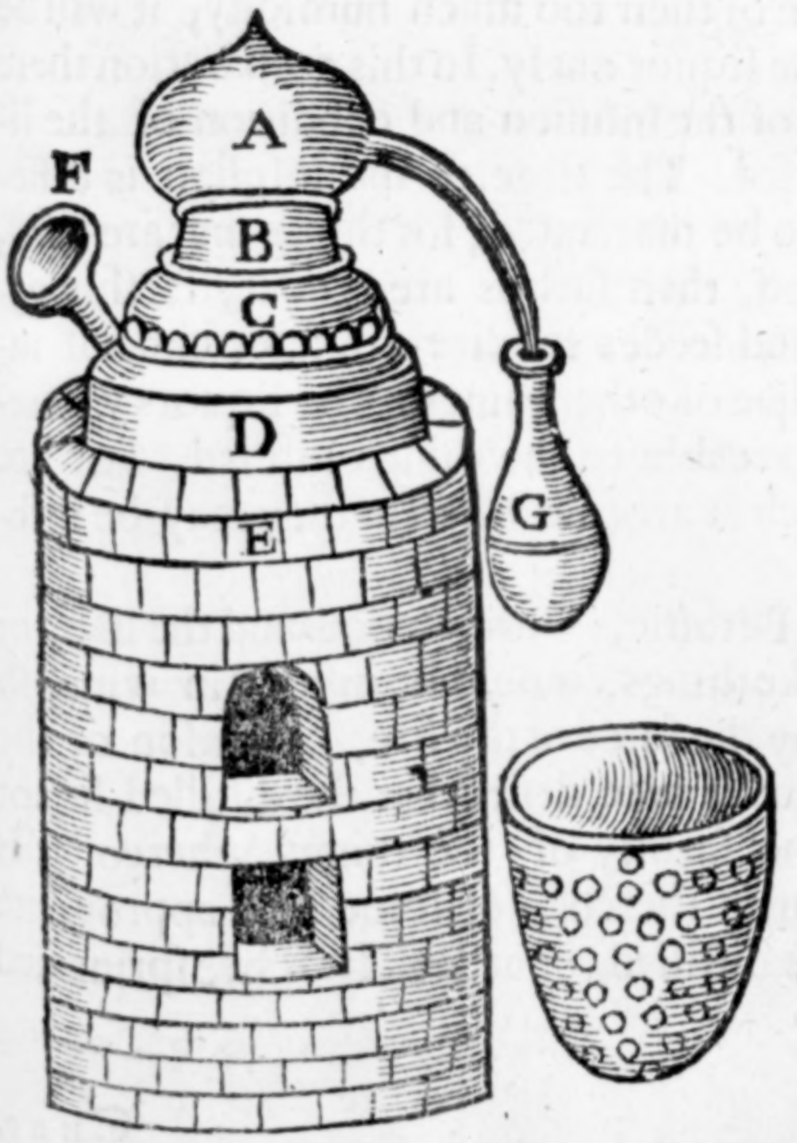
B. *A plate of Lead whereon it ſtands.*

C. *Strings that bind the Alembecke to the plate.*

D. *Rings through which the ſtrings are put, to faſten the Alembecke.*

You may alſo diſtill the liquors of things by the vapour or ſteame of boyling water, if ſo be that you bee provided of Veſſells and formes made after this following manner.

A Fornace with his veſſells to diſtill liquors with the ſteme of boyling water.



A. Shewes the head of the Alembecke.

B *The body thereof, placed in a braſſe veſſell made for that purpoſe.*

C. *A braſſe veſſell perforated in many places to receive the vapour of the water. This veſſell ſhall conteine th'Alembecke compaſſed about with ſawduſt, not onely that it may the better and longer retaine the heate of the vapour, but alſo leaſt it ſhould be broken by the hard touch of the braſen veſſell.*

D. *Shewes the braſſe veſſell containing the water as it is plac't in the Fornace.*

E. *The Fornace containing the veſſell.*

F. *A Funnell by which you may now and then powre in water, in ſtead of that which is vaſniſht and diſſipated by the heate of the fire.*

G. *The Receiver.*

Now for the faculties of diſtilled waters it is certaine, that thoſe which are drawne in *balne Mariæ* or a double veſſell, are farre better and efficacious, becauſe, they

Why thoſe things that are diſtilled in *Balneo* retaine more of the ſtrength of things.

doe not onely reteine the ſmell of the things which are diſtilled, but alſo the taſte, as acidity, harſhneſſe, ſweetneſſe, bitterneſſe, and other qualities, ſo that they will neither ſavour of ſmoake nor burning; for the milde and gentle heate of a bath containes by his humidity, the more ſubtle parts of the plants that are diſtilled, that they be not diſſipated and exhaled, contrary to which it uſually happens in things which are diſtilled by the burning heate of wood or coales. For theſe have a certaine nitrous and acrid taſte, ſavouring of the ſmoake of fire. Beſides, they acquire a maligne quality from the veſſells out of which they are diſtilled, eſpecially if they bee of Lead, whence they contract qualities hurtfull to the principall, vitall, and naturall parts.

Therefore the plants which are thus diſtilled, if they be bitter by nature, preſently become inſipid, as you may perceive by wormewood water thus diſtilled. Thoſe things which are diſtill'd in *Balneo Mariæ* are contained in a glaſſe veſſell, from which they can borrow no maligne quality. Therefore the waters ſo drawne are more effectuall and pleaſing in taſte, ſmell, and ſight. You may draw waters not onely from one kind of plant, but alſo from many compounded and mixed together: Of theſe ſome are alimentary, others medicinall, yea and purging; others acquir'd for ſmell, others for waſhing or ſmoothing of womens faces, as wee ſhall ſhew hereafter.

CHAP. VI.

How the materialls muſt be prepared before Diſtillation.

THings before they be put into the Alembecke muſt undergoe a preparation, that is, they muſt be cut ſmall, beaten and macerated, that is, ſteeped in ſome liquor, that ſo they may be the more eaſily diſtilled and yeeld the more water, and retaine their native ſmell and faculties; yet ſuch preparation is not convenient for all things; for there be ſome things, which neede no infuſion or maceration, but muſt rather bee dryed before they bee diſtilled, as Sage, Time, Roſemary, and the like, by reaſon of their too much humidity; it will be ſufficient to ſprinkle other things with ſome liquor onely. In this preparation there are two things obſervable, to wit, the time of the infuſion and condition of the liquor wherein theſe things ought to bee infuſed. The time of the infuſion is different according to the variety of the matter to be macerated; for things that are hard, ſolid, dry or whole, muſt be longer macerated, than ſuch as are tender, freſhly gathered or beaten: whence it is that rootes and ſeedes require a longer time of infuſion; flowers and leaves a ſhorter, and the like of other things. The liquors wherein infuſion muſt be made, ought to bee agreeable to the things infuſed. For hot ingredients require hot liquors, and cold ſuch as are cold wherein they may be infuſed.

What things neede not to be macerated before they bee diſſolved.

Such things as have not much juice, as Betonie, wormewood and the like, or which are very odoriferous, as all aromaticke things, would be infuſed in wine, ſo to preſerve their ſmell, which otherwiſe by the force of the fire, by reaſon of the tenuity of the ſubſtance, eaſily vaniſhes. But if wee deſire that the diſtilled liquor ſhould more exactly reteine and have the faculty of the things whereof it is diſtilled, then muſt you infuſe it in the juice thereof, or ſome ſuch appropriate liquor, that it may ſwimme in it whileſt it is diſtilled, or at leaſt let it bee ſprinckled therewith.

The maceration of plants in their owne juice.

CHAP. VII.

Of the art of diſtilling of waters.

BEfore I deſcribe the manner how to diſtill waters, I thinke it not amiſſe briefly to reckon up how many ſorts of diſtilled waters there bee, and what the faculties of them are. Therefore of diſtilled waters ſome are medicinall, as the waters of Roſes, Plantaine, Sorrell, Sage, and the like: others are alimentary, as thoſe waters that we call Reſtauratives; otherſome are compoſed of both, ſuch as are theſe reſtaurative waters which are alſo mixed with medicinall things; others are purging, as the diſtilled water of greene and freſh Rubarbe; otherſome ſerve for ſmoothing the skinne, and others for ſmell; of which ſort are thoſe that are deſtilled of aromaticke things.

The varieties of ſtilled waters.

To diſtill Roſe water, it will be good to macerate the Roſes before you diſtill them for the ſpace of two or three dayes, in ſome formerly diſtilled Roſewater, or their preſſed out juice, luting the veſſell cloſe; then put them into an Alembecke cloſely luted to his head and his receiver, and ſo put into a *Balneum Mariæ*, as wee have formerly deſcribed.

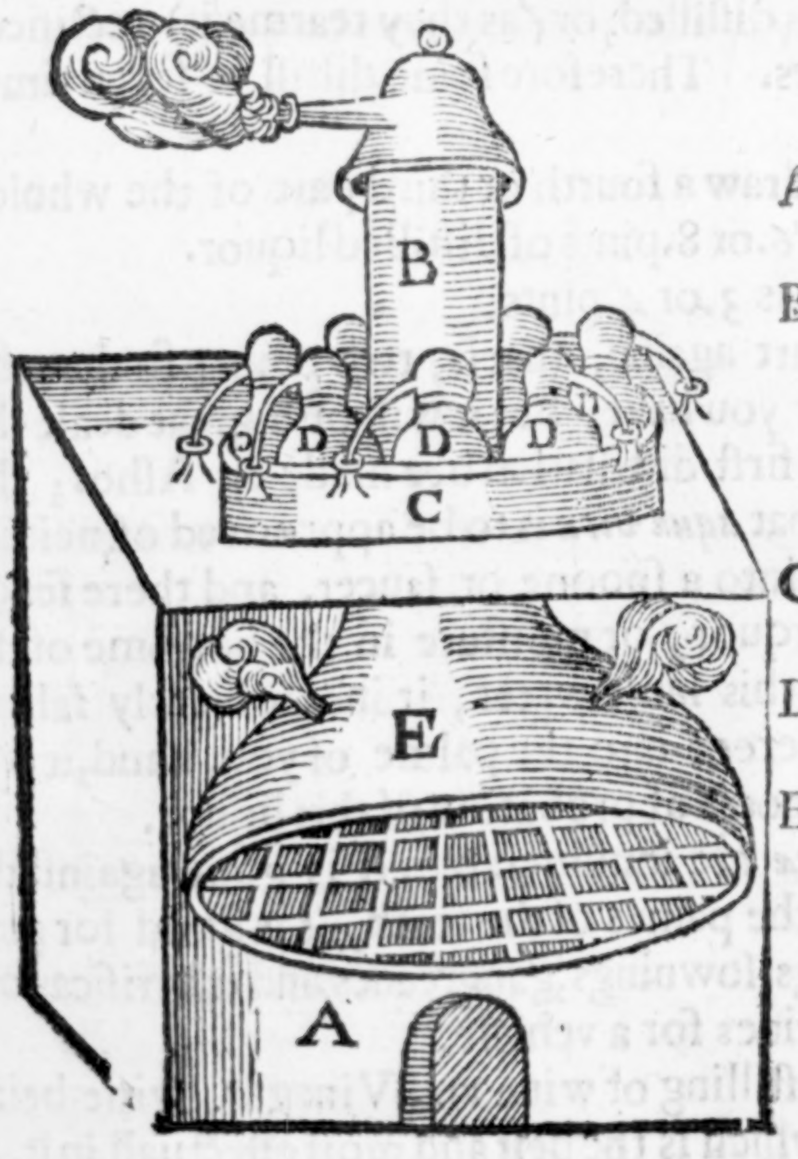
Roſe water.

The diſtilled Alimentary liquors are nothing elſe than thoſe that wee vulgarly call Reſtauratives; this is the manner and art of preparing them. Take of Veale, Mutton, Kid, Capon, Pullet, Cocke, Partridge, Pheaſant, as much as ſhall ſeeme fit for your purpoſe: cut it ſmall, and leaſt it ſhould acquire heate, or *empyreuma* from the fire, mixe therewith a handfull of French Barley, and of red Roſe leaves dry and freſh, but firſt ſteeped in the juice of Pomegranats, or citrons and Roſewater with a little Cinnamon, as much.

Reſtauratives.

But if you deſire that this reſtaurative ſhould not onely bee alimentary but alſo medicinall, you ſhall adde thereto ſuch things as ſhall reſiſt the diſeaſe, ſuch as are Cordiall pouders as of *El. Diamargarit. frigid. De Gemmis, Aromaticum Roſat.* Conſerve of Bugloſſe, Borrage, roots, hearbes, ſeeds and other things of that kind. But if it be in a peſtiferous ſeaſon, Treacle, Mithridate and other Antidotes ſhall be added; each of theſe ſhall be laid in rankes or orders one over another, which is vulgarly termed *ſtratum ſuper ſtratum*, in a glaſſe Alembeck, and diſtilled in *balneo Mariæ* with the heate of Aſhes, or elſe of warme ſand, as the following figure ſhewes.

The delineation of a Balneum Mariæ, *which may alſo ſerve for to diſtill with Aſhes.*



A. *Shewes the Fornace with the hole to take forth the Aſhes.*

B. *Shewes another Fornace, as it were ſet in the other: now it is of Braſſe, and runs through the midſt of the kettle made alſo of braſſe, that ſo the conteined water or aſhes may bee the more eaſily heated.*

C. *The kettle wherein the water, aſhes, or ſand are conteined.*

D. *The Alembecke ſet in the water, aſhes, or ſand, with the mouthes of the receivers.*

E. *The bottome of the ſecond braſſe Fornace, whoſe top is marked with* B. *which containes the fire.*

There

Another way of making reſtorative Liquors.

There may be made other reſtrauratives in ſhorter time with leſſe labour and coſt. To this purpoſe the fleſh muſt be beaten and cut thinne, and ſo thruſt through with a double thred, ſo that the peices thereof may touch each other; then put them into a Glaſſe, and let the thred hang out; ſo ſtop up the glaſſe cloſe with a linnen cloth, Cotton, or Towe, and lute it up with paſte made of meale and the whites of egges; then ſet it up to the necke in a kettle of water, but ſo that it touch not the bottome, but let it be kept upright by the formerly deſcribed meanes; then make a gentle fire thereunder, untill the contained fleſh by long boyling ſhall bee diſſolved into juyce, and that will commonly be in ſome foure houres ſpace. This being done, let the fire be taken from under the kettle, but take not forth the glaſſe before the water be cold, leaſt it being hot ſhould be broken by the ſuddaine appulſe of the cold aire. Wherefore when as it is cold, let it be opened, and the thred with the peeces of fleſh be drawne forth, ſo that onely the juyce may be left remaining; then ſtraine it through a bagge, and aromatize it with Sugar and Cinnamon, adding a little juyce of Citron, Verjuice or Vinegar, as it ſhall beſt like the patients palate.

After this manner you may quickely, eaſily and without great coſt have and prepare all ſorts of reſtauratives aſwell medicated as ſimple. But the force and faculty of purging medicines is extracted after a cleane contrary manner than the oyles and waters are drawne of Aromaticke things, as Sage, Roſemary, Time, Aniſeedes, Fennell, Cloves, Cinnamon, Nutmegs, and the like. For the ſtrength of theſe, as that which is ſubtile and ayery, flies upwards in diſtillation; but the ſtrength of purging things, as Turbith, Agaricke, Rubarbe and the like, ſubſide in the bottome. For the purgative faculty of theſe purgers inſeparably adheres to the bodies and ſubſtances.

Now for ſweet waters and ſuch as ſerve to ſmooth the ſkinne of the face, they may be diſtilled in *Balneo Mariæ* like as Roſe water.

Chap. VIII.

How to diſtill Aqua vitæ, or the ſpirit of wine.

TAke of good White or Clarret wine or Sacke which is not ſowre nor muſtie, nor otherwiſe corrupt, or of the Lees that quantity which may ſerve to fill the veſſell wherein you make the diſtillation to a third part; then put on your head furniſhed with the noſe or pipe, and ſo make your diſtillation in *Balneo Mariæ*. The oftner it is diſtilled, or (as they tearme it) rectified, the more noble and effectuall it becomes. Therefore ſome diſtill it ſeven times over.

Spirit of wine ſeaven times rectified.

At the firſt diſtillation it may ſuffice to draw a fourth or third part of the whole; to wit, of 24. pints of Wine or Lees, draw 6. or 8. pints of diſtilled liquor.

At the ſecond time the halfe part of that is 3. or 4. pints.

At the third diſtillation the halfe part againe, that is, two pints; ſo that the oftner you diſtill it over, the leſſe liquor you have, but it will be a great deale the more efficacious. I doe well like that the firſt diſtillation bee made in Aſhes; the ſecond in *Balneum Mariæ*. To conclude, that *aqua vitæ* is to be approoved of, neither is it any oftner to be diſtilled, which put into a ſpoone or ſaucer, and there ſet on fire, burnes wholly away and leaves no liquor, or moiſture in the bottome of the veſſell; if you drop a drop of oyle into this ſame water, it incontinently falls to the bottome; or if you drop a drop thereof into the palme of your hand, it will quickly vaniſh away, which are two other notes of probation of this liquor.

The faculties of the ſpirit of wine.

The faculties and effects of *aqua vitæ* are innumerable, it is good againſt the epilepſie and all cold diſeaſes, it aſſwages the paines of the teeth, it is good for punctures and wounds of the Nerves, faintings, ſownings, gangreenes and mortification, both of its fleſh, as alſo put to other medicines for a vehicle.

There is this difference betweene the diſtilling of wine and Vinegar, wine being of an ayery and vaporous ſubſtance, that which is the beſt and moſt effectuall in it, to wit, the aiery and fiery liquor, comes from it preſently at the firſt diſtillation. Therefore the reſidue that remaines in the bottome of the veſſell, is of a cold, dry and acrid nature; on the contrary, the water that comes firſt from Vinegar being diſtilled is inſipide and flegmaticke. For Vinegar is made by the corruption of wine, and the ſegregation of the fiery and aiery parts; wherefore the wine becomming ſowre, there remaines nothing almoſt of the former ſubſtance but phlegme; wherefore ſeeing phlegme is chiefly predominant in Vinegar, it firſt riſes in diſtillation. Wherefore he that hopes to diſtill the ſpirit of Vinegar, hee muſt caſt away the phlegmaticke ſubſtance that firſt riſes, and when by his taſte he ſhall perceive the ſpirit of the Vinegar, he ſhall keepe the fire there under, untill the flowing liquor ſhall become as thicke as honey; then muſt the fire be taken away, otherwiſe the burning of it will cauſe a great ſtinch.

The diſtilling of Wine and Vinegar is different.

The veſſells fit to diſtill *aqua vitæ* and Vinegar are diverſe, as an Alembicke or Retort ſet in ſand or Aſhes; a Coppar or braſſe bottome of a ſtill, with a head thereto, having a pipe comming forth thereof which runs into a worme, or pipe faſtned in a barrell or veſſell filled with cold water, and having the lower end comming forth thereof, whoſe figure wee ſhall give you when as wee come to ſpeake of the drawing of oyles out of vegetables.

Chap. IX.

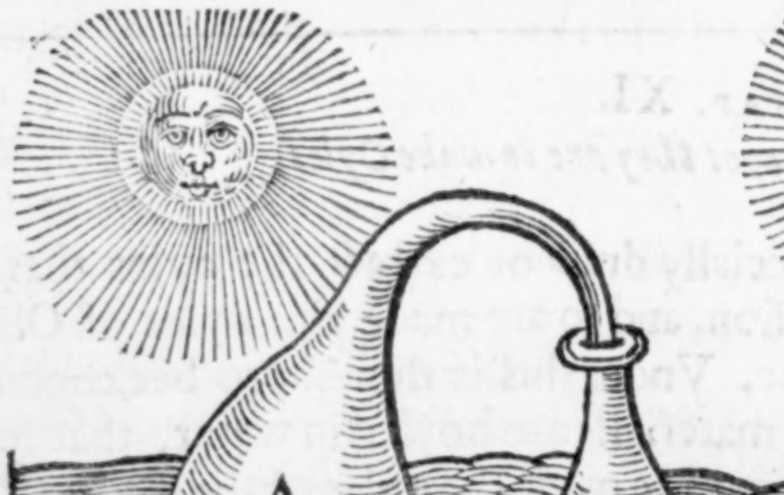
Of the manner of rectifying, that is, how to encreaſe the ſtrength of waters, that have beene once diſtilled.

The firſt way.

To rectifie the waters that have beene diſtilled in *Balneo Mariæ*, you muſt ſet them in the Sunne in glaſſes well ſtopped and halfe filled, being ſet in ſand to the third part of their height, that the water waxing hot by the heate of the Sun may ſeparate it ſelfe from the phlegme mixed therewith, which will be performed in 12. or 15. dayes. There is another better way to doe this, which is to diſtill them againe in *Balneo* with a gentle fire, or if you will put them into a retort furniſhed with his receiver, and ſet them upon cryſtall or iron bowles, or in an iron mortar directly oppoſite to the beames of the Sun, as you may learne by theſe enſuing ſignes.

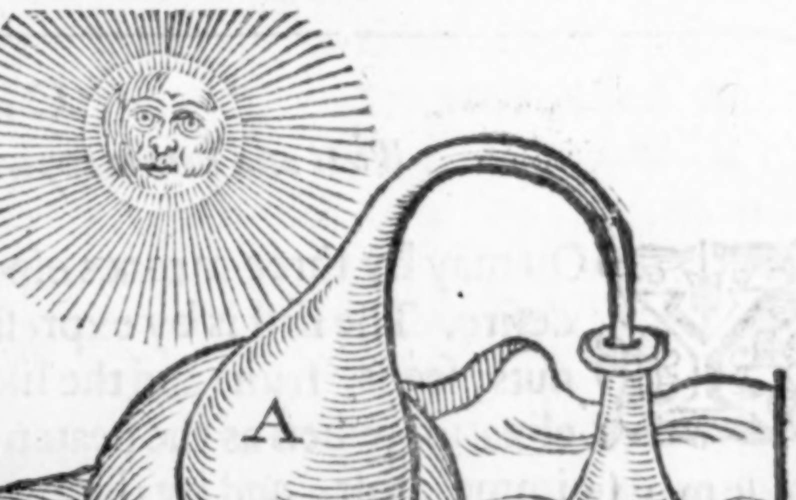
The ſecond.

A Retort with his receiver ſtanding upon Cryſtall bowles, juſt oppoſite to the Sunne beames.



A. *Shewes the Retort.*
B. *The receiver.*
C. *The Cryſtall bowles.*

Another Retort with his receiver ſtanding in a Marble or Iron mortar, directly oppoſite to the Sun.



A. *Shewes the Retort.*
B. *The Marble, or Iron mortar.*
C. *The receiver.*

Chap. X.

Of diſtillation by filtring.

You ſhall ſet three baſons or veſſells of convenient matter in that ſite and order that each may be higher than other; that which ſtands in the higheſt place, ſhall conteine the liquor to bee diſtilled, and that which ſtands loweſt ſhall receive the diſtilled liquor. Out of the firſt and ſecond veſſell ſhall hang ſhreds or peeces of cloth or cotton, with their broader ends in the liquor or upper veſſell, and the other ſharper ends hanging downe, whereby the more ſubtle and defæcate liquor may fall downe by drops into the veſſell that ſtands under it, but the groſſer and more feculent part may ſubſide in the firſt and ſecond veſſell. You by this meanes may at the ſame time diſtill the ſame liquor divers times, if you place many veſſells one under another after the forementioned manner, and ſo put ſhreds into each of them, ſo that the loweſt veſſell may receive the purified liquor. In ſtead of this diſtillation Apothecaries oft times uſe bagges.

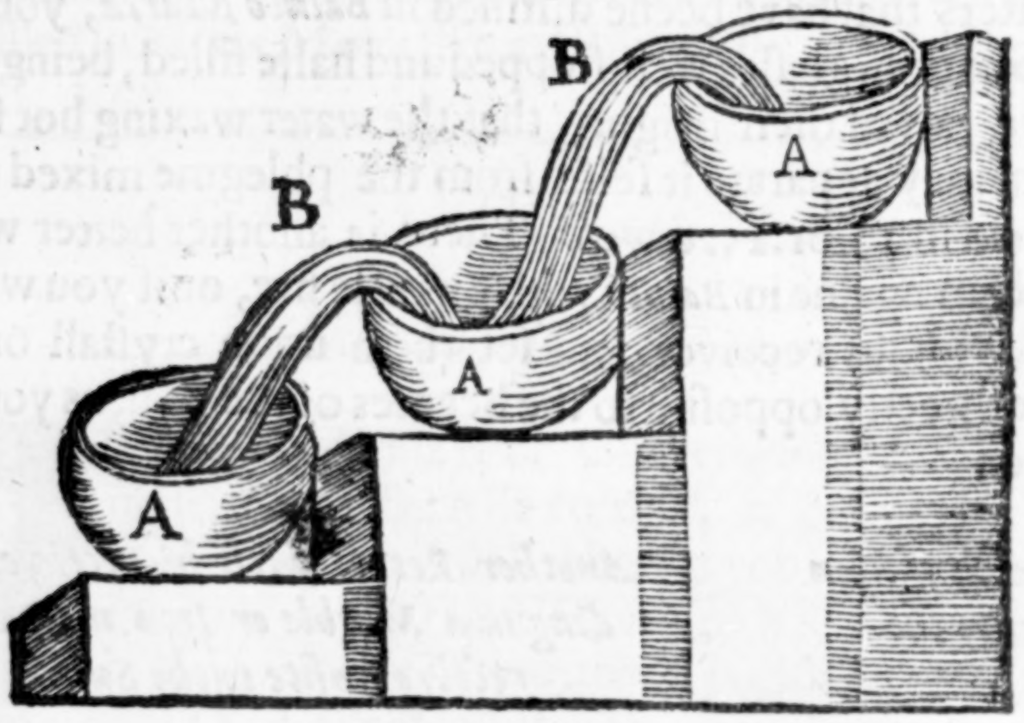
This manner of diſtillation was invented to make more cleare and pure waters, and all juices and compoſitions, which are of ſuch a liquid conſiſtence. You may take an example of this from *Lac Virginis*, or Virgins milke, of which this is the deſcription.

Lac Virginis.

℞. *litharg. auri diligenter pulveriſ.* ℥iij. *macerentur in aceti boni* ℥vj. *trium horarum ſpatio, ſeorſim etiam in aqua plantaginis, ſolani, roſarum, aut communi ſal infundatur*; then diſtill them both by ſhreads, then mixe the diſtilled liquors, and you ſhall have that which for the milkie whiteneſſe is termed Virgins milke, being good againſt the redneſſe and pimples in the face, as we have noted in our Antidotary.

Ch. 44. of ſuci.

The deſcription of veſſells to performe the diſtillation or filtration by ſhreds.



A, *Shewes the veſſell:*
B, *The Clothes or ſhreds:*

Chap. XI.

What and how many wayes they are to make Oyles.

You may by three meanes eſpecially draw or extract the oyles that you deſire. The firſt is by expreſſion, and ſo are made the oyles of Olives, nuts, ſeeds, fruits and the like. Under this is thought to bee conteined elixation, when as the beaten materialls are boyled in water, that ſo the oyle may ſwimme aloſt, and by this meanes are made the oyles of the ſeedes of the berries of Elder and Danewort, and of bay-berries. Another is by infuſion, as that which is by infuſing the parts of plants and other things in oyles. The third is by diſtillation, ſuch is that which is drawne by the heate of the fire, whether by aſcent or by deſcent, or by concourſe; The firſt way is knowne by all; now it is thus, take almonds in their huskes, beate them, worke them into a maſſe, then put them into a bagge made of haire, or elſe of ſtrong cloth firſt ſteeped in water or in white Wine, then put them into preſſe and ſo extract their oyle. You may doe the ſame in pine apple kernells, Hazell nuts, Coco nuts, nutmegs, peach kernells, the ſeeds of gourds & cucumbers, piſticke nuts, and all ſuch oiely things. Oyle of bayes may be made of ripe bay-berries newly gathered, let them be beaten in a morter and ſo boiled in a double veſſell, and then forthwith put into preſſe, ſo to extract oyle as you

Oiles by expreſſion.

By infuſion.

By diſtillation.

Oyle of Bayberries.

you doe from Almonds, unleſſe you had rather get it by boyling as we have formerly noted. Oyle of Egges is made of the yoalkes of Egges boiled very hard; when they are ſo, rub them to peeces with your fingers, then frie them in a panne over a gentle fire, continually ſtirring them with a ſpoone untill they become red, and the oyle be reſolved and flow from them; then put them into a haire cloth, and ſo preſſe forth the oile. The oyles prepared by infuſion are thus made, make choiſe of good oyle wherein let plants, or creatures, or the parts of them bee macerated for ſome convenient time, that is, untill they may ſeeme to have transfuſed their faculties into the oyle, then let them be boiled, ſo ſtrained or preſſed out. But if any aquoſity remaine, let it be evaporated by boyling. Some in compounding of oyles adde gums to them, of which though we have formerly ſpoken in our Antidotary, yet have I thought good to give you this one example. ℞. *flor. hyper.* ℔ ß. *immittantur in phialam cum flo. cent. & gum. elemi, an.* ℥ij. *olei com.* ℔. ij. Let them be expoſed all the heate of Summer to the Sunne. If any will adde *aqua vitæ* wherein ſome Benzoin is diſſolved, he ſhall have a moſt excellent oyle in this kind. Oyle of Maſticke is made *Ex olei roſati* ℥xij *maſtich.* ℥iij. *vini optimi* ℥viij. Let them all bee boiled together to the conſumption of the wine, then ſtraine the Oyle and reſerve it in a veſſell.

Of Egges.

Oyle of S. Iohns wort.

Of Maſticke.

Chap. XII.

Of extracting Oiles of vegetables by Diſtillation.

Almoſt all hearbes that carry their flowres and ſeeds in an umbell, have ſeeds of a hot, ſubtle and aiery ſubſtanc, and conſequently oyly. Now becauſe the oyly ſubſtance that is conteined in ſimple bodyes is of two kindes, therefore the manner alſo of extracting is twofold. For ſome is groſſe, earthy, viſcous, and wholy confuſed and mixt with the bodyes out of which they ought to be drawne, as that which wee have ſayd is uſually extracted by expreſſion; this becauſe it moſt tenaciouſly adheres to the groſſer ſubſtance, and part of the body, therefore it cannot by reaſon of this naturall groſſeneſſe, bee lifted up, or aſcend. Otherſome are of a ſlender, and aiery ſubſtance, which is eaſily ſevered from their body, wherefore being put to diſtillation it eaſily riſes: ſuch is the oyly ſubſtance of aromaticke things, as of Iuniper, Aniſeeds, Cloves, Nutmegs, Cinnamon, Pepper, Ginger, and the like odoriferous and ſpicy things. This is the manner of extracting oyles out of them; let your matter be well beaten and infuſed in water to that proportion, that for every pound of the materiall, there may bee ten pints of water; infuſe it in a copper bottome, having a head thereto either tinned or ſilvered over, and furniſhed with a couller filled with cold water. Set your veſſell upon a furnace having a fire in it, or elſe in ſand, or aſhes. When as the water contained in the head ſhall waxe hot, you muſt draw it forth, and put in cold, that ſo the ſpirits may the better be condenſed, and may not fly away: you ſhall put a long neckt receiver to the noſe of the Alembecke, and you ſhall increaſe the fire, untill the things conteined in the Alembecke boyle.

What oyles are to be drawne by expreſſion.

The firſt manner of drawing oiles by diſtillation.

There is alſo another manner of performing this diſtillation, the matter preſerved and infuſed as we have formerly declared, ſhall be put in a braſſe or copper bottome covered with his head, to which ſhall be fitted, and well luted, a worme of Tinne, this worme ſhall runne through a barrell filled with cold water, that the liquor which flowes forth with the oyle, may be cooled in the paſſage forth; at the lower end of this worme you ſhall ſet your receiver. The fire gentle at the firſt, ſhall be encreaſed by little and little, untill the conteined matter, as wee formerly ſayd, do boyle; but take heede that you make not too quicke or vehement a fire, for ſo the matter ſwelling up by boyling may exceede the bounds of the containing veſſell, and ſo violently fly over.

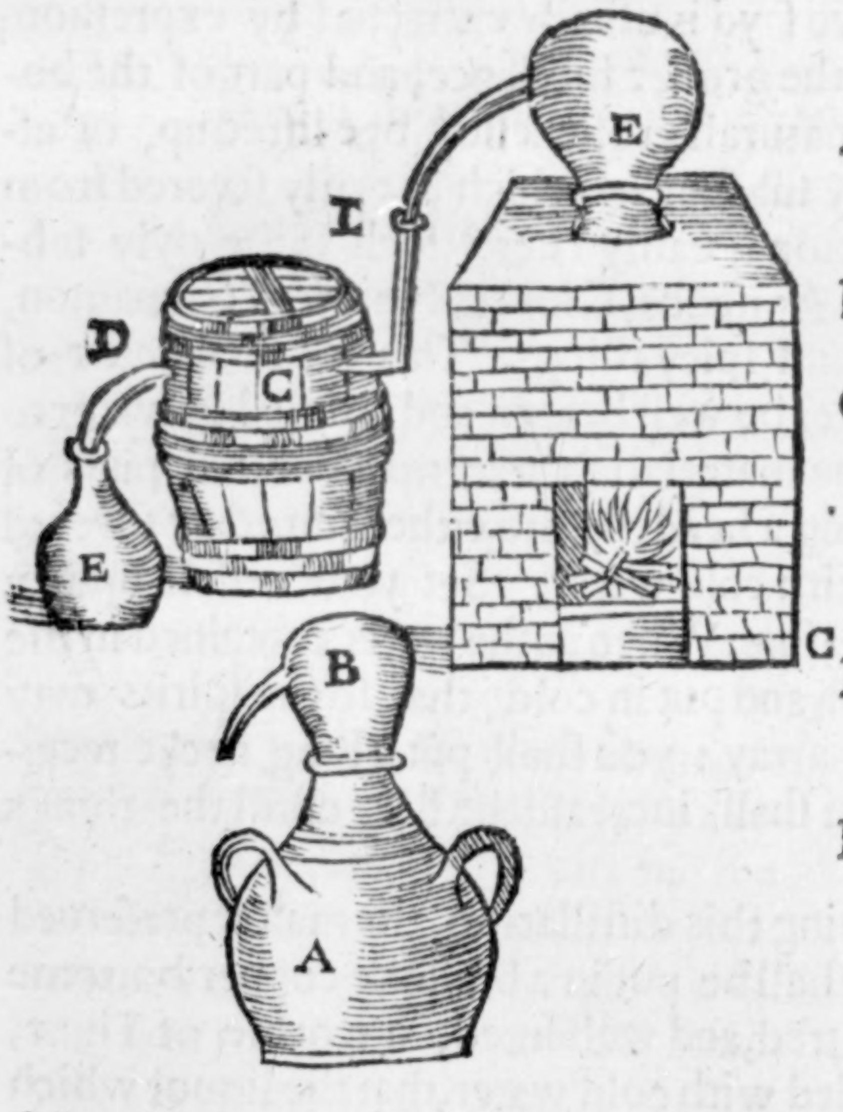
Another way.

Obſerving theſe things, you ſhall preſently at the very firſt ſee an oiely moiſture flowing forth together with the watriſh. When the oyle hath done owing which you may know by the colour of the diſtilled liquor, as alſo by the conſiſtence and taſte, then put out the fire; and you may ſeparate the oyle from the water by a little veſſell made like a Thimble and tyed to the end of a ſticke; [or, which is better, with a glaſſe funnell, or inſtrument made of glaſſe for the ſame purpoſe.] Here you muſt alſo note that there be ſome oiles that ſwimme upon the top of the water, as oile of aniſeedes; otherſome on the contrary, which fall to the bottome, as oile of Cinnamon, Mace, and Cloves.

What oiles fall to the bottome.

Moreover you muſt note, that the watriſh moiſture, or water that is diſtilled with oile of Aniſeede and Cinnamon, is whitiſh, and in ſucceſſe of time, will in ſome ſmall proportion turne into oile. Alſo theſe waters muſt bee kept ſeverall, for they are farre more excellent than thoſe that are diſtilled by *Balneum Mariæ*, eſpecially thoſe that firſt come forth together with the oyle. Oiles are of the ſame faculties with the bodies from whence they are extracted, but much more effectuall; for the force which formerly was diffuſed in many pounds of this, or that medicine, is after diſtillation contracted in a few drams. For example, the facultie that was diſperſed over j. pound of Cloves, will be contracted into two ounces of oyle at the moſt; and that which was in a pound of Cinnamon will be drawne into ʒ ß. or ʒ ij. at the moſt of oile. But to draw the greater quantity with the leſſer charge, and without feare of breaking the veſſells, whereto glaſſes are ſubject, I like that you diſtill them in copper veſſells, for you neede not feare that the oyle which is diſtilled by them will contract an ill quality from the copper, for the watriſh moiſture that flowes forth together therewith will hinder it, eſpecially if the copper ſhall be tinned or ſilvered over. I have thought good to deſcribe and ſet before your eyes, the whole manner of this operation.

A Fornace with ſet veſſells to extract the Chymicall oiles, or ſpirits of Sage, Roſemary, Time, Lavender, Aniſeeds, Fennell ſeeds, Cloves, Nutmegs, Cinnamon, Pepper Ginger, and the like; as alſo to diſtill the ſpirit of wine, of Vinegar aud aqua vitæ. *In ſtead of the barrell and worme, you may uſe a head with a bucket or rowler about it.*



A. *Shewes the bottome, which ought to be of Copper and tinned on the inſide.*

B. *The head.*

C. *The Barrell filled with cold water to refrigerate and condenſate the water and oyle that run through the pipe or worme that is put through it.*

D. *A pipe of braſſe or lattin, or rather a worme of Tinne running through the Barrell.*

E. *The Alembecke ſet in the fornace with the fire under it.*

Now becauſe we have made mention of Cinnamon, Pepper, and other ſpices, which grew not here with us, I have thought good to deſcribe theſe out of *Thevets* Coſmography, he having ſeene them growing. Pepper growes on ſhrubs in *India*, theſe ſhrubs ſend forth little branches whereon hang cluſters of berries, like to Ivy berries, or bunches of ſmall blacke grapes, or currance. The leaves are like thoſe of the Citron tree, but ſharpiſh and pricking.

The deſcription of Pepper.

The *Indians* gather thoſe berries with great diligence, and ſtow them up in large cellars, as ſoone as they come to perfect maturity. Wherefore it oft times happens, that there are more than 200. ſhippes upon the coaſt of the leſſer *Iava* an Iſland of that country, to carry thence Pepper and other ſpices. Pepper is uſed in Antidotes againſt poyſons, it provokes urine, digeſts, attracts, reſolves, and cures the bites of Serpents. It is properly applyed and taken inwardly againſt a cold ſtomacke; in ſauces it helpes concoction and procures appetite; you muſt make choyſe of ſuch as is blacke, heavie, and not flaccide. The trees which beare white, and thoſe that beare blacke pepper, are ſo like each other, that the natives themſelves know not which, is which, unleſſe when they have their fruite hanging upon them, as the like happens upon our Vines which beare white and blacke grapes.

The uſes thereof,

The tree that yeelds Cinnamon growes in the mountaines of *India*, and hath leaves very like to bay leaves; branches and ſhootes at certaine times of the yeere are cut from this tree, by the appointment of the King of that province, the barke of which is that we terme Cinnamon. This is ſold to no ſtranger unleſſe at the Kings pleaſure and he ſetting the price thereof, it is not lawfull for others to cut any thereof.

The Cinnamon tree,

Galen writes that Cinnamon is of very ſubtle parts, hot in the third degree, and partaking of ſome aſtriction; therefore it cuts and diſſolves the excrements of the body, ſtrengthens the parts, provokes the courſes when as they ſtoppe by reaſon of the admixture of groſſe humors; it ſweetens the breath, and yeelds a fine taſte and ſmell to medicines, hippocras, and ſauces. Of Cinnamon there is made an excellent water againſt all cold diſeaſes, and alſo againſt ſwoonings, the plague and poyſons. The compoſition thereof is this. Take of the choyſeſt and beſt Cinnamon one pound, beate it groſſely, and put thereto of Roſe water 4 pints, of white wine halfe a pint, being thus mixed, put them into a glaſſe and ſo let them ſtand in infuſion 24 houres, often ſtirring of them. Then diſtill them in *Balneo Mariæ*, cloſely luting the receiver and veſſels leaſt the ſpirit ſhould fly away.

7. ſimp.

An excellent Cinnamon tree.

CHAP. XIII.

Another manner how to draw the eſſence and ſpirits of herbes, flowers, ſeedes, and ſpices; as alſo of Rubarbe, Agaricke, Turbith, Hermodactiles, and other Purgers.

YOu may extract the eſſences and ſpirits of the things mentioned in the title of this chapter, as thus. Take Sugar, Rubarbe, Cinnamon, or any other materiall you pleaſe; cut it ſmall, or elſe beate it, then put it into a glaſſe with a long necke, and poure thereupon as much *aqua vitæ* as ſhall be ſufficient to cover the materials or ingredients, & to overtop them ſome fingers bredth, then ſtop up the glaſſe very cloſe that no ayre enter thereinto; Thus ſuffer it to infuſe for 8 dayes in *balneo* with a very gentle heate; for thus the *aqua vitæ* will extract the facultyes of the ingredients, which you ſhall know that it hath done, when as you ſhall ſee it perfectly tinctured with the colour of the ingredients. The eight dayes ended, you ſhall put this ſame *aqua vitæ* into another veſſell filled with the like quantity of the ſame materialls prepared after the ſame manner, that it may alſo take forth the tincture thereof, and doe thus three or foure times, untill the *aqua vitæ* be deepely tinctured with the colour of the infuſed Ingredients.

A ſigne that the ſpirit of wine hath fetcht out the ſtrength of the ingredients.

But if the materialls from whence you deſire to extract this ſpirit or eſſence, bee of great price, as *Lignum Aloes*, *Rubarbe*, *&c.* You muſt not thinke it ſufficient to infuſe it once onely, but you muſt goe over it twiſe, or thriſe, untill all the efficacie be extracted out thereof; you may know that it is all wholy inſipide.

These things thus done, as is fitting, put all the liquor tinctured and furniſhed with the colour and ſtrength of the ingredients, into an Alembecke, fitted and cloſely luted to its head, and ſo put into *Balneum Mariæ*, that ſo you may extract or draw off the *aqua vitæ*, to keepe for the like purpoſe, and ſo you ſhall have the ſpirit, and eſſence remaining in the bottome.

A ſigne that the ingredients have loſt their ſtrength.

Now if you deſire to bring this extract to the height of honey, ſet it in an earthen pot well leaded, upon hot aſhes, ſo that the thinne part thereof may be evaporated, for thus at length, you ſhall have a moſt noble and effectuall eſſence of that thing which you have diſtilled, whereof one ſcruple will be more powerfull in purging, than two or three drammes of the thing its ſelfe.

Chap. XIIII.

How to extract oyle out of Gums, condenſed juices, and roſines, as alſo out of ſome woods.

What a Retort is.

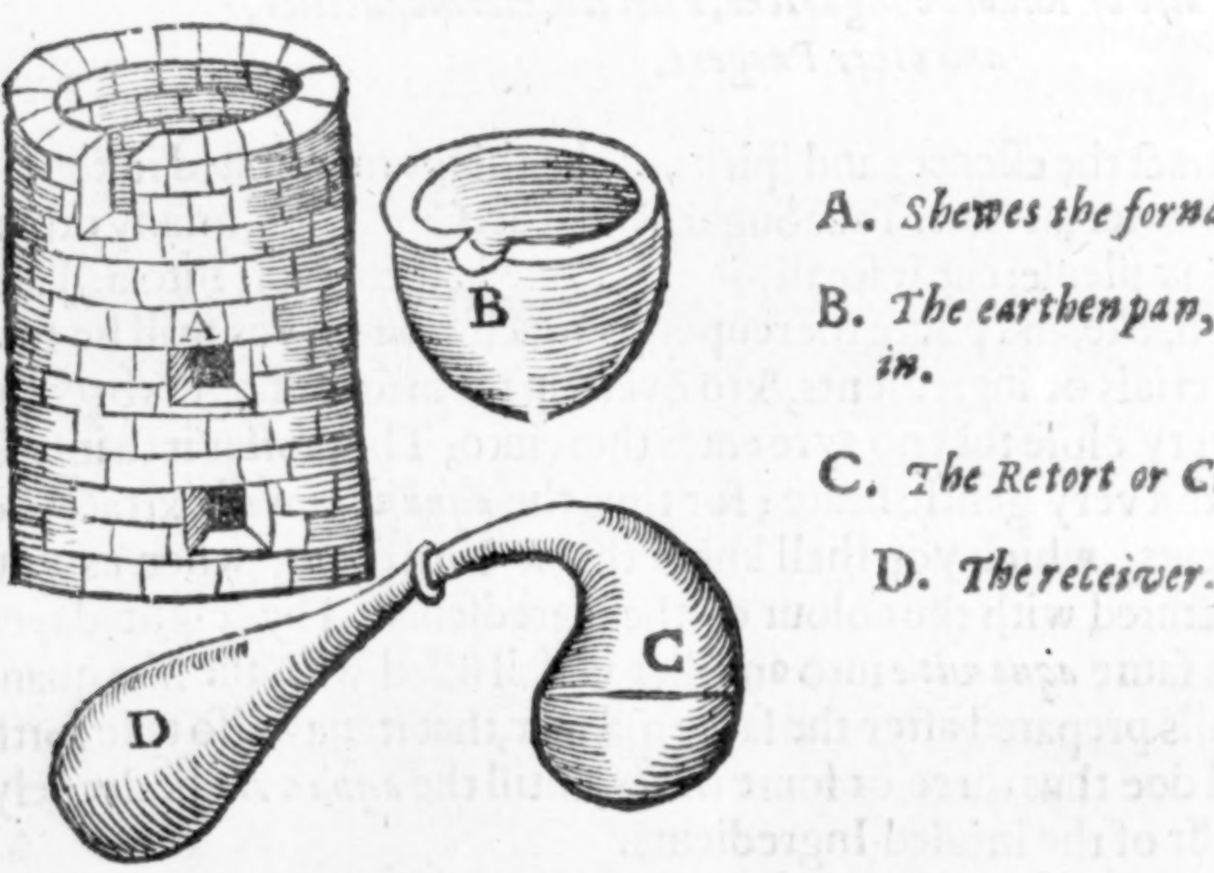
ALL oyles that are drawne out of Gummes, oyely woods and mettalls, are extracted by that veſſell which we vulgarly terme a Retort. It muſt bee made of glaſſe, or jugges mettall well Leaded, and of ſuch bigneſſe as ſhall be convenient for the operation you intend, though commonly it ſhould be made to hold ſome gallon and an halfe of water; the necke thereof muſt be a foote and an halfe, or at leaſt a foote long. The receiver is commonly a viall whereinto the necke of the Retort is fitted and inſerted. Then the Retort ſhall bee ſet in an earthen pan filled with aſhes, or ſand, and ſo ſet into a furnace, as you may ſee by the following figure.

The differences of Gummes.

Cautions in diſtilling of gummes.

Of gummes ſome are liquid, ſome ſolide; and of the ſolide, ſome are more ſolide than otherſome; thoſe that are ſolide are more troubleſome to diſtill than the liquide, for they are not ſo eaſily diſſolved or melted, neither doe they yeeld ſo well to the fire, ſo that oft times they are burnt before they bee diſſolved; whence it is that ſome for every pound of ſolide gumme, adde two or three pounds of moſt cleare and liquide oyle of Turpentine. Beſides, liquide things are alſo hard to be diſtilled, becauſe when as they come to be throughly hot at the fire, they ſwell up ſo much, that they exceed, or runne out of the Retort, and ſo fall into the receiver, as they were put into the Retort, eſpecially if ſo be that the fire be too hot at the firſt. Many to ſhunne this inconvenience, adde to the things put into the Retort, ſome ſand, as it were, to balaſt it withall.

The figure of a furnace, with his earthen pan and receiver.



A. *Shewes the fornace.*

B. *The earthen pan, or veſſell to ſet the Retort in.*

C. *The Retort or Cucurbite.*

D. *The receiver.*

How to make oyle of Turpentine.

Oyle of Roſin and Turpentine is thus made; take two or three pounds of Turpentine, and put it into a Retort of ſuch largeneſſe, that three parts thereof might remaine empty, and for every pound of Turpentine adde three or foure ounces of ſand; then place the Retort in an earthen pan, filled with ſifted aſhes, and ſet it upon the fornace as is fit, and to the necke thereof fit and cloſely lute a receiver. Laſtly, kindle thereunder a ſoft fire at the firſt, leaſt the contained materialls ſhould runne over; encreaſe this fire by little, and little, and take heed that the things become not too hot on a ſuddaine. At the firſt, a cleare and acide liquor will drop out, wherein a certaine ſediment uſes to concreat; then will flow forth a moſt cleere oyle, ſomewhat reſembling the watry and phlegmaticke liquor; then muſt the fire be ſome what encreaſed, that the third oyly, cleare, thinne and very golden coloured liquor may riſe and diſtill; but then alſo a clearer and more violent fire muſt be rayſed, that ſo you may extract an oyle that will be red like a carbuncle, and of a conſiſtence indifferently thicke. Thus therefore you may extract, foure kinds of liquors out of Turpentine, and receive them being different in ſeverall receivers; yet I judge it better to receive them all in one, that ſo by diſtilling them againe afterwards you may ſeparate your deſired oyle; now there will ten or twelve ounces of oyle, flow from an ounce of Turpentine. This kind of oyle is effectuall againſt the Palſie, Convulſions, punctures of the nerves, and wounds of all the nervous parts.

How to make oyle of waxe.

But you ſhall thus extract oyle out of waxe; take one pound of waxe, melt it, and put it into a glaſſe Retort ſet in ſand, or aſhes, as wee mentioned a little before in drawing of oyle of Turpentine, then deſtill it, by encreaſing the fire by degrees. There diſtills nothing forth of waxe, beſides an oyly ſubſtance and a little *Phlegma*, yet portion of this oyly ſubſtance, preſently concreats into a certaine butter-like matter, which therefore would be diſtilled over againe; you may draw ℥vj, or viij. of oyle, from one pound of waxe.

The faculties thereof.

This oyle is effectuall againſt Contuſions, and alſo very good againſt cold affects.

CHAP. XV.

Of extracting of oyles out of the harder ſorts of Gummes, as myrrhe, maſtich, frankincenſe and the like.

SOme there be who extract theſe kinds of oyles with the Retort ſet in aſhes or ſand, as we mentioned in the former Chapter of oyles of more liquid gums, adding for every pound of gumme two pints of *Aqua vitæ*, and two or three ounces of oyle of Turpentine, then let them infuſe for eight or ten dayes in *Balneo Mariæ*, or elſe in horſe dung; then they ſet it to diſtill in a Retort. Now this is the true manner of making of oyles of Myrrhe; Take Myrrhe made into fine pouder, and therewith fill hard Egges in ſtead of their yoalkes being taken out; then place the Egges upon a gridiron, or ſuch like grate in ſome moiſt place as a cellar, and ſet under them a Leaden earthen panne; the Myrrhe will diſſolve into an oilely water, which being preſently put into a glaſſe and well ſtopped, with an equall quantitie of rectified *aqua vitæ*, and ſo ſet for three or foure monthes in hot horſe dung, which paſt the veſſell ſhall be taken forth, and ſo ſtopped that the conteined liquor may be poured into an Alembecke, for there will certaine groſſe ſetling by this meanes remaine in the bottome, then ſet your Alembecke in *Balneo* and ſo draw off the *aqua vitæ* & phlegmaticke liquor, and there will remaine in the bottome a pure & cleare oile, whereto you may give a curious colour by mixing therewith ſome Alkanet, and a ſmell by droping thereinto a little oyle of Sage, Cinnamon or cloves

How to make oyle of myrrhe.

How to give it a pleaſing colour and ſmell.

Now let us ſhew the compoſition and manner of making of balſames by giving you one or two examples; the firſt of which is taken out of *Veſalius* his Chirurgery; and is this.

Veſalius his balſame.

℞. *terebinth. opt.* ℔. j. *ol. laurini* ℥iiij *galbani*, ʒiij. *gum. elem.* ℥iiij ß. *thuris*, *Myrrhæ*, *gum. hederæ*, *centaur. majoris*, *ligni aloës*, *an.* ℥iij. *galangæ*, *caryophyll. conſolidæ majoris*, *Cinamoni*, *nucis moſchat. zedoariæ*, *zinzib. dictamni albi*, *an.* ʒj. *olei vermium terreſtrium*, ℥ij. *aq. vitæ* ℔. vj.

The manner of making it is this, let all theſe things be beaten and made ſmall, and ſo infuſed for three dayes ſpace in *aqua vitæ*, then diſtilled in a Retort juſt as wee ſaid, you muſt diſtill oyle of Turpentine and waxe. There will flow hence three ſorts of liquors, the firſt watriſh and cleare, the other thinne, and of pure golden colour; the third of the colour of a Carbuncle, which is the true Balſame. The firſt liquor is effectuall againſt the weakeneſſe of the ſtomacke comming of a cold cauſe, for that it cuts flegme and diſcuſſes flatulencies; the ſecond helpes freſh and hot bleeeing wounds, as alſo the palſie. The third is chiefly effectuall againſt theſe ſame effects. The compoſition of the following *Balſamum* is out of *Fallopius*; and is this. ℞. *terebinth. claræ*, ℔. ij. *olei de ſemine lini* ℔. j. *reſinæ pini*, ℥vj, *thuris*, *myrrhæ*, *aloes*, *maſtiches*, *ſarcocollæ*, *an.* ℥iij. *macis*, *ligni Aloes*, *an.* ℥ij.

Fallopius his balſame.

croci, ℥ß. Let them all be put in a glaſſe Retort, ſet in aſhes and ſo diſtilled. Firſt there will come forth a cleere water, then preſently after, a reddiſh oyle, moſt profitable for wounds.

What frankinſenſe is.

The faculties thereof.

Now you muſt know that by this meanes, we may eaſily diſtill all Axungia's, fatts, parts of creatures, woods, all kinds of barkes and ſeeds, if ſo bee that they be firſt macerated as they ought to bee, yet ſo that there will come forth more watry than oyly humidity. Now for that wee have formerly frequently mentioned *Thus* or frankinſenſe, I have heere thought good out of *Thevets* Coſmography to give you the deſcription of the tree from which it flowes. The frankincenſe tree (ſaith hee) growes naturally in *Arabia*, reſembles a pine, yeelding a moiſture that is preſently hardened, and it concreates into whitiſh cleare graines, fatty within, which caſt into the fire, take flame. Now frankincenſe is adulterated with pine-roſin and Gumme, which is the cauſe that you ſhall ſeldome finde that with us, as it is here deſcribed; you may finde out the deceit as thus, for that neither Roſin nor any other gumme takes flame, for Roſin goes away in ſmoake, but frankinceſe preſently burnes. The ſmell alſo bewrayes the counterfeite, for it yeelds no gratefull ſmell as frankincenſe doth. The *Arabians* wound the tree that ſo the liquor may the more readily flow forth, whereof they make great gaine. It fills up hollow Vlcers and cicatrizes them; wherefore it enters as a cheefe ingredient into artificiall ballame; frankincenſe alone made into powder and applyed, ſtanches the blood that flowes out of wounds.

Mathiolus ſaith, that it being mixed with Fullers earth, and oyle of Roſes, is a ſingular remedy againſt the inflammation of the breaſts of women, lately delivered of childe.

Chap. XVI.

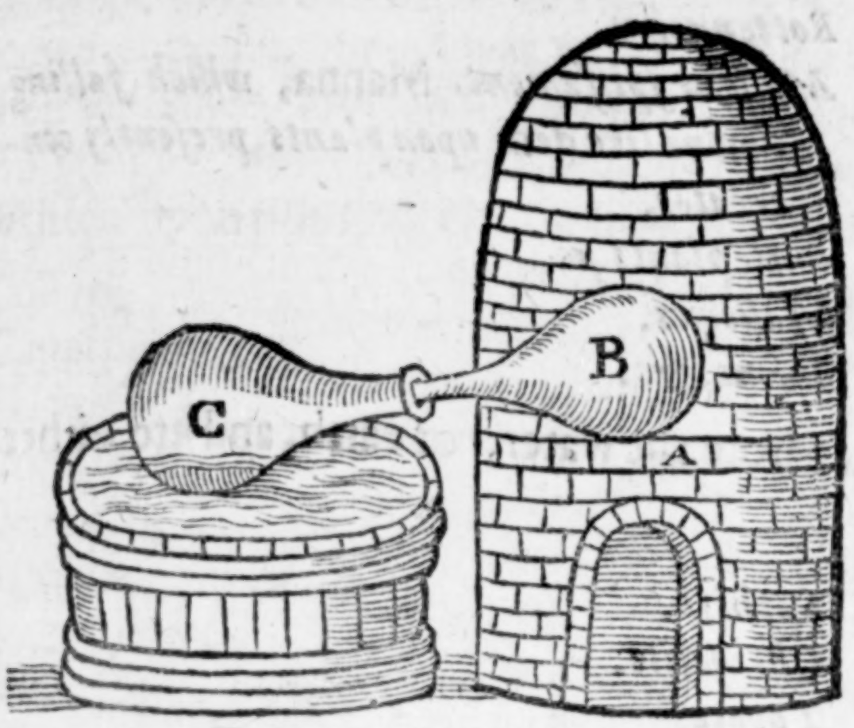
The making of oyle of Vitriall.

The ſigne of perfectly calcined vitrioll.

TAke ten pounds of Vitrioll, which being made into powder, put it into an earthen pot, and ſet it upon hot coales, untill it be calcined, which is when as it becomes reddiſh; after ſome five, or ſixe houres, when as it ſhall bee throughly cold, breake the pot, and let the vitrioll be againe made into powder, that ſo it may be calcined againe, and you ſhall doe thus ſo often and long untill it ſhall be perfectly calcined, which is when as it ſhall be exactly red; then let it be made into powder, and put into an earthen Retort, like that wherein *aqua fortis* is uſually drawne, adding for every pound of your calcined vitrioll of tile ſhreds, or powdered bricke 1 quarter; then put the Retort furniſhed with its receiver into a fornace of Reverberation, alwayes keeping a ſtrong fire, and that for the ſpace of 48 houres, more or leſſe according to the manner and plenty of the diſtilling liquor. You ſhall know the diſtillation is finiſhed when as the receiver ſhall begin to recover his native perſpicuity, being not now filled with vaporouſe ſpirits, wherewith as long as the humor diſtills it is repleniſhed and lookes white.

Now for the receiver there are 2 things to be obſerved. The firſt is, that it bee great and very capacious, that it may not be diſtended and broken by the abundant flowing of vaporous ſpirits, as it doth oft times happen; another thing is, that you ſet it in a veſſell filled with cold water, leaſt it ſhould be broken by being over hot; you may eaſily perceive all this by the enſuing figure.

A Fornace or Reverberation furniſhed with his Retort and Receiver.



A. *Shewes the Fornace.*

B. *The Retort.*

C. *The Receiver.*

D. *The veſſell ſilled with cold water.*

CHAP. XVII.

A table or Catalogue of medicines and inſtruments ſerving for the cure of Diſeaſes.

Medicines and medicinall meates fit for the cure of diſeaſes, are taken from living Creatures, plants and mineralls. From living creatures are taken,

Hornes.
Hooves.
Haires.
Feathers.
Shells.
Sculles.
Scailes.
Sweates.
Skinnes.
Fatts.
Fleſh.
Blood.
Entrailes.
Vrine.
Smells whether they be ſtincking or ſweete, as alſo poyſons: whole creatures themſelves, as,
Foxes.
Whelpes.
Hedgehogs.
Frogs.
Wormes.
Crabs.
Cray-fiſhes.
Scorpions.
Horſeleaches.
Swallowes.
Dungs.

Bones.
Extreame parts.
Hearts.
Liver.
Lungs.
Braine.
Wombe.
Secundine.
Teſticles.
Pizle.
Bladder.
Sperme.
Taile.
Coats of the Ventricle.
Expirations.
Briſtles.
Silke.
Webbes.
Teares.
Spittle.
Honey.
Waxe.
Egges.
Milke.
Butter.
Cheeſe.
Marrow.
Rennet.

From Plants, that is, Trees, ſhrubs, and hearbes are taken,

Roots.
Moſſe.
Pith.
Sions.

Buds.
Stalkes.
Leaves.
Floures.

Cups.
Fibers, or hairy threds.
Eares.
Seeds.
Barke.
Wood.
Meale.
Iuices.
Teares.
Oyles.
Gums.
Roſins.
Rottenneſſe.
Maſſe or ſpiſſament. Manna, *which falling downe like dew upon plants, preſently concreates.*
whole plants, as
Mallowes.
Onions, &c.

Mettalls, or mineralls, are taken either from the water, or earth, and are either kinds of earth, ſtones, or mettalls, &c.

The kinds of earth are,
Bole Armenicke.
Terra ſigillata.
Fullers earth.
Chaulke.
Okar.
Plaiſter.
Lime.
Now the kinds of ſtone are,
Flints.
Lapis judaicus.
Lapis Lyncis.
The Pumice.
Lap. Hæmatites.
Amiantus.
Galactites.
Spunge ſtones.
Diamonds.
Saphire.
Chryſolite.
Topace.
Loadſtone.
The Pyrites *or fire-ſtone.*
Alablaſter.
Marble.
Criſtall, and many other precious ſtones.
The kinds of Salts as well naturall as artficiare,
Common ſalt.
Sal nitrum.
Sal Alkali.
Sal Ammoniacum.
Salt of Vrine.
Salt of tartar and generally all ſalts that may be made of any kind of plants.

Thoſe that are commonly called mineralls are,

Marchaſite.
Antimony.
Muſcovy Glaſſe.
Tutty.
Arſnicke,
Orpiment,
Lazure, or blew,
Roſe agar.
Brimſtone:
Quicke ſilver,
White Coproſe,
Chalcitis,
Pſory.
Roman Vitrioll
Colcothar, *vitrioll, or greene Coproſe.*
Alumen ſciſſile, *Common Alome,*
Alumen rotundum. *Round Alome.*
Alumen liquidum.
Alumen plumoſum.
Boraxe, *or Burrace,*
Bitumen,
Naphtha.
Cinnabaris, *or Vermillion.*
Litharge of Gold.
Litharge of Silver
Chryſocolla.
Scandaracha.
Red Lead.
White Lead, and divers other

Now the Mettals themſelves are,

Gold,
Silver,
Iron,
Lead,
Tinne,
Braſſe,
Copper,
Steele.
Lattin and ſuch as ariſe from theſe, as the ſcailes, verdegreace, ruſt, &c.

Now from the waters, as the Sea, Rivers, Lakes and Fountaines, and the mud of theſe waters, are taken divers medicines, as white and red Corrall, Pearles and infinite other things which nature the handmayd of the great Architect of this world, hath produced for the cure of diſeaſes; ſo that into what part ſoever you turne your eyes, whether to the ſurface of the earth, or the bowels thereof, a great multitude of remedies preſent themſelves to your view. The choyſe of all which is taken from their ſubſtance, or quantity, quality, action, place, ſeaſon, ſmell, taſte, ſite, figure, and weight, other circumſtances, as *Sylvius* hath aboundantly ſhewed in his booke written upon this ſubject. Of theſe ſimples are made diverſe compoſitions, as,

Collyria.
Caputpurgia.
Eclegmata.
Dentifrices.
Dentiſcalpia.
Apophlegmatiſmi.
Gargariſmes.
Pills.
Boles.
Potions.
Emplaiſters.
Vnguents.
Cerates.
Liniments.
Embrocations.
Fomentations.
Epithemes.
Attractives:
Reſolvers.
Suppuratives:
Emollients.
Mundificatives:
Incarnatives.
Cicatriſers.
Purifiers.
Corroſives.
Agglutinatives.
Anodynes.
Apozemes.
Iuleps.
Syrupes.
Powders.
Tablets.
Opiates.
Conſerves.
Preſerves.
Confections.
Rowles.
Vomits.
Sternutatoryes.
Sudorifickes.
Glyſters.
Peſſaries.
Suppoſitoryes:
Fumigations.
Trochiſces.
Frontalls.
Cappes.
Stomichers.
Bagges.
Bathes.
Halfe-bathes.
Virgins-milke.
Fuci.
Pications.
Depilatoryes.
Veſicatoryes.
Potentiall cauteries.
Noſe-gayes.
Fannes.
Cannopyes, or extended cloathes to make winde.
Artificiall fountaines, to diſtill or droppe downe liquors.

Now theſe that are thought to be nouriſhing medicines are,

Reſtauratives
Culliſſes
Expreſsions
Gellyes
Ptiſans
Barly-creames
Ponadoes
Almond-milkes
Marchpaines
Wafers
Hydro ſacchar
Hydromel *and ſuch other drinkes.*
Mucilages
Oxymel
Oxycrate
Roſe Vinegar
Hydrælium
Metheglin
Cider
Drinke of Serviſſes
Ale
Beere
Vinegar
Verjuice
Oyle
Steeled water
Water brewed with bread crummes
Hippocras
Perry, and ſuch like.

Waters and diſtilled oyles,and divers other Chymicall extractions.

As the waters and oyles of hot,dry and aromaticke things, drawne in a copper Alembecke, with a cooler, with ten times as much water in weight as of hearbes; now the hearbes muſt be dry,that the diſtillation may the better ſucceede.

Waters are extracted out of flowres put in a Retort,by the heate of the Sunne,or of dung, or of an heape of preſſed out Grapes, or by *Balneo*, if there bee a receiver put and cloſely luted thereto. All kindes of ſalt of things calcined,diſſolved in water,and twiſe or thriſe filtred, that ſo they may become more pure and fit to yeeld oyle.

Other diſtillations are made either in Cellars by the coldneſſe or moyſture of the place, the things being layd either upon a marble, or elſe hangd up in a bagge;and thus is made oyle of Tartar, and of ſalts, and other things of An aluminous nature.

Bones muſt bee diſtilled by deſcent, or by the joyning together of veſſels. All woods,rootes,barkes, ſhells of fiſhes,and ſeedes, or graines, as of corne,broome, beanes,and other things whoſe juice cannot be got out by expreſſion, muſt bee diſtilled by deſcent, or by the joyning together of veſſells in a Reverberatory fornace.

Mettalls calcined and having acquired the nature of ſalt, ought to bee diſſolved and filtred, and then evaporated till they bee dry; then let them bee diſſolved in diſtilled vinegar,and then evaporated and dryed againe;for ſo they will eaſily diſtill in a Cellar upon a Marble, or in a bagge. Or elſe by putting them into a glaſſie retort,and ſetting it in ſand, and ſo giving fire thereto by degrees untill all the watery humidity be diſtilled;then change the receiver and lute another cloſe to the Retort, then encreaſe the fire above and below, and thus there will flow forth an oyle very red coloured; Thus are all metalline things diſtilled,as Alomes,ſalts,&c.

Gummes *axungiæ*, and generally all roſins are diſtilled by retort ſet in an earthen veſſell filled with Aſhes upon a fornace; now the fire muſt be encreaſed by little and little according to the different condition of the diſtilled matters.

The veſſels and Inſtruments ſerving for diſtillations are commonly theſe.

Bottomes of Alembeckes,
The heads of them, from whence the liquors droppe.
Refrigeratories.
Veſſels for ſublimation.
For Reverberation.
For diſtilling by deſcent.
Crucibiles and other ſuch.
Veſſells for Calcination.
Haire ſtrainers .
Bagges,
Earthen platters.
Veſſells for circulation, as
Pellicanes.
Earthen Baſons for filtring:
Fornaces.
The ſecret fornaces of Philoſophers:
The Philoſophers egge:
Cucurbites
Retorts
Bolt heads
Vrinalls
Receivers
Veſſells ſo fitted together that the lowermoſt receives the mouth of the uppermoſt, whence they may bee termed conjoyned Veſſells: They are uſed in diſtilling *per deſcenſum*.
Marbes exquiſitly ſmooth for diſtillations to be made in Cellars.
Pots to diſſolve calcined mettalls in.

A

A CATALOGVE OF THE Chirurgions Inſtuments mentioned in this whole worke.

RIngs wherein little Lancets lye hid, to open Impoſtumes.

Trunkes or hollow Inſtruments going with ſprings.

A vent, or cooler for the wombe made like a peſſary.

Hollow tents.

Sundry Cauteries, as flat round, ſharpe pointed, cutting, &c.

Conſtrictory rings to twitch or binde the Columella.

Speculum
Oris.
Ocul.
Ani.
Vteri.

A trunke or pipe with an actuall Cautery in it.

Crooked Knives.

A pipe in forme of a quill.

Divers truſſes with one, or more boulſters.

A ſhoulder-band to bee put about the necke, to hold up a truſſe.

A needle to draw through a golden wire, &c.

Pipes with feneſtells, and needles fit for ſutures.

Cutting mullets.

Mullets onely to hold and not to cut.

Mullets to take forth ſplinters of bones.

Mullets to draw teeth.

An inciſion knife.

Scrapers to plaine or ſmooth the bones, or elſe to cut them.

Cutting or hollow Scrapers.

A Leaden mallet to drive the ſcrapers or Chiſſels into the ſcull.

A Gimblet in ſhape and uſe reſembling that which Coopers uſe to lift up the ſunke ſtaves of their caske withall.

Levatories, of which kind is the three footed one.

Other Levatories, which taken by their handles, and their tongues put under the depreſt bones, lift them up.

Sawes.

A deſquamatory Trepan.

Plyers to take forth ſplinters of bones.

A Gimblet to perforate the ſcull.

A Trepan fit to divide the ſcull, with the ſcrew, peirnt or procer, brace, and cover or cap that keepes it from running in too farre.

A plate to ſet one foote of the compaſſe upon.

A cutting paire of Compaſſes both open and ſhut.

A fit inſtrument to depreſſe the *Dura Mater* without hurting thereof.

A ſyring to make injection withall.

A paire of Pincers with holes through them to take up the skinne for making a Seton.

Setons as well dry, as moyſtened with oyntments.

Crowes,
Parrots,
Swans,
Duckes,
Lizards,
Cranes,
Beakes, and theſe either
ſtraight,
crooked,
toothed, or
ſmooth.

Catch-bullets, and Plyers to draw forth peices of maile, and ſplinters of bones that lye deepe in.

Hollow and ſmooth Dilaters, diverſly made for the different wounds of the parts.

Probes fit for to put flamulaes into wounds; and theſe either ſtraight, or crooked, perforated, or unperforated.

Screwed mullets to draw forth barbed heads of Arrowes and the like.

Lancets to let blood, and ſcarrifie as well ſtraight, as crooked.

A *Pyulcos*, or Matter-drawer.

Ligatures, bands, ſwathes, thongs of Leather, woollen, linnen, round, ſlit, ſowne together; againe ſome are upper binders, others under binders.

Againe theſe are either expreiſing, or elſe conteining, and that either the applyed medicines, or the lips of wounds, or members put in a fit poſture, which therefore they call a ſarcoticke Ligature.

Thred.

Bottomes, or clewes of thred, or yarne.

Pledgets, compreſſes, boulſters, doubled cloathes.

Ferulæ, or Splints.

Caſſes.

Boxes.

Iuncke

Iunckes.

Gloſſocomies.

Ambi, a kinde of Gloſſocomie.

A pully, with its wheeles, and wooden and Iron pinnes, whereon the wheeles may runne:

Ropes aſwell to draw and extend, as hold up the member, &c.

Screw pins.

A hand-vice.

Hookes.

Buttons or ſtayes to faſten to the skinne to hold together the lippes of the wounds.

Linte.

Cuſhions, pillowes, linnen cloathes.

Files.

Dentiſcalpia, Dentifricia, Dentiſpicia.

Catheters, guiders of the worke.

A bathing chaire or ſeat, bathing tubbes, halfe tubs, caldrons, funnells, with all other circumſtances belonging to a bath.

Stoves, or hot houſes to ſweate in.

Cockes to turne and let out water.

A Gimblet to breake the ſtone.

Hookes.

Hollow probes ſlit on their upper ſides.

Winged Inſtruments to draw forth ſtones.

An inſtrument to clenſe the bladder.

Spathulaes ſtraight and crooked.

Cupping-glaſſes.

Hornes.

Pipes or catheters to weare Caruncles.

Artificiall members, as eyes of gold enamelled, &c.

An Vrinall, or caſe to ſave the water in.

An artificiall yard.

Crutches.

Niples, or leaden covers for ſore breaſts.

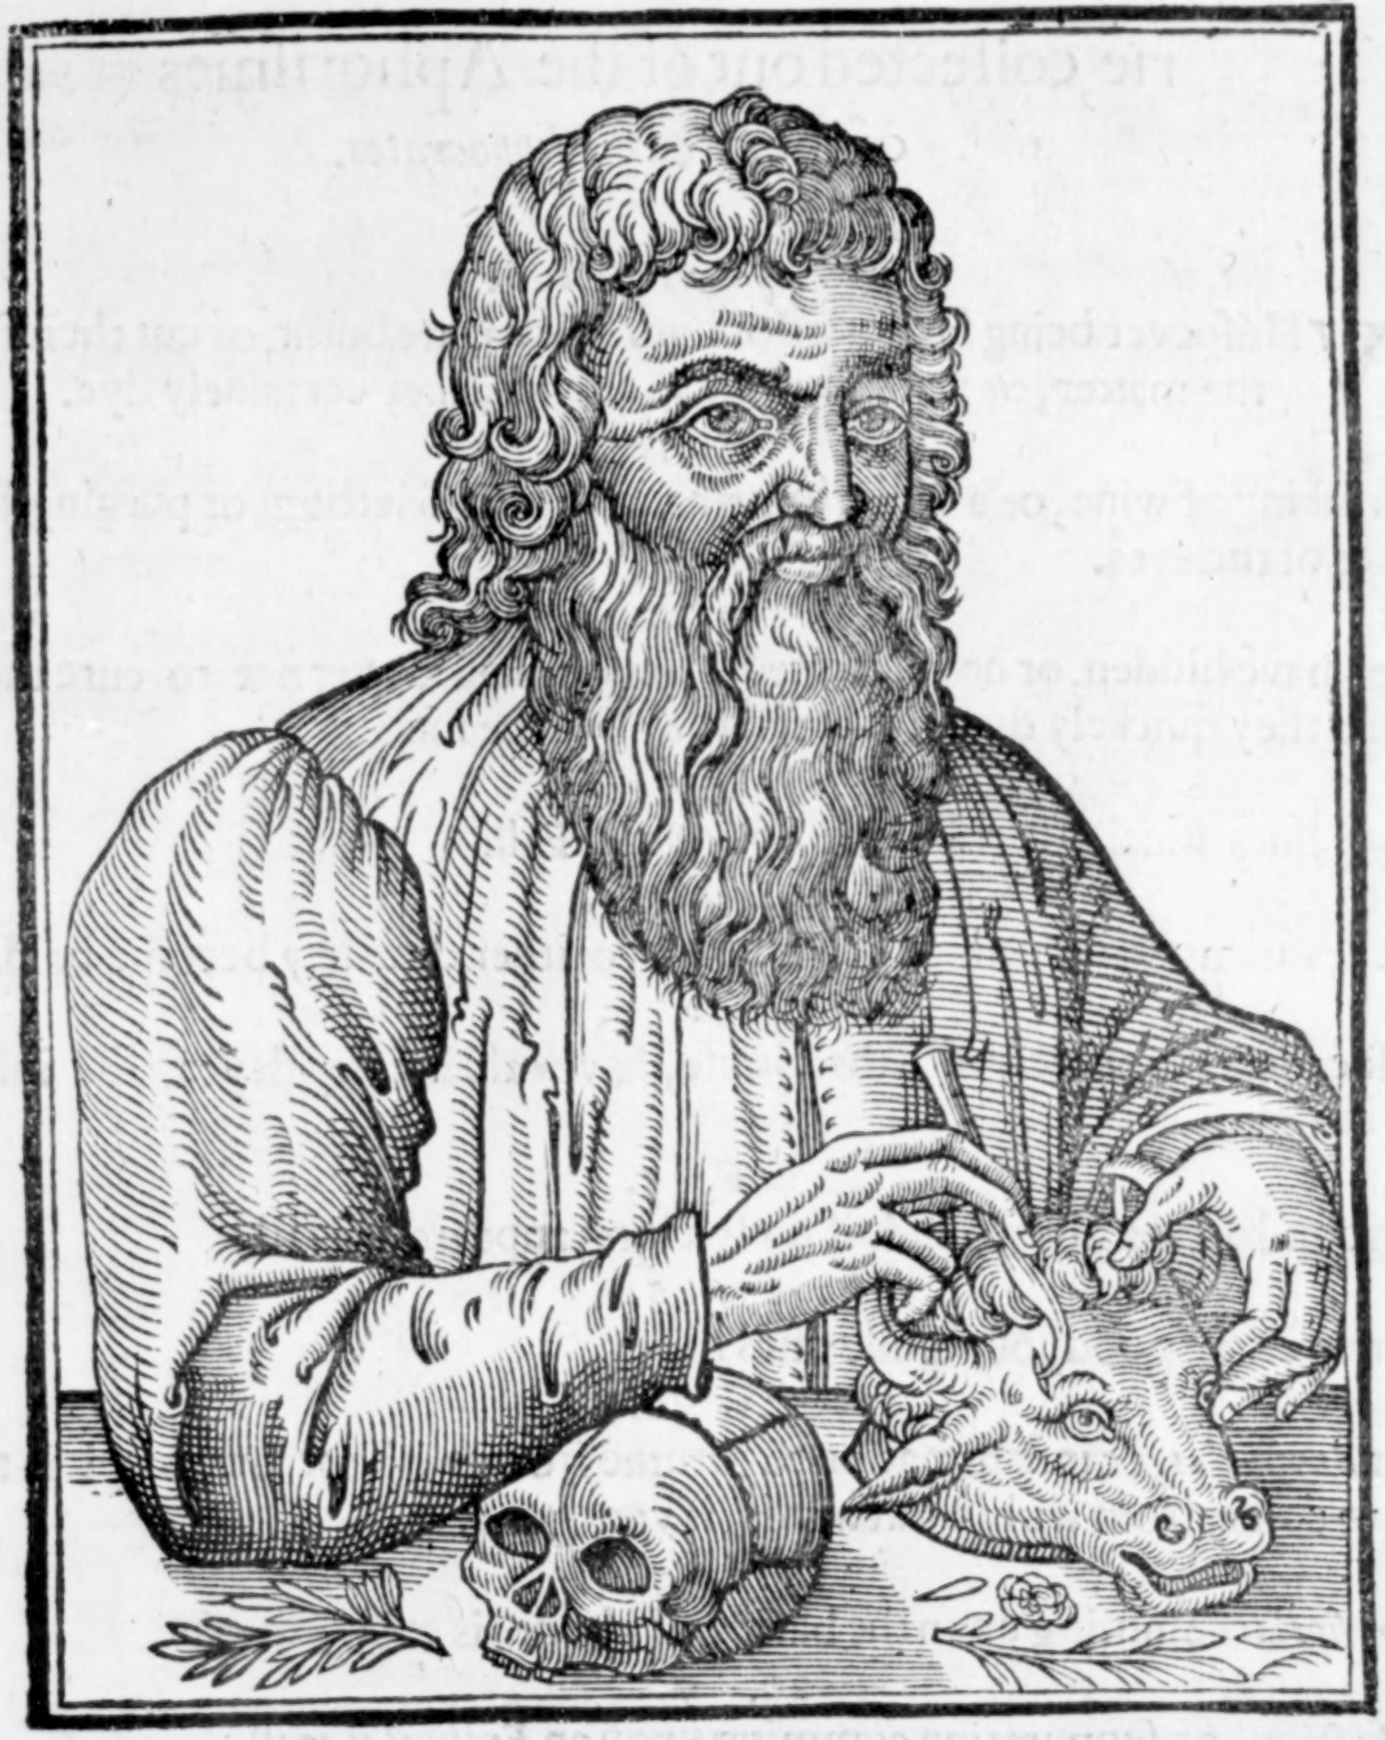
Griffins tallents to draw forth a *Mola*, out of the wombe.

A ſucking glaſſe to draw a breaſt withall.

Peſſaries, both long and ovall.

Syrings to give gliſters, as alſo to make injection into the eares, and wombe.

THE EFFIGIES OF HIPPOCRATES OF *COOS*, THE PRINCE OF PHYSITIONS.



INVICTUM (*Hippocrates*) *quòd te potuere ſuperbæ*
Eoi nunquam flectere Regis opes,
Cecropidæ fronti ex auro fulgente coronam
Promeriti memores impoſuere tuæ.
Gratia ſed levis eſt, Actæis tantus Athenis
Nec fuit hinc uni quàm tibi partus honos.
Nam quòd quæ recreent languentia corpora morbo
Pæonias fueris promere largus opes.
Sed tua tam fundit, quàm magni machiña mundi
Gratia, & inſignis tam tua fama volat.

BON. GRA. PARIS. MEDIC.

SELECT

SELECT APHORISMES CONCERNING CHIRVRGERIE, collected out of the Aphoriſmes of the great *Hippocrates*.

Aph. 27. *ſect.* 6.

VV Hoſoever being ſuppurate or hydropicall, are burnt, or cut therefore, if all the matter, or water flow forth at once, they certainely dye.

31. 6.

The drinking of wine, or a bath, fomentation, blood-letting, or purging, helpe the paines of the eyes.

38. 6.

Such as have hidden, or not ulcerated Cancers, had better not to cure them. For healed they quickely dye, not cured they live the longer.

55. 6.

Gouty paines uſually ſtirre in the Spring and Fall.

28. 6.

Eunuches are not troubled with the Goute, neither doe they become bald.

49. 6.

Whoſoever are troubled with the Goute, have eaſe in forty dayes, the inflammation ceaſing.

66. 5.

In great and dangerous wounds if no ſwelling appeare, it is ill.

67. 5.

Soft tumors are good, but crude ones ill.

25. 6.

For an *Eryſipelas*, or inflammation to returne from without inwards, it is not good; but to come from within outwards, is very good.

19. 7.

An *Eryſipelas* comming upon the baring of a bone, is evill.

20. 7.

Putrefaction, or ſuppuration comming upon an *Eriſipelas*, is ill.

21. 6.

If *Varices* or Hæmorrhoides happen to ſuch as are mad, their madneſſe ceaſes.

21. 7.

A fluxe of blood enſuing upon a great pulſation in Vlcers is ill.

26. 2.

It is better that a feaver happen upon a convulſion, than a convulſion upon a feaver.

4. 6.

Thoſe Vlcers that have the skinne ſmooth or ſhining about them, are evill.

18. 6.

The wound is deadly whereby the bladder, braine, heart, midriffe, any of the ſmall Guts, ſtomacke or Liver are hurt.

45. 6.

Whatſoever Vlcers are of a yeares continuance or more, the bone muſt neceſſarily ſcaile, and the ſcarres become hollow.

2. 7.

The bone being affected, if the fleſh be livide, it is ill.

14. 7.

Stupidity and lacke of reaſon, upon a blow of the head, is evill.

24. 7.

A *Delirium* happens if a bone (to wit, the ſcull) bee cut even to the hollowneſſe thereof.

Whileſt

Whilſt *Pus*, or matter is in generating, paines and feavers happen rather than when it is already made.

18. 5.

Cold things are hurtfull to the bones, teeth, nerves, braine, ſpinall marrow, but hot things are good.

46. 2.

Two paines infeſting together, but not the ſame place, the more vehement obſcures the other.

74. 7.

A corruption and abſceſſe of the bone is cauſed by the corruption of the fleſh.

506. *Coacar. prænot.*

A livid or dry Vlcer, or yellowiſh, is deadly.

19. 6.

When as a bone, or griſtle, or nerve, or ſmall portion of the cheeke, or the prepuce is cut aſunder, it neither encreaſes, nor growes together.

24. 6. *Aph. &* 513. *Coacar.*

If any of the ſmall guts be cut, it knits not againe.

50. 7.

Thoſe that have the braine ſphacelate, that is, corrupt, they dye within three dayes; if they eſcape theſe, they recover.

9. 7.

Bleeding at a wound cauſing a Convulſion, is the foreteller of death.

20. 5.

Cold is biting to Vlcers, hardens the skin, cauſes paine, not eaſily comming to ſuppuration, blackneſſe, aguiſh ſhakings, convulſions, crampes.

508. *Coac.*

Thoſe who have the temples cut, have a Convulſion upon the parts contrary to the ſection.

44. 7.

Whoſoever being ſuppurate are burnt or cut, if pure and white quitture ſhall flow forth they eſcape; but if that which is bloody, feculent, and ſtinking, then they dye.

Galen. comment. ad Aphor. 29. 2.

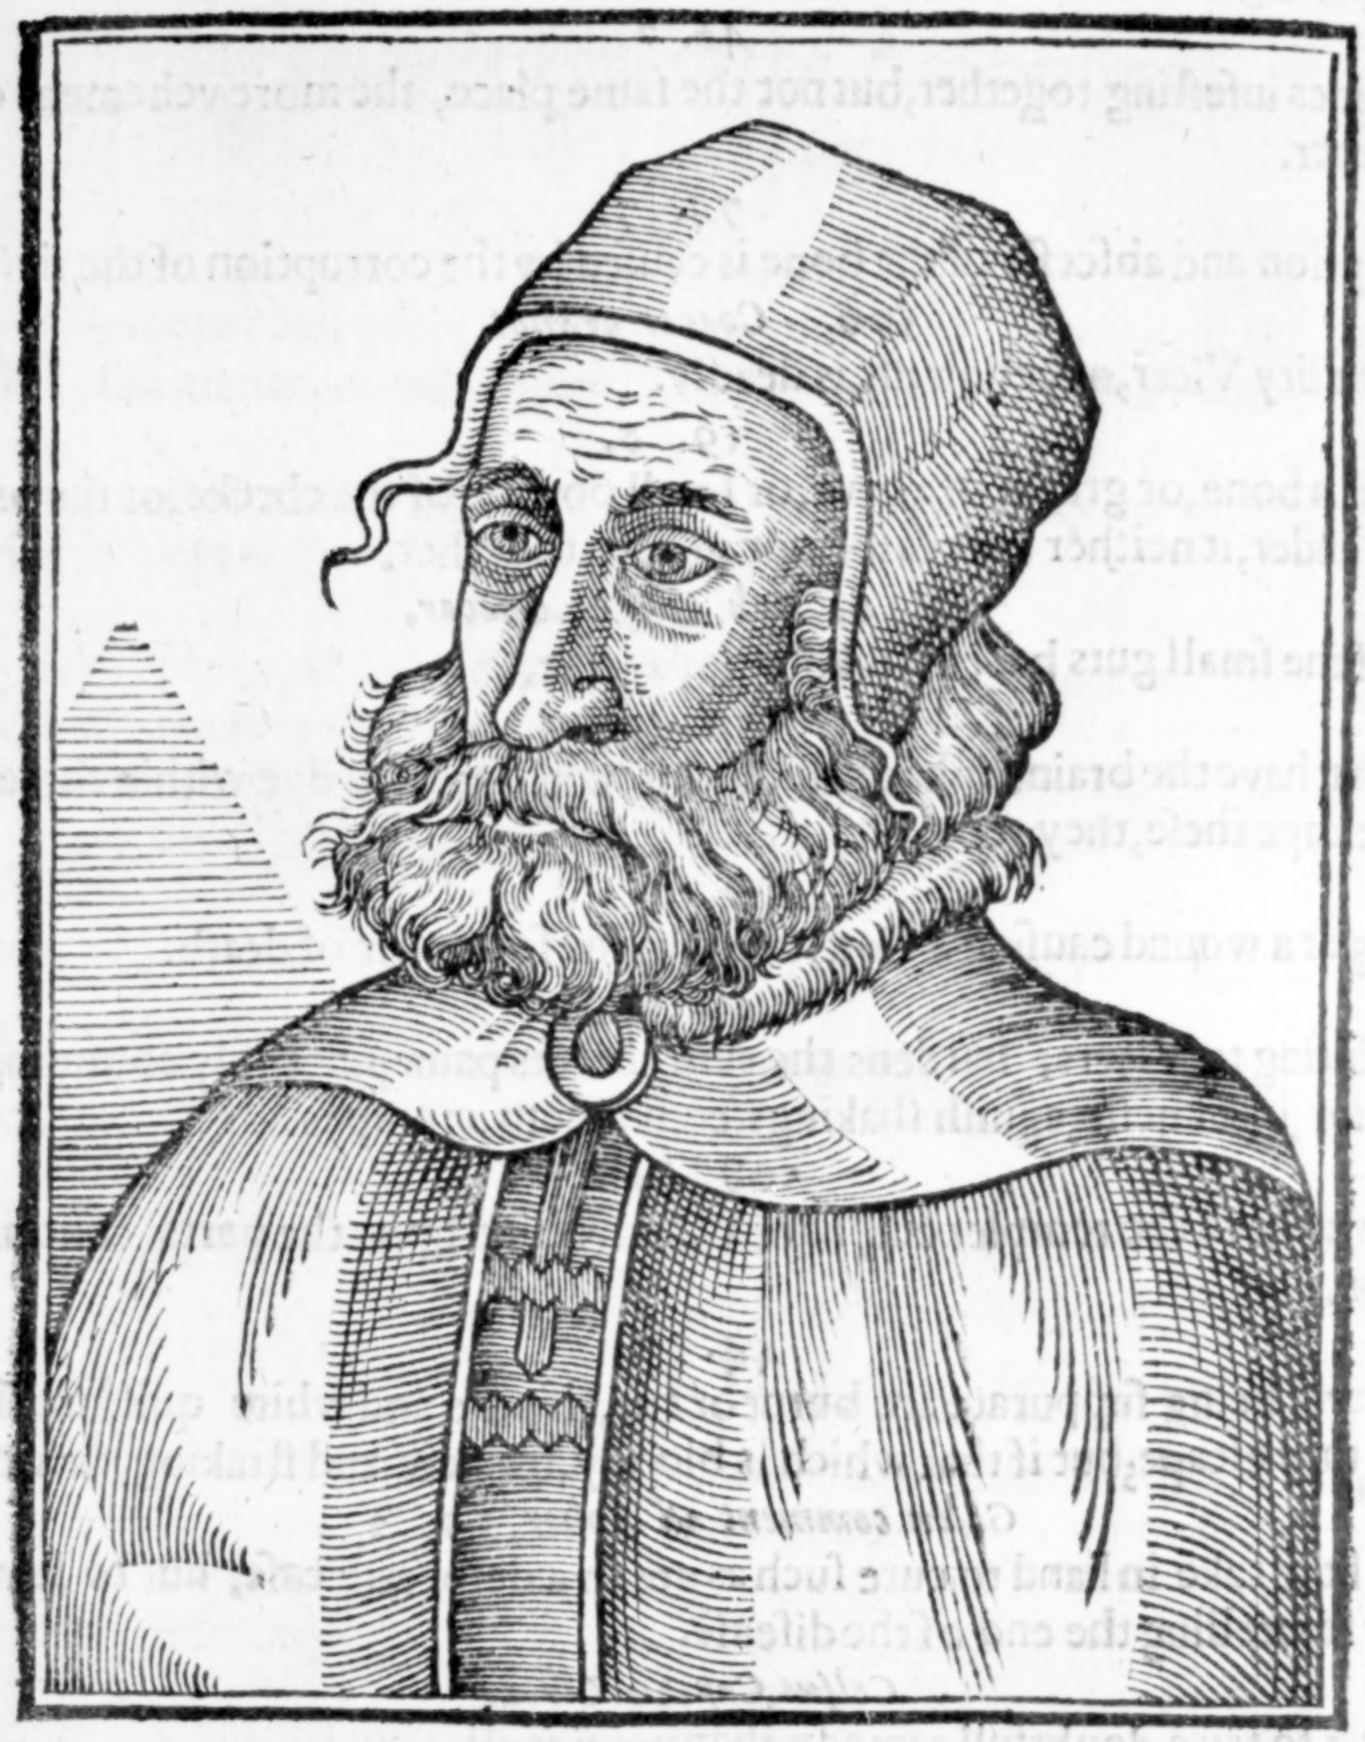
It is not fit to take in hand to cure ſuch as are in a deſperate caſe, but to leave them, onely foretelling the end of the diſeaſe.

Celſus, Cap. 10. *Lib.* 2.

It is better to try a doubtfull remedy than none at all.

FINIS.

THE EFFIGIES OF GALEN THE PRINCE OF PHYSITIONS NEXT TO HIPPOCRATES.



AEQVVM erat Hippocratem divino è ſemine Divûm,
Orbem muneribus conciliare ſibi:
Scripta ſed involuit tam multo ænigmate, verum
Vt quamvis ſolers nullus habere queat;
Pergamei auxilio niſi ſint monimenta Galeni,
Qui docta ambages ſuſtulit arte ſenis.
Ergo macte eſto virtute, arcana reſolvens,
Quæ nulli fuerant nota (Galene) prius;
Obſtringenſque orbem æterno tibi munere totum,
Æternis ſacras te quoq; temporibus.

BON, GRA. PARIS. MEDIC.

RVLES OF CHIRVRGERY BY THE AVTHOR.

1

PRactiſe is an operation agreeable to the rules and lawes of the Theory.

2

Health is not received by words, but by remedies fitly uſed.

3

Remedies knowne and approved by uſe and reaſon, are to be preferred before ſuch as are unknowne, or but lately found out.

4

Science without experience gets the Phyſition no great credit with the patient.

5

Hee that would performe any great and notable worke, muſt diligently apply himſelfe to the knowledge of his ſubject.

6

It is the part of a good Phyſition to heale the diſeaſe, or certainly to bring it to a better paſſe, as nature ſhall give leave.

7

The Chirurgion muſt be active, induſtrious, and well handed, and not truſt too much to bookes.

8

He that hath not beene verſed in the operations of the Art, nor a frequent auditor of the Lectures of ſuch as are learned therein, and ſets forth himſelfe for a brave Chirurgion for that hee hath read much, he is either much deceived or impudent.

9

He ſhall never doe any thing praiſe-worthy, that hath got his maſtery in Chirurgery by gold, not by uſe.

10

You ſhall comfort the patient with hope of recovery, even when as there is danger of death.

11

To change Phyſitions and Chirurgions is troubleſome, but not good for the Patient.

12

Though the diſeaſe prove long, yet it is not fit that the Phyſition give over the patient.

13

Great wounds of large veſſells, are to be judged deadly.

14

Every contuſion muſt be brought to ſuppuration.

15

As the nature or kind of the diſeaſe muſt bee knowne; ſo alſo muſt the remedy.

16

An Abſceſſe of the bone of the pallate, is in danger to cauſe a ſtinking breath.

17

Bleeding cauſed by heate muſt be repreſt by cold.

18

Wounds of nervous parts require medicines which by the ſubtlety of the parts may enter in and draw from farre.

19

It is not fit for ſuch as have Vlcers in their Legges, neither to walke, ſtand nor ſit, but to reſt themſelves in bed.

20

All biting and acrid medicines are offenſive to cleane Vlcers.

21

For reſtoring of diſlocations you muſt hold them faſt, ſtretch them out, and force them in.

22

A great Gangreene admits no cure, but cutting.

23

A monſter is a thing diſſenting from the lawes of nature.

24

Wounds of the Cheſt preſently become ſanious and purulent.

25

The wounds made by all venemous creatures are dangerous.

26

The ſouth wind blowing, wounded members eaſily become mortifyed.

27

Such as are wounded, and deſire to bee quickly whole, muſt keepe a ſpare diet.

28

Vntemperate bodies doe not eaſily recover of diſeaſes.

29

Round Vlcers unleſſe they be drawne into another figure, doe not eaſily heale up.

30

An Eryſipelatous Vlcer requires purgation by ſtoole.

31

Crying is good for an infant, for it ſerves in ſtead of exerciſe and evacuation.

32

Greeſe is good for none but ſuch as are very fat.

33

Idleneſſe weakens and extinguiſheth the native heate.

34

An ill natured Vlcer yeelds not unleſſe to a powerfull remedy.

35

A bath reſolves and diſcuſſes humors, and gently procures ſweate.

36

Cold diſeaſes are troubleſome to old people, and hard to be helped; but in young bodies they are neither ſo troubleſome, nor contumacious.

37

Exerciſed bodies are leſſe ſubject to diſeaſes.

38

Moiſt bodies though they neede ſmall nouriſhment, yet ſtand they in neede of large evacuation.

39

Sicke people dye ſooner of an hot diſtemper than of a cold, by reaſon of the quicke and active operation of fire.

40

The quitture that flowes from an Vlcer is laudible, which is white, ſmooth and equall.

The end of the twentiſeaventh Booke.

HOVV TO MAKE REPORTS, AND TO EMBALME [illegible] EAD.

THE TVVENTIEIGHTH BOOKE.

Now it onely remaines that wee inſtruct the Chirurgion in making or framing his reporte, or opinion, eyther of the death of any perſon, or of the weakeneſſe, or deprivation of any member in the function or execution of its proper office and duty. Herein it is meete that hee be very conſiderate, that is to ſay, ingenious or wiſe in making his report, becauſe the events of diſeaſes are oftentimes doubtfull and uncertaine, neither can any man foretell them certainly, whether they will be for life or death, by reaſon of the manifold nature of the ſubject of which we ſpeake, and alſo the uncertaine condition of the humors both in their kind and motion. Which was the cauſe why *Hippocrates* even in the firſt of his Aphoriſmes pronounceth, that judgement is difficult. But firſt of all, it is very expedient that a Chirurgion be of an honeſt mind, that hee may alwayes have before his eyes a carefull regard of true piety, that is to ſay, the feare of God and faith in Chriſt, and love toward his neighbours with hope of life everlaſting, leaſt that hee being carried away by favour, or corrupted with money or rewards, ſhould affirme or teſtifie theſe wounds to bee ſmall that are great, and theſe great that are ſmall; for the report of the wound is received of the Chirurgion according to the civill Law.

Why a Chirurgion muſt be carefull in making of Reports.

Why judgement is difficult.

It is recorded in the workes of ancient Phyſitions that wounds may bee called great for three reſpects.

Wounds termed great for three reſpects,

The firſt is by reaſon of the greatneſſe of the diſſolved unitie or reſolution of Continuity, and ſuch are theſe wounds which made by a violent ſtroake with a backeſword, have cut off the arme, or legge, or overthwart the breaſt. The ſecond is by reaſon of the dignitie or worthineſſe of the part; now this dignity dependeth on the excellencie of the action; therefore thus any little wound made with a bodkin, knife, in any part whoſe ſubſtance is noble, as in the Braine, Heart, Liver or

How long a Chirurgion muſt ſuſpend his judgement in ſome caſes.

or any other part whoſe action and function is neceſſary to preſerve life, as in the Weaſant, Lungs or Bladder, is judged great. The third is, by reaſon of the greatneſſe and ill habit, or the abundance of ill humors or debility of all the wounded body; ſo thoſe woundes that are made in nervous parts, and old decayed people, are ſayd to be great. But in ſearching of wounds let the Chirurgion take heede that he be not deceived by his probe. For many times it cannot goe into the bottome of the wound but ſtoppeth, and ſticketh in the way, either becauſe he hath not placed the patient, in the ſame poſture, wherein he was when he received his hurt; or elſe for that the ſtroake being made downe right, ſlipt aſide to the right or left hand, or elſe from below upwards, or from above downewards, and therefore hee may expect that the wound is but little and will be cured in a ſhort time, when it is like to bee long in curing, or elſe mortall. Therefore from the firſt day it behooveth him to ſuſpend his judgement of the wound untill the ninth, for in that time the accidents will ſhew themſelves manifeſtly, whether they be ſmall or great, according to the condition of the wound, or wounded bodyes, and the ſtate of the ayre according to his primitive qualities, or venomous corruption.

Generall ſignes whereby we judge of diſeaſes.

But generally the ſignes, whereby we may judge of diſeaſes, whether they bee great or ſmall, of long or ſhort continuance, mortall or not mortall, are foure. For they are drawne [illegible] nature, and eſſence of the diſeaſe, or from the cauſe or effects thereof, [illegible] the ſimilitude, proportion and compariſon, of thoſe diſeaſes with the ſeaſon or preſent conſtituti[illegible]he times. Therefore if wee are called to the cure of a greene wound, whoſe na[illegible]nd danger, is no other but a ſimple ſolution of Continuity in the muſculous fleſh, we may preſently pronounce that wound to be of no danger, and that it will ſoone be cured. But if it have an Vlcer annexed unto it, that is, if it be ſanious, then we may ſay it will be more difficult and long in the curing; and ſo we may pronounce of all diſeaſes, taking a ſigne of their eſſence and nature. But of the ſignes that are taken of the cauſes, let this bee an example. A wound that is made with a ſharpe pointed and heavie weapon, as with an halbeard being ſtricken with great violence, muſt be accounted great, yea and alſo mortall if the accidents be correſpondent.

Wounds deadly by the fault of the ayre.

But if the patient fall to the ground through the violence of the ſtroake, if a cholericke vomiting follow thereon, if his ſight faile him, together with a giddineſſe, if blood come forth at his eyes and noſthrills, if diſtraction follow with loſſe of memory and ſenſe of feeling, we may ſay; that all the hope of life, remaineth in one ſmall ſigne which is to be deduced from the effects of the wound. But by the comparing it unto the ſeaſon that then is, and diſeaſes that then aſſault mans body, wee may ſay, that all thoſe that are wounded with gunſhot are in danger of death, as it happened in the ſchirmiſhes at the ſeige of *Roan*, and at the battall of Saint *Deuis*. For at that time, whether it were by reaſon of the fault of the heavens, or ayre, through the evill humors of mans body, and the diſturbance of them; all wounds that were made by gunſhot, were for the moſt part mortall. So likewiſe at certaine ſeaſons of the yeare, we ſee the ſmall pockes and meaſels breake forth in children, as it were by a certaine peſtilent contagion to the deſtruction of children onely, inferring a moſt cruell vomit and laske, and in ſuch a ſeaſon the judgement of thoſe diſeaſes is not difficult.

Singnes of a fractured ſcull.

But you by the following ſignes may know what parts are wounded. If the patient fall downe with the ſtroake, if he lye ſenſeleſſe, as it were aſleepe, if he voyde his excrements unwittingly, if he be taken with giddineſſe, if blood come out at his eares, mouth, and noſe, and if he vomit choller, you may underſtand that the ſcull is fractured, or pearced through, by the defect in his underſtanding and diſcourſe. You alſo may know when the ſcull is fractured, by the judgement of your externall ſenſes, as if by feeling it with your finger you finde it elevated or depreſſed beyond the naturall limits, if by ſtriking it with the end of a probe, when the *Pericranium* or nervous filme that inveſteth the ſcull is cut croſſe wiſe; and ſo divided there from it, yeeld a baſe and unperfect ſound like unto a pot ſheard that is broken, or rather like unto an earthen pitcher that hath a cleft, or rent therein.

Signes of death by a wound on the head.

But we may ſay, that death is at hand if his reaſon and underſtanding faile him, if he be ſpeechleſſe, if his ſight forſake him, if he would tumble headlong out of his bed, being not at all able to moove the other parts of his body; if he have a continuall feaver, if his tongue be blacke with drieneſſe, if the edges of the wound bee blacke or dry, and caſt forth no ſanious matter, if they reſemble the colour of ſalted fleſh, if he have an apoplexie, phrenſie, convulſion or palſie with an involuntarie excretion, or abſolute ſuppreſſion of the Vrine and excrements. You may know that a man hath his throate, that is, his weaſon and winde pipe cut. Firſt by the ſight of his wound, and next by the aboliſhment of the function or office thereof both wayes, for the patient can neither ſpeake nor ſwallow any meate or drinke; and the parts that are cut aſunder, divide themſelves by retraction upwards or downewards one from another, whereof commeth ſodaine or preſent death. You may know that a wound hath peirced into the breſt or concavity, of the body, if the ayre come forth at the wound, making a certaine whizzing noyſe, if the patient breathe with great difficulty, if he feele a great heavineſſe or weight, on or about the midriffe, whereby it may be gathered that a great quantity of blood, lyeth on the place or midriffe, and ſo cauſeth him to feele a weight or heavineſſe, which by little and little, will bee caſt up by vomiting. But a little after a feaver commeth, and the breath is unſavory, and ſtinking, by reaſon that the putrefying blood is turned into *ſanies*: the patient cannot lye but on his backe, and he hath an often deſire to vomit, but if hee eſcape death, his wound will degenerate into a Fiſtula, and at length will conſume him by little and little.

Signes that the throate is cut.

Signes that a wound hath pierced in the capacity of the cheſt.

We may know that the Lungs are wounded, by the foaming and ſpumous blood, comming out both at the wound and caſt up by vomiting; hee is vexed with a greevous ſhortneſſe of breath and with a paine in his ſides. We may perceive the Heart to be wounded by the aboundance of blood that commeth out at the wound, by the trembling of all the whole body, by the faint and ſmall pulſe, paleneſſe of the face, cold ſweate, with often ſwounding, coldneſſe of the extreame parts, and ſuddaine death.

Signes that the Lungs are wounded.

That the heart is wounded.

When the midriffe (which the Latines call *Diaphragma*) is wounded, the patient feeleth a great weight in that place, he raveth and talketh idlely, he is troubled with ſhortneſſe of winde, a cough, and fit of greevous paine, and drawing of the entralls upwards. Wherefore when all theſe accidents appeare, we may certainely pronounce that death is at hand.

The midriffe.

Death appeareth ſodainely, by a wound of the hollow Veine, or the great Arterie, by reaſon of the great and violent evacuation of blood and ſpirits, whereby the functions of the Heart and Lungs are ſtopped and hindred.

The *Vena Cava* and great Artery.

The marrow of the backebone being pierced, the patient is aſſaulted with a Palſie or convulſion very ſuddainely, and ſence and motion faileth in the parts beneath it, the excrements of the bladder, are either evacuated againſt the patients will, or elſe are altogether ſtopped.

The ſpinall marrow.

When the Liver is wounded, much blood commeth out at the wound, and pricking paine diſperſeth it ſelfe even unto the ſword-like griſtle, which hath its ſituation at the Lower end of the breſt bone called *Sternon*: the blood that falleth from thence downe into the inteſtines doth oftentimes inferre moſt maligne accidents, yea and ſometimes death.

The Liver.

When the ſtomacke is wounded, the meate and drink come out at the wound, there followeth a vomiting of pure choler, then commeth ſweating and coldneſſe, of the extreame parts, and therefore we ought to prognoſticate death to follow ſuch a wound.

The ſtomacke.

When the milt or ſpleene is wounded, blacke and groſſe blood cometh out at the wound, the patient will be very thirſty, with paine on the left ſide, and the blood breakes forth into the belly, and there putrifying cauſeth moſt maligne and greevous accidents and often times death to follow.

The ſpleene.

When the guts are wounded, the whole body is griped and pained, the excrements come out at the wound, whereat alſo often times the guts breake forth with great violence.

The guts.

When the reines or Kidnyes are wounded, the patient will have great paine in making his Vrine, and the blood commeth out together therewith, the paine commeth downe even unto the groine, yard, and teſticles.

The kidneyes.

When

The bladder. When the bladder and Vreters are wounded, the paine goeth even unto the entralls; the parts all about, and belonging to the groine are diſtended, the Vrine is bloody that is made, and the ſame alſo commeth often times out at the wound.

The womb. When the wombe is wounded, the blood commeth out at the privities, and all other accidents appeare, like as when the bladder is wounded.

The Nerves. When the ſinewes are pricked or cut halfe aſunder, there is great paine in the affected place, and there followeth a ſuddaine inflammation, fluxe, abſceſſe, feaver, convulſion, and oftentimes a gangreene or mortification of the part, whereof commeth death, unleſſe it be ſpeedily prevented.

Having declared the ſignes and tokens of wounded parts, it now remaineth that we ſet downe other ſignes of certaine kindes of death that are not common, or naturall, whereabout when there is great ſtrife and contention made, it oftentimes is determined and ended by the judgement of the diſcreete Phyſition or Chirurgion.

Signes that an infant is ſmothered, or over-layd. Therefore if it chance that a nurſe either through drunkenneſſe, or negligence, lyes upon her infant lying in bed with her, and ſo ſtifles or ſmothers it to death. If your judgement be required, whether the infant dyed through the default, or negligence of the nurſe? or through ſome violent or ſuddaine diſeaſes that lay hidden and lurking in the body thereof? You ſhall finde out the truth of the matter by theſe ſignes following.

For if the infant were in good health before, if he were not froward or crying, if his mouth and noſethrills now being dead, be moyſtned or bedewed with a certaine foame, if his face be not pale but of a Violet or purple colour; if when the body is opened the Lungs be found ſwolne and puffed up, as it were with a certaine vaporous foame and all the other entralls ſound, it is a token that the infant was ſtifled, ſmothered or ſtrangled by ſome outward violence.

If the body or dead corpes of a man be found lying in a field, or houſe alone, and you be called by a magiſtrate to deliver your opinion, whether the man were ſlaine by lightning or ſome other violent death? you may by the following ſignes finde out the certainety hereof.

Signes of ſuch as are ſlaine by Lightning. For every body that is blaſted, or ſtriken with lightning, doth caſt forth or breathe out an unholſome, ſtinking or ſulphureous ſmell, ſo that the birdes or fowles of the ayre, nor dogges will not once touch it, much leſſe prey or feede on it: the part that was ſtricken often times ſound, and without any wound, but if you ſearch it well, you ſhall finde the bones under the skinne to be bruiſed, broken or ſhivered in peeces.

Lib.2.cap.54. But if the lightening hath pierced into the body, which making a wound therein (according to the judgement of *Pliny*) the wounded part is farre colder than all the reſt of the body. For lightning driveth the moſt thinne and fiery ayre before it, and ſtriketh it into the body with great violence, by the force whereof the heate that was in the part is ſoone diſperſed, waſted and conſumed. Lightening doth alwayes leave ſome impreſſion or ſigne of ſome fire either by uſtion or blackneſſe: for no lightning is without fire.

Moreover whereas all other living creatures when they are ſtriken with lightening fall on the contrary ſide, onely man falleth on the affected ſide, if hee be not turned with violence toward the coaſt or region from whence the lightening came.

If a man bee ſtriken with lightening while he is aſleepe, hee will be found with eyes open; contrarywiſe, if hee be ſtriken while hee is awake, his eyes will be cloſed (as *Plinie* writeth.) *Philip Commines* writeth that thoſe bodyes that are ſtricken with lightning are not ſubject to corruption as others are.

Therefore in ancient time it was their cuſtome neither to burne, nor bury them, for the brimſtone which the lightning bringeth with it, was unto them in ſtead of ſalt, for that by the dryneſſe and fiery heate thereof it did preſerve them from putrefaction.

Alſo it may be enquired in judgement, Whether any that is dead and wounded, received theſe wounds alive or dead. Truely the wounds that are made on a living man, if he dye of them, after his death will appeare red and bloody, with the ſides or edges ſwollne, or pale round about: contrary wiſe, thoſe that are made in a dead man, will bee neither red, bloody, ſwollne, nor puffed up. For all the faculties and functions of life in the body doe ceaſe and fall together by death; ſo that thenceforth no ſpirits nor blood can be ſent, or flow unto the wounded place. Therefore by theſe ſignes which ſhall appeare, it may be declared that hee was wounded dead or alive.

Signes of wounds given to a living and dead man.

The like queſtion may come in judgement when a man is found hanged, whether he were dead, or alive. Therefore if he were hanged alive, the impreſſion or print of the rope will appeare red, pale, or blacke, and the skinne round about it will be contracted or wrinkled, by reaſon of the compreſſion which the cord hath made; alſo often times the head of the *aſpera arteria* is rent and torne, and the ſecond ſpondile, and the necke luxated or mooved out of his place. Alſo the armes and legges will be pale, by reaſon of the violent and ſodaine ſuffocation of the ſpirits: moreover there will be a foame about his mouth, and a foamie and filthy matter hanging out at his noſethrills, being ſent thither both by reaſon that the Lungs are ſodainely heated and ſuffocated, as alſo by the convulſive concuſſion of the braine like as it were in the falling ſickneſſe. Contrariwiſe, if he be hanged dead, none of theſe ſignes appeare: for neither the print of the rope appeares red or pale, but of the ſame colour as the other parts of the body are, becauſe in dead men the blood and ſpirits doe not flow to the greeved parts.

Signes whether one be hanged alive or dead.

Whoſoever is found dead in the waters, you ſhall know whether they were throwne into the water alive or dead. For all the belly of him that was throwne in alive, will be ſwollen, and puffed up by reaſon of the water that is contained therein; certaine clammie excrements come out at his mouth and noſethrills, the ends of his fingers will be worne and excoriated, becauſe that hee dyed ſtriving and digging or ſcraping in the ſand or bottome of the river, ſeeking ſomewhat whereon hee might take hold to ſave himſelfe from drowning. Contrariwiſe if he be throwne into the waters being dead before, his belly will not be ſwollne, becauſe that in a dead man all the paſſages and conduites of the body doe fall together, and are ſtopped and cloſed, and for that a dead man breathes not, there appeareth no foame nor filthy matter about his mouth and noſe, and much leſſe can the toppes of his fingers be worne and excoriated, for when a man is already dead, he cannot ſtrive againſt death.

Whether one found dead in the water came therein alive or dead.

But as concerning the bodies of thoſe that are drowned, thoſe that ſwimme on the upper part of the water being ſwollne or puffed up, they are not ſo by reaſon of the water that is contained in the belly, but by reaſon of a certaine vapour, into which a great portion of the humors of the body are converted by the efficacy of the putryfying heate. Therefore this ſwelling appeareth not in all men which doe periſh, or elſe are caſt out dead into the waters, but onely in them which are corrupted with the filthineſſe or muddineſſe of the water, long time after they were drowned; and are caſt on the ſhore.

But now I will declare the accidents that come to thoſe that are ſuffocated and ſtifled or ſmoothered with the vapour of kindled or burning charcoales, and how you may foretell the cauſes thereof by the hiſtory following. In the yeere of our Lord God 1575. the tenth day of May, I with *Robert Greanline* Doctor of Phyſicke, was ſent for by Maſter *Hamell* an advocate of the Court of Parlament of *Paris*, to ſee and ſhew my opinion on two of his ſervants, of whom the one was his Clarke, and the other his Horſe-keeper. All his family ſuppoſed them dead, becauſe they could not perceive or feele their Arteries to beate, all the extreame parts of their bodyes were cold, they could neither ſpeake nor move, their faces were pale and wanne, neither could they bee raiſed up with any violent beating or plucking by the haire, Therefore all men accounted them dead, and the queſtion was onely of what kind of death they dyed, for their maſter ſuſpected that ſome body had ſtrangled them, others thought that each of them had ſtopped one anothers winde with their hands; and others judged that they were taken with a ſodaine apoplexie. But I preſently enquired whether there had beene any fire made with Coales in the houſe lately,

Of ſuch as are ſmothered by Charcoales.

whereunto their maſter giving eare, ſought about all the corners of the chamber (for the chamber was very little and cloſe) and at laſt found an earthen panne with charcoale halfe burned; which when we once ſaw, we all affirmed with one voyce, that it was the cauſe of all this misfortune, and that it was the maligne fume and venemous vapour, which had ſmothered them, as it were by ſtopping the paſſages of their breath. Therefore I put my hand to the regions of their hearts, where I might perceive that there was ſome life remaining by the heat and pulſation that I felt though it were very little, wherefore we thought it convenient to augment and encreaſe it. Therefore firſt of all, artificially opened their mouthes, which were very faſt cloſed, and ſticking obſtinately together; and thereinto both with a ſpoone and alſo with a ſilver pipe, we put *aqua vita* often diſtilled with diſſolved *hiera* and treacle; when we had injected theſe medicines often into their mouthes, they began to moove and to ſtretch themſelves, and to caſt up and expell many viſcous excrementall and filthy humors at their mouth and noſtrells, and their Lungs ſeemed to be hot, as it were in their throates.

Therefore then we gave them vomitories of a great quantity of *Oxymel*, and beate them often violently on the laſt ſpondill of the backe, and firſt of the loynes, both with the hand and knee (for unto this place the orifice of the ſtomacke is turned) that by the power of the vomitory medicine, and concuſſion of the ſtomacke, they might be conſtrained to vomit. Neither did our purpoſe faile us, for preſently they voided clammie, yellow and ſpumous fleame and blood.

But wee not being content with all this, blowed up into their noſtrells out of a Gooſe quill, the powder of *Euphorbium*, that the expulſive faculty of the braine might be ſtirred up to the expulſion of that which oppreſſed it; therefore preſently the braine being ſhaken, or mooved with ſneeſing and inſtimulated thereunto by rubbing the chymicall oyle of mints on the pallate and on the cheekes, they expelled much viſcous and clammie matter at their noſtrells.

Then we uſed frictions of their armes, legges, and backe-bones; and miniſtered ſharpe gliſters, by whoſe efficacie the belly being abundantly looſened, they beganne preſently to ſpeake and to take things that were miniſtered unto them of their owne accord, and ſo came to themſelves againe.

In the doing of all theſe things, *Iames Guillemeau* Chirurgion unto the King, and of *Paris*, and *Iohn* of Saint *Germanes* the Apothecary, did much helpe and further us.

In the afternoone that the matter being well begunne might have good ſucceſſe, *Iohn Hautie*, and *Lewis Thibaut*, both moſt learned Phiſitions, were ſent for unto us, with whom we might conſult on other things that were to be done. They highly commending all things that we had done already, thought it very convenient that cordialls ſhould be miniſtered unto them, which by ingendering of laudable humors, might not onely generate new ſpirits, but alſo attenuate and purifie thoſe that were groſſe and cloudy in their bodies. The reſt of our conſultation was ſpent in the enquirie of the cauſe of ſo dire a miſchance. For they ſayd that it was no new or ſtrange thing, that men may be ſmothered with the fume and cloudy vapour of burning coales.

Lib.9.cap.12. lib.23. A hiſtory.

For we reade in the workes of *Fulgoſius*, *Volateranus* and *Egnatius*, that as the Emperour *Iovinian*, travelled in winter time toward Rome, he being weary in his journey, reſted at a Village called *Didaſtanes*, which divideth *Bithynia* from *Galatia*, where he lay in a chamber that was newly made, and plaiſtered with lime, wherein they burnt many coales, for to dry the worke or plaiſtering, that was but as yet greene on the walls or roofe of the chamber. Now he dyed the very ſame night being ſmothered or ſtrangled with the deadly and poyſonous vapour of the burned charcoale, in the midſt of the night; this happened to him in the eighth moneth of his reigne, the thirtyeth yeere of his age, and on the twentyeth day of Auguſt. But what neede we to exemplifie this matter by the ancient hiſtories, ſeeing that not many yeeres ſince three ſervants dyed in the houſe of *Iohn Bigine* goldſmith, who dwelleth at the turning of the bridge of the Change, by reaſon of a fire made of coales in a cloſe chamber, without a chimney where they lay. And as concerning the cauſes, theſe were alleaged. Many were of opinion that it happened by the default of the vapour proceeding from the burned coales, which being in a place voyd of all ayre or wind, inferres ſuch like accidents as the vapour of muſte or new wine doth, that is to ſay, paine, and giddineſſe of the head. For both theſe kindes of vapour beſides that they are crude, like unto thoſe things whereof they come, can alſo very ſuddainely obſtruct the originall of the Nerves, and ſo cauſe a convulſion, by reaſon of the groſſeneſſe of their ſubſtance.

For ſo *Hippocrates* writing of thoſe accidents that happen by the vapour of new wine, ſpeaketh. If any man being drunken doe ſuddainely become ſpeechleſſe and hath a convulſion, he dyeth unleſſe he have a feaver therewithall; or if he recover not his ſpeech againe when his drunkenneſſe is over.

Sect.5.Aph.5.

Even on the ſame manner the vapour of the coales aſſaulting the braine cauſed them to be ſpeechleſſe, unmoveable and voyde of all ſenſe, and had dyed ſhortly unleſſe by miniſtring and applying warme medicines into the mouth and to the noſethrells, the groſſneſſe of the vapour had beene attenuated, and the expulſive faculties mooved or provoked to expell all thoſe things that were noyſome: and alſo although at the firſt ſight the Lungs appeared to be greeved more than all the other parts, by reaſon that they drew the maligne vapour into the body, yet when you conſider them well, it will manifeſtly appeare that they are not greeved, unleſſe it be by the ſimpathy or affinity that they have with the braine when it is very greevouſly afflicted.

The proofe hereof is, becauſe preſently after, there followeth an interception or defect of the voyce, ſenſe and motion: which accidents could not bee unleſſe the beginning or originall of the nerves were intercepted or letted from performing its function, being burthened by ſome matter contrary to nature.

And even as thoſe that have an apoplexie doe not dye but for want of reſpiration, yet without any offence of the Lungs, even ſo theſe two young mens deathes were at hand, by reaſon that their reſpiration or breathing was in a manner altogether intercepted, not through any default of the Lungs, but of the braine and nerves diſtributing ſence and motion to the whole body and eſpecially to the inſtruments of reſpiration. Others contrariwiſe contended and ſayd, that there was no default in the braine, but conjectured the interception of the vitall ſpirits letted or hindered from going up unto the braine from the heart, by reaſon that the paſſages of the Lungs were ſtopped, to be the occaſion that ſufficient matter could not be afforded for to perſerve and feed the animall ſpirit. Which was the cauſe that thoſe young men were in danger of death, for want of reſpiration, without the which there can be no life.

The occaſion of the death of ſuch as have the apoplexie.

For the heart being in ſuch a caſe, cannot deliver it ſelfe from the fuliginous vapour that encompaſſeth it, by reaſon that the Lungs are obſtructed by the groſſeneſſe of the vapour of the coales, whereby inſpiration cannot well bee made, for it is made by the compaſſing ayre drawne into our bodyes: but the ayre that compaſſeth us doth that which nature endeavoureth to doe by inſpiration, for it moderateth the heate of the heart, and therefore it ought to bee endued with foure qualities. The firſt is, that the quantity that is drawne into the body bee ſufficient. The ſecond is, that it be cold, or temperate in quantity. The third is, that it be of a thinne and meane conſiſtence. The fourth is, that it be of a gentle and benigne ſubſtance.

But theſe foure conditions were wanting in the ayre which theſe two young men drew into their bodyes being in a cloſe chamber.

For firſt, it was little in quantity, by reaſon that ſmall quantity that was contained in that little cloſe chamber, was partly conſumed by the fire of coales, no otherwiſe than the ayre that is conteined in a cupping glaſſe is conſumed in a moment by the flame ſo ſoone as it is kindled.

Conditions of the ayre good to breath in.

Furthermore it was neither cold nor temperate, but as it were enflamed with the burning fire of coales.

Thirdly, it was more groſſe in conſiſtence than it ſhould bee by reaſon of the admixtion of the groſſer vapour of the coales: for the nature of the ayre is ſo that it may bee ſoone altered, and will very quickly receive the formes and impreſſions of thoſe ſubſtances that are about it.

Laſtly, it was noyſome and hurtfull in ſubſtance, and altogether offenſive to the aiery ſubſtance of our bodies. For Charcoale are made of greene wood burnt in pits under ground, and then extinguiſhed with their owne fume or ſmoake, as all Colliers can tell. Theſe were the opinions of moſt learned men although they were not altogether agreeable one unto another, yet both of them depended on their proper reaſons. For this at leaſt is manifeſt, that thoſe paſſages which are common to the breaſt and braine, were then ſtopped with the groſſeneſſe of the vapour of the coales: whereby it appeareth that both theſe parts were in fault, for as much as the conſent and connexion of them with the other parts of the body is ſo great, that they cannot long abide ſound and perfect without their mutuall helpe by reaſon of the loving and friendly ſympathy and affinitie that is betweene all the parts of the body one with another.

Wherefore the ventricles of the braine, the paſſages of the lungs and the ſleepie Arteries being ſtopped, the vitall ſpirit was prohibited from entring into the braine, and conſequently the animall ſpirit retained and kept in, ſo that it could not come or diſperſe its ſelfe through the whole body, whence happened the defect of two of the faculties neceſſary for life.

Of the ſignes of virginitie.

It many times happeneth and is a queſtion too frequently handled concerning womens maidenheads; whereof the judgement is very difficult. Yet ſome ancient women and Midwives will bragge that they aſſuredly know it by certaine and infallible ſignes. For (ſay they) in ſuch as are virgins there is a certaine membrane or parchment-like skin in the necke of the womb, which will hinder the thruſting in of the finger if it be put in any thing deepe, which membraine is broken when firſt they have carnall copulation, as may afterwards be perceived by the free entrance of the finger. Beſides, ſuch as are defloured have the necke of their womb more large and wide; as on the contrary, it is more contracted, ſtraite and narrow in virgins. But how deceitfull and untrue theſe ſignes and tokens are, ſhall appeare by that which followeth; for this membraine is a thing preternaturall, and which is ſcarce found to be in one of a thouſand from the firſt conformation. Now the necke of the womb will be more open or ſtraite according to the bigneſſe and age of the party. For all the parts of the body have a certaine mutuall proportion and commenſuration in a well made body.

Lib. de error. popul.

Ioubertus hath written, that at *Lectoure* in *Gaſconye*, a woman was delivered of a child in the ninth yeare of her age, and that ſhe is yet alive and called *Ioane du Perie* being wife to *Videau Beche* the receiver of the amercements of the King of *Navare*: which is a moſt evident argument, that there are ſome women more able to accompany with a man at nine yeares old, than many other at fifteene, by reaſon of the ample capacity of their wombe and the necke thereof; Beſides alſo, this paſſage is enlarged in many by ſome accident, as by thruſting their owne fingers more ſtrongly thereinto by reaſon of ſome itching, or by the putting up of a Nodule, or Peſſarie of the bigneſſe of a mans yard, for to bring downe the courſes. Neither to have milke in their breaſts is any certaine ſigne of loſt virginity; For *Hippocrates* thus writes; But if a woman which is neyther with child, nor hath had one, have milke in her breaſts, then her courſes have failed her.

Aph. 39. ſect. 5.

Lib. 4. de hiſt. animal. cap. 20.

Moreover, *Ariſtotle* reports that there be men who have ſuch plenty of milke in their breaſts, that it may be ſucked or milked out.

Lib. 12. de ſubtilit.

Cardan writes, that he ſaw at *Venice* one *Antony Buſſey* ſome 30. yeares old, who had milke in his breaſts in ſuch plenty, as ſufficed to ſuckle a child, ſo that it did not onely drop, but ſpring out with violence like a womans milke. Wherefore let Magiſtrates beware leaſt thus admoniſhed, they too raſhly aſſent to the reports of women. Let Phyſitions and Chirurgions have a care leaſt they doe too impudently bring magiſtrates into an errour, which will not redound ſo much to the judges diſgrace, as to theirs.

But if any deſire to know, whether one be poyſoned, let him ſearch for the Symptomes and ſignes in the foregoing and particular treatiſe of poyſons. But that this doctrine of making Reports may be the eaſier, I thinke it fit, to give preſidents, in imitation whereof the young Chirurgion may frame others. The firſt preſident ſhall be of death to enſue; a ſecond of a doubfull judgement of life and death; the third of an impotency of a member; the fourth of the hurting of many members.

A certificate of death.

I *A. P.* Chirurgion of *Paris*, this twentieth day of May by the command of the Counſell, entred into the houſe of *Iohn Broſſey*, whom I found lying in bed, wounded on his head, with a wound in his left temple, piercing the bone with a fracture and effracture, or depreſſion of the broken bone, ſcailes and *meninges* into the ſubſtance of the braine, by meanes whereof, his pulſe was weake, he was troubled with raving, convulſion, cold ſweate, and his appetite was dejected. Whereby may bee gathered that certaine and ſpeedy death is at hand. In witneſſe whereof I have ſigned this Report with my owne hand.

Another in a doubtfull caſe.

By the Coroners command I have viſited *Peter Lucey*, whom I found ſicke in bed, being wounded with a Halbard on his right thigh. Now the wound is of the bredth of three fingers, and ſo deepe that it pierces quite through his thigh with the cutting alſo of a veine and Artery, whence enſued much effuſion of blood, which hath exceedingly weakned him, and cauſed him to ſwound often; now all his thigh is wollne, livide, and gives occaſion to feare worſe ſymptomes, which is the cauſe that the health and ſafety of the party is to be doubted of.

In the loſſe of a member.

By the Iuſtices command I entred into the houſe of *Iames Bertey*, to viſite his owne brother; I found him wounded in his right harme, with a wound of ſome foure fingers bigneſſe, with the cutting of the tendons bending the legge, and of the Veines, Arteries, and Nerves. Wherefore I affirme that he is in danger of his life, by reaſon of the maligne ſymptomes that uſually happen upon ſuch wonnds, ſuch as are great paine, a feaver, inflammation, abſceſſe, convulſion, gangreene and the like. Wherefore he ſtands in neede of provident and carefull dreſſing, by benefit wherof if he eſcape death, without doubt he will continue lame, during the remainder of his life, by reaſon of the impotency of the wounded part. And this I affirme under my hand.

Another in the hurts of divers parts.

We the Chirurgions of *Paris*, by the command of the Senate, this twentieth day of March, have viſited Maſter *Lewis Vertoman*, whom wee found hurt with five wounds. The firſt inflicted on his head, in the middle of his forehead bone, to the bigneſſe of three fingers, and it penetrates even to the ſecond table, ſo that we were forced to plucke away three ſplinters of the ſame bone. The other was atwhart his right cheeke, and reacheth from his eare, to the midſt of his noſe, wherefore wee ſtitched it with foure ſtitches. The third is on the midſt of his belly, of the bigneſſe of two fingers, but ſo deepe that it aſcends into the capacity of the belly, ſo that we were forced to cut away portion of the Kall, comming out thereat, to the bigneſſe of a wallnut, becauſe having loſt its naturall colour, it grew blacke and putrified. The fourth was upon the backe of his left hand, the bigneſſe almoſt of foure fingers, with the cutting of the Veines, Arteries Nerves and part of the bones of that part; whence it is, that he will be lame of that hand, howſoever carefully and diligently healed.

Now becauſe by hurting the ſpinall marrow, men become lame, ſometimes of a legge; it is fit you know that the ſpinall marrow deſcends from the braine like a rivelet for the diſtribution of the Nerves, who might diſtribute ſenſe and motion to all the parts under the head; wherefore if by hurting the ſpinall marrow, the patients armes or hands are reſolved or numme, or wholy without ſenſe, it is a ſigne theſe Nerves are hurt which come forth of the fifth, ſixth, ſeaventh *vertebræ* of the necke. But if the ſame accidents happen to the thigh, legge or foote with refrigeration, ſo that the excrements flow unvoluntarily, without the patients knowledge, or elſe are totally ſuppreſt, it is a ſigne that the ſinewes which proceed from the *vertebræ* of the loynes and holy-bone are hurt or in fault; ſo that the animall faculty beſtowing ſenſe and motion upon the whole body, and the benefit of opening and ſhutting to the ſphincter muſcle of the bladder and fundament, cannot ſhew its ſelf in theſe parts, by which meanes ſuddaine death happens, eſpecially if there be difficulty of breathing therewith.

A caution in making report of a woman with child being killed.

Being to make report of a child killed with the mother, have a care that you make a diſcreete report, whether the childe were perfect in all the parts and members thereof, that the judge may equally puniſh the author thereof. For he meriteth farre greater puniſhment, who hath killed a child perfectly ſhaped and made in all the members; that is, he which hath killed a live childe, than he which hath killed an *Embryon*, that is, a certaine concretion of the ſpermaticke body. For *Moſes* puniſheth the former with death, as that he ſhould give life for life, but the other with a pecuniary mulcte. But I judge it fit to exemplifie this report by a preſident.

I *A. P.* by the Iudges command viſited Miſtris *Margaret Vlmary*, whom I found ſicke in bed, having a ſtrong feaver upon her, with a convulſion and effluxe of blood out of her wombe, by reaſon of a wound in her lower belly, below her navill on the right ſide, penetrating into the capacity of her belly, and the wombe therein; whence it hath come to paſſe, that ſhe was delivered before her time, of a male childe, perfect in all his members but dead, being killed by the ſame wound piercing through his ſcull, into the marrow of the braine. Which in a ſhort time will be the death of the mother alſo. In teſtimony whereof I have put my hand and ſeale.

The manner how to Embalme the dead.

I Had determined to finiſh this my tedious worke with the precedent treatiſe of Reports; but a better thought came in my head, which was, to bring man whoſe cure I had undertaken, from his infancie, to his end, and even to his grave, ſo that nothing might be heere defective which the Chirurgion might by his profeſſion, performe about mans body either alive, or dead. Verily there hath ſcarſe ever beene a nation ſo barbarous, which hath not onely beene carefull for the buriall, but alſo for the Embalming or preſerving of their dead bodyes. For the very *Scythians*, who have ſeemed to exceede other nations in barbarouſneſſe, and inhumanity, have done this; for (according to *Herodotus*) the *Scythians* bury not the corpes of their King, before that being embowelled and ſtuffed full of beaten Cypreſſe, frankincenſe, the ſeedes of Perſly, and Anniſe, hee be alſo wrapped in cearcloathes. The like care hath alſo poſſeſſed the mindes of the *Ethiopians*; for having disburdened the corpes of their friends, of their entrails and fleſh, they plaiſtered them over, and then having thus rough caſt them, they painted them with colours ſo to expreſſe the dead to the life; they incloſed them thus adorned in a hollow pillar of glaſſe, that thus incloſed they might be ſeene and yet not anoy the ſpectators with their ſmell. Then were they kept the ſpace of a yeere, in the hands of their next kindred; who during this ſpace offered and ſacrifized to them. The yeare ended, they carryed them forth of the Citty and placed them about the walls each in his proper vault, as *Herodotus* affirmes. But this pious care of the dead, did farre otherwiſe affect the *Ægyptians*, than it did other nations. For they were ſo ſtudious to preſerve the memory of their anceſtors, that they embalmed their whole body with aromaticke oyntments, and ſet them in tranſlucent Vrnes, or glaſſe Cells in the more eminent and honoured part of their houſes, that ſo they might have them dayly in their ſight, and might be as monuments, and inciters to ſtirre them up to imitate their fathers and Grandſires vertues. Beſides alſo the bodyes thus embalmed with aromatick & balſamick oyntments were in ſteed of a moſt ſure pawn, ſo that if any *Ægyptian* had neede of a great ſum of money, they might eaſily procure it, of ſuch as knew them & their neighbours, by pawning the bodye of ſome of their dead parents. For by this meanes the creditour was certaine, that he which pawned it would ſooner looſe his life, than break his promiſe: But if all things ſo unhappily ſucceeded with any, ſo that through poverty he could not fetch home his pawne againe, but was forced to forgoe it, he was ſo infamous amongſt all men, during the reſt of his life, as one baniſhed, or forlorne; and looſing his freedome he ſhall become a ſervant, yea ſcorned and reviled of all men, he ſhould be accounted unworthy to enjoy the light and ſociety of men. And certainely the *Ægyptians* underſtanding the life, which we heere lead, to be of ſhort continuance, compariſon being made with that which wee are to live after

The care of the *Scythians* in the Embalming their dead.

The like care of the *Ethiopians*.

Lib. 3.

Of the *Egyptians*.

The reaſon of building the *Egyptian* Pyramides;

Lib. 2:

after the ſeparation of the ſoule from the body, they were more negligent in building their houſes they dwelt in, but in raring the pyramides which ſhould ſerve them in ſteed of ſepulchers, they were ſo beyond reaſon ſumptuous and magnificent, that for the building of one of theſe edifices ſo renowned over all the world, which King *Cheopes* begun, a hundred thouſand men were every 3 moneths, for twenty yeeres ſpace there kept at worke: it was five furlongs, and being ſquare, each ſide was 800. foot long, and ſo much in height. Almoſt all the peeces of marble went to the building thereof, were thirty foote long, engraven and carved with various workemanſhip, as *Herodotus* reports. But before the bodyes were committed to theſe magnificent Sepulchers, they were carryed to the Salters and Embalmers, who for that purpoſe had allowance out of the publicke ſtocke. Theſe beſmeared them with Aromaticke, and balſamicke oyntments, and ſowed up the inciſions they made, then ſtrewed them over with ſalt, and then covered them with brine, for 70. dayes; which being expired, they waſhed them, being taken thence, and all the filth being taken off, they wrapped them in Cotton cloathes, glewed together with a certaine gumme; then their kinſemen placed them thus ordered in a wooden Coffinne carved like to a man. This was the ſacred and accuſtomed rite of embalming and burying dead bodyes amongſt the *Ægyptians* which were of the richer ſort. Our Countriemen the *French* ſtirred up with the like deſire, embalme the bodyes of their Kings and Nobles, with ſpices and ſweete oyntments. Which cuſtome they may ſeeme piouſly and chriſtianly to have taken from the Old and New Teſtament, and the ancient and laudible cuſtome of the Iewes; for you may reade in the New Teſtament that *Ioſeph* bought a fine linnen cloath, and *Nicodemus* brought a mixture of myrrhe and Aloes about 100. pound weight, that they might embalme and bury the body of *Ieſus Chriſt* our Saviour, for a ſigne and argument of the renovation and future integrity which they hoped for by the reſurrection of the dead. Which thing the Iewes had received by tradition from their anceſtors. For *Ioſeph* in the old Teſtament commaunded his Phyſitions, they ſhould embalme the dead body of his father with ſpices.

Iohn 19, 39:

Gen 50, 2.

The manner of embalming for the long continuance.

But the body which is to be embalmed with ſpices for very long continuance, muſt firſt of all be embowelled, keeping the heart apart, that it may bee embalmed and kept as the kinsfolkes ſhall thinke fit. Alſo the braine, the ſcull being divided with a ſaw, ſhall be taken out. Then ſhall you make deepe inciſions alongſt the armes, thighes, legges, backe, loynes and buttockes, eſpecially where the greater Veines and Arteries runne, firſt that by this meanes the blood may be preſſed forth, which otherwiſe would putrifie and give occaſion and beginning to putrefaction to the reſt of the body; and then that there may be ſpace to put in the aromaticke powders; the whole body ſhall be waſhed over with a ſpunge dipped in *Aqua vitæ*, and ſtrong vinegar, wherein ſhall be boyled wormewood, aloes, coloquintida, common ſalt and Alume. Then theſe inciſions, and all the paſſages and open places of the body, and the three bellyes ſhall be ſtuffed with the following ſpices groſſely powdered. ℞. *pul. roſar. chamæm. melil. balſami, menthæ, anethi, ſalviæ, lavend. roriſmar. majoran. thymi, abſinthij, cyperi, calami aromat. gentianæ, ireos florent. aſſæ odoratæ, caryophyll. nucis moſchat. cinamoni, ſtyracis, calamitæ. benjoini, myrrhæ, aloes, ſantal. omnium quod ſufficit.* Let the inciſions be ſowed up and the open ſpaces that nothing fall out; then forthwith let the whole body be anointed with Turpentine diſſolved with oyle of roſes and Chamomile, adding if you ſhall thinke it fit, ſome Chymicall oyles of ſpices, and then let it be againe ſtrewed over with the forementioned powder; then wrap it in a linnen cloath, and then in ceare-cloathes.

How to embalme bodyes when as we want ſpices.

Laſtly, let it be put in a Coffin of Lead, ſure ſoudred and filled up with dry ſweete hearbes. But if there be no plenty of the forementioned ſpices, as it uſuall happens in beſeiged townes, the Chirurgion ſhall be contented with the powder of quenched lime, common aſhes made of Oake wood.

Why the bodyes of our Princes, how well ſoever embalmed, corrupt in a few dayes.

For thus the body being over and above waſhed in ſtrong vinegar, or Lie, ſhall be kept a long time, if ſo be that a great and diſſolving heate doe not beare ſway, or if it be not put in a hot and moyſt place. And this condition of time and place is the cauſe why the dead bodyes of Princes and Kings, though embalmed with Art and coſt, within the ſpace of ſixe or ſeaven dayes, in which they are kept to bee ſhewed to the people after their embalming, doe caſt forth ſo greevous a ſent, that none can endure it; ſo that they are forced to be put in a leaden Coffinne. For the ayre which encompaſſeth them groweth ſo hot by reaſon of the multitude of people flowing to the ſpectacle, and the burning of lights night and day, that the ſmall portion of the native heate which remaineth being diſſipated, they eaſily putrefie, eſpecially when as they are not firſt moyſtened & macerated in the liquor of aromaticke things, as the *Ægyptians* anciently uſed to doe, ſteeping them in brine for 70 dayes, as I formerly told you out of *Herodotus*. I put in minde hereby, uſe, that ſo the embalming may become the more dureable, to ſteepe the bodyes (being embowelled, and pricked all over with ſharpe bodkinnes, that ſo the liquor hindring putrefaction may penetrate the deeper into them) in a wooden tubbe filled with ſtrong vinegar of the decoction of aromaticke and bitter things, as Aloes, Rue, Wormewood, and Coloquintida; and there keepe them for twenty dayes, pouring thereinto eleven or twelve pints of *Aqua vitæ*. Then taking it forth, and ſetting it on the feete, I keepe it in a cleare and dry place. I have at home the body of one that was hanged, which I begged of the Shriffe, embalmed after this manner, which remaines ſound for more than 25 yeeres, ſo that you may tell all the muſcles of the right ſide (which I have cut up even to their heads, and plucked them from thoſe that are next them for diſtinctions ſake, that ſo I may view them with my eyes, and handle them with my hands as often as I pleaſe, that by renuing my memory I may worke more certainely and ſurely, when as I have any more curious operation to be performed) the left ſide remaines whole, and the Lungs, Heart, *Diaphragma*, ſtomacke, ſpleene, kidneyes, beard, haires, yea and the nailes, which being pared, I have often obſerved to grow againe to their former bigneſſe.

And let this be the bound of this our immenſe labour, and by Gods favour our reſt; to whom Almighty, all-powerfull, immortall and inviſible, be aſcribed all honour and glory for ever, and ever, *Amen*.

Labor improbus omnia vincit.

The end of the Treatiſe of reports, and embalming the dead.

THE APOLOGIE AND TREATISE, CONTAINING THE VOYAGES MADE INTO DIVERS PLACES.

BY

Ambroſe Pare of *Laval* in *Maine*, Counſellor and cheefe Chirurgion to the King.

The Twentininth Booke.

Of what the Adverſary accuſeth the Author.

TRuely I had not put my hand to the penne, to write on ſuch a thing, were it not that ſome have impudently injured, taxed, and more through particular hatred, diſgraced me, than for zeale or love they beare to the publicke good; which was, concerning my manner of tying the Veines and Arteries, writing thus as followeth.

The words of the Adverſary.

Male igitur & nimium arroganter inconſultus & temerarius quidam, vaſorum uſtionem poſt emortui membri reſectionem a veteribus omnibus plurimum commendatam & ſemper probatam damnare auſus eſt, novum quendam deligandi vaſa modum, contra veteres omnes medicos ſine ratione, experientia & judicio docere cupiens, nec animadvertit majora multo pericula ex ipſa vaſorum deligatione quam acu partem ſanam profunde tranſfigendo adminiſtrari vult, imminere quàm ex ipſa uſtione. Nam ſi acu nervoſam aliquam partem, vel nervum ipſum pupugerit, dum ita novo & inuſitato modo venam abſurde conatur conſtringere, nova inflammatio neceſſario conſequetur, a qua Convulſio & a convulſione cita mors. Quorum ſymptomatum metu Galenus non ante tranſverſa vulnera ſuere audebat (quod tamen minus erat periculoſum) quàm muſculorum apoueuroſes denudaſſet. Adde quòd forcipes quibus poſt ſectionem iterum carnem dilacerat, cum retracta verſus originem vaſa ſe poſſe extrahere ſomniat, non minorem adferant dolorem quàm ignita ferramenta admota. Quod ſi quis laniatum expertus incolumis evaſerit, is Deo optimo maximo cuius Beneficentia crudelitate iſta & carniſicina liberatus eſt, maximas gratias habere & ſemper agere debet; which is thus: Ill then, and too arrogantly a certaine indiſcreet and raſh perſon would blame and condemne the cauterizing of veſſels after the amputation of a rotten and corrupted member, much praiſed and commended and alwayes approved by the Ancients; deſiring to ſhew and teach us without reaſon, judgement, and experience, a new way to tye the veſſels, againſt the opinion of the Ancient Phyſitions, taking no heede, nor being well adviſed, that there happens farre greater perills, and accidents, through this new way of tying

tying the veſſells (which he will have to be made with a needle, piercing deepely the ſound part) than by the burning and uſtion of the ſayd veſſells; for if the needle ſhall pricke any nervous part, yea the nerve it ſelſe, when he ſhall by this new and unaccuſtomed way abſurdly conſtraine the veine by binding it, there muſt neceſſarily follow a new inflammation; from an inflammation a convulſion, from a convulſion death: for feare of which accidents, **Galen** never durſt ſtitch tranſverſall wounds, (which notwithſtanding were leſſe dangerous) before he had diſcovered the Aponeuroſes of the muſcles. Moreover the pincers with which after the ſection, the fleſh is againe dilacerated, while he thinkes to draw the veſſells out which are drawne in toward their originall, bring no leſſe paine than the cautering irons doe. And if any one having experimented this new manner of cruelty have eſcaped danger, he ought to render thankes to almighty God for ever, through whoſe goodneſſe he hath beene freed from ſuch tyrannie, feeling rather his executioner than his methodicall Chirurgion.

The Authors anſwere.

O what ſweete words are heere for one, who is ſayd to be a wiſe and learned Doctor? he remembers not that his white beard admoniſheth him, not to ſpeake any thing unworthy of his age, and that he ought to put off and drive out of him all envie and rancor conceived againſt his neighbour. So now I will proove by authority, reaſon and experience, that the ſayd Veines and Arteryes ought to be tyed.

Autherities.

In the booke of Fiſtulaes of the fundament in the 3 chap. 5. booke 4. leafe.

AS for Authorities, I will come to that of that worthy man *Hippocrates*, who wils and commands the cure of Fiſtula's in the fundament by ligature, as well to conſume the calloſity, as to avoyd hemorragie.

2. Treatiſe chap. 17.

Galen in his method, ſpeaking of a fluxe of blood made by an outward cauſe, of whom ſee heere the words, It is (ſaith he) moſt ſure to tye the roote of the veſſell, which I underſtand to be that which is moſt neere to the Liver, or the heart.

Treatiſe 3. doct. 1. chap. 3

Avicen commands to tye the veine and the Arterie, after it is diſcovered, towards his originall.

Guido of *Cauliac*, ſpeaking of the wounds of the Veines and Arteries, injoyneth the Chirurgion to make the ligature in the veſſell.

In the 3 book chap. 4. of the matter of Chirurgery.

Maſter *Hollier* ſpeaking of a fluxe of blood, commands expreſſely, to tye the veſſells.

Wounds chap. 12.

Calmetheus in the chapter of the wounds in the Veines and Arteries, tells a moſt ſure way to ſtay a fluxe of blood, by ligature of the veſſell.

In the 26 chap. of the 5 book.

Celſus from whom the ſayd Phyſition hath ſnatched the moſt part of his booke, chargeth expreſſely, to tye the veſſells in a fluxe of blood happening to wounds, as a remedy moſt eaſie and moſt ſure.

In the 4. ch. of the 3 booke.

Veſalius in his Chirurgery, willeth that the veſſells be tyed in a fluxe of blood.

In the book 1 treatiſe.

Iohn de Vigo treating of a hemorragie in bleeding wounds, commands to tye the Veine, and the Artery.

In the 12. chap. of the 2. booke.

Tagaultius treating of the meanes to ſtay a fluxe of blood, commands to pinch the Veine or Artery with a Crow or Parrots bill, then to tye it with a very ſtrong thred.

In the 4. treat. 11 chap. 1. booke.

Peter of *Argillata* of *Bullongne*, diſcourſing of a fluxe of blood, and the meanes to ſtoppe it, giveth a fourth way expreſſely, which is made by ligature of the veſſells.

In the firſt booke 1 ſection 3. chap. 16. page 5 upon the 38. ch. of the booke of *Paul*.

Iohn Andreas a Cruce, a *Venetian*, makes mention of a method, to ſtay a fluxe of blood by the ligature of the veſſells.

D'Alechamp commands to tye the Veines, and Arteries.

See then (my little good man) the authorities which command you to tye the veſſells. As for the reaſons, I will debate of them.

In the book 2. ch. of Angealogie, leafe 76. In the booke 1 ch. of ſtiches.

The hemorragie (ſay you) is not ſo much to be feared in the ſection of the Call, as that of the Varices, and the inciſion of the temporall Arteries, as after the amputation of a member. Now you your ſelfe command, that in cutting the Varices, the fluxe of blood be ſtopped by the ligature of the veſſells. You command the ſame, ſpeaking of the ſtitch, with the amputation and ſection of the Call, changed by the outward ayre, ſee heere your owne words: After that muſt bee conſidered concerning the Call: for if there be any part corrupted, putrified, withered, or blackiſh; Firſt having tyed, for feare of a fluxe of blood, you doe not bid afterward to have it cauterized; but to ſay the truth, you have your eyes ſhut, and all your ſenſes dulled, when you would ſpeake againſt ſo ſure a method, and that it is not but through anger, and an ill will. For there is nothing which hath more power to drive reaſon from her ſeate, than choler and anger. Moreover when one comes to cauterize the diſmembred parts, oftentimes when the eſcar comes to fall off, there happens a new flux of blood: As I have ſeene divers times, not having yet beene inſpired by God, with ſo ſure a meanes then, when I uſed the heate of fire. Which if you have not found, or underſtood this method in the bookes of the Ancients, you ought not thus to tread it under your feete, and ſpeake unluckely of one who all his life hath preferred the profit of the Common-wealth before his owne particular. Is it not more than reaſonable to bee founded upon the ſaying of *Hippocrates*; upon whoſe authority you ſerve your ſelfe, which is thus? That what the medicament cureth not, the iron doth, and what the iron doth not amend, the fire exterminateth. It is a thing which ſavours not of a Chriſtian, to fall to burning at the firſt daſh without ſtaying for any more gentle remedies. As you your ſelfe write, ſpeaking of the conditions required in a Chirurgion to cure well; which paſſage you borrow from ſome other place: for that which may bee done gently without fire, is much more commended than otherwiſe. Is it not a thing which all ſchooles hold as a Maxime, that we muſt alwaies begin with moſt eaſie remedies, which if they be not ſufficient, we muſt then come to extreame, following the doctrine of *Hippocrates*? *Galen* commands in the place before alledged, to treate or dreſſe the diſeaſed quickly, ſafely, and with the leaſt of paine that is poſſible.

In the chapter of burning, 2 booke leafe 206.

In the firſt booke leafe the 5.

Galen in 4. booke of the *Meth.* and in the booke of Art of *Hippocrates Apho.* the 6. booke 1. In the booke of *arte parva.*

Let us come now to Reaſon.

Now ſo it is, that one cannot apply hot irons but with extreame and vehement paine in a ſenſible part, void of a Gangreene, which would be cauſe of a Convulſion, Feaver, yea oft times of death. Moreover, it would bee a long while afterwards before the poore patients were cured, becauſe that by the action of the fire there is made an eſchar, which proceeds from the ſubject fleſh, which being fallen, nature muſt regenerate a new fleſh in ſtead of that which hath beene burned, as alſo the bone remaines diſcovered and bare; and by this meanes, for the moſt part there remaines an Vlcer incurable. Moreover there is yet another accident. It happeneth that oftentimes the cruſt being fallen off, the fleſh not being well renewed, the blood iſſueth out as much as it did before. But when they ſhall be tyed, the ligature falls not off untill firſt the fleſh have very well covered them againe: which is prooved by *Galen*, ſaying, that eſcharoticke medicines which cauſe a cruſt or eſchar, whenſoever they fall off, leave the part more bare than the naturall habit requires. For the generation of a cruſt proceeds from the parts ſubject, and which are ſcituate round about it, being alſo burned, as I may ſay: wherefore by how much the part is burnt, by ſo much it looſeth the naturall heate. Then tell me when it is neceſſary to uſe eſcharoticke medicines, or cautering irons? Tis when the flux of blood is cauſed by eroſion, or ſome Gangreene or putrifaction. Now is it thus? In freſh bleeding wounds there is neither Gangreene nor putrifaction. Therefore, the cauteries ought not to be there applyed. And when the Ancients commanded to apply hot irons to the mouthes of the veſſells, it hath not beene onely to ſtay the flux of blood, but cheefely to correct the malignitie, or gangreenous putrifaction which might ſpoile the neighbouring parts. And it muſt be here noted, that if I had knowne ſuch accidents to happen, which you have declared in your booke, in drawing and tying the veſſells, I had never beene twice deceived; nor would I ever have left by my writings to poſteritie, ſuch a way of ſtopping a flux of blood: But I writ it after I had ſeene it done and did it very often, with happy ſucceſſe. See then what may happen through your inconſiderate counſell, without

Of what the eſchar is made.

In the 5 book of his *Meth.*

Words of the adverſary.

Propoſition of the Adverſary.

In the 5, booke ch. 26, and in the 7 booke ch. 33.

In the ch. of cutting booke the 2.

out examining, or ſtanding upon the facility of tying the ſayd veſſells. For ſee, heere's your ſcope and propoſition, to tye the veſſells after amputation is a new remedy, ſay you; then it muſt not be uſed, it is an ill argument for a Doctor.

But as for that (ſay you) one muſt uſe fire after the amputation of members, to conſume, and drie the putrifaction, which is a common thing in Gangreenes, and mortifications, that indeed hath no place here, becauſe the practiſe is to amputate the part above that which is mortified, and corrupted; as *Celſus* writes and commands, to make the amputation upon the ſound part, rather than to leave any whit of the corrupted. I would willingly aske you, if when a veine is cut tranſverſe, and that it is very much retracted towards the originall, whether you would make no conſcience to burne till that you had found the orifice of the veine, or artery; and if it be not more eaſie onely with a Crow bill to pinch and draw the veſſell, and ſo tie it? In which you may openly ſhew your ignorance, and that you have your minde ſeiſed with much rancor and choler. We daily ſee the ligature of the veſſells practiſed with happy ſucceſſe after the amputation of a part, which I will now verifie by experiences and hiſtories, of thoſe to whom the ſaid ligature hath beene made, and perſons yet living.

Experiences.

A notable hiſtory.

The operation of *Charbonell*.

In the 7, ſentence of the booke of Ulcers.

THe 16. day of *Iune* 1582. in the preſence of Maſter *Iohn Liebaud* doctor in the faculty of Phyſicke at *Paris*, *Claud Viard* ſworne Chirurgion, Maſter *Mathurin Huron*, Chirurgion of Monſieur *de Souvray*, and I, *Iohn Charbonell* maſter Barber Chirurgion of *Paris*, well underſtanding the *Theoricke*, and *Practicke* of Chirurgery, did with good dexterity amputate the left legge of a woman tormented the ſpace of three yeares with extreame paine, by reaſon of a great *Caries* which was in the bone *Aſtragal*, *Cyboides*, great and little *focile*, and through all the nervous parts, through which ſhe felt extreame and intollerable paines night and day: ſhe is called *Mary* of *Hoſtel*, aged 28 yeares, or thereabouts, wife of *Peter Herve*, Eſquire of the Kitchin to the Lady *Ducheſſe* of *Vzez*, dwelling in the ſtreete of *Verbois* on the other ſide Saint *Martin* in the fields, dwelling at the ſigne of the Saint *Iohns* head; where the ſayd *Charbonell* cut off the ſayd legge, the breadth of foure large fingers below the Knee, and after that he had inciſed the fleſh, and ſawed the bone, hee griped the Veine with the Crow bill, then the Artery, then tyed them; from whence I proteſt to God (which the company that were there, can witneſſe) that in all the operation which was ſodainely done, there was not ſpilt one porrenger of blood; and I bid the ſayd *Charbonell* to let it bleed more, following the precept of *Hippocrates*, that it is good in all wounds and alſo in inveterate ulcers, ſo let the blood runne; by this meanes, the part is leſſe ſubject to inflammation. The ſayd *Charbonell* continued the dreſſing of her, who was cured in two moneths, without any fluxe of blood happening unto her, or other ill accident; and ſhe went to ſee you at your lodging being perfectly cured.

Another hiſtory.

Operation done by Viard.

Another hiſtory of late memory, of a ſinging man of our Ladyes Church named maſter *Colt*, who broke both the bones of his legge which were cruſht in divers peeces, inſomuch that there was no hope of cure: to withſtand a gangreene and mortification, and by conſequence death. Monſieur *Helin* Doctor, Regent in the faculty of Phyſicke, a man of honour and of good knowledge, *Claud Viard*, and *Simon Peter*, ſworne Chirurgions of *Paris*, men well exerciſed in Chirurgery; and *Balthazar* of *Leſtre*, and *Leonard de Leſchenal*, Maſter Barber Chirurgions, well experimented in the operations of Chirurgery, were all of opinion to withſtand the accidents aforeſayd, to make entire amputation of the whole legge, a little above the broken & ſhivered bones & the torne nerves, veines, arteries; the operation was nimbly done, by the ſayd *Viard*, and the blood ſtancht by the ligature of the veſſells in the preſence of the ſayd *Helin*, and maſter *Tonſard* great Vicar of our Ladyes Church, and was continually dreſt by the ſayd *Leſchenal*, and I went to ſee him other whiles; he was happily cured without the application of hot irons, and walketh luſtily on a woodden legge.

Another Hiſtory.

IN the yeare 1583. the 10. day of *December*, *Touſſaim Poſſon* borne at *Ronieville*, at this preſent dwelling at *Beauvais* neare *Dourdan*, having his Legge all ulcered, and all the bones cariez'd and rotten, prayed me for the honor of God to cut off his Legge by reaſon of the great paine which he could no longer endure. After his body was prepared I cauſed his legge to be cut off, fowre fingers below the *rotula* of the knee, by *Daniel Powlet* one of my ſervants, to teach him and to imbolden him in ſuch workes; and there he readily tyed the veſſells to ſtay the bleeding, without application of hot irons, in the preſence of *Iames Guillemeau* ordinary Chirurgion to the King, and *Iohn Charbonell* maſter Barber Chirurgion of *Paris*: and during the cure was viſited by Maſter *Laffile* and Maſter *Courtin* Doctors, Regents in the facultie of Medicine at *Paris*. The ſaid operation was made in the houſe of *Iohn Gobell* Inkeeper, dwelling at the ſigne of the white horſe in the Greve. I will not here forget to ſay, that the Lady Princeſſe of *Montpenſier*, knowing that he was poore, and in my hands, gave him money to pay for his chamber and diet. He was well cured, God be prayſed, and is returned home to his houſe with a woodden Leg.

Another Hiſtory.

Gangreene happening by an antecedens cauſe.

A Gangreene happened to halfe of the Legge to one named *Nicholas Meſnager* aged threeſcore and ſixteene yeares, dwelling in S. *Honores* ſtreet, at the ſigne of the Basket; which happened to him through an inward cauſe, ſo that wee were conſtrained to cut off his Legge to ſave his life: and it was taken; off by *Anthony Renaud*, maſter Barber Chirurgion of *Paris* the 16. day of *December* 1583. in the preſence of Maſter *Le Fort*, and Maſter *La Noüe* ſworne Chirurgions of *Paris*; and the blood was ſtanched by the Ligature of the veſſells, and hee is at this preſent cured and in health, walking with a woodden Leg.

Another Hiſtory.

A Waterman at the Port of *Neſle*, dwelling neare *Monſieur de Mas*, Poſtmaſter, named *Iohn Bouſſereau*, in whoſe hands a Musket brake aſunder, which broke the bones of his head, and rent and tore the other parts in ſuch ſort that it was needfull and neceſſary to make amputation of the hand two fingers above the wriſt: which was done by *Iames Guillemeau* then Chirurgion in ordinary to the king, who dwelt at that time with me. The operation likewiſe being redily done, and the blood ſtancht by the Ligature of the veſſells without burning irons: hee is at this preſent living.

Operation done *Guillemeau.*

Another Hiſtory.

A Merchant Grocer dwelling in St. *Denis* ſtreet at the ſigne of the great *Tournois* named the Iudge, who fell upon his head, where was made a wound neare the temporall muſcle, where he had an artery opened, from whence iſſued forth blood with great impetuoſity, in ſo much that common remedies would not ſerve the turne; I was called thither, where I found Maſter *Raſſe*, Maſter *Cointeret*, Maſter *Viard*, ſworne Chirurgions of *Paris*, to ſtay the blood; where preſently I tooke a needle and thread, and tyed the arterie, and it bled no more after that, and was quickly cured. Maſter *Rouſſelet* can witneſſe it, not long ſince Deacon of your Facultie, who was in the cure with us.

Operation done by the Author.

Another Hiſtory.

Another operation.

A Sergeant of the Chaſtlet dwelling neare S. *Andrew des Arts*, who had a ſtroake of a ſword upon the throate in the Clackes medow, which cut aſunder the jugular veine externe, as ſoone as he was hurt he put his handkercher upon the wound, and came to looke mee at my houſe, and when hee tooke away his handkercher the blood leaped out with great impetuoſity: I ſuddainly tyed the veine toward the roote; he by this meanes was ſtanched and cured thankes be to God. And if one had followed your manner of ſtanching blood by cauteries, I leave it to be ſuppoſed whether he had beene cured; I thinke hee had beene dead in the hands of the operator. If I would recite all thoſe whoſe veſſells were tyed to ſtay the blood which have beene cured, I ſhould not have ended this long time; ſo that me thinkes there are Hiſtories enough recited to make you beleeve the blood of veines and arteries is ſurely ſtanched without applying any actuall cauteries.

DU BARTUS.

He that doth ſtrive againſt experience,
Daignes not to talke of any learned ſcience.

Booke the 6. Chap. 4 and 5 booke 2. chap. 4. booke 3, ch. 9, ſection 7.

NOw my little Maſter, ſeeing that you reproach me, that I have not written all the operations of Chirurgery in my workes which the Ancients writ of, I ſhould be very ſorry for it: for then indeede might you juſtly call me *Carnifex*. I have left them becauſe they are too cruell, and am willing to follow the modernes, who have moderated ſuch cruelty: which notwithſtanding you have followed ſtep by ſtep, as appeareth by the operations here written, extracted from your booke, which you have drawne here and there from certaine ancient Authors, ſuch as follow: and ſuch as you have never practiſed nor ſeene.

The firſt operation.

In the 2. booke of the chap. of *Hypoſpatiſme*, booke 14, ch. laſt, of the Meth.
In the 4. chap. of the 16. booke of my worke.
Booke 6 chap. 7, Booke 2, chap. 5.

TO inveterate fluxions of the eyes, & Migrimes, *Paulus Ægineta* as alſo *Albucaſis* command to make *Arteriotomie*, ſee here the words of the ſame *Æginete*. You marke the Arteries which are behind the eares, then divide them in cutting to the very bone, and make a great inciſion the breadth of two fingers; which is the will alſo of *Aetius* that the inciſion be made tranverſe, cutting or inciſing the length of two fingers, even till that the Artery be found, as you command to bee done in your booke; but I holding the opinion of *Galen*, who commands to dreſſe the diſeaſed quickly, ſafely and with the leaſt paine that is poſſible, I teach the young Chirurgion the meanes to remedy ſuch evills in opening the Arteries behind the eares, and thoſe of the Temples, with one onely inciſion, as a letting blood, and not to make a great inciſion and cut out worke for a long time.

The ſecond operation.

In the 2, book chap. of *Periſcythiſme*.

TO fluxions which are made a long time upon the eyes, *Paul Æginete* and *Albucaſis* command to make inciſion which they call *Periſcythiſmos* or *Angiologie* of the Greekes; and ſee heere the words of *Paul*, In this operation firſt the head is ſhaved, then taking heede of touching the temporall muſcles, a tranſverſe inciſion muſt bee made, beginning at the left Temple and finiſhing at the right, which you have put in your booke word for word, without changing any thing: which ſheweth openly you are a right wound-maker; as may be ſeene in the Chapter which you call the Crowne cut, which is made halfe round under the Coronall ſuture from one temple to the another even to the bone. Now I doe not teach ſuch a cruell kind of remedy, but inſtruct the operator by reaſon, authority and notable proofe of a ſure and certaine way to remedy ſuch affections without butchering men in this kind.

In the 26. ch. of the 9. book of my workes.

The third.

Book 6. chap. 44. booke 2, chap. 3 booke 3. chap. 22.

IN the cure of the *Empyema*, *Paul Æginete*, *Albucaſis* and *Celſus* commanded to apply ſome 13. others 15. Cauteries to give iſſue to the matter contained in the breaſt, as the ſaid *Celſus* in the aforeſaid place appointeth for Aſthmatick people, which is a thing out of all reaſon (with reſpect to their honour be it ſpoken) that ſince the Chirurgions ſcope is to give iſſue to the matter therein contained, there is no other queſtion than to make apertion, to evacuate the matter in the moſt inferior part, I have ſhewed the young Chirurgion the meanes to doe it ſafely, without tormenting the patients for nothing.

The fourth.

IN Paps that are too great, **Paul Æginet** and **Albucraſis** commands to make a croſſe inciſion, to take out all the fat, and then joyne together the wound by ſtitch: In brieſe, it is to flea a man alive, which I have never practiſed, nor counſell it to bee done by the young Chirurgion.

Guido of Cauliac the 2, treatiſe. Doct. 1. chap. 1. Booke 7. chap 10. booke 6. chap 46, book 2, chap. 47.

The fifth.

ALbucraſis and **Paul Æginet** will cauterize the Liver and the Spleene with hot irons, which the modernes have never practiſed; for indeede reaſon is manifeſtly repugnant thereunto.

In the firſt booke, chap. 29, & 30. alſo in booke 2, chap. 32. Booke 6, chap. 47, and 48.

The Sixth.

IN the *Paracenteſis* which is made in the third kind of Dropſie called *Aſcites*, *Celius Aurelianus* commandeth divers apertions to be made in the belly. *Albucraſis* applies nine actuall cauteries, that is to ſay, foure about the Navell, one upon the Stomacke, one upon the Spleene, one upon the Liver, two behind the backe upon the ſpondills, one of them neare the breaſt, the laſt neare the Stomacke. *Ætius* is likewiſe of the ſame opinion, to open the belly with divers cauteries. **Paul Æginet** commands to apply five actual cauteries to make the ſaid *Paracenteſis*. But abhorring ſuch a kind of burning of which you ſpeake much in your third booke, I ſhew another kind of practiſe, the which is done in making a ſimple inciſion in the ſayd belly, as may be ſeene in my workes, with happy ſucceſſe. I doe not teach yong men in my workes the manner of burning, which the Ancients have called *inſibulare*, that is not in practiſe though *Celſus* writeth of it.

In the 5, book chap. 1, *De internis morbis*. Booke 1. chap. 33. book 3, ſect. 2, chap. 89. booke the 6, chap. 50. In the 3. book 12. chap. 6, 7.

The Seaventh.

IN the Sciaticke proceeding from an internall cauſe, and becauſe the viſcous humors diſplace the bones, **Paul** commands to burne or cauterize the ſaid joynt to the bone: *Diaſcorides* commands the ſame, Which I doe not finde expedient, taking indication from the ſubjacent parts: for there where one would burne, tis in the place of the foure twin muſcles, under which paſſeth the great Nerve deſcending from the holy bone; which being burnt, I leave it to your cenſure what might happen, as **Galen** remarketh ſpeaking of the *Vſtion* which muſt be made in the ſhoulder called *humerus*.

In the 7, book chap. 25. book 6, chap. 6 book 2, chap, 72, upon the ſentence 49, of the 1 ſection of the book of Arts.

The Eighth.

IN the outward Laxation of the Spondills, **Hippocrates** commands to bind the man right upon a Ladder, the Armes and Legges tyed and bound: then afterwards having raiſed the Ladder to the top of a tower, or the ridge of an houſe, with a great rope in a pully, then to let the patient fall plumbe downe upon the hard pavement; which **Hippocrates** ſayes was done in his time. But I doe not ſhew any ſuch way of giving the ſtrapado to men, but I ſhew the Chirurgion in my workes, the way to reduce them ſurely, and without great paine. Moreover I ſhould be ſorry to follow the ſaying of the ſayd **Hippocrates**, in the third booke *De morbis*, who commands in the diſeaſe called *Volvulus* to cauſe the belly to bee blowne with a paire of Bellowes, putting the noſell of them into the *inteſtinum rectum*, and then blow there till

Sentence the 22, and 23, of the 3 ſection of the booke of the joynts. chap. 16. of the 15. booke.

till the belly be much ſtretcht, afterwards to give an emollient gliſter, and to ſtop the fundament with a ſponge. Such practiſe as this is not made now a dayes, therefore wonder not if I have not ſpoken of it. And you not being contented to patch together the operations of the above ſaid Authors, you have alſo taken divers in my workes, as every man may know: which ſheweth manifeſtly that there is nothing of your owne in your Chirurgions Guide. I leave out divers other unprofitable operations which you quote in your booke, without knowing what beaſts they are, in never having ſeene them practiſed; but becauſe you have found them written in the bookes of the Ancients, you have put them into your booke.

Moreover you ſay that you will teach me my leſſon in the operations of Chirurgery, which I thinke you cannot doe: becauſe I have not onely learned them in my Study, and by the hearing for many yeares the leſſons of Doctors of Phyſicke: but as I have ſayd before in my Epiſtle to the Reader, I was reſident the ſpace of three yeares in the Hoſpitall of *Paris*, where I had the meanes to ſee and learne divers workes of Chirurgery, upon divers diſeaſes, together with the Anatomy, upon a great number of dead bodies, as oftentimes I have ſufficiently made triall publickly in the Phyſitions ſchoole at *Paris*, and my good lucke hath made mee ſeene much more. For being called to the ſervice of the Kings of France (foure of which I have ſerved) I have beene in company at Battells, Skirmiſhes, aſſaults, and beſeiging of Citties and Fortreſſes; as alſo I have beene ſhut up in Citties with thoſe that have beene beſeiged, having charge to dreſſe thoſe that were hurt. Alſo I have dwelt many yeares in this great and famous City of *Paris*, where, thankes bee to God, I have lived in very good reputation amongſt all men, and have not beene eſteemed the leaſt in rancke of men of my profeſſion, ſeeing there was not any cure, were it never ſo difficult and great, where my hand and my counſell have not beene required, as I make it appeare in this my worke. Now dare you (theſe things being underſtood) ſay you will teach mee to performe the workes of Chirurgery, ſince you never went further than your ſtudy? The operations of the ſame are foure in generall (as we have declared heretofore) where you make but three, that is to ſay, joyne that which is ſeparated, ſeparate that which was conjoyned, and to take away that which is ſuperfluous, and the fourth which I make, is as much neceſſary as induſtrious invention, to adde to Nature that which is wanting, as I have ſhewed heere above. Alſo it is your will that the Chirurgion make but the three operations above ſayd without medling to ordaine a ſimple Cataplaſme, ſaying it is that which comes to your part belonging to the Phyſition: And that the Ancients (in the diſcourſe which you have made to the Reader) have divided the practiſe of Phyſick into three kinds, that is to ſay, Diet, Medicine, and Chirurgery. But I would willingly demand of you, who hath made the partition, and where any thing ſhould be done, who are thoſe which are content with their part, without any enterprize upon the other? For *Hippocrates*, *Galen*, *Ætius*, *Avicen*, in briefe, all the Phiſitions, as well Greekes and Latins as Arabians, have never ſo treated of the one, that they have not treated of the other, for the great affinitie and tye that there is betweene them two, and it ſhould bee very difficult to doe otherwiſe. Now when you will vilifie Chirurgery ſo much, you ſpeake againſt your ſelfe, for in your Epiſtle which you have dedicated to Monſieur of *Martignes*, you ſay, that Chirurgery is the moſt noble part of Phyſicke, as well by reaſon of the originall; antiquity, neceſſity, as certainty in her actions; for ſhee workes *Luce aperta*, as learnedly writeth *Cellus* in the beginning of his ſeaventh booke; therefore it is to be beleeved you never went out of your ſtudy, but to teach the *Theorick* (if you have beene able to doe it.)

A faire ſimilitude.

The operations of Chirurgery are learn't by the eye, & by the touch. I will ſay that you much reſemble a young Lad of Low *Britany* of plump buttocks, where was ſtuffe ſufficient; who demanded leave of his father to come to *Paris*, to take *France*; being arrived the Organiſt of our Ladys Church, met with him at the Pallace gate, who took him to blow the Organs, where hee was remaining three yeeres: hee ſaw hee could ſomewhat ſpeake *French*, he returnes to his father, and told him that he ſpake good *French*, and moreover he knew well, to play on the Organs: his father received him very joyfully, for that hee was ſo wiſe and learned in ſo ſhort a time. Hee went to the Organiſt of their great Church, and prayed him to permit his ſonne to play on the Organs, to the end he might know whether his ſonne was become ſo skilfull a maſter, as he ſayd he was; which the Organiſt agreed to very willingly. Being entred to the Organs, he caſt himſelfe with a full leape to the bellowes, the maſter Organiſt bid him play, and that he would blow; then this good maſter anſweares, Let him play himſelfe on the Organs if he would for him, hee could doe nothing but play on the bellowes. I thinke alſo my little maſter, that you know nothing elſe, but to prattle in a chaire; but I will play upon the keyes, and make the Organs ſound (that is to ſay) I will doe the operations of Chirurgery, that which you cannot in any wiſe doe, becauſe you have not gone from your ſtudy or the ſchooles, as I have ſayd before. But alſo, as I have ſayd already in the Epiſtle to the Reader, that the labourer doth little profit by talking of the ſeaſons, diſcourſe of the manner of tilling the earth, to ſhew what ſeedes are proper to each ſoyle; all which is nothing if he put not his hand to the Plough, and couple the Oxen together. So likewiſe is it no great matter if you doe not know the *Practicke*, for a man may execute Chirurgery well, although he have no tongue at all. As *Cornelius Celſus* hath very well remarked in his firſt booke when he ſaith, *Morbos non eloquentia, ſed remedijs curari: quæ ſi quis elinguis, uſu diſcretus benenorit, hunc aliquanto majorem medicum futurum, quàm ſi ſine uſu linguam ſuam excoluerit*; that is to ſay; Diſeaſes are not to bee cured by eloquence, but by remedies well and duely applyed, which if any wiſe and diſcreete man though he have no tongue know well the uſe thereof, this man in time ſhall become the greater Phyſition, than if without practiſe his tongue were dipt with oratory; the which you your ſelfe confeſſe in your ſayd booke by a Tetraſticke which is thus:

To talke's not all in Chirurgions Art,
But working with the hands
Aptly to dreſſe each greeved part,
And guide, fire, knife, and bands.

Ariſtotle in the firſt booke of his Metaphyſicks the firſt chapter ſaith, Experience is almoſt like unto ſcience, and by the ſame, Art and ſcience have beene invented. And indeed we ſee theſe which are experimented, attaine ſooner to that which they intend, than thoſe which have reaſon and not experience, becauſe that the ſayd experience is a knowledge of ſingular and particular things, and ſcience on the contrary is a knowledge of things univerſall. Now that which is particular is more healeable than that which is univerſall, therefore thoſe which have experience are more wiſe and more eſteemed, than thoſe which want it, by reaſon they know what they doe. Moreover I ſay, that ſcience without experience, bringeth no great aſſurance.

Alciat a Doctor of *Milan*, boaſted one day of himſelfe, that his glory was greater and more famous than that of Counſellors, *Preſidents*, maſters of Requeſt: becauſe that it was by his ſcience, and his inſtructions that they became ſuch: but he was anſweared by a Counſellor, that he was like unto a whetſtone, which made the knife ſharpe and ready to cut, not being able ſo to doe it ſelfe, and alledged the verſes of *Horace* that:

Fungebatur vice cotis, acutum
Reddere quæ ferrum valet, exors ipſa ſecandi.

See you now (my little maſter) my anſwers to your calumniations, and pray you, if you beare a good minde (to the publicke good) to review and correct your booke, as ſoone as you can, and not to hold young Chirurgion in this errour by the reading of the ſame, where you teach them to uſe hot irons after the amputation of members, to ſtay a fluxe of blood, ſeeing there is another meanes, and not ſo cruell and more ſure and eaſie. Moreover if to day after an aſſault of a Citty, where diverſe Souldiers have had armes and legges broken, and ſhot off by Cannon Bullets, Cutlas or other inſtruments of warre; to ſtay the fluxe of blood, if you ſhould uſe hot irons, it would be needfull to have a forge, and much coales to heate them: and alſo the ſouldiers would hold you in ſuch horror for this cruelty, that they would kill you like a Calfe, even as in times paſt they did to one of the chiefeſt Chirurgions of *Rome*, which may be found written before in the third chapter of the Introduction of Chirurgery, the 1 booke. Now leaſt the Sectators of your writings ſhould fall into ſuch inconveniencie, I pray them to follow the methode aforeſayd, the which I have ſhewed to be true and certaine, and approved by authority, reaſon and experience.

The Voyage of Thurin, 1536.

MOreover, I will heere ſhew to the readers the places where I have had meanes to learne the Art of Chirurgery, for the better inſtructing of the young Chirurgion: and firſt in the yeere 1536, the great King *Francis* ſent a great Army to *Thurin*, to recover the Cittyes and Caſtles, which the Marqueſſe of *Guaſt*, Lievtenant generall of the Emperor had taken: where the high Conſtable of *France* the great maſter, was Lievtenant generall of the Army, and Monſieur *de Montian* Colonel generall of the foote, of which I was then Chirurgion. A great part of the Army arrived in the Country of *Suze*; we found the enemy which ſtopt the paſſage, and had made certaine Forts, and trenches, inſomuch that to hunt them out and make them leave the place, we were forced to fight, where there were divers hurt and ſlaine, as well of the one ſide as of the other: but the enemies were conſtrayned to retire, and get into the Caſtle, which was cauſed partly by one Captaine *Ratt*, who climed with divers of the ſouldiers of his company upon a little Mountaine; there where he ſhot directly upon the enemies, hee received a ſhot upon the anckle of his right foote, wherewith preſently he fell to the ground; and ſayd then, Now is the *Rat* taken. I dreſſed him, and God healed him. We entred the throng in the Citty, and paſſed over the dead bodyes, and ſome which were not yet dead, we heard them cry under our horſes feete, which made my heart relent to heare them. And truely I repented to have forſaken *Paris* to ſee ſo pittifull a ſpectacle. Being in the Citty, I entred into a ſtable thinking to lodge my owne, and my mans horſe, where I found foure dead ſouldiers, and three which were leaning againſt the wall, their faces wholly disfigured, and neither ſaw nor heard, nor ſpoake; and their cloathes did yet flame with the gunpowder which had burnt them. Beholding them with pitty, there happened to come an old ſouldier, who asked me if there were any poſſible meanes to cure them, I told him no: he preſently approached to them, and gently cut their throates without choler. Seeing this great cruelty, I told him he was a wicked man, he anſwered me that he prayed to God, that whenſoever he ſhould be in ſuch a caſe, that he might finde ſome one that would doe as much to him, to the end he might not miſerably languiſh. And to returne to our former diſcourſe, the enemie was ſõmoned to render, which they ſoon did, & went out, their lives onely ſaved, with a white ſtaffe in their hands; the greateſt part whereof went and got to the Caſtle of *Villane*, where there was about 200. Spaniards; Monſieur the Conſtable would not leave them behind, to the end that the way might be made free. This Caſtle is ſeated upon a little mountaine, which gave great aſſurance to them within, that one could not plant the Ordinance to beate upon it, and were ſommoned to render, or that they ſhould be cut in peeces; which they flatly refuſed, making anſwere that they were as good and faithfull ſervants to the Emperor, as Monſieur the Conſtable could bee to the King his maſter. Their anſwere heard, they made by force of arme, two great Cannons to be mounted in the night with cords and ropes, by the Swiſſers and Lanſquenets; when as the ill lucke would have it, the two Cannons being ſeated, a Gunner by great negligence ſet on fire a great bagge of Gunpowder; wherewith he was burned together with ten or twelve ſouldiers; and moreover the flame of the powder was a cauſe of diſcovering the Artillery, which made them that all night, they of the Caſtle did nothing but

The retiring of the enemies.

Hiſtory.

Brave anſwere of the Souldiers.

ſhoot

ſhoote at that place where they diſcovered the two peeces of Ordinance, wherewith they kild and hurt a great number of our people.

The next day early in the morning a Battery was made, which in a few houres made a breach, which being made they demanded to parly with us; but twas too late for them; For in the meane time our French foote, ſeeing them amazed, mounted to the breach, and cut them all in peeces, except a faire young luſty mayd of *Piedmount*, which a great Lord would have kept and preſerved for him to keepe him company in the night, for feare of the greedy wolfe. The Captaine and Enſigne were taken alive, but ſoone after were hanged upon the gate of the Citty, to the end they might give example and feare to the Imperiall ſouldiers not to bee ſo raſh and fooliſh, to be willing to hold ſuch places againſt ſo great a Army. Now all the ſayd ſouldiers of the Caſtle, ſeeing our people comming with a moſt violent fury, did all their endeavour to defend themſelves, they kild and hurt a great company of our ſouldiers, with Pikes, Muskets, and ſtones, where the Chirurgions had good ſtore of worke cut out. Now at that time I was a freſh water Souldier, I had not yet ſeene wounds made by gun-ſhot at the firſt dreſſing. It is true, I had read in *Iohn de Vigo*, in the firſt booke of wounds in generall, the eighth chapter, that wounds made by weapons of fire did participate of Venenoſity, by reaſon of the pouder, and for their cure commands to cauterize them with oyle of Elders ſcalding hot, in which ſhould be mingled a little Treackle; and not to faile, before I would apply of the ſayd oyle, knowing that ſuch a thing might bring to the Patient great paine, I was willing to know firſt, before I applyed it, how the other Chirurgions did for the firſt dreſſing, which was to apply the ſayd oyle the hotteſt that was poſſible into the wounds, with tents and ſetons; inſomuch that I tooke courage to doe as they did. At laſt I wanted oyle, and was conſtrained in ſteed thereof, to apply a digeſtive of yolkes of egges, oyle of Roſes, and Turpentine. In the night I could not ſleepe in quiet, fearing ſome default in not cauterizing, that I ſhould finde thoſe to whom I had not uſed the burning oyle dead impoyſoned; which made me riſe very early to viſit them, where beyond my expectation I found thoſe to whom I had applyed my digeſtive medicine, to feele little paine, and their wounds without inflammation or tumor, having reſted reaſonable well in the night: the other to whom was uſed the ſayd burning oyle, I found them feveriſh, with great paine and tumour about the edges of their wounds. And then I reſolved with my ſelfe never ſo cruelly, to burne poore men wounded with gunſhot. Being at *Thurin* I found a Chirurgion, who had the fame above all others, for the curing of wounds of Gunſhot, into whoſe favour I found meanes to inſinuate my ſelfe, to have the receipt of his balme, as he called it wherewith he dreſſed wounds of that kind, and hee held me off the ſpace of two yeeres, before I could poſſible draw the receipt from him. In the end by gifts and preſents he gave it me, which was this, to boyle young whelpes new pupped, in oyle of Lillies, prepared earth wormes, with Turpentine of *Venice*. Then was I joyfull and my heart made glad, that I had underſtood his remedy, which was like to that which I had obtained by great chance. See then how I have learned to dreſſe wounds made with gunſhot, not by bookes. My Lord Marſhall of *Montian* remained Lievtenant generall for the King in *Piedmont*, having ten or twelve thouſand men in garriſon through the Cittyes and Caſtles, who often combated with ſwords and other weapons, as alſo with muskets; and if there were foure hurt, I had alwayes three of them, and if there were queſtion of cutting off an arme or a legge, or to trepan, or to reduce a fracture or diſlocation, I brought it well to paſſe. The ſayd Lord Marſhall ſent me one while this way, another while that way, for to dreſſe the appointed Souldiers which were beaten aſwell in other Citties as that of *Thurin*, inſomuch that I was alwayes in the Countrey one way or other. Monſieur the Marſhall ſent for a Phyſition to *Milan*, who had no leſſe reputation in the medicinall Art (than the deceaſed Monſieur *le Grand*) to take him in hand for an hepaticall flux, whereof at laſt he dyed. This Phyſitian was a certaine while at *Thurin* to deale with him, and was often called to viſite the hurt people, where he alwayes found me, and I conſulted with him, and ſome other Chirurgions, and when wee had reſolved to doe any ſerious worke of Chirurgery, twas *Ambroſe Pare* that put his hand thereto,

The death of Marſhall *Montian.*

where I did it promptly and with dexterity, and with a great aſſurance, in ſo much that the ſayd Phyſition admired me, to ſee me ſo ready in the operation of Chirurgery, ſeeing the ſmall age which I had, One day diſcourſing with the ſayd Lord Marſhall, he ſayd to him, *Signor, tu hai un Chirurgico giovane di anni, ma egli é vecchio di ſapere e di eſperientia. Guarda lo bene, perche egli ti fara ſervicio & bonore.* That is to ſay, Thou haſt a young Chirurgion of age, but he is old in knowledg and experience, preſerve him well; for he will doe thee ſervice, and honour. But the old man knew not that I had dwelt three yeares in the Hoſpitall of *Paris*, there to dreſſe the diſeaſed. In the end Monſieur *Marſhall* dyed with his hepaticall fluxe. Being dead, the King ſent Monſieur the Marſhall of *Annebaut* to be in his place, who did me this honour to pray me to dwell with him, and that he would uſe me as well or better, than Monſieur the Marſhall *Mountian*; which I would not doe for the greefe I had for the loſſe of my maſter who loved me intimately, and I him in the like manner; and ſo I came backe to *Paris*.

The Voyage of Marolle *and of low* Brritany, 1543.

The Engliſh retire.

Dances of the Countrey Wenches.

Wraſtlers; little *Brittan* a good wraſtler.

I Went to the Camp of *Marolle*, with the deceaſed Monſieur *de Rohan*, where King *Francis* was in perſon, and I was Chirurgion of the company of the ſayd Monſieur *de Rohan*. Now the King was advertized by Monſieur *de Eſtampes*, governour of *Brittany*, that the *Engliſh* had hoyſte Sayle to land in Low *Brittany*, and prayed him that he would ſend Monſieur *de Rohan*, and Monſieur *de Laval* for ſuccour, becauſe they were the Lords of that Countrey, and for their ſakes thoſe of that Countrey would beate backe the enemy and keepe them from landing. Having received this advertiſement, his Majeſty diſpatched to ſend the ſayd Lords for the releefe of their Countrey, and to each was given as much power as to the Governour; in ſo much that they were all three the Kings Lievetenants. They tooke willingly this charge upon them, and ſpeedily went away in Poſte, and lead me with them to *Landreneau*, there where we found every one in armes, the Alarum bells ſounding on every ſide, yea five or ſixe leagues about the *Harbors*, that is to ſay, *Breſt*, *Conquet*, *Crozon*, *Le Fou Doulac*, *Laudanec*, each of them well furniſht with Artillery, as Cannons, Demy-cannons, Culverins, Sakers, Serpentines, Falcons, Harque buzes, in breefe there was nothing wanting in Artillery, or ſouldiers aſwell *Brittanes* as *French*, to hinder that the Engliſh made no landing, as they had reſolved at their parting from *England*. The enemies Army came unto the very mouth of the Cannon, and when we perceived them that they would land, they were ſaluted with Cannon ſhot, and we diſovered our men of warre, together with our Artillery: they fled to Sea againe, where I was glad to ſee their veſſells hoiſe ſaile againe, which was in a great number and in good order, and ſeemed like a Foreſt which marched upon the Sea. I ſaw a thing alſo whereat I marveiled much, which was that the bullets of great peeces made great rebounds, and grazed upon the water as upon the ground. Now to make the matter ſhort, the Engliſh did us no harme, and returned whole and ſound into England, and left us in peace. We ſtayd in that Countrey in garriſon, till we were aſſured that their army was diſperſed. In the meane time our horſemen exerciſed their feates of activity, as to run at the ring, fight in duell, and others, ſo that there was ſtill ſomething to imploy me withall. Monſieur *de Eſtampes*, to make ſport and pleaſure to the ſayd Monſieur *de Rohan*, and *Laval*, and other gentlemen, cauſed diverſe Countrey wenches, to come to the feaſts, to ſing ſongs in the Low *Brittan* tongue, where their harmony was like the croaking of Frogges, while they are in love. Moreover made them dance the *Brittany Triory*, without mooving feete or buttockes, hee made them heare and ſee much good. Otherwhiles they cauſed the Wraſtlers of the Cittyes, and Townes, to come where there was a Prize for the beſt, and the ſport was ſeldome ended, but that one or other had a legge or an arme broken, or the ſhoulder or hippe diſplaced: there was a little man of Low *Britany* of a ſquare body and well ſet, who held a long time the credit of the field, and by his skill, and ſtrength, threw five or ſixe to the ground; there came to him a great ſchoolemaſter, who was ſayd to be one of the beſt wraſtlers of all *Brittany*: he entred into the liſts, having taken off his long jacket, in hoſe and doublet, and being neere the little man, he ſeemed as if he had beene tyed to his girdle. Notwithſtanding when each of them tooke hold of the collar, they were a long time without doing any thing, and they thought they would remaine equall in force and skill: but the little man caſt himſelfe with an ambling leape under this great Pedant, and tooke him on his ſhoulder, and caſt him on his Kidneyes ſpread abroad like a frogge, and then all the company laught at the skill and ſtrength of this little fellow. This great *Dativo* had a great ſpight, for being caſt by ſo little a man: he roſe againe in choler, and would have his revenge. They tooke hold againe of each others collar, and were againe a good while at their hold without falling to ground: in the end this great man let himſelfe fall upon the little, and in falling put his elbow upon the pitch of his ſtomacke, and burſt his heart, and kild him ſtarke dead. And knowing he had given him his deathes blow, tooke againe his long caſſocke, and went away with his tayle betweene his legges and hid himſelfe, ſeeing that the little man came not againe to himſelfe, either for Wine, Vinegar or any other thing that was preſented unto him; I, drew neere to him, and felt his pulſe which did not beate at all, then I ſayd he was dead; then the *Brittanes* who aſſiſted the wraſtling ſayd aloud in their jabbering, that is not in the ſport. And ſome ſayd that the ſayd Pedagoge was accuſtomed to doe ſo, and that but a yeere paſſed he had done the like in a wraſtling. I would needes open the body to know the cauſe of this ſodaine death, where I found much blood in the *Thorax* and in the inferiour belly, and I ſtrived to finde out any apertion in the place, from whence might iſſue ſo great a quantity of blood, which I could not doe for all the dilligence I could make. Now I beleeve it was *per Diapedeſin* or *Anaſtomoſin*, that is to ſay by, the apertion of the mouthes of the veſſells, or by their poroſities; the poore little wraſtler was buryed. I tooke leave of *Meſsieurs de Rohan, de Laval*, and *Eſtamps*. Monſieur *de Rohan*, gave mee a preſent of fifty double duckets, and an ambling horſe, and Monſieur *de Laval* another for my man, and Monſieur *de Eſtamps*, a Diamond of thirty Crownes, and ſo I returned to my houſe at *Paris*.

The little Brittan kild.

The body opened by the Author.

The Voyage of Parpignan, 1543.

A Little while after Monſieur *de Rohan* tooke me with him poſte, to the campe of *Parpignan*; being there, the enemy made a Sally forth, and came and incloſed three peeces of our Artillery, where they were beaten back, to the gates of the Citty: which was not done without hurting and killing many, and amongſt the reſt *de Briſſac*, (who was then chiefe maſter of the Artillery) received a musket ſhot upon the ſhoulder: returning to his Tent, all the others that were hurt followed him, hoping to be dreſt by the Chirurgions, that ought to dreſſe them. Being come to his Tent and layd on his bed, the bullet was ſearched for by three or foure the moſt expert Chirurgions of the Army, who could not finde it, but ſayd it was entred into his body.

In the end hee called for me, to ſee if I were more skilfull than them, becauſe he had knowne me before in *Piedmount*: by and by I made him riſe from his bed, and prayed him to put his body into that poſture as it was then when hee received his hurt; which he did taking a javelin betweene his hands as he held the Pike in the skirmiſh. I put my hand about the wound, and found the bullet in the fleſh, making a little tumor under the *Omoplate*: having found it I ſhewed them the place where it was, and it was taken out by Maſter *Nicholas Lavernaut* Chirurgion to Monſieur the *Dolphin*, who was the Kings Lievtenant in that army, yet notwithſtanding the honour remained to me for finding of it.

Addreſſe of the Author.

I ſaw one thing of great remark, which is this: that a ſouldier in my preſence gave to one of his fellowes a ſtroake with an Halbard upon the head, penetrating even to the left ventricle of the braine, without falling to the ground. Hee that

Hiſtory.

ſtrooke him ſaid, he had heard that he had cheated at Dice, and that he had drawne a great ſumme of money, and that it was his cuſtome to cheate; I was called to dreſſe him, which I did as it were for the laſt, knowing well that he would quickly die: having dreſt him he returned all alone to his lodging, which was at leaſt two hundred paces diſtant: I bid one of his companions ſend for a Prieſt to diſpoſe of the affaires of his ſoule; he helpt him to one who ſtayd with him to the laſt gaſpe. The next day the patient ſent for mee by his ſhee friend in a boyes apparell to come to dreſſe him, which I would not doe, fearing hee ſhould die under my hands; and to put it off, I ſayd I muſt not take off the dreſſing till the third day, by reaſon hee would die though hee were never touched. The third day hee came ſtaggering, and found me in my Tent accompanied with his wench, and prayed mee moſt affectionately to dreſſe him: And ſhewed me a purſe wherein he had an hundred or ſixſcore peeces of Gold, and that he would content me to my deſire; for all that, yet notwithſtanding I left not off to deferre the taking off his dreſſing, fearing leaſt hee ſhould die at the ſame inſtant. Certaine Gentlemen deſired me to goe dreſſe him, which I did at their requeſt, but in dreſſing him he died under my hands in a Convulſion. Now this Prieſt accompanied him untill death, who ſeazed upon the purſe for feare leaſt another ſhould take it, ſaying, hee would ſay Maſſes for his ſoule. Moreover hee furniſht himſelfe with his cloathes, and with all the reſt of his things. I have recited this Hiſtory as a monſtrous thing, that the Souldier fell not to ground when he had received this great ſtroake, and was in good ſenſes even till death. Soone after, the Campe was broken for divers cauſes; the one becauſe we were advertized that foure companies of *Spaniards* were entred into *Parpignam*; the other, that the Plague begun much in our Campe, and it was told us by the people of the countrey that ſhortly there would bee a great overflowing of the Sea, which might drowne us all; and the preſage which they had, was a very great winde from Sea, which aroſe in ſuch manner that there remained not one Tent which was not broken and overthrowne, for all the ſtrength and dilligence that could be given; and the Kitchins being all uncovered, the winde raiſed ſo the duſt and ſand which ſalted and poudred our meate, in ſuch ſort that wee could not eate it, ſo that wee were conſtrained to boile it in pots and other veſſells well covered.

Now we did not uncampe our ſelves in ſo good time, but that there were many Carts and Carters Mules, and Mule drivers drowned in the Sea, with great loſſe of baggage. The Campe broken, I returned to *Paris.*

The voyage to Landreſy. 1544.

KIng *Francis* raiſed a great Army to victuall *Landreſy*: on the other ſide the Emperour had no leſſe people, yea much more; that is to ſay, eighteene thouſand *Germans*, tenne thouſand *Spaniards*, ſixe thouſand *Wallons*, tenne thouſand *Engliſh*, and a matter of thirteene or fouretcene thouſand Horſe. I ſaw the two Armies neare one another, within Canon ſhot, and it was thought they would never part without giving battaile. There were ſome certaine fooliſh Gentlemen who would approach the enemies Campe; certaine ſhot was made at them, and ſome dyed at the place, others had their Legges or Armes carried away. The King having done what hee deſired, which was to revictuall *Landreſy*, retired himſelfe with his Army to *Guiſe*, which was the day after All Saints, one thouſand five hundred forty foure, and from thence I returned to *Paris.*

The Voyage of Boulogne. 1545.

A Little while after we went to *Boulogne*, where the *Engliſh* ſeeing our Army, left the Forts which they had, that is to ſay, *Moulambert*; the little Paradiſe, *Monplaiſir*, the fort of *Shatillon*, the *Portet*, the Fort *Dardelot*. One day going through the Campe to dreſſe my hurt people, the enemies who were in the Tower of *Order*, ſhot off a peece of Ordinance, thinking to kill two horſemen which ſtayd to talke one with another. It happened that the Bullet paſſed very neare one of them, which threw him to the ground, and t'was thought the ſaid Bullet had toucht him, which it did not at all, but onely the winde of the ſaid Bullet in the midſt of his coate, which went with ſuch a force that all the outward part of the Thigh became blacke and blew, and had much adoe to ſtand. I dreſt him, and made him divers Scarifications to evacuate the contuſed blood, which the winde of the ſaid Bullet had made; and the rebounds that it made on the ground, kild foure ſouldiers which remained dead in the place. I was not farre from this ſtroake, ſo that I felt ſomewhat the mooved aire, without doing mee any harme, than a little feare which made mee ſtoope my head very low, but the Bullet was already paſſed farre beyond mee.

The Souldiers mock't me to be affraid of a Bullet already gone. (My little Maſter) I thinke if you had beene there, that I had not beene affraid alone, and that you would have had your ſhare of it. What ſhall I ſay more? Monſieur the Duke of *Guiſe*, *Francis* of *Lorraine*, was hurt before *Bullogne* with a ſtroake of a Lance, which above the right eye, declining towards the noſe, entred and paſſ'd quite through on the other ſide betweene the *nucha* and the eare, with ſo great a violence, that the head of the Lance with a great part of the wood was broken and remained within, in ſuch ſort that it could not bee drawne out but with great force, yea with Smithes pincers. Notwithſtanding all this violence which was not done without breaking of bones, nerves, and arteries, and other parts; my ſaid Lord, by the helpe of God was cured: the ſaid Lord went alwayes with open face, which was the cauſe that the Lance went through on the other ſide.

The hurt of Monſieur *de Guiſe*.

The voyage of Germany. 1552.

I Went the voyage to *Germany* in the yeare 1552. with Monſieur *De Rohan* Captaine of 50. horſe, where I was Chirurgion of his company, which I have ſaid already. In this voyage Monſieur the high Conſtable of *France* was Generall of the Army: Monſieur *de Chaſtillon*, ſince Admirall, was chiefe Colonell of the foote, having foure Regiments of Lanſquenets, under the conduct of theſe Captaines, *Recrod* and *Ringrave*, having each of them two Regiments, each Regiment was of tenne Enſignes, and each Enſigne of five hundred men. And beſides theſe, was Captaine *Chartel*, who conducted the troopes that the Proteſtant Princes had ſent to the King. This was a very faire company on foote, accompanied with fifteene hundred Horſe, with the following of each one two Archers, which might make foure thouſand five hundred Horſe, beſides two thouſand Light horſe, and as many Muſkettieres on horſebacke, of whom Monſieur *de Aumalle* was Generall, beſides the great number of Nobility who came for their pleaſure. Moreover, the King was accompanied with two hundred Gentlemen of his houſe, & likewiſe with divers Princes; there was alſo for his troope that ſerved him, the *French*, *Scottiſh*, and *Swiſſers* Guards, amounting to ſixe hundred men on foote, and the companies of Monſieur the *Dolphin*, *Meſſieres de Guiſe*, *de Aumalle*, and of the Marſhall S. *Andrew*, which amounted to foure hundred Lances, which was a mervelous thing to ſee ſuch a faire Company; and in this equipage the King entred into *Thou* and *Mets*. I will not omit to tell that it was ordained, that the Companions of *Meſſieres de Rohan*, of the Count of *Sancerr*, of *Iarnac*, which was each of them of fifty horſe, went by the Wings of the Campe; and God knowes we had ſcarcitie of victualls, and I proteſt to God that at three divers times I had thought I ſhould have beene famiſht, and it was not for want of money for I had enough, and we could not have victualls but by force, by reaſon that the *Peſants* withdrew it all into the Citties and Caſtles.

History.

One of the ſervants of a Captaine of the company of Monſieur *de Rohan*, went with others thinking to enter into a Church where the *Peſants* were retired, thinking to finde victualls by force or love: but amongſt the reſt this man was well beaten, and returned with ſeaven wounds, with a ſword in the head; the leaſt of which penetrated the ſecond table of the ſcull, and he had foure other upon the armes, and upon the right ſhoulder, which cut more than one halfe of the blade-bone, or *Omoplate*.

He

Charity of the Author.

He was brought backe to his maſters lodging, who ſeeing of him ſo wounded, and that they were to depart thence the morrow after at the breake of day, and not thinking ever he could be cured, made him a grave, and would have caſt him therein, ſaying that, or elſe the *Peſants* would maſſacre and kill him; I mov'd with pitty told him that he might yet be cured if he were well dreſt: divers Gentlemen of the company prayd him that he would cauſe him to bee brought along with the Baggage, ſeeing I had the willingneſſe to dreſſe him; to which he agreed, and after that I had cloth'd him, he was but put into a Cart upon a bed well covered and well accommodated, which one horſe did draw. I did the office of a Phyſition, Apothecary, Chirurgion, and Cooke; I dreſt him even to the end of his cure, and God cured him, in ſo much that all theſe three Companies admired at this cure. The horſemen of the company of Monſieur *de Rohan*, the firſt muſter that was made, gave me each one, one Crowne, and the Archers halfe a Crowne.

The voyage of Danvilliers. 1552.

AT the returne from the *German* Campe, King *Henry* beſeiged *Danvilliers*, thoſe within would not render. They were well beaten and our pouder failed us, in the meane time they ſhot much at our people. There was a Culverin ſhot paſs'd a traverſe the Tent of Monſieur *de Rohan*, which hit a Gentlemans Leg, which was of his traine; which I was faine to finiſh the cutting off, the which was done without applying hot irons.

Another Hiſtory.

The King ſent for pouder to *Sedan*, which being come they began a greater battery than before, in ſuch ſort that they made a breach. *Meſſiers de Guiſe*, and the high Conſtable being in the Kings Chamber, told him they concluded the next day to make aſſault, & that they were aſſured they ſhould enter into it, & that they ſhould keep it ſecret leſt the enemy were advertized. And all of them promiſed not to ſpeake of it to any one. Now there was a Groome of the Kings chamber who lay under the Kings bed in the Camp to ſleep, underſtood that they reſolved the next day to give an aſſault, he preſently revealed it to a certaine Captaine and told him that for certaine the day following aſſault ſhould be given, & that he had heard it of the King, & praid the ſaid Captaine that he would not ſpeake a word of it to any body, which he promiſed: but his promiſe was not kept, for at the ſame inſtant, he went and declared it to a Captaine, & this Captaine to another Captaine, and from the Captaines to ſome of the Souldiers, ſaying alwayes, ſay nothing. It was ſo well hid that the next day early in the morning there was ſeene the greateſt part of the Souldiers with their round hoſe and their breeches cut at knee for the better mounting at the breach. The King was advertiz'd of the rumor which runne through the Campe, that the aſſault muſt be given, whereof hee much mervailed, ſeeing there was but three of that adviſe, which had promiſed one to another, not to tell it to any one. The King ſent for Monſieur *de Guiſe*, to know if hee had not talked of this aſſault; hee ſwore and affirmed to him he had not told it to any body; and Monſieur the Conſtable ſaid as much; who ſaid to the King he muſt expreſſely know who had declared this ſecret counſell; ſeeing they were but three. Inquiſition was made from Captaine to Captaine, in the end the truth was found; for one ſayd twas ſuch a one told me, another ſayd as much, till at length they came to the firſt, who declared he had learnd it of a Groome of the Kings chamber, named *Guyard*, borne at *Blois*, the ſonne of the deceaſed King *Francis* his Barber. The King ſent for him into his Tent, in the preſence of Monſieur *de Guiſe*, and of Monſieur the Conſtable, to underſtand from him whence he had it, and who told him that this aſſault was to bee given. The King told him that if he did not tell the truth, that he would cauſe him to be hanged; then he declared, he lay downe under his bed thinking to ſleepe, and ſo having heard it, he declared it to a Captaine who was a friend of his, to the end hee might prepare himſelfe with his Souldiers the firſt for the aſſault. After the King knew the truth; he told him, he ſhould never ſerve him againe, and that he deſerved to be hanged, and forbid him ever to come againe to the Court. My Groome of the Chamber went away with this ſad newes, and lay with one of the Kings

What it is to reveale the ſecrets of Princes.

Chirurgions in ordinary, named Maſter *Lewis*, and in the night gave himſelfe ſix wounds with a knife, and cut his throate; yet the ſaid Chirurgion perceived nothing till morning, till hee ſaw the bed bloody, and the dead body by him: hee much mervailed at this ſpectacle upon his waking, and was afraid leaſt they ſhould ſay he was the cauſe of this murther; but was ſoone freed, knowing the cauſe to bee from deſperation, having loſt the good amitie which the King bore to him. The ſaid *Guyard* was buried. And thoſe of *Danvilliers* when they ſaw the breach large enough for them to enter in, and the Souldies prepared for the aſſault, yeelded themſelves to the mercy of the King. The chiefe of them were priſoners, and the Souldiers ſent away without armes. The Campe being broken up I returned to *Paris* with my Gentleman whoſe Leg I had cut off, I dreſt him and God cured him; I ſent him to his houſe merry with a woodden Leg, and was content, ſaying that he ſcaped good cheape, not to have beene miſerably burnt, as you write in your booke, my little Maſter.

The Voyage of Caſtle the Compt. 1552.

The King of *Navarre* prayed the Author to follow him.

A Little while after King *Henry* levied an Army of thirty thouſand men, to goe make ſpoile about *Hedin*. The King of *Navarre* who was then called Monſieur *de Vendoſme*, was chiefe of the Army, and the Kings Lievtenant. Being at S. *Denis* in *France*, ſtaying while the companies paſs'd by, he ſent for me to *Paris* to come ſpeak with him; being there, he prayed me, and his requeſt was a command, that I would follow him this voyage; and I about to make my excuſe told him him my wife was ſicke in her bed, he made me anſwer, that there were Phiſitions at *Paris* for to cure her; and that he as well left his owne, who was as well deſcended as mine; promiſing me that hee would uſe me well, and forthwith gave command that I ſhould be lodged as one of his Traine. Seeing this great affection, which he had to leade me with him, I durſt not to refuſe him. I went and met with him at the Caſtale of *Compt*, within 3. or 4. leagues of *Hedin*, there where there was the Emperors Souldiers in garriſon with a number of *Peſſants* round about: hee cauſed them to be ſummond to render themſelves; and they made anſwer they ſhould never have them but by peeces, and let them doe their worſt, and they would doe their beſt to defend themſelves. They put confidence in their ditches full of water, and in two houres with a great number of Bavins, and certaine empty Caskes, way was made to paſſe over the foote: when they muſt goe to the aſſault and were beaten with five peeces of Cannon, till a breach was made large enough to enter in, where they within received the aſſault very valiantly, and not without killing and hurting a great number of our people with musket ſhot, pikes and ſtones. In the end when they ſaw themſelves conſtrained, they put fire to their pouder and munition, which was the cauſe of burning many of our people, and of theirs likewiſe, and they were all almoſt put to the edge of the ſword. Notwithſtanding ſome of our Souldiers had taken twentie or thirtie, hoping to have ranſome for them. That was knowne, and ordered by the Counſell that it ſhould be proclaimed by the Trumpet through the Campe, that all Souldiers who had any *Spaniards* priſoners were to kill them, upon paine to be hanged and ſtrangled, which was done upon cold blood. From thence we went and burnt diver Villages, whoſe barnes were full of all kind of graine, to my great greefe. Wee went along even to *Tournaham*, where there was a verygreat Tower where the Enemies retired, but there was no man found in it, all was pillaged, and the Tower was made to leape by a Mine, and then with Gunpouder turned topſy turvy. After that, the Campe was broken up, and I returned to *Paris*. I will not yet forget to write that the day after the Caſtle of *Compt* was taken, Monſieur *de Vendoſme* ſent a Gentleman to the King to make report to him of all which had paſs'd, and amongſt other things, told the King that I had greatly done my duty in dreſſing thoſe that were wounded, and that I had ſhewed him eighteene Bullets which I had taken or drawne out of the hurt bodies, and that there were divers more which I could neither finde, nor draw out, and told more good of mee than there was by halfe. Then the King ſaid hee would have mee into his ſervice, and

History of deſperate people.

The taking of Caſtle of *Compt*.

and commanded Monſieur *de Goguier* his chiefe Phyſition to write me downe as entertained one of his Chirurgions in ordinary, and that I ſhould goe meete with him at *Rheimes* within ten or twelve dayes; which I did, where he did me the honour to command me that I would dwell neare him, and that he would doe me good. Then I thankt him moſt humbly for the honour it pleaſed him to doe me, in calling me to his ſervice.

The Voyage of Mets. 1552.

The names of the Princes who were at the ſeige of *Mets.*

THe Emperour having beſeiged *Mets*, and in the hardeſt time of winter, as each one knowes of freſh memory: and that there was in the Citty five or ſixe thouſand men, and amongſt the reſt ſeaven Princes; that is to ſay, Monſieur the Duke of *Guiſe* the Kings Lievtenant, *Meſsieurs d'Anguien, de Conde, de Montpenſier, de La Roch upon Yon*, Monſieur *de Nemours*, and divers other Gentlemen, with a number of old Captaines of warre, who often made ſallies forth upon the enemies, (as wee ſhall ſpeake of hereafter) which was not done without ſlaying many, as well on the one ſide as the other. For the moſt part all our wounded people dyed, and it was thought the medicaments wherewith they were dreſſed were poyſoned; which cauſed Monſieur *de Guiſe* and other Princes to ſend to the King for mee, and that hee would ſend me with Drogues to them, for they beleeved theirs were poyſoned, ſeeing that of their hurt people few eſcaped. I doe not beleeve there was any poyſon, but the great ſtroakes of the Cutlaſſes, Muſket ſhot, and the extremity of cold were the cauſe. The King cauſed one to write to Monſieur the Marſhall of S. *Andrew* which was his Lievtenant at *Verdun*, that hee found ſome meanes to make me enter into *Mets*. The ſaid Lord Marſhall of S. *Andrew* and Monſieur the Marſhall of old *Ville*, got an *Italian* Captaine, who promiſed them to make me enter in, which he did, and for which hee had fifteene hundred Crownes: the King having heard of the promiſe which the *Italian* Captaine had made, ſent for mee and commanded me to take of his Apothecary named *Daigue* ſuch, and as many Drogues as I ſhould thinke fit for the hurt who were beſeiged, which I did, as much as a poſthorſe could carry. The King gave me charge to ſpeake to Monſieur *de Guiſe* and to the Princes, and Captaines who were at *Mets*. Being arrived at *Verdun*, a few dayes after Monſieur the Marſhall of S. *Andrew*, cauſed horſes to be given to mee, and my man and for the *Italian*, who ſpake very good high *Dutch*, *Spaniſh* and *Walon* with his owne naturall tongue: When we were within eight or tenne Leagues of *Mets*, wee went not but in the night, and being neare the Campe, I ſaw a league and a halfe off bright fires round about the Citty, which ſeemed as if all the earth were on fire, and I thought wee could never paſſe through thoſe fires without being diſcovered, and by conſequent be hanged and ſtrangled, or cut in peeces, or pay a great ranſome. To ſpeake truth, I wiſhed my ſelfe at *Paris*, for the eminent danger which I foreſaw. God guided ſo well our affaires that wee entred into the Citty at midnight with a certaine Token, which the Captaine had with another Captaine of the company of Monſieur *de Guiſe*: which Lord I went to, and found him in bed, who received me with great thankes, being joyfull of my comming. I did my meſſage to him of all that the King had commanded me to ſay to him; I told him I had a little letter to give him, and that the next day I would not faile to deliver it him. That done he commanded mee a good lodging, and that I ſhould be well uſed, and bid mee I ſhould not faile to be the next day upon the Breach, where I ſhould meete with all the Princes, and divers Captaines, which I did; who receaved me with great joy, who did mee the honour to imbrace me, and tell me I was very welcome, adding withall they did not feare to dye if they ſhould chance to be hurt: Monſieur *de La Roch upon Yon* was the firſt that feaſted me, and inquired of me what they ſayd at the Court concerning the Citty of *Mets*; I told him what I thought good. Then preſently he deſired mee to goe ſee one of his Gentlemen, named Monſieur *de Magnane* at this preſent Knight of the Kings order, and Lievtenant of his Majeſties Guard; who had his Leg broken by a Cannon ſhot. I found him in his bed, his Leg bended and crooked, without any

Nota.

Commiſsion of the Author.

dreſſing

History.

dreſſing upon it; becauſe a Gentleman promiſed him cure, having his name, and his girdle, with certaine words. The poore Gentleman wept, and cryed with paine which he felt, not ſleeping either night or day, in foure dayes: then I mock't at this impoſture and falſe promiſe. Preſently I did ſo nimbly reſtore and dreſſe his Legge, that he was without paine and ſlept all night, and ſince (thanks be to God) was cured, and is yet at this preſent living, doing ſervice to the King. The ſaid Lord of the *Roch upon Ton* ſent me a Tunne of wine to my lodging, and bid tell me, when it was dronken hee would ſend mee another. That done, Monſieur *de Guiſe* gave me a liſt of certaine Captaines and Lords, and commanded me to tell them what the King had given me in charge; which I did, which was to doe his commendations and a thankſgivng for the duty they had done, and did in the keeping of the Citty of *Mets*, and that he would acknowledge it. I was more than eight daies in acquitting my charge, becauſe they were many; firſt to the Princes and others, as the Duke of *Horace*, the Count of *Martigues*, and his brother, Monſieur *de Bauge*, the Lords *Montmorancy*, and *d'Anville*, then Marſhall of *France*, Monſieur *de La Chapel*, *Bonnivet Caroug* now Governour of *Rohan*, the *Vidaſme* of *Chartres*, the Count of *Lude*, Monſieur *de Biron* now Marſhall of *France*, Monſieur *de Randan* the *Rochfoucaut*, *Boxdaille d'Etrez*, the yonger, Monſieur *de S. Iohn* in *Dolphiny*, & many others which it would bee too long to recite; and chiefely to divers Captaines who had very well done their duty in defence of their lives, and Citty. I demanded afterwards of Monſieur *de Guiſe*, what it pleaſed I ſhould doe with the Drogues which I had brought, he bid me impart them to the Chirurgions and Apothecaries, and chiefely to the poore hurt Souldiers in the Hoſpitall which were in great number; which I did, and can aſſure you, I could not doe ſo much as goe ſee them, but they ſent for mee to viſit and dreſſe them. All the beſeiged Lords prayed mee carefully to ſollicite above all others Monſieur *de Pienne* who was hurt at the breach by a ſtone raiſed by a Cannon ſhot in the Temple with a fracture, and depreſſion of the bone. They told mee that preſently when hee received the ſtroake, hee fell to the earth as dead, and caſt blood out of his mouth, noſe, and eares with great vomitings, and was fourteene dayes without ſpeaking one word, or having any reaſon; there happened to him alſo ſtartings ſomewhat like Convulſions, and had all his face ſwell'd and livid. Hee was trepan'd on the ſide of the temporll muſcle upon the *Os Coronale*. I dreſt him with other Chirurgions, and God cured him, and is at this day living, God be thanked. The Emperour cauſed battery to be made with forty double Cannons, where they ſpared no pouder night nor day. Preſently when Monſieur *de Guiſe* ſaw the Artillery ſeated to make a breach, hee made the neareſt houſes to be pulled downe to make Ramparts, and the poſts and beames were ranged, end to end, and betweene two clods of earth, beds and packs of wooll, and then other poſts and beames were put againe upon them as before. Now much wood of the houſes of the ſuburbs which had beene put to the ground (for feare leaſt the enemie ſhould be lodged, cloſe covered, and that they ſhould not helpe themſelves with any wood) ſerved well to repaire the breach. Every one was buſied to carry earth to make the Ramparts night and day. *Meſſieres* the Princes, Lords and Captaines, Lievtenants, Enſignes, did all carry the basket, to give example to the Souldiers, and Cittizens to doe the like, which they did, yea both Ladies and Gentlewomen, and thoſe which had not baskets, helpt themſelves with kettles, panniers, ſackes, ſheets, and with what elſe they could to carry earth; in ſo much that the enemy had no ſooner beaten downe the wall, but hee found behind a Rampart more ſtrong. The wall being fallen our Souldiers cryed to thoſe without, the Fox, the Fox, the Fox, and ſpake a thouſand injuries one to another. Monſieur *de Guiſe* commanded upon paine of death that no man ſhould ſpeake to them without, for feare leaſt there ſhould be ſome Traitor who would give them intelligence what was done in the Citty; the command made, they tyed living Cats at the end of their Pikes, and put them upon the Wall and cryed with the Cats miau, miau.

The hurt of Monſieur *de Pienne*, trepand and cured.

Princes carried the Baskets.

Breach.

Truely the Emperialiſts were very much vexed to have beene ſo long making a breach, and at ſo great expence, which was the breach of fourescore ſteps, to enter fifty men in front, where they found a Rampart more ſtrong than the wall; they fell upon the poore Catts, and ſhot at them with their muskets as they uſe to doe at birds. Our people did oftentimes make ſallies by the command of Monſieur *de Guiſe*. The day before there was a great preſſe, to make themſelves enrowled, who muſt make the ſally chiefely of the young Nobility, led by well experimented Captaines. Inſomuch that it was a great favour, to permit them to ſally forth, and runne upon the enemy: and they ſallied forth alwayes the number of one hundred, or ſixeſcore armed men with Cutlaſſes, Muskets, Piſtolls, Pikes, Partiſans and Halberds, which went even to their trenches to awaken them. Where they preſently made an alarum throughout all their Campe, and their Drummes ſounded, plan, plan, ta, ti, ta, ta, ta, ti, ta, tou, touf, touf: likewiſe their Trumpets and Cornets, ſounded, to the ſaddle, to the ſaddle, to the ſaddle, to horſe, to horſe, to horſe, to the ſaddle, to horſe. And all their ſouldiers cry'd Arme, arme, arme, to armes, to armes, to armes, arme, to armes, arme, to armes, like the cry after Wolves, and all divers tongues, according to their nations: and they were ſeene to goe out from their tents, and little lodgings, as thicke as little Bees, when their Hive is diſcovered; to ſuccour their fellowes, who had their throates cut like ſheepe. The horſemen likewiſe came from all parts, a great gallop, patati, patata, patati, patapa, ta, ta, patata, patata, and tarried well that they might not bee in the throng, where ſtroakes were imparted to give and receive. And when our men ſaw they were forced, they returned into the Citty, ſtill fighting, and thoſe who runne after were beaten backe with the Artillery which they had charged with flint ſtones, and foureſquare peeces of iron; and our ſouldiers who were upon the ſayd wall made a volley of ſhot, and ſhowred downe their bullets upon them like haile, to ſend them backe to their lodging, where divers remained in the place of the combate, and alſo our men did not all come with whole skinnes, and there ſtill remained ſome for the Tythe, who were joyfull to dye in the bed of honour. And where there was a horſe hurt he was flayed, and eaten by the Souldiers in ſteed of beefe and bacon, and it was fit I muſt runne, to dreſſe our hurt men. A few dayes after, other ſallyes were made, which did much anger the enemies, becauſe they did not let them ſleepe but little in ſafety. Monſieur *de Guiſe*, made a warlike ſtratagem which was, he ſent a Peſant who was none of the wiſeſt with two paire of Letters toward the King, to whom he gave ten Crownes, and promiſed the King ſhould give him an hundred, provided he gave him the letters. In the one he ſent word that the enemy made no ſigne of retiring himſelfe, and by all force made a great breach which he hop't to defend, yea to the loſing of his life, and of all thoſe that were within, and that the enemy had ſo well placed his Artillery in a certaine place which he named, that with great difficulty was it kept that they had not entred into it, ſeeing it was a place the moſt weake of all the Citty: but he hoped quickely to fill it up againe in ſuch ſort, that they cannot be able to enter. One of theſe letters was ſowed in the lining of his doublet, and he was bid to take heede that he told it not to any man. And there was alſo another given to him: wherein the ſayd Monſieur *de Guiſe* ſent word to the King, that he & all the beſieged did hope well to keepe the Citty, and other matters, which I ceaſe to ſpeake of. They made the Peſant goe forth in the night, and preſently after, he was taken by one that ſtood Sentinell, and carryed to the Duke of *Albe*, to underſtand what was done in the Citty, and they asked him if he had any letters, he ſayd yes, and gave them one; and having ſeene it he was put to his oath, whether he had any other, and he ſwore, not; then they felt and ſearch't him, and found that which was ſowed to his doublet, and the poore meſſenger was hanged.

The ſayd letters were communicated to the Emperor, who cauſed his counſell to be called there, where it was reſolved ſince they could doe nothing at the firſt breach, that preſently the Artillery ſhould be drawne to the place which they thought the moſt weake, where they made great attempts to make another breach, and dig'd and undermined the wall, and endeavoured to take the Tower of Hell, yet they durſt not come to the aſſault. The Duke of *Albe* declared to the Emperor that the ſouldiers dyed dayly, yet, more than the number of two hundred, and that there was but little hope to enter into the Citty, ſeeing the ſeaſon, and the great quantity of ſouldiers that there were. The Emperor demanded what people they were that dyed, and if that they were gentlemen of remarke or quality: anſweare was made, that they were all poore ſouldiers; then ſayd he, it makes no matter if they dye, comparing them to caterpillers and graſhoppers, which eate the buddes of the earth: And if they were of any faſhion, they would not bee in the campe for twelve ſhillings the month, and therefore no great harme if they dyed. Moreover he ſayd he would neuer part from before that Citty, till he had taken it by force, or famine, although he ſhould looſe all his army: by reaſon of the great number of Princes which were therein, with the moſt part of the Nobility of *France*. From whom hee hoped to draw double his expence, and that he would goe once againe to *Paris*, to viſite the Pariſiens, and make himſelfe King of all the kingdome of *France*. Monſieur *de Guiſe* with the Princes, Captaines ,and Souldiers, and generally all the Cittizens of the Citty, having underſtood the intention of the Emperor, which was to extirpate us all, they adviſed of all they had to doe: And ſince it was not permitted to the ſouldiers, nor Cittizens, no nor to the Princes, nor Lords themſelves to eate either freſh fiſh, or Veniſon, as likewiſe ſome Partridges, Woodcockes, Larkes, Plovers ,for feare leaſt they had gathered ſome peſtilentiall ayre which might give us any contagion; but that they ſhould content themſelves with the ammunition fare, that is to ſay, with Biſquite, Beefe, poudered Cowes, Lard, and gammons of Bacon: Likewiſe fiſh, as Greenefiſh, Salmon, Sturgeon, Anchovies, Pilchers and Herrings, alſo Peaſe, Beanes, Riſe, Garlike, Onions, Prunes, Cheeſe, Butter, Oyle, Salt, Pepper, Ginger, Nutmegges, and other Spiceries to put into pyes, cheefely to horſefleſh, which without that would have had a very ill taſte; divers Citizens having gardens in the Citty ſowed therein great Raddiſhes, Turnippes, Carrots, and Leekes, which they kept well and full deare, againſt the extremity of hunger. Now all theſe ammunition victualls were diſtributed by weight, meaſure, and juſtice, according to the quality of the perſon, becauſe we knew not how long the ſeige would laſt. For having underſtood from the mouth of the Emperor, that he would never part from before *Mets*, till he had taken it by force, or famine; the victualls were leſſened, for that which was wont to be diſtributed to three, was now ſhared amongſt foure, and defence made they ſhould not ſell what remained after their dinner, but twas permitted to give it to the wenches that followed the Campe. And roſe alwayes from table with an appetite, for feare they ſhould be ſubject to take Phyſicke. And before we would yeeld our ſelves to the mercy of our enemies; had reſolved to eate our Aſſes, Mules, Horſes, Dogges, Cats, and Ratts, yea our bootes and other skinnes which we could ſoften and frie. All the beſeiged did generally reſolve to defend themſelves with all ſorts of inſtruments of warre, that is to ſay ,to ranke, and charge the Artillery, at the entry of the breach with bullets, ſtones, Cart nayles, barres, and chaines of iron. Alſo all kinds and differences of artificiall fire; as Boettes, Bariquades, Granadoes, Potts, Lances, torches, ſquibbes, burning faggots. Moreover ſcalding water, melted lead, powder of unquenched lime to blind their eyes. Alſo they were reſolved to have made holes through, and through their houſes, there to lodge musketiers, there to batter in the flanke and haſten them to goe, or elſe make them lye for altogether. Alſo there was order given to the women to unpave their ſtreetes, and to caſt them out at their windowes billets, tables, treſlles, formes , and ſtooles, which would have troubled their braines: moreover there was a little further , a ſtrong Court of Guard, fild with carts and palliſadoes, pipes and hogs heads, fild with earth, for barriquadoes to ſerve to interlay with faulcons, faulconets, field peeces, harquibuzes, muskets, and piſtolls and wilde fire, which would have broken legges and thighes, inſomuch that they had beene beaten in head, in flancke, and in tayle; and where they had forced this Court of Guard, there was others at the croſſing of the ſtreets, each diſtant an hundred paces, who have beene as bad companions as the firſt, and would not have beene without making a great many Widdowes, and Orphans. And if fortune would have beene ſo much againſt us, as to have broken our Courts of gard, there was yet ſeaven great Baſtallions ordered in ſquare, and triangle, to combate altogether, each one accompanied with a Prince to give them boldneſſe, and encourage them to fight, even till the laſt gaſpe, and to dye altogether. Moreover it was reſolved, that each one ſhould carry his treaſure, rings, and jewells, and their houſehold ſtuffe of the beſt, to burne them in the great place, and to put them into aſhes rather than the enemy ſhould prevaile and make tropheyes of their ſpoyles; likewiſe there was people appointed to put fire to the munition, and to beate out the heads of the Wine caskes, others to put the fire in each houſe, to burne our enemies and us together: the Citizens had accorded it thus, rather than to ſee the bloody knife upon their throate, and their Wives and Daughters violated, and to be taken by force, by the cruell and inhumane ***Spaniards***. Now we had certaine priſoners which Monſieur ***de Guiſe*** ſent away upon their faith, to whom was ſecretly imparted our laſt reſolution, wil and deſperate mindes; who being arrived in their Campe, I doe not deferre the publiſhing; which bridled the great impetuoſity, and will of the ſouldiers to enter any more into the Citty to cut our throates, and to enrich themſelves of our pillage. The Emperor having underſtood this deliberation of the great warriour, the Duke of *Guiſe*, put water in his wine, and reſtrained his great choller and furie, ſaying, He could not enter into the Citty without making a great ſlaughter, and butchery, and ſpill much blood, aſwell of the defendants, as of the aſſaillants, and that they ſhould be dead together, and in the end could have nothing elſe but a few aſhes, and that afterward it might be ſpoken of that, as of the deſtruction of ***Ieruſalem*** already made by *Titus* and ***Veſpaſian***. The Emperor then having underſtood our laſt reſolution, and ſeeing their little prevailing by their battery, and undermining, and the great plague which was in his whole army, and the indiſpoſition of the time; and the want of victualls and money, and that his ſouldiers forſooke him, and went away in great companies; concluded in the end to retire themſelves accompanied with the Cavallery of his Vantgard, with the greateſt part of his Artillery, and the Battalia; The Marqueſſe of ***Brandeborg*** was the laſt which uncampt, maintained by certaine bands of *Spaniards*, ***Bohemians***, and his ***Germane*** compaines, and there remained one day and a halfe after, to the great greefe of Monſieur *de Guiſe*, who cauſed foure peeces of Artillery to be brought out of the Citty, which he cauſed to be diſcharged at him on one ſide; and the other to haſten them to be gone, which he did full quickely, with all his Troopes. He being a quarter of a league from ***Mets*** was taken with a feare leaſt our Cavallery ſhould fall upon him in the Rere, which cauſed him to put fire to his munition powder, and leave certaine peeces of Artillery and much baggage which hee could not carry becauſe the Vantgard, and the Battalia, and great Cannons had too much broken the way. Our horſemen would by all meanes have gone out of the Citty to have fallen upon their breech. But Monſieur *de Guiſe* would never permit them, but on the contrary we ſhould rather make plaine their way, and make them bridges of gold and ſilver, and let them goe, being like to a good ſhepheard, who will not looſe one of his ſheepe. See now how our wellbeloved Imperialiſts went away from before the Citty of *Mets*, which was the day after *Chriſtmas* day, to the great contentment of the beſeiged, and honour of Princes, Captaines and Souldiers who had endured the travells of this ſeige the ſpace of two monthes. Notwithſtanding they did not all goe, there wanted twenty thouſand who were dead aſwell by Artillery, by the ſword, as alſo by the plague, cold, and hunger, and for ſpight they could not enter into the Citty to cut our throates, and have the pillage: and alſo a great number of their horſes dyed, of which they had eaten a great part in ſteed of Beefe and Bacon. They went where they had beene encamped, where they found divers dead bodyes not yet buried, and the earth all dihged like Saint *Innocents* Churchyard, in the time of the plague. They did likewiſe leave in their lodgings, pavillions and tents, divers ſick people: alſo bullets, armes, Carts, Waggons, & other baggage with a great many of Munition loaves ſpoyled and rotten by the raine and ſnow, yet the ſouldiers had it not but by weight and meaſure; & likewiſe they left great proviſion of wood, of the remainders of the houſes, of the Villages which they had pluckt downe 2 or 3 miles compaſſe, likewiſe divers other houſes of pleaſure belonging to the Cittizens accompanied with faire gardens, graſſe plotts fild with fruite trees, for without that they had beene ſterv'd with cold, and had beene conſtrained to have rais'd the ſeige ſooner. The ſayd Monſieur ***de Guiſe*** cauſed the dead to be buried, and dreſſe their ſicke people, likewiſe the enemies left in the Abby of S. *Arnoul* divers of their hurt ſouldiers which they could not leade with them: the ſayd Monſieur *de Guiſe* ſent them all Victualls enough and commanded me and other Chirurgions to goe dreſſe them and give them medicines; which we willingly did, and thinke they would not have done the like toward others (becauſe the *Spaniard* is moſt cruell, perfidious and inhumane, & therefore enimy to all nations) which is proved by *Lopez* a *Spaniard* & *Benzo* of *Milan* & others who have written the hiſtory of *America*, & the Weſt *Indies*, who have beene conſtrayned to confeſſe, that the cruelty, avarice, blaſphemy, and wickedneſſe of the *Spaniards*, have altogether alienated the poore *Indians*, from the religion which the ſayd *Spaniards* are ſayd to hold. And all write they are leſſe worth than the Idolatrous *Indians*, by the cruell uſage done to the ſayd *Indians*.

And a few dayes after we ſent a Trompet to *Thionville* toward the enemy, that they ſhould ſend backe for their wounded men in ſafety, which they did with Carts and Waggons, but not enough. Monſieur *de Guiſe*, cauſed them to have Carts and Carters, to helpe to carry them to the ſayd *Thionville*. Our ſayd Carters being returned backe, brought us word that the way was paved with dead bodyes, and that they never lead backe the halfe, for they dyed in their Carts, and the *Spaniards* ſeeing them at the point of death, before they had caſt out their laſt gaſpe, caſt them out of their Carts, and buryed them in the mudde, and mire, ſaying they had no order to bring backe the dead. Moreover our ſayd Carters ſayd, they met by the way divers Carts loaden with baggage ſticking in the mire, which they durſt not ſend for backe, for feare leaſt thoſe of *Mets* ſhould fall upon them. I will againe returne to the cauſe of their mortality, which was principally through honger, plague, and cold; for the ſnow was two foote thicke upon the earth, and they were lodged in the caves of the earth, onely covered with a little ſtraw. Notwithſtanding each ſouldier had his field bed, and a covering ſtrewed with glittering ſtarres, more bright than fine gold, and every day had white ſheetes, and lodg'd at the ſigne of the Moone, and made good cheere when they had it, and payd their hoſte ſo well over night, that in the morning they went away quitte, ſhaking their eares, and they needed no combe, to take away the doune out of their haires, either of head or beard, and found alwayes a white table cloath, loſing good meales for want of Victualls. Alſo the greateſt part of them had neither bootes, nor buskinnes, ſlippers, hoſe, or ſhooes, and divers had rather have none than have them, becauſe they were alwayes in mudde, halfe way of the legge; and becauſe they went bare leg'd, we called them the Emperors Apoſtles. After the Campe was wholly broaken, I diſtributed my patients into the hands of the Chirurgions of the Citty, to finiſh their cure: then I tooke leave of Monſieur *de Guiſe*, and came backe toward the King, who received me with a loving countenance, and demanded of me how I did enter into the Citty of *Mets*. I recounted to him, all that I had done, he cauſed two hundred crownes to be given me, and one hundred I had at my going out, and told me he would not leave me poore; then I thanked him moſt humbly of the good and the honour which he pleaſed to doe me.

The Voyage of Hedin, 1553.

CHarles the Emperor cauſed the Citty of *Therouenne* to be beſeiged, where Monſieur the Duke of *Savoy*, was Generall of the whole army: it was taken by aſſault where there was a great number of our men ſlaine and priſoners. The King willing to prevent that the enemy ſhould not alſo come to beſeige the Citty & Caſtle of *Hedin*, ſent *Meſſiers* the Duke *Bouillion*, the Duke *Horace*, the Marqueſſe of *Villars*, a number of Captaines, and about eight hundred ſouldiers, & during the ſeige of *Therouenne*, the ſayd Lords fortified the ſayd Caſtle of *Hedin*, in ſuch ſort that it ſeemed impregnable. The King ſent me to the ſayd Lords to helpe them with my Art, if there were any neede. Now ſoone after the taking of *Therouenne*, we were beſeiged with the army: there was a quicke cleare fountaine or Spring, within Cannon ſhot, where there was about foureſcore whores, and wenches of the enemies, who were round about it to draw water. I was upon a Rampart beholding the Campe, and ſeeing ſo many idlers about the ſayd fountaine, I prayed Monſieur *de Pont* Commiſſary of the Artillery, to make one Cannon ſhot, at that roguiſh company, he made me much deniall, anſwering me that ſuch kind of people were not worth the powder they ſhould waſte,

waſte. Againe I prayed him to levell the Cannon, telling of him, the more dead the fewer enemies; which he did through my requeſt, and at that ſhot fifteene or ſixteene were kild and many hurt. Our ſouldiers ſallied forth upon the enemies, where there was many kild, and ſlaine with musket ſhot and ſwords, as well on the one ſide, as of the other, and our ſouldiers did often make ſallyes forth upon the enemies before their trenches were made; where I had much worke cut out, ſo that I had no reſt night nor day for dreſſing the wounded. And I will tell this by the way, that we had put many of them in a great Tower, layd upon a little ſtraw, and their pillowes were ſtones, their coverlets were their cloakes, of thoſe that had any. Whilſt the battery was making, as many ſhot as the Cannons made, the patients ſayd they felt paine in their woundes, as if one had given them blowes with a ſtaffe, the one cry'd his head, the other his arme, and ſo of other parts; divers of their wounds bled afreſh yea in greater quantity than firſt when they were wounded, and then it was I muſt runne to ſtay their bleeding. My little maſter, if you had beene there, you had beene much troubled with your hot irons, you had neede to have had much charcoale to make them red hot, and beleeve they would have ſlaine you like a Calfe for this cruelty. Now through this diabolicall tempeſt of the Eccho from theſe thundring Inſtruments, and by the great and vehement agitation of the colliſion of the ayre reſounding and reverberating in the wounds of the hurt people, divers dyed, and others becauſe they could not reſt by reaſon of the groanes and cryes that they made, night and day; and alſo for want of good nouriſhment and other good uſage neceſſary to wounded people. Now my little maſter, if you had beene there, you would hardly have given them gelly, reſtauratives, culliſes, preſſures, panado, cleanſed barly, white meate, almond milke, Prunes, Raiſons, and other proper meates for ſicke people: your ordinance would onely have beene accompliſht in paper, but in effect they could have had nothing but old Cow beefe, which was taken about *Hedin* for our munition, ſalted and halfe boyled, inſomuch that who would have eate it he muſt pull it with the force of his teeth, as birds of Prey doe carrion. I will not forget their linnen wherewith they were dreſt, which was onely rewaſhed every day, and dryed at the fire, and therefore dry & ſtubborne like Parchment, I leave you to thinke how their wounds could heale well. There was foure luſty whores to whom charg was given to waſh their linnen, who diſcharged their duty under penalty of the batoone, and alſo they wanted both ſoape and water. See then how the ſicke people dyed for want of nouriſhments, and other neceſſary things. One day our enemies fained to give us a generall aſſault, to draw our Souldiers upon the breach, to the end to know our countenance and behaviour: every one ranne thither, we had made great proviſion of artificiall fire, to defend the breach; a Prieſt belonging to Monſieur *du Boüillon* tooke a granado, thinking to throw it on the enemies, and ſet it on fire ſooner then he ought to have done: it brake aſunder, and the fire fell amongſt our fire workes, which were put into a houſe neere the breach; which was to us a mervelous diſaſtre, becauſe it burned diverſe poore ſouldiers: it alſo tooke hold on the houſe it ſelfe, and we had beene all burned had not great helpe beene uſed for to quench it; there was but one Well there wherein was water in our Caſtle, which was almoſt quite dryed up, and in ſteede of water, we tooke beere and quenched it: then afterwards we had great ſcarcity of water; and to drinke the reſt that remained which we muſt ſtraine through napkins.

Now the enemy ſeeing this ſmoake and tempeſt of the fire workes which caſt a very great flame and claſhing noyſe, beleeved wee had put the fire on purpoſe for the defence of our breach, to burne them, and that wee had great ſtore of others. That made them to be of another opinion, than to take us by aſſault; they did undermine, and digge into the greateſt part of our walls, ſo that it was the way to overthrow wholly the Caſtle topſie turvie, and when the mines were finiſht, and that their Artillery ſhot, the whole Caſtle did ſhake under us, like an earthquake, which did much aſtoniſh us. Moreover he had levelled five peeces of Artillery which they had ſeated upon a little hill, to play upon our backes when wee ſhould goe to defend the breach.

The Duke *Horace* had a Cannon ſhot upon one ſhoulder, which caried away his arme on one ſide, and the body on the other, without being able to ſpeake one onely word. His death was to us a great diſaſture for the ranke which hee held in this place.

Likewiſe Monſieur *de Martigues* had a ſtroake with a Bullet which peirc't through his Lungs; I dreſt him, as I will declare hereafter. Then we demanded Parle, and a Trumpet was ſent toward the Prince of *Piedmont*, to know what compoſition it pleaſed him to make us: His anſwer was, that all the chiefe, as Gentlemen, Captaines, Lievtenants, and Enſignes, ſhould be taken for ranſome, and the Souldiers ſhould goe out without Armes; and if they refuſed this faire and honeſt proffer, the next day we ought to be aſſured they would have us by aſſault or otherwiſe. Counſell was held, where I was called to know if I would ſigne as divers Captaines, Gentlemen and others, that the place ſhould bee rendred up. I made anſwer it was not poſſible to be held, and that I would ſigne it with my proper blood, for the little hope that I had, that wee could reſiſt the enemies force, and alſo for the great deſire which I had to be out of this torment, and hell; for I ſlept not eyther night or day, by reaſon of the great number of hurt people, which were about two hundred. The dead bodies yeelded a great putrifaction, being heaped one upon the other like Fagots, and not being covered with earth becauſe we had it not; and when I entred into one lodging, Souldiers attended me at the dore to goe dreſſe others at another; when I went forth, there was ſtriving who ſhould have me, and they carried me like a holy body not touching the ground with my foote in ſpight one of another, nor could I ſatiſfie ſo great a number of hurt people. Moreover I had not what was neceſſary to dreſſe them withall; for it is not ſufficient that the Chirurgion doe his duty towards the patients, but the patient muſt alſo doe his, and the aſſiſtance, and all exterior things; witneſſe *Hippocrates* in his firſt *Aphoriſme*. Now having underſtood the reſolution of the yeelding up of our place, I knew our affaires went not well; and for feare of being knowne I gave a veluet Coate, a Satin doublet, a very fine cloth cloak lin'd with velvet, to a Souldier, who gave me a ſcurvy old torne doublet cut and ſlaſht with uſing, and a leather jerkin well examined, and an ill favoured hat, and a little cloake; I ſmutcht the collar of my ſhirt with water in which I had mingled a little ſoote; likewiſe I wore out my ſtockings with a ſtone at the knees and the heeles as if they had beene worne a long time, and I did as much to my ſhooes, in ſo much that they would rather take me for a Chimney ſweeper, than a Kings Chirurgion. I went in this equipage towards Monſieur *de Martigues*, where I pray'd him that he would take order that I might remaine neare him to dreſſe him, which he agreed to moſt willingly, and had as much deſire I ſhould remaine with him as I my ſelfe. Soone after, the Commiſſioners who had charge to elect the priſoners, entred into the Caſtle, the ſeaventeenth day of *Iuly* one thouſand five hundred fifty three, where they made *Meſſieurs* the Duke of *Boüillon*, the Marqueſſe of *Villars*, the Baron of *Culan*, Monſieur *du Pont* commiſſary of the Artillery, and Monſieur *de Martigues* and I to be taken through the requeſt that he made to them; and all other Gentlemen which they could perceive were able to pay any ranſome, and the moſt part of the Souldiers and the cheefe of the Companies, having ſuch, and ſo many priſoners as they would.

Afterward the *Spaniſh* Souldiers entred by the Breach without any reſiſtance, for ours eſteemed they would hold their faith and compoſition that they ſhould have their lives ſaved. They entred in with a great fury to kill, pillage, and riſle all they retained: ſome hoping to have ranſome, they tyed their ſtones with Arquebuſe cords, which was caſt over a Pike which two held upon their ſhoulders, then pulled the ſaid cord with a great violence and deriſion, as if they would ring a Bell, telling them that they muſt put themſelves to the ranſome, and tell of what houſes they were; and if they ſaw they could have no profit, made them cruelly dye betweene their hands, or preſently after their genitall parts would have falne into a Gangreene, and totall mortification; but they kild them all with their Daggers, and cut their throats. See now their great cruelty and perfidiouſneſſe, let him truſt to it that will. Now to returne to my purpoſe being lead from the Caſtle to the Citty with Monſieur *de Martigues*, there was a Gentleman of the Duke of *Savoyes*, who asked mee if Monſieur *de Martigues* wound was curable, I anſwered, not; who preſently went and told the Duke of *Savoy*; now I thought he would ſend Phyſitions and Chirurgions to viſit and dreſſe my ſaid Monſieur *de Martigues*: in the meane time I thought with my ſelfe whether I ought to make it nice and not to acknowledge my ſelfe a Chirurgion for feare leaſt they ſhould retaine mee to dreſſe their wounded, and in the end they would know I was the Kings Chirurgion, and that they would make me pay a great ranſome. On the other ſide I feared, if I ſhould not make my ſelfe knowne to bee a Chirurgion, and to have carefully dreſſed Monſieur *de Martigues*, they would cut my throate, ſo that I tooke a reſolution to make it appeare to them he would not dye for want of good dreſſing and looking to. Soone after, ſee, their arrives divers gentlemen accompanied with the Phyſition and Chirurgion to the Emperour, and thoſe of the ſaid Duke of *Savoy*, with ſixe other Chirurgions following the Army, to ſee the hurt of the ſaid Lord of *Martigues*, and to know of mee how I had dreſſed him, and with what medicines. The Emperours Phyſition bid me declare the eſſence of the wound, and how I had dreſt it. Now all the aſſiſtance had a very attentive eare to know if the wound were mortall or not: I began to make a diſcourſe that Monſieur *de Martigues* looking over the wall to perceive them that did undermine it, received a ſhot from an Arquebuſe quite through the body; preſently I was called to dreſſe him, I ſaw hee caſt blood out of his mouth, and his wounds. Moreover he had a great difficultie of breathing, and caſt out winde by the ſaid wounds with a whiſtling, in ſo much that it would blow out a Candle, and he ſaid he had a moſt ſharpe pricking paine at the entrance of the Bullet. I doe beleeve and thinke it might bee ſome little peeces of bones which prickt the Lungs. When they made their Syſtole and Diaſtole, I put my finger into him; where I found the entrance of the Bullet to have broken the fourth Rib in the middle and ſcales of bones which the ſaid Bullet had thruſt in, and the outgoing of it had likewiſe broken the fift Rib with peeces of bones which had beene driven from within outward; I drew out ſome but not all, becauſe they were very deepe and adherent. I put in each wound a Tent, having the head very large, tyed with a thread, leaſt by the inſpiration it might bee drawne into the capacity of the *Thorax*, which hath beene knowne by experience to the detriment of the poore wounded; for being fallen in, it cannot be taken out, which is the cauſe that engenders putrifaction, a thing contrary to nature. The ſaid Tents were annointed with a medicine compos'd of yolks of Egges, *Venice* Turpentine, with a little oyle of Roſes: My intention for putting the Tents was to ſtay the flux of blood, and to hinder that the outward ayre did not enter into the breaſt, which might have cooled the Lungs and by conſequent the heart. The ſaid Tents were alſo put, to the end that iſſue might bee given for the blood that was ſpilt within the *Thorax*. I put upon the wound great Emplaſters of *Diacalcitheos* in which I had relented oyle of Roſes and Vinigar to the avoyding of inflammation, then I put great ſtupes of *Oxycrate*, and bound him up, but not hard, to the end he might have eaſie reſpiration; that done I drew from him five porrengers of blood from the Baſilicke veine of the right arme, to the end to make revulſion of the blood which runs from the wounds into the *Thorax*, having firſt taken indication from the wounded part, and cheefely his forces, conſidering his youth and his ſanguine temper; Hee preſently after went to ſtoole, and by his urine and ſeege caſt great quantity of blood. And as for the paine which he ſaid he felt at the entrance of the Bullet which was as if he had beene pricked with a bodkin, that was becauſe the Lungs by their motion beate againſt the ſplinters of the broken Rib. Now the Lungs are covered with a coate comming from the membrane called *Pleura*, interweaved with nerves of the ſixt conjugation from the braine, which was cauſe of the extreame paine he felt; likewiſe he he had a great difficultie of breathing, which proceeded from the blood which was ſpilt in the capacitie of the *Thorax*, and upon the *Diaphragme*, the principall inſtrument of reſpiration, and from the dilaceration of the muſcles which are betweene each Rib, which helpe alſo to make the expiration and the inſpiration; and likewiſe becauſe the Lungs were torne and wounded by the Bullet, which hath cauſed him ever ſince to ſpit blacke and putrid blood in coughing. The Feaver ſeazed him ſoone after he was hurt, with faintings and ſwoonings. It ſeemed to mee that the ſaid feaver proceeded from the putredinous vapours ariſing from the blood which is out of his proper veſſells, which hath fallen downe, and will yet flow downe. The wound of the Lungs is growne great and will grow more great, becauſe it is in perpetuall motion, both ſleeping and waking, and is dilated and compreſt to let in the aire to the heart, and caſt fuliginous vapours out: by the unnaturall heate is made inflammation, then the expulſive vertue is conſtrained to caſt out by cough whatſoever is obnoxious unto it: for the Lungs cannot be purged but by coughing, & by coughing the wound is dilated, and growes greater, from whence the blood iſſues out in great aboundance, which blood is drawne from the heart by the veine arteriall to give them nouriſhment, and to the heart by the *vena cava*; his meate was barly broth, ſtewed prunes, ſometimes *panado*; his drinke was Ptiſan: He could not lye but upon his backe which ſhewed he had a great quantity of blood ſpilt within the capacity of the *Thorax*, and being ſpread or ſpilled along the ſpondills, doth not ſo much preſſe the Lungs as it doth being laid on the ſides or ſitting.

What ſhall I ſay more, but that the ſaid Lord *Martigues* ſince the time hee was hurt hath not repoſed one houre onely, and hath alwayes caſt out bloody urines and ſtooles. Theſe things then *Meſſieres* conſidered, one can make no other prognoſticke but that he will dye in a few dayes, which is to my great greefe. Having ended my diſcourſe I dreſt him as I was wont; having diſcovered his wounds, the Phyſitions and other aſſiſtants preſently knew the truth of what I had ſaid.

The ſaid Phyſitions having felt his pulſe and knowne his forces to be almoſt ſpent, and aboliſhed, concluded with mee that in a few dayes he would dye; and at the ſame inſtant went all toward the Lord of *Savoy*, where they all ſaid, that the ſaid Lord *Martigues* would dye in a ſhort time, he anſwered, it were poſſible if hee were well dreſt he might eſcape. Then they all with one voyce ſaid, hee had beene very well dreſt, and ſollicited with all things neceſſary for the curing of his wounds, and could not be better, and that it was impoſſible to cure him, and that his wound was mortall of neceſſity. The Monſieur *de Savoy* ſhewed himſelfe to bee very much diſcontented and wept, and asked them againe if for certaine they all held him deplored and remedileſſe, they all anſwered, yes. Then a certaine *Spaniſh* impoſtor offered himſelfe, who promiſed on his life that he would cure him, and if he failed to cure him, they ſhould cut him in an hundred peeces; but he would not have any Phyſitions, Chirurgions or Apothecaries with him. And at the ſame inſtant the ſayd Lord of *Savoy* told the Phyſitions and Chirurgions they ſhould not in any wiſe goe any more to ſee the ſayd Lord of *Martigues*. Alſo he ſent a Gentleman to me to forbid me upon paine of life not to touch any more the ſaid Lord of *Martigues*, which I promiſed not to doe; wherefore I was very glad, ſeeing he ſhould not dye in my hands, and commanded the ſaid impoſtor to dreſſe the ſaid Lord of *Martigues*. And that he ſhould have no other Phyſitions nor Chirurgions but him; he came preſently to the ſaid Lord of *Martigues*, who told him,

Senor Cavallero el ſenor Dugue me ha mandado que vinieſſe a curar voſtra herida, yo os juro á Dios que antes de acho dias yo os haga ſubir a Cavallo con la lanſa en puno contalque no ago que yo qúos togue, Comereis y bibereis todas comidas que fueren de voſtro guſto y yo hare la dieta pro V. m. y deſto os de veu aſeguirar ſobre de mi, yo he ſanado mun hos que tenian magores heridas que la Voſtra. That is to ſay, Lord *Cavalleere*, Monſieur the Duke of *Savoy* hath commanded me to come dreſſe thy wound; I ſweare to thee by God, that before eight dayes I will make thee mount on horſebacke with thy Lance in thy hand, provided, that no man may touch thee but my ſelfe; thou ſhalt eate and drinke any thing thou haſt a minde to, I will performe thy diet for thee, and of this thou maiſt be aſſured upon my promiſe, I have cured divers who have had greater wounds than thine: and the Lord replyed, God give you the grace to doe it.

He demanded of the ſayd Lord a ſhirt and tore it in little ragges, which hee put a croſſe, muttering, and murmuring certaine words over the wound; and having dreſt him, permitted him to eate and drinke what he would, telling him hee would obſerve a dyet for him, which he did, eating but ſix prunes and ſixe bits of bread at a meale, and drinking but beere. Notwithſtanding, two dayes after, the ſayd Lord of *Martigues* dyed; and my *Spaniard*, ſeeing of him in the agony, eclipſt himſelfe and got away without bidding, farewell to any body; and I beleeve if he had beene taken he had bin hang'd for his falſe promiſes, which he had made to Monſieur the Duke of *Savoy*, and to divers other gentlemen.

He dyed about tenne of the clocke in the morning, and after dinner, the ſayd Lord of *Savoy*, ſent Phyſitions and Chirurgions and his Apothecary, with a great quantity of Drogues, to embalme him; they came accompanied with divers gentlemen and Captaines of the Army.

The Emperors Chirurgion came neere to me, and prayed me kindly to open the body; which I refuſed, telling him I was not worthy to carry his plaſter boxe after him: he prayed me againe, which then I did for his ſake, if it ſo liked him. I would yet againe have excuſed my ſelfe, that ſeeing he was not willing to embalme him, that he would give this charge to another Chirurgion of the company; he made me yet anſwere, that he would it ſhould be I, and if I would not doe it, I might hereafter repent it: knowing this his affection, for feare he ſhould not doe me any diſpleaſure, I tooke the raſor and preſented it to all in particular, telling them I was not well practiſed to doe ſuch operations which they all refuſed.

The body being placed upon a table, truely I purpoſed to ſhew them that I was an Anatomiſt, declaring to them diverſe things, which ſhould be heere too long to recite. I began to tell all the company that I was ſure the bullet had broken two ribs, and that it had paſt through the Lungs, and that they ſhould finde the wound much enlarged, becauſe they are in perpetuall motion, ſleeping or waking, and by this motion the wound was the more dilacerated. Alſo that there was great quantity of blood ſpilt in the capacity of the breſt, and upon the midriffe, and ſplinters of the broken ribbes which were beaten in at the entrance of the bullet, and the iſſuing forth of it, had carried out. Indeed all which I had told them was found true in the dead body.

One of the Phyſitions asked me, which way the blood might paſſe to be caſt out by Vrine, being contained in the *Thorax*. I anſweared him that there was a manifeſt conduit, which is the *Vena Azygos*, who having nouriſht the ribbes, the reſt of the blood deſcends under the *Diaphragme*, and on the left ſide is conjoyned to the emulgent veine, which is the way by which the matter in *pleureſies* and in *Empiema*, doe manifeſtly empty themſelves by urine and ſtoole. As it is likewiſe ſeene, the pure milke of the breſts of women newly brought to bed, to deſcend by the *Mammillary* Veines, and to be evacuated downewards by the necke of the wombe without being mixt with the blood. And ſuch a thing is done (as it were by a miracle of nature) by her expulſive and ſequeſting vertue, which is ſeene by experience of two glaſſe veſſells called Mount-wine; let the one be filled with water, and the other with Claret wine, and let them be put the one upon the other, that is to ſay, that which ſhall bee filled with water, upon that which ſhall be filled with wine; and you ſhall apparently ſee the wine mount up to the top of the veſſell quite through the water, and the water deſcend atraverſe the wine, and goe to the bottome of the veſſell without mixture of both; and if ſuch a thing be done ſo exteriorly and openly to the ſenſe of our eye, by things without life: you muſt beleeve the ſame in our underſtanding. That nature can make matter and blood to paſſe, having beene out of their veſſells yea through the bones without being mingled with the good blood.

Our diſcourſe ended, I embalmed the body, and put it into a Coffinne; after that the Emperors Chirurgion tooke me apart, and told me if I would remaine with him that he would uſe me very well, and that he would cloath me anew, alſo that I ſhould ride on horſebacke. I thanked him very kindly for the honour he did me, and told him that I had no deſire to doe ſervice to ſtrangers, and enemies to my Countrey; then he told mee I was a foole, and if he were priſoner as I, hee would ſerve the divell to get his liberty. In the end I told him flat that I would not dwell at all with him.

The Emperors Phyſition returned toward the ſayd Lord of *Savoy*, where he declared the cauſe of the death of the ſayd Lord of *Martigues*, and told him that it was impoſſible for all the men in the would to have cured him; and confirmed againe, that I had done what was neceſſary to be done, and prayed him to winne mee to his ſervice, and ſpoke better of me than I deſerved.

Having beene perſwaded to take me to his ſervice, he gave charge to one of his ſtewards named Monſieur *du Bouchet*, to tell me, if I would dwell in his ſervice that he would uſe me kindly: I anſwered him, that I thank't him moſt humbly, and that I had reſolved not to dwell with any ſtranger. This my anſwer being heard by the Duke of *Savoy*, he was ſomewhat in choller, and ſayd, hee would ſend mee to the Gallies.

Monſieur *de Vaudeville*, Governour of *Gravelin*, and Colonell of ſeaventeene Enſignes of foote, prayed him, to give me to him, to dreſſe him of an Vlcer which he had in his Leg this ſix or ſeaven yeares; Monſieur *de Savoy* told him becauſe I was of worth, that he was content, and if I ranckled his Leg it would be well done; Hee anſwered that if hee perceaved any thing, that hee would cauſe my throate to be cut.

Soone after, the ſaid Lord of *Vaudeville* ſent for me by fowre Germane Halberdiers, which affrighted me much, not knowing whither they led mee, they ſpake no more *French* than I high *Dutch*; being arrived at his lodging, he told mee I was welcome, and that I was his; and as ſoone as I ſhould have cured him of that Vlcer in his Leg, that he would give me leave to be gone without taking any ranſome of me. I told him I was not able to pay any ranſome.

Then he made his Phyſition and Chirurgions in ordinary to ſhew mee his ulcerated Leg; having ſeene and conſidered it, we went apart into a Chamber where I began to tell them, that the ſaid Vlcer was annuall, not being ſimple but complicated: that is to ſay, of a round figure, and ſcaly, having the lips hard and callous, hollow and ſordid, accompanied with a great varicous veine which did perpetually feede it; beſides a great tumor, and a phlegmonous diſtemper very painefull through the whole Leg, in a body of cholericke complexion; as the haire of his face and beard demonſtrated. The method to cure it (if cured it could be) was to begin with univerſall things, that is, with purgation and bleeding, and with this order of dyet, that hee ſhould not uſe any wine at all, nor any ſalt meates, or of great nouriſhment, chiefely theſe which did heat the blood: afterward the cure muſt begun with making divers ſcarifications about the Vlcer, and totally cutting away the callous edges or lips, and giving a long or a triangular figure, for the round will very hardly cure, as the Ancients have left it in writing, which is ſeene by experience. That done, the filth muſt be mundified, as alſo the corrupted fleſh, which ſhould be done with *Vnguentum Ægyptiacum*, and upon it a bolſter dipt in juice of Plantaine and Nightſhade and *Oxycrate*, and roule the Leg beginning at the foote, and finiſhing at the knee, not forgetting a little bolſter upon the *Varicous* veine, to the end no ſuperfluities ſhould flow to the Vlcer. Moreover that he ſhould take reſt in his bed, which is commanded by **Hippocrates**, who ſaith, that thoſe who have ſoare Legs ſhould not uſe much ſtanding or ſitting, but lying along. And after theſe things done and the Vlcer well mundified, a plate of Lead rubbed with quickeſilver ſhould be applyed. See then the meanes, by which the ſaid Lord *Vaudeville* might be cured of the ſaid Vlcer; all which they found good. Then the Phyſition left mee with the Chirurgion, and went to the Lord *Vaudeville*, to tell him that he did aſſure him I would cure him, and told him all that I had reſolved to doe, for the cure of his Vlcer: whereof hee was very joyfull. He made mee to bee called to him, and asked me if I was of the opinion that his Vlcer could be cured, and I told him, yes, provided he would be obedient to doe what he ought. He made me a promiſe hee would performe all things which I would appoint; and as ſoone as his Vlcer ſhould be cured, he would give me liberty to returne without paying any ranſome. Then I beſeech't him to come to a better compoſition with me, telling him that the time would be too long to bee in liberty, if I ſtayd till hee was perfectly well, and that I hoped within fifteene dayes the Vlcer ſhould bee diminiſhed more than one halfe, and it ſhould bee without paine, and that his Phyſitions and Chirurgions would finiſh the reſt of the cure very eaſily. To which hee agreed, and then I tooke a peece of paper, and cut it the largeneſſe of the Vlcer, which I gave him, and kept as much my ſelfe. I prayd him to keepe promiſe, when he ſhould finde his buſineſſe done: He ſwore by the faith of a Gentleman he would doe it; then I reſolved to dreſſe him well, according to the method of *Galen*, which was, that after all ſtrange things were taken out of the Vlcer, and that there wanted nothing but filling up with fleſh, I dreſt him but once a day, and he found that very ſtrange. And likewiſe his phyſition which was but a freſh man in thoſe affaires, who would perſwade mee with the Patient, to dreſſe him two or three times a day, I prayd him to let me doe what I thought good; and that it was not to prolong the cure, but on the contrary to haſten it, for the great deſire I had to be in liberty. And that he would looke in *Galen* in the fourth book of the compoſition of medicaments *ſecundum genera*, who ſaith, that if a medicine doe not remaine long upon the part it profits not ſo much, as when it doth continue long, a thing which many Phyſitions have beene ignorant of, and have thought it hath beene better to change the Plaſter often. And this ill cuſtome is ſo inveterate and rooted, that the Patients themſelves accuſe oftentimes the Chirurgions of negligence, becauſe they doe not oftner remove their emplaſters; but they are deceived. For as you have underſtood and read in my workes in divers places: The qualities of all bodies which mutually touch, operate one againſt another, and both of them ſuffer ſomething, where one of them is much ſtronger than the other, by meanes whereof the ſaid qualities are united, they familiariſe with the time, although they are very much differing from the manner, that the quality of the medicament doth unite, and ſometimes becomes like to that of the body, which is a very profitable thing. Therefore they ſay, he is to be praiſed much who firſt invented not to change the Plaſters ſo often, becauſe it is knowne by experience, this is a good invention.

Moreover it is ſaid, great fault is committed to dreſſe Vlcers often in wiping of them hard, for one takes not away onely the unprofitable excrement, which is the *pus* or *Sanies* of the Vlcer, but the matter whereof the fleſh is engendred; wherefore for the reaſons aforeſaid it is not needefull to dreſſe Vlcers ſo often.

The ſaid Lord *Vaudeville*, would ſee whether that which I alledged out of *Galen* were true, and commanded the ſaid Phyſition to looke there, for that hee would know it; he cauſed the booke to be brought upon the table, where my ſaying was found true, and then the Phyſition was aſhamed, and I very joyfull. So that the ſaid Lord of *Vaudeville* deſired not to bee dreſſed but once a day, in ſo much that within fifteene dayes the Vlcer was almoſt cicatrized; the compoſition being made betweene us, I began to be merry. He made me eate and drinke at his Table, when there was not men of more great ranke with him.

He gave me a great red ſcarſe, which hee commanded me to weare. I may ſay I was as glad of it as a dog that hath a clog, for feare he ſhould goe into the vineyard and eate the grapes. The Phyſition and Chirurgion led mee through the Campe to viſit their hurt people, where I tooke notice what our enemies did; I perceived they had no more peeces of Cannon, but onely twenty five or thirty peeces for the field.

Monſieur *de Vaudeville* held Monſieur *de Bauge* priſoner, the brother of Monſieur *de Martignes* who dyed at *Hedin*. The ſaid Lord of *Bauge* was priſoner in the Caſtle of the heape of wood belonging to the Emperour, who had beene taken at *Theroüenne* by two *Spaniſh* Souldiers. Now the ſaid Lord of *Vaudeville* having looked well upon him, conceived he muſt be a Gentleman of ſome good houſe, and to be the better aſſured, he cauſed him to have his ſtockings pulled off, & ſeeing his ſtockings and his feete cleare and neate, together with his white fine ſocke, it confirmed him the better in his opinion, that it was a man was able to pay ſome good ranſome. He demands of the Souldiers if they would take thirty Crownes for their priſoner, and that he would give it to them preſently, to which they agreed willingly, becauſe they had neither meanes to keepe him, nor feede him; beſides they knew not his worth, therefore they delivered their priſoner into the hands of the ſaid Lord of *Vaudeville*, who preſently ſent him to the Caſtle of the heape of wood with a guard of foure Souldiers with other Gentlemen priſoners of ours. The ſaid Lord *Bauge* would not diſcover himſelfe, who hee was, and endured very much, being kept but with bread and water, and lay upon a little ſtraw. The ſaid Lord of *Vandeville* after the taking of *Hedin*, ſent word to the ſaid Lord *Bauge* and other priſoners, that the place of *Hedin* was taken, and the liſt of thoſe that had beene ſlaine, and amongſt the reſt reſt, Monſieur *de Martigues*, and when the ſaid Lord of *Bauge* heard the ſound of the death of his brother the Lord *Maatigues*, he began much to weepe and lament; his keeper demanded of him, why he made ſo many & ſo great lamentations? He declared unto them that it was for Monſieur *de Martigues* his brothers ſake. Having underſtood that, the Captaine of the Caſtle diſpatcht a man away quickly, to tell it to Monſieur *de Vandeville* that he had a good priſoner; who having received this good newes rejoyced greatly, and the next day ſent me with his Phyſition and foure Souldiers to the wood Caſtle to know if his priſoner would give him fifteene thouſand Crownes for a ranſome; he would ſend him free to his owne houſe, and for the preſent he deſired but the ſecurity of two Merchants of *Antwerp*, that hee would name. The ſaid Lord *Vaudeville* perſwaded me that I would make his agreement with his priſoner. See then why he ſent me to the wooden Caſtle, and commanded the Captaine of the Caſtle to uſe him well, and to put him into a Chamber hung with Tapeſtrie, and that they ſhould make his guard more ſtrong, and from that time they made him good cheare at his expence.

The anſwer of the ſaid Lord of *Bauge* was, that to put himſelfe to ranſome hee was not able; and that, that depended upon Monſieur *d'Eſtamps* his Vnckle, and of Miſtriſſe *de Breſſure* his Aunt, and that he had not any meanes to pay ſuch a ranſome. I returned with my keepers to the ſaid Lord *Vaudeville*, and told him the anſwer of his ſaid priſoner, who told me, Perhaps he ſhould not out at ſo good a rate, which was true, for he was diſcovered. And forthwith the Queene of *Hungary*, and the Duke of *Savoy* ſent word to the Lord *Vaudeville*, that this morſell was too great for him, and that he muſt ſend him to them, (which he did) and that he had enough priſoners beſides him: he was put to forty thouſand Crownes ranſome beſides other expenſes.

Returning toward the ſaid Lord *Vandeville* I paſſed by S. *Omer*, where I ſaw their great peeces of battery, whereof the greateſt part was flawed and broken. I came backe alſo by *Theroüenne*, where I did not ſee ſo much as ſtone upon ſtone, unleſſe the marke of a great Church. For the Emperour gave commandement to the country people within five or ſix leagues about, that they ſhould empty and carry away the ſtones; in ſo much, that now one may drive a Cart over the Citty, as is likewiſe done at *Hedin*, without any appearance of Caſtle or Fortreſſe. See then the miſcheefe which comes by the warres.

And to returne to my purpoſe, preſently after my ſaid Lord *Vaudeville* was very well of his Vlcer and little wanted of the entire cure, which was the cauſe hee gave me my leave, and made me be conducted with a Paſſeport by a Trumpet to *Abbeville*, where I tooke poſt, and went and found the King *Henry* my Maſter at *Auſimon*, who received me with joy, and a good countenance.

He ſent for the Duke of *Guiſe* the high Conſtable of *France*, and Monſieur *d'Eſtrez*, to underſtand by me what had paſt at the taking of *Hedin*; and I made them a faithfull report, and aſſured them I had ſeene the great peeces of Battery, which they had carried to S. *Omer*. Whereof the King was very joyfull, becauſe hee feared leaſt the enemy ſhould come further into *France*. He gave me two hundred Crownes to retire my ſelfe to my owne houſe, and I was very glad to bee in liberty and out of this great torment and noiſe of Thunder from the Diabolicke artillery, and farre from the Souldiers, blaſphemers and deniers of God. I will not omit to tell here that after the taking of *Hedin*, the king was advertiſed that I was not ſlaine, but that I was a priſoner, which his Majeſtie cauſed to be written to my wife by Monſieur *du Goguier* his cheefe Phyſition, and that ſhee ſhould not be in any trouble of mind for me, for that I was ſafe and well, and that he would pay my ranſome.

The Battell of S. *Quintin*. 1557.

AFter the battell of S. *Quintin*, the King ſent me to the Fere in *Tartemis* toward Monſieur the Marſhall of *Bourdillon*, to have a Paſſeport by the Duke of *Savoy* to goe to dreſſe Monſieur the Conſtable, who was grievouſly hurt with a Piſtoll ſhot in the backe, whereof hee was like to dye, and remained a priſoner in his enemies hands. But the Duke of *Savoy* would never give conſent that I ſhould goe to the ſaid Lord Conſtable, ſaying hee ſhould not remaine without a Chirurgion, and that he doubted I was not ſent onely to dreſſe him, but to give him ſome advertiſement, and that he knew I underſtood ſomething elſe beſides Chirurgery, and that he knew me to have beene his priſoner at *Hedin*. Monſieur the Marſhall of *Bourdillon* advertized the King of the Dukes deniall, by which meanes the King writ to the ſaid Lord of *Bourdillon*, that if my Lady, the Lord high Conſtables wife, did ſend any body of her houſe; which was an able man, that I ſhould give him a letter, and that I ſhould alſo have told him by word of mouth, what the King and Monſieur the Cardinall of *Lorraine* had given me in charge. Two dayes after there arrives a ſervant of the Lord Conſtables Chamber, who brought him ſhirts, and other linnen, for which the ſayd Lord Marſhall gave Paſſe-port, to goe to the ſayd Lord Conſtable; I was very glad thereof, and gave him my letter, and gave him his leſſon, of that which his Maſter ſhould doe, being priſoner. I had thought being diſcharged of my embaſſage to returne toward the King. But the ſayd Lord of *Bourdillon* pray'd me to ſtay with him at the Fere to dreſſe a great number of people who were hurt, and were thither retired after the battell; and that he would ſend word to the King, the cauſe of my ſtay; which I did. The wounds of the hurt people were greatly ſtincking, and full of wormes with Gangreene and putrifaction; ſo that I was conſtrayned to come to my knife to amputate that which was ſpoyld, which was not without cutting off armes and legges, as alſo to Trepan diverſe. Now there were not any medicines to be had at the Fere, becauſe the Chirurgions of our Campe had carried all with them; I found out that the Chariot of the Artillery tarried behind at the Fere, nor had it yet beene touched. I prayd the ſayd Lord Marſhall that he would cauſe ſome of the drogues to be delivered unto me which were in it; which he did, and there was given to me, one halfe onely at a time, and five or ſixe dayes after I way conſtrayned to take the reſt, neither was there halfe enough to dreſſe ſo great a number of the people, and to correct and ſtay the putrifaction, and to kill the wormes which were entred into their wounds; I waſhed them with *Ægyptiacum* diſſolved in wine and *Aqua vita*, and did for them, all which I could poſſible, yet notwithſtanding all my diligence, very many of them dyed.

There were Gentlemen at the Fere who had charge to finde out the dead body of Monſieur *de Bois-Dolphin* the elder, who had beene ſlaine in the battell; they prayed me to accompany them to the Campe to finde him out amongſt the dead, if it were poſſible, which indeed was impoſſible; ſeeing that the bodyes were all diſfavoured and overwhelmed with putrefaction. We ſaw more than halfe a league about us the earth covered with dead bodyes; neither could we abide long there, for the cadaverous ſents, which did ariſe from the dead bodyes, aſwell of men, as of horſes. And I thinke we were the cauſe, that ſo great a number of flyes, roſe from the dead bodees, which were procreated by their humidity and the heate of the Sunne, having their tayles greene and blew; that being up in the ayre made a ſhaddow in the Sunne We heard them buzze, or humme, which was much mervaile to us. And I thinke it was enough to cauſe the Plague, where they alighted. (My little maſter) I would you had beene there as I was, to diſtinguiſh the ordures and alſo to make report to them which were never there. Now being cloyed and annoyed in that Countrey, I prayd Monſieur the Lord Marſhall, to give me my leave to be gone, and that I was affrayd I ſhould be ſicke, by reaſon of my too great paines, and the ſtinckes which did ariſe from the wounded bodyes, which did almoſt all dye, for what diligence ſoever was uſed unto them. He made other Chirurgions, to come finiſh the dreſſing of the ſayd hurt people, and I went away with his good grace and favour. He wrote a letter to the King, of the paines I had taken with the poore wounded. Then I returned to *Paris*, where I found yet many Gentlemen who had beene hurt, and were there retired after the battell.

The Voyage of the Campe of Amiens, 1558.

THe King ſent me to *Dourlan*, and made me to be conducted by Captaine *Govaſt* with fifty men in armes, for feare I ſhould be taken by the enemies. And ſeeing that in the way we were alwayes in alarums, I cauſed my man to alight, making him to be my maſter for that time, and I got upon his horſe, which carryed my male, and tooke his cloake and hat, and gave him my ambling Mare. My man being upon her backe, one would have taken him for the maſter, and I for the ſervant. Thoſe of *Dourlan* ſeeing us farre off, thought we were enemies, and let flye their Cannon ſhot at us. Captaine *Govaſt* my conductor, made ſigne with his hat, that we were not enemies, ſo that they left ſhooting, and we entred into *Dourlan* with great joy. Thoſe of *Dourlan* made a ſally forth, upon the enemies five or ſixe dayes before, who kild and hurt diverſe of our Captaines, and good ſouldiers; and amongſt the reſt Captaine St. *Aubin* valiant at the ſword, whom Monſieur *de Guiſe* loved very well, and for whom chiefely the King ſent me thither, who being in the fit of a quartaine feaver, would needes goe out to command the greateſt part of his company: a *Spaniard* ſeeing him that he commanded, perceived hee was a Captaine, and ſhot a musket bullet quite through his necke; my Captaine Saint *Aubin* thought with this ſtroake he was dead, and with the feare (I proteſt to God) he loſt his quartane ague, and was altogether freed from it. I dreſſed him with *Anthony Portall* Chirurgion in ordinary to the King, and divers other Souldiers: ſome dyed, others eſcaped quit with the loſſe of a legge, or an arme, or the loſſe of an eye, and they ſayd they eſcaped good cheape, eſcape that can. When the enemie had broke their Campe, I returned to *Paris*. Heere I hold my peace of my little maſter, who was more at eaſe in his houſe than I at the Warres.

The voyage of Harbor *of Grace*, 1563.

YEt I will not omit to ſpeake of the voyage of the *Harbor* of Grace; then when they made the approaches to plant the Artillery, the Engliſh who were within it kild ſome of our Souldiers, & divers Pioners, who undermined, who when they were ſeene to be ſo hurt that there was no hope of curing, their fellowes ſtript them & put them yet alive, in the mines, which ſerved them for ſo much filling earth. The *Engliſh* ſeeing they could not withſtand an aſſault, becauſe they were very much attainted with diſeaſes, and chiefely with the Plague, they yeelded, their lives and jewells ſaved. The King cauſed them to have ſhippes to returne to *England*, being glad to be out of this place infected with the Plague: the greateſt part dyed, and carryed the Plague into *England*, and ſince have not yet beene exempted. Captaine *Sarlabous* maſter of the Campe, was left there in garriſon, with ſixe Enſignes on foote, who had no feare of the Plague, and were very joyfull to enter therein, hoping there to make good cheere. My little maſter had you beene there you had done as they.

The Voyage to Roüen, 1562.

NOw for the taking of *Roüen* they kild divers of ours before the aſſault, and at the aſſault: the day after they entred into the Citty, I Trepaned eight or nine, who were hurt at the breach with the ſtroakes of ſtones. There was ſo malignant an ayre, that divers dyed, yea of very ſmall hurts, inſomuch that ſome thought they had poyſoned their bullets: thoſe within ſayd the like by us, for although they were well treated in their neceſſities within the Citty, yet they dyed alſo aſwell as thoſe without. The King of *Navar* was hurt in the ſhoulder with a bullet ſome few dayes before the aſſault; I viſited and helpt to dreſſe him, with his owne Chirurgion, named

med Maſter *Gilbert* one of the chiefe of *Montpelier*, and others. They could not finde the bullet, I ſearcht for it very exactly, I perceived by conjecture, that it was entred by the head of the *Adiutorium*, and that it had runne into the cavity of the ſayd bone, which was the cauſe we could not finde it. The moſt part of them ſayd it was entred and loſt within the cavity of the body. Monſieur the Prince of the *Rocke upon Yon*, who intimately loved the King of *Navarre*, drew me to one ſide, and aſkt me if the wound was mortall. I told him yea, becauſe all wounds made in great joynts, and principally contuſed wounds, were mortall according to all Authors who have written of them. He enquired of the others what they thought, and cheefely of the ſayd *Gilbert*, who told him that hee had great hope that the King his maſter, would be cured, and the ſayd Prince was very joyfull. Foure dayes after the King and the Queene mother, Monſieur the Cardinall of *Bourbon* his brother, Monſieur the Prince of *Rocke upon Yon*, Monſieur *de Guiſe*, and other great perſonages, after we had dreſſed the King of *Navarre*, cauſed a conſultation to be made in their preſences, where there was diverſe Phyſitions and Chirurgions: each man ſayd what ſeemed good unto him, and there was not one of them, who had not good hope of him; ſaying that the King would be cured, and I perſiſted alwayes on the contrary.

Monſieur the Prince of the *Rocke upon Yon* who loved me, withdrew me aſide, and ſayd I was onely againſt the opinion of all the reſt, and prayd me not to be obſtinate againſt ſo many worthy men. I anſwered him, that when I ſaw any good ſignes of cure, I would change my adviſe. Divers conſultations were made, where I never changed my word, and prognoſticke, ſuch as I had made at the firſt dreſſing, and alwayes ſayd that the arme would fall into a Gangreene, which it did, what diligence ſoever could be had to the contrary; and gave up his ſoule to God the eighteenth day of his hurt. Monſieur the Prince *Vpon Yon*, having heard of the death of the ſayd King, ſent his Phyſition and Chirurgion toward me, named *Feure* now in ordinary to the King, and to the Queene Mother, to tell me, that he would have the bullet taken out, and that it ſhould be lookt for in what place ſo ever it could be found: then I was very joyfull, and told them that I was well aſſured to finde it quickely, which I did in their preſences, and divers gentlemen. It was lodged in the very midſt of the cavity of the Adiutory bone. My ſayd Prince having it, ſhewed it to the King and the Queene, who all ſayd, my prognoſticke was found true. The body was layd to reſt in the Caſtle Galliard, and I returned to *Paris*, where I found divers hurt men who were hurt at the breach at *Roüen*, and cheefely *Italians*, who deſired me very much to dreſſe them, which I did willingly; there were divers that recovered; and others dyed. I beleeve (my little maſter) you were called to dreſſe ſome of them, for the great number there was of them.

The Voyage of the battell of Dreux 1562.

THe day after the battell given at *Dreux*, the King commanded me, to goe dreſſe Monſieur the Count of *Eu*, who had beene hurt with a Piſtoll ſhot in the right thigh, neere the joynt of the hippe; which fractured and broke the *Os femoris* in divers places, from whence divers accidents did ariſe, and then death, which was to my great greefe. The day after my arrivall I would goe to the field, where the battell was given, to ſee the dead bodyes; I ſaw a league about, all the earth covered, where there was by eſtimation five and twenty thouſand men, or more. All which were diſpatcht in the ſpace of two houres. I would (my little maſter) for the love I beare you, that you had beene there to recount it to your ſchollers and to your children. Now in the meane time while I was at *Dreux* I viſited and dreſt a great number of gentlemen and poore Souldiers, & amongſt the reſt many *Swiſſer* Captaines, I dreſſed 14 in one chamber, onely all hurt with Piſtoll ſhot, and other inſtruments of Diabolicall fire, and not one of the fourteene dyed. Monſieur the Count of *Eu* being dead, I made no long tarrying at *Dreux*: there came Chirurgions from *Paris* who performed well their duty toward the hurt people, as *Pigray*, *Cointeret*, *Hubert*, and others; and I returned to *Paris*, where I found diverſe gentlemen wounded, who had retired themſelves thither after the battell to be dreſt of their hurts.

The Voyage of the battell of Moncontor. 1569.

DVring the battell of *Moncontour* King *Charles* was at *Pleſſei* the Towers, where he neard they had wonne it; a great number of hurt gentlemen and Souldiers withdrew themſelves into the Citty and ſuburbes of Towers, to be dreſt and helpt, where the King and Queene Mother commanded me to ſhew my duty with the other Chirurgions, who were then in quarter, as *Pigray, du Bois, Portail*, and one named *Siret*, a Chirurgion of *Towers*, a man very skilfull in Chirurgery, and at that time Chirurgion to the Kings brother; and for the multitude of the wounded wee were but little in repoſe, nor the Phyſitions likewiſe. Count *Mansfield* Governer of the *Duchy* of *Luxembourge*, Knight of the King of *Spaines* order, was greatly hurt in the battell, in the left arme, with a Piſtoll ſhot, which broke a great part of the joynt of the elbow, and had retired himſelfe to *Bourgueil* neere *Towers*; being there he ſent a gentlemen to the King, affectionately to beſeech him to ſend one of his Chirurgions to helpe him in his hurt. Counſell was held what Chirurgion ſhould be ſent. Monſieur the Marſhall of *Montmorency* told the King and the Queene, that it were beſt to ſend him his cheefe Chirurgion, and declared to them that the ſayd Lord *Mansfield* was one part of the cauſe of winning the battell. The King ſayd flat he would not that I ſhould goe, but would have me remaine cloſe to him. Then the Queene Mother ſayd, I ſhould but goe and come, and that he muſt conſider it was a ſtrange Lord, who was come from the King of *Spaines* ſide, to help and ſuccour him. And upon this he permitted me to goe, provided that I ſhould returne quickly. After this reſolution he ſent for me, and likewiſe the Queene Mother, and commanded me to goe finde the ſayd Lord *Mansfield* in the place, where I was to ſerve him in all I could, for the cure of his hurt; I went and found him, having with me a letter from their Majeſties: having ſeene it, he received me with a good will, and from thenceforth diſcharged three other Chirurgions that dreſt him; which was to my great greefe, becauſe his hurt ſeemed to me uncureable. Now at *Bourgueil* there were retired divers gentlmen, who had beene hurt at the ſayd battell, knowing that Mounſieur *de Guiſe* was there, who had beene alſo very mnch hurt with a Piſtoll ſhot through one legge, well aſſured that he would have good Chirurgions to dreſſe him, and alſo that hee being kind and liberall, would aſſiſt them with a great part of their neceſſities. And for my part, I did helpe and ayd them in my Art as much as it was poſſible; ſome dyed, ſome recovered, according to their hurts. The Count *Ringrave* died, who had ſuch a ſhot in the ſhoulder, as the King of *Navarre* before *Roüen*; Monſieure *de Baſſompiere* Colonell of twelve hundred horſe, was hurt alſo in ſuch a like place as Count *Mansfield*, whom I dreſt and God cured. God ſo well bleſſed my worke that within three weekes I led him back to *Paris*, where I muſt yet make ſome inciſions in the arme of the ſayd Lord *Mansfield*, to draw out the bones which were greatly broken and caries'd, he was cured by the grace of God, and gave me an honeſt reward, ſo that I was well contented with him and he with me, as he hath ſince made it appeare: he writ a letter to the Duke of *Aſcot* how that he was cured of his hurt, and alſo Monſieur *de Baſſompiere* of his, and divers others, which I had dreſſ't after the battell of *Montcontour*, and counſelled him to beſeech the King of *France* my good maſter, to give me leave to goe ſee Monſieur the Marqueſſe of *Auret* his brother.

Voyage of Flanders.

MOnſieur the Duke of *Aſcot* did not faile to ſend a Gentleman to the King with a letter, humbly to beſeech him to doe him ſo much good and honour, as to permit and command his cheefe Chirurgion to come ſee the Marqueſſe of *Auret* his brother; who had received a Musket ſhot neare the knee, with fracture of the bone, about ſeaven monthes ſince, with the Phyſitions and Chirurgions in thoſe parts were much troubled to cure. The King ſent for me, and commanded me to goe ſee the ſaid Lord *Auret*, and to helpe him in all that I could for the cure of his hurt; I told him I would imploy all that little knowledge which it had pleaſed God to give me. I went then conducted by two Gentlemen to the Caſtle of *Auret*, which is a league and a halfe from *Mounts* in *Hainaut*, where the ſaid Marqueſſe was: as ſoone as I arrived I viſited him, and told him the King had commanded me to come ſee him, and to dreſſe him of his hurt; he told me he was glad of my comming, and was much bound to the King to have done him the honour, to have ſent me to him. I found him in a great Feaver, his eyes very much ſunke, with a countenance gaſtly and yellow, his tongue drie and rough, and all the body emaciated and leane, his ſpeech low like that of a dying man: then I found his thigh much ſwelled, apoſtemated, ulcerated, and caſting out a greene ſtinking matter; I ſearcht it with a ſilver probe, and by the ſame I found a cavity neare the groyne, ending in the middle of the thigh, and others about the knee, ſanious and cuniculous; alſo certaine ſcales of bones ſome ſeparated, others not. The Legge was much tumified, and ſoaked with a pituitous humor, cold, moiſt, and flatulent; in ſo much that the naturall heate was in the way to be ſuffocated, and extinguiſhed, and the ſaid Legge crooked and retracted toward the buttockes, his rumpe ulcerated the breadth of the palme of an hand, and he ſaid he felt there a great paine and ſmarting, and likewiſe in his reines, in ſo much that hee could not take any reſt night or day; neither had hee any appetite to eate, but to drinke enough; it was told mee hee fell often into faintings and ſwoonings, and ſometimes as it were into an Epilepſie, and had oftentimes deſire to vomit, with ſuch a trembling that hee could not carry his hands to his mouth. Seeing and conſidering all theſe great accidents, and the forces much abated; truly I was much grieved to have gone to him, becauſe me thought there was little appearance that he could eſcape. Notwithſtanding to give him courage and good hope, I told him, that I would quickly ſet him on foote by the grace of God, and the Phyſitions and Chirurgions helpe. Having ſeene him, I went a walking into a Garden, where I prayed to God that hee would give me the grace to cure him, and that hee would give a bleſſing to our hands, and medicaments, to combate againſt ſo many complicated maladies. I bethought in my minde the wayes I muſt keepe to doe it. They called mee to dinner, I entred into the kitchin where I ſaw taken out of a great pot, halfe a Mutton, a quarter of Veale, three great peeces of Beefe, and two Pullets, and a great peece of Bacon, with great ſtore of good Hearbes. Then I ſaid to my ſelfe this broth was full of juice, and of good nouriſhment; After dinner all the Phyſitions and Chirurgions aſſembled, we entred into conference in the preſence of Monſieur the Duke of *Aſcot*, and ſome Gentlemen that did accompany him; I began to tell the Chirurgions that I mervailed much they had made no apertions in the Marqueſſes thigh, which was all apoſtemated, and the matter which iſſued out was very foule and ſtinking, which ſhewed it had a long time lurked there, and that I had found with my probe a *Caries* in the bone, and ſmall ſcales which were already ſeparated; they made mee anſwer, hee would never give conſent, and likewiſe it was almoſt two monthes ſince they could winne him to put on cleane ſheets on his bed, neither duſt one ſcarce touch the coverlet, he feelt ſo great paine. Then ſaid I, for to cure him, we muſt touch other things than the coverlet of the bed. Each one ſaid what hee thought beſt of the Lords greefe, and for concluſion held it altogether deplorable. I told them there was yet ſome hope, becauſe of his youth, and that God and nature doe ſometime ſuch things which ſeeme to Phyſitions and Chirurgions to bee impoſſible. My conſultation was, that all theſe accidents were come by reaſon of the bullet hitting neare the joynt of the knee, which had broken the Ligaments, tendons, and *aponeuroſes* of the muſcles which tye the ſayd joynt together with the *Os femoris*; alſo nerves, veines, and arteries from whence had followed paine, inflammation, apoſteme and ulcer: and that wee muſt begin the cure by the diſeaſe, which was the cauſe of all the ſayd accidents, that is to ſay, to make apertions to give iſſue to the matter reteined in the interſpaces of the muſcles, and in the ſubſtance of them: Likewiſe to the bones which cauſed a great corruption in the whole thigh, from whence the vapors did ariſe and were carryed to the heart, which cauſed the ſincope, and the feaver; and the feaver an univerſall heate through the whole body; and by conſequent, depravation of the whole *Oeconomie*; Likewiſe that the ſaid vapours were communicated to the braine, which cauſed the Epilipſie, and trembling, and to the ſtomacke diſdaine and loathing, and hindred it from doing his functions, which are cheefely to concoct and diſgeſt the meate, and to convert it into *Chylus*; which not being well concocted, they ingender crudities and obſtructions, which makes that the parts are not nouriſhed, and by conſequent the body dryes, and growes leane; and becauſe alſo it did not doe any exerciſe, for every part which hath not his motion remaineth languid, and *atrophiated*, becauſe the heate & ſpirits are not ſent or drawne thither, from whence followes mortification. And to nouriſh and fatten the body, frictions muſt be made univerſally through the whole body, with warme linnen cloathes, above, below, on the right ſide, and left, and round about: to the end to draw the blood and ſpirits from within outward, and to reſolve any fuliginous vapours retained betweene the skinne, and the fleſh; thereby the parts ſhall be nouriſhed and reſtored, (as I have heretofore ſayd in the tenth booke treating of wounds of Gunſhot) and wee muſt then ceaſe when we ſee heate and redneſſe in the skinne, for feare of reſolving that wee have already drawne, and by conſequent make it become more leane. As for the Vlcer which he had upon his rumpe, which came through too long lying upon it without being remooved, which was the cauſe that the ſpirits conld not floriſh or ſhine in it; by the meanes of which there ſhould bee inflammation, apoſteme and then ulcer, yea with loſſe of ſubſtance of the ſubject fleſh, with a very great paine; becauſe of the nerves which are diſſeminated in this part. That wee muſt likewiſe put him into another ſoft bed, and give him a cleane ſhirt, and ſheets; otherwiſe all that wee could doe would ſerve for nothing, becauſe that thoſe excrements and vapors of the matter retained ſo long in his bed, are drawne in by the Syſtole and Diaſtole of the Arteries which are diſſeminated through the skin, and cauſe the ſpirits to change and acquire an ill quality and corruption, which is ſeene in ſome that ſhall lye in a bed where one hath ſweate for the Pox, who will get the Pox by the putrid vapours which ſhall remaine ſoaked in the ſheets and coverlets. Now the cauſe why he could in no wiſe ſleepe, and was as it were in a conſumption, t'was becauſe he eate little, and did not doe any exerciſe, and becauſe hee was grieved with extreame paine. For there is nothing that abateth ſo much the ſtrength as paine. The cauſe why his tongue was dry and fowle, was through the vehemence of the heate of the feaver, by the vapors which aſcended through the whole body to the mouth. For as we ſay in a common proverbe, when an Oven is well heate, the throate feeles it. Having diſcourſed of the cauſes and accidents, I ſayd they muſt be cured by their contraries, and firſt we muſt appeaſe the paine, making apertions in the thigh to evacuate the matter retained, not evacuating all at a time for feare leaſt by a ſodaine great evacuation there might happen a great decay of ſpirits, which might much weaken the patient and ſhorten his dayes. Secondly, to looke unto the great ſwelling and cold in his Legge, fearing leaſt it ſhould fall into a Gangreene; and that actuall heate muſt bee applyed unto him becauſe the potentiall could not reduce the intemperature, *de potentia ad actum*; for this cauſe hot brickes muſt bee applyed round about, on which ſhould bee caſt a decoction of nervall hearbes boyled in wine and Vinegar, then wrapt up in ſome napkin, and to the feete an earthen bottle filled with the ſayd decoction, ſtopt and wrapt up with ſome linnen clothes; alſo that fomentations much be made upon the thigh, and the whole

Legge, of a decoction made of Sage, Roſemary, Time, Lavender, flowers of Camomile, melilot, and red Roſes boyled in white wine, and a *Lixivium* made with oake aſhes with a little Vinegar, and halfe an handfull of ſalt. This decoction hath vertue to attenuate, inciſe, reſolve and drye the groſſe viſcous humor. The ſayd fomentations muſt bee uſed a long while, to the end there may bee a greater reſolution; for being ſo done a long time together, more is reſolved than attracted, becauſe the humor contained in the part is liquified, the skin and the fleſh of the muſcles is rarified. Thirdly, that there muſt be applyed upon the rumpe a great emplaſter made of the red deſiccative and *Vnguentum Comitiſſæ* of each equall parts incorporated together, to the end to appeaſe his paine and dry up the Vlcer, alſo to make him a little downe pillow which might beare his rumpe aloft without leaning upon it. Fourthly to refreſh the heate of his kidneys one ſhould apply the unguent called *Refrigerans Galeni* freſhly made, and upon that the leaves of water Lillies. Then a napkin dipt in *Oxycrate*, wrung out and often renewed: and for the corroboration and ſtrengthning of his heart a refreſhing medicine ſhould bee applyed made with oyle of *nenuphar*, and unguent of Roſes and a little ſaffron diſſolved in Roſe Vinegar, and Treakle ſpread upon a peece of Scarlet: For the *Sincope* which proceded from the debilitation of the naturall ſtrength troubling the braine. Alſo he muſt uſe good nouriſhment full of juice, as rere egges, Damaske prunes ſtewed in wine and ſugar, alſo *Panado* made with the broth of the great pot (of which I have already ſpoken) with the white fleſhy parts of Capons, and Partridge wings minced ſmall, and other roſtmeate eaſie of diſgeſtion, as Veale, Goate, Pigeon, Partridge, and the like. The ſauce ſhould be Orenges, Verjuice, Sorrell, ſharpe Pomegranets; and that he ſhould likewiſe eate of them boyled with good hearbes; as Sorrell, Lettice, Purſlan, Succory, Bogloſſe, Marygolds, and other the like. At night hee might uſe cleanſed barley with juice of *Nenuphar* and Sorrell, of each two ounces, with five or ſix graines of *Opium* and of the foure cold ſeedes bruiſed, of each halfe an ounce, which is a remedy nouriſhing and medicinall, which will provoke him to ſleepe: that his bread ſhould be of Meſlin, neither too new nor too ſtale; and for the great paine of his head, his haire muſt be cut, and rub his head with *Oxirrhodinum* luke warme, and leave a double cloth wet therein upon it; likewiſe ſhould be made for him a frontall of oyle of Roſes, *Nenuphar*, Poppies, and a little *opium* and Roſe Vinegar, and a little Campher and to renew it ſometimes. Moreover one ſhould cauſe him to ſmell to the flowers of Henbane and *Nenuphar* bruiſed with Viniger Roſewater, and a little campher wrapped in a handkercher, which ſhall be often and a long time held to his noſe to the ead that the ſmell may be communicated to the braine, and theſe things to be continned till that the great inflammation and paine be paſt, for feare of cooling the braine too much. Beſides, one may cauſe it to raine artificially in powring downe from ſome high place into a kettle, and that it make ſuch a noyſe that the patient may heare it, by theſe meanes ſleepe ſhall bee provoked on him. And as for the retraction of his Legge that there was hope to redreſſe it, when evacuation was made of the matter and other humors contained in the thigh, which by their extention (made by repletion) have drawne backe the Leg, which might be remedied in rubbing the whole joynt of the knee with *Vnguentum Dialthæa* and oyle of Lillies, and a little *aqua vitæ*, and upon it to be laid, blacke wooll with the greaſe thereof. Likewiſe putting in the hamme a feather-pillow foulded in double, and by little and little to make his Leg to ſtretch out. All which my diſcourſe was well approoved of by the Phyſitions and Chirurgions: the conſultation ended wee went to the ſicke patient, and I made him three apertions in his thigh, from whence iſſued out great quantity of matter and *Sanies*; and at the ſame time I drew out ſome ſcales of bones, nor would I let out too much aboundance of the ſaid matter for feare of too much decaying his ſtrength: Then two or three houres after I cauſed a bed to bee made neare his owne, where there were cleane white ſheets then a ſtrong man lifted him into it, and rejoyced much in that hee was taken out of his foule ſtinking bed. Soone after hee demanded to ſleepe, which hee did almoſt foure houres, where all the people of the houſe began to rejoyce, cheefely Monſieur the Duke of *Aſcot* his brother.

The dayes following I made injections into the bottome and cavities of the Vlcer, made with *Ægyptiacum*, diſſolved ſometimes in *aqua vitæ*, and ſometimes in wine. I applyed to mundifie and dry the ſpongie and looſe fleſh, bolſters, at the bottome of the ſinuoſityes hollow tents of Lead, that the *Sanies* might have paſſage out; and upon it a great Emplaſter of *Diacalcitheos* diſſolved in wine: likewiſe I did rowle it with ſuch dexterity, that he had no paine, which being appeaſed the fever began much to diminiſh. Then I made him drinke wine moderately allayed with water, knowing that it reſtores and quickens the ſpirits: and all the things which we reſted on in the conſultation were accompliſht, according to time, and order; and his paines and fever ceaſed, he began to grow better, and diſcharged two of his Chirurgions, and one of his Phyſitions, ſo that we were but three with him. Now I remained thereabout two monethes, which was not without ſeeing divers ſicke people, as well rich as poore which came to me three or foure leagues about. They gave meate and drinke to the needy, all which he recommended to me, and prayed me alſo for his ſake to helpe them. I proteſt I did not refuſe any one, and did to them what I poſſibly could, whereof he was joyfull. Then when I ſaw he began to mend, I told him hee muſt have a conſort of Violons & a jeſter to make him merry, which he did: in one moneth we ſo wrought, that he could hold himſelfe up in a chaire, and made himſelfe to be carried and walke in his garden, and at the gate of his Caſtle to ſee the people paſſe by. The Countrey people of two or three leagues about, knowing they could ſee him, came the feaſt day male and female, to ſing and dance pell mell, in joy of his amendment, all being very glad to ſee him, which was not done without good laughing and drinking. He caus'd ſtill a barrell of beere to be given them, and they dranke all merrily to his good health. And the Cittizens of *Mont Hainaut* and other gentlemen neighbours came to ſee him in admiration, as a man coming from the tombe. And as ſoone as he began to mend, he was not without company, and as one went out another came in, to viſite him: his table was alwayes well covered. Hee was greatly loved of the Nobility, and of the common people, as well for his liberality as by reaſon of his beauty, and honeſty, having a pleaſant looke and a gracious ſpeech, inſomuch that thoſe that beheld his face were conſtrained to love him. The cheefe of the City of *Monts* came on Saturday to beſeech him to permit mee to goe to *Monts*, where they had a great deſire to feaſt, and make me good cheere for his ſake. He told them he would pray me to goe there, which he did. But I made them anſwere that they ſhould not doe me ſo much honour, as alſo that they could not give me better cheere than I had with him. And he prayed mee againe affectionately to goe thither, and that I ſhould doe that for his ſake, to which I agreed. The day after they fetcht me with two Coaches, and being arrived at *Monts* we found the dinner ready, and the cheefe of the Citty with their wives, ſtayed for mee with a good will. We went to the Table and they placed me at the upper end, and dranke all to me, and to the health of Monſieur *D'auret*, ſaying that he was very happy, and they likewiſe to have obtained me to take him in hand, for that they knew that in this company, he was greatly honoured and loved. After dinner they led mee backe to the Caſtle of *Auret*, where Monſieur the Marqueſſe ſtayd for me with great expectation to recount unto him, what we had done in our banquet, I told him that all the company had dranke divers times to his health: in *6* weekes he began to uphold himſelfe a little with crutches, and to grow very fat and get a lively naturall colour. Now he had a deſire to goe to *Beaumont* which is the dwelling place of Monſieur the Duke of *Aſcot*, and made himſelfe be carried in a great chaire with eight men by turnes, and the Country folkes where we paſſed along, knowing 'twas Monſieur the Marqueſſe fought and ſtrove together who ſhould carry him, and conſtrained us to drinke, but it was but Beere, but I beleeve had it beene Wine or Hippocras they would have given it us with a very good will, ſo much did they ſhew themſelves joyfull to ſee the ſayd Marqueſſe, and prayd all to God for him. Being arrived at *Beaumont* all the people came before us to doe him reverence, and prayed God to bleſſe him, and keepe him in good health. We entred into the Caſtle where there was more than 50 gentlemen which the Duke of *Aſcot* had ſent for to come make good cheere with his brother, who kept his table furniſht three dayes together. After dinner the gentlemen runne at the Ring, playd at Foyles, and rejoyced greatly to ſee Monſieur *Auret*, becauſe they had heard he would never come out of his bed againe, or be cured of his hurt. I was alwayes at the upper end of the table, where every one dranke carouſes to him, & me, thinking to make me foxt, which they could not do: for I drank but according to my old cuſtome. A few dayes after wee returned backe and tooke leave of Madam the Dutcheſſe of *Aſcot*, who tooke a Diamond ring from her finger which ſhe gave me, acknowledging I had very well dreſt her brother; which Diamond was more worth than fifty Crownes. Monſieur *Auret* grew ſtill better and better, and walked all alone round about his garden with crutches. I beg'd leave of him divers times, to come away to *Paris*, declaring that his Phyſition, and Chirurgion, would well doe the reſt that remained, for the cure of his greefe. And now to begin a little to eſtrange my ſelfe from him, I prayd him to give me leave to goe ſee the Citty of *Antwerp*, which he willingly accorded to: and commanded his Steward to conduct me thither accompanied with two Pages: we paſſed through *Malignes* and *Bruxelle*, where the cheefe of the Citty prayed the ſayd Steward, that at our returne they might heare of it; and that they had a great deſire to feaſt me, as they of *Monts* had done. I thank't them moſt kindly, and told them that I was not worthy of ſuch honour; I was two dayes and a halfe to ſee the Citty of *Antwerp*, where ſome Merchants knowing the Steward, prayd him to doe them the honour, that they might beſtow a dinner or ſupper upon us. There was ſtriving who ſhould have us, and were all very joyfull to heare of the good health of the Marqueſſe of *Auret*, doing me more honour than I expected. To conclude, we came backe to the Marqueſſe making good cheere, and within five or ſixe dayes I asked my leave of him, which he granted with great greefe, and gave me an honeſt Preſent, and of great valew, and made me be conducted by the ſayd maſter of his houſe and two Pages, even to my houſe at *Paris*.

I have forgot to tell you, that the *Spaniards* have ſince ruined, and demoliſht his Caſtle of *Auret*, ſack't, pillag'd, rifled and burnt all the houſes, and Villages belonging unto him, becauſe he would not be of their ſide, in the ſlaughters and ruines of the Low Countryes.

The Voyage of Bourges, 1562.

THe King with his Campe remained not long at *Bourges*, but thoſe within yeelded it up, and went out with their jewells ſaved. I know nothing worthy of memory, but that a Boy of the Kings privie kitchin, who being neere the walls of the Citty before the compoſition was made, cryed with a loud voyce, Huguenot, huguenot, ſhoot heere, ſhoote heere, having his armes lifted up, and his hand ſtretched out; a ſouldier ſhot his hand quite through with a bullet: having received his ſtroake, he came and found me out to dreſſe him. My Lord high Conſtable, ſeeing the Boy to have his hand all bloody, and all rent and torne; demanded of him who had hurt him. Then there was a gentleman who ſaw the ſhot made, ſayd it was well beſtow'd becauſe he cried, *Huguenot*, ſhoot here, ſhoot here. Then the ſayd Lord Conſtable ſayd this *Huguenot* was a good musketiere, and bare a pittifull mind, for it was very likely if he would have ſhot at his head, he might have done it more eaſily than in the hand. I dreſſ'd the ſayd Cooke who was very ſicke, but at length was cured, but with lameneſſe of his hand, and ever ſince his companions call him *Huguenot*; he is living.

The battell of Saint Denis, 1567.

ANd as for the battell of Saint *Denis*, there were divers ſlaine aſwell on one ſide as on the other: ours being hurt, went backe to *Paris* to be dreſſed together with the Priſoners who were taken, whereof I dreſſed a great part. The King commanded me by the requeſt of the Lady high Conſtable, to goe to her houſe to dreſſe my Lord, who had received a Piſtoll ſhot in the middle of the ſpondills of his backe; whereby he preſently loſt all ſence and motion of thighes and legges, with retention of excrements, not being able to caſt out his Vrine, nor anything by the fundament, becauſe that the ſpinall marrow, (from whence proceede the ſinewes to give ſenſe and motion to the inferiour parts.) was bruiſed, broken, and torne by the vehemence of the bullet. He likewiſe loſt his reaſon, and underſtanding, and in a few dayes he dyed. The Chirurgions of *Paris* were a long time troubled to dreſſe the ſayd wounded people, I beleeve (my little maſter) that you ſaw ſome of them. I beſeech the great God of Victories, that we may never be imployed in ſuch evill encounters, and diſaſters.

The voyage of Bayonne, 1564.

NOw I ſay moreover, what I did in the voyage with the King to *Bayonne*, where we have beene two yeares and more to compaſſe all this Kingdome, where in divers Citties and Villages I have beene called into conſultations for divers diſeaſes, with the deceaſed Monſieur *Chaplaine* cheefe Phiſition to the King, and Monſieur *Chaſtellan* cheefe to the Queene Mother, a man of great honour and knowledge in Phyſicke and Chirurgery: making this voyage I was alwayes inquiſitive of the Chirurgions if they had marked any rare thing of remarke in their practice, to the end to learne ſome new thing. Being at *Bayonne* there happened two things of remarke for the young Chirurgions. The firſt was, that I dreſt a *Spaniſh* Gentleman, who had a greevous great impoſtume in his throate: he came to have beene touched by the deceaſed King *Charles* for the Evill. I made inciſion in his Apoſteme, where there was found great quantity of creeping wormes as bigge as the point of a ſpindle, having a blacke head; and there was great quantity of rotten fleſh. Moreover there was under his tongue an impoſtume called *Ranula*, which hindred him to utter forth his words, and to eate and ſwallow his meate: he pray'd mee with his held up hands to open it for him if it could be done without perill of his perſon, which I immediatly did, and found under my Lancet a ſolid body, which was five ſtones like thoſe which are drawne from the bladder. The greateſt was as big as an Almond and the other like little long Beanes, which were five in number; in this apoſteme was contained a ſlimy humor of a yellow colour which was more than foure ſpoonefulls; I left him in the hands of a Chirurgion of the Citty to finiſh the cure.

Monſieur *de Fontaine* Knight of the Kings Order, had a great continuall peſtilent Feaver, accompanyed with divers Carboncles in divers parts of his body, who was two dayes without ceaſing to bleed at noſe, nor could it be ſtancht; and by that meanes the feaver ceaſed with a very great ſweat, and ſoone after the Charboncles ripened and were by me dreſſed and by the grace of God cured.

I have publiſht this Apologie to the end that each man may know, with what foot I have alwayes marched, and I thinke there is not any man ſo tickliſh, which taketh not in good part what I have ſaid, ſeeing my diſcourſe is true, and that the effect ſheweth the thing to the eye; reaſon being my warrant againſt all Calumnies.

The end of the Apologie and Voyages.

FINIS.

A GENERALL TABLE OF ALL THE CHIEFE THINGS TREATED of in this Worke.

Of divers beaſts, &c. as of the Succarath,* 61. *Of the Elephant,* 63. 1020. *Of the Rhinoceros,* 65. *Of the Cammell,* 71. *Of the Crocodile,* 77, 1023. *Of a Crab,* 279. *Of the Scorpion, &c.* 762, 764. *Of the Serpent Hæmorrhous,* 791. *Of the Serpent ſeps,* 792. *Of the baſiliske,* 793. *Of the ſalamander and Torpedo,* 794. *Of the ſting-Ray,* 803. *Of the Sea-hare,* 804. *Of the Monke and Biſhop fiſh,* 1002. *Of the Sea Devill,* 1004. *Of the Sea Morſe and Bore,* 1105. 1006. *Of the Fiſh Hoga,* 1008. *Of a monſtrous flying fiſh,* 1009. *Of* Bernard *the Hermite,* 1010. *Of the ſayling fiiſh,* 1011. *Of the whale,* 1013. *Of an Eſtrich,* 1014. *Of the birds of Paradiſe,* 1016. *Of a Giraffa,* 1018. *Of a Beaſt called Thanacth,* 1021. *Of the beaſt Haÿt & a monſtrous African beaſt,* 1022 *of a Chamæleon.* 1024.
Figures of Furnaces and other things fit for diſtillation, 1096, 1093, 1099, 1101, 1102. 1104. 1106, 1109.
Figure of a fractured arme with a wound in a fit poſture, 576. *Of a Leg fractured with a wound and bound up,* 584. *Of Ligatures for extenſion,* 598. *How to reſtore the diſlocated ſpine,* 605. *Of putting the ſhoulder into joynt,* 609, 610, 611, 612, 613, 614. *Of the Ambi and the uſe thereof,* 615, 616. *Of reſtoring the diſlocated Elbow,* 610. *Of the thigh-bone diſlocated inwards,* 628. *Outwards,* 629. *Of reſtoring a knee diſlocated forwards.* 631
Figure of a Semicupium, 670. *Of a Barrell to be uſed in the cure of a Caruncle,* 743. *Of the Helmet floure,* 807. *Of the ſite of the child in the wombe,* 900. *Of leaden Nipples,* 912. *Of a glaſſe to ſucke the breaſts with.* 919
Figures of Artificiall Eyes, 870. *Of Noſes,* 871. *of Teeth,* 872. *Palats,* 873. *How to ſupply the defect of the tongue,* 874. *of the Eares,* 875 *Iron Breaſtplates,* 876. *of an Vrine-Baſon and artificiall Yard,* 877. *of an iron finger ſtall,* 878. *of an erector of the Hand,* 879. *of Bootes for ſuch as are crookelegged,* 880. *of an artificiall hand,* 881. *of an arme and legge,* 882, 883. *of a Crutch.* 884
Filings of Lead, their harme taken inwardly, and cure. 811
Filtration the manner and uſe thereof. 1102
Fingers and their parts, &c. 218. *their diſlocation,* 623. *Why eaſily reſtored,* ibid. *how to take away ſuch as be ſuperfluous, and helpe thoſe that ſticke together,* 661. *How to ſupply their defects.* 878

Fire and the qualities thereof, 6. The force thereof againſt the Plague. 823
Fiſhes their induſtry, 57. They may be tamed 64
Fiſher, a Fiſh ſo called. 68
Flatulent Tumors, their cauſes, ſignes and cure. 269
Flatulencies about the joynts counterfeiting the Goute. 718
Fiſtula lachrimoſa, ſee Ægilops.
Fiſtulaes what, their differences, ſignes, &c. 484. Their cure, ibid. In the Fundament, 485. The cure, 486. Vpon wounds of the Cheſt and the cure. 391
Fleſhy Pannicle, the Hiſtory thereof. 90
Fleſh quickly putrifies in maritime parts. 416
Flexores muſculi. 230, Superior. 238
Flux of blood in wounds how helped. 328
Flux of the belly how to bee ſtopped. 865, 866
Flying fiſh of a monſtrous ſhape. 1009
Focile what, 231. How to cure the ſeparation of the greater and leſſer, 631. The ſeparation from the paſterne bone. 632
Fomentations and their uſe, 1063. For broken bones. 591. They hurt plethoricke bodies, 591. What to bee obſerved in their uſe. 591, 634
Fornaces, their matter and forme, 1094, 1096, 1097, &c.
Fornix. 168
Foxes and their craft. 67
Fracture what and the differences thereof, 501. Their cauſes, 562. Signes and prognoſticks, ibid. Their generall cure, 564. How to helpe the ſymptomes, 566. Why deadly in the joynt of the ſhoulder, 570. why neare a joynt more dangerous, 581
Fractures of the ſcull, their differences, 337, 338. Of the cauſes and ſignes, 339, Signes manifeſt to ſenſe, 346. A Fiſſure, the firſt kind of Fracture, 341. How to finde it being leſſe manifeſt, 342. A contuſion the ſecond kind of fracture, 343. An Effracture the third kind, 346. A Seat the fourth kind, 348. Reſonitus the fift kind, ibid. The Prognoſticks, 352. generall cure of them and their ſymptomes 356. They are hurt by venery, 359 By noiſe, 360. The particular cure, 362. Why Trepaned. 364
Fractures more particularly and firſt of the noſe, 567. Of the lower jaw, ibid. Of the Collar-bone, 568. Of the ſhoulderblade, 569. Of the breaſt bone, 570. Of the Ribs, 571. Of the vertebræ, or Rack bones. 573. Of the Holy-bone, 574. Of the Rumpe, ibid. Of the Hip, ibid. Of the ſhoulder or armebone, 575. Of the Cubite or Ell a Wand, ibid. Of the Hand, 577. Of the Thigh, ibid. Of the Thigh neare the joynt, 581. Of the patella or whirlebone, 582. Of the legge, 582. Of the bones of the feete. 591
Fractures aſſociated with wounds, how to be bound up. 557, 584
French Poxes, ſee Lues venerea.
Frictions, their kinds and uſe. 34
Fuci, how made. 1078
Fumigations, their differences, matter and forme. 1072, 1073
Fundament, the falling downe thereof. 313, 958. The cauſes and cure. ibid.
Fungus, an excreſcence ſometimes happening in Fractures of the ſcull. 370, 371

G.

Galens Effigies and praiſe. 1118
Gall and the bladder thereof, &c. 110
Ganglion what, 272. Properly ſo called. 274
Gangreene what, 452. The generall and particall cauſes, ibid. That which is occaſioned by cold, upon what part it ſeaſes, 454. Signes, 454. Prognoſticks, 455. The generall cure, ibid. The particular cure. 456
Gargareon. 193
Gargariſmes, their matter and forme, 1070. repelling, ripening and detergent ones. 297
Garlicke good againſt the Plague. 823
Gaſtrica vena. 112
Gaſtrepiplois vena, 112 Major. 113
Geeſe their warineſſe in fleeing over mount Taurus. 68
Gemelli muſculi. 237
Gemini muſculi. 230
Generation, what it is, 23. What neceſſary thereto. 889
Generation of the Navill. 891
Giddineſſe, ſee Vertigo.
Ginglymos what. 243
Giraffa a ſtrange beaſt. 1017, 1018
Glandula what ſort of Tumor. 272
Glandula lachrimalis. 182
Glandules in generall. 108. At the roote of the tongue, 193. Their inflammation and cure. 293 294
Glans penis, 126. Not rightly perforated, how to be helped. 663
Glyſters, their differences, materialls &c. 1050. Severall deſcriptions of them, 1051.

1051. They may nouriſh. 1052
Goates dung is good to diſcuſſe ſchirrhous tumors. 279
Golden ligature, how made. 309
Gomploſis what. 243
Gonorrhæa, how different from a virulent ſtrangury, 738. The cure. 740
Gout, the names and kinds thereof, 697. The occult cauſes thereof, ibid. The manifeſt cauſes thereof, 699. out of what parts it may flow, 701. Signes that it flowes from the Braine, or Liver, ibid. How to know this or that humor accompanying the Gouty malignity, 702. Prognoſtickes. ibid. The generall method to prevent and cure it, 704. Vomiting ſometimes good, 705. other generall remedies, 706. Diet convenient, 707. What wine not good, 708. How to ſtrengthen the joynts, ibid. The palliative cure thereof, 709. Locall medicines in a cold Gout, 710. In a hot or ſanguine Goute, 713. In a Cholericke Goute, 714. What is to be done after the fit is over, 717. Tophi or knots how cauſed, ibid. The hip goute or ſciatica, 719. The cure thereof. 720
Griſtles what, 136. of the noſe, 186. of the Larinx. 194
Groines their wounds, 399. Their Tumors, ſee Bubo's.
Guajacum, The choiſe faculties and parts, 728. The preparation of the decoction thereof, 729. The uſe. 730
Gullet and the Hiſtory thereof, 157. The wounds thereof. 387
Gums overgrowne with fleſh, how to be helped. 293
Guns, who their inventer, 406. Their force, 407. The cauſe of their reports. 415
Gunpouder not poyſonous, 409. 412. How made. 412
Gutta roſacea what, 1080. The cure. 1081
Guts, their ſubſtance, figure and number, 105 Their ſite and connexion, 106. Action, 107. How to be taken forth, 115. Signes that they are wounded, 396. Their cure, 397. Their Vlcers. 480

H.

Hæmorrhoides what, their differences and cure, 487. In the necke of the wombe. 955
Hæmorrhoidalis interna, 112. Externa. 117
Hæmorrhoidalis arteria, ſive meſenterica inferior. 115
Hæmorrhous a Serpent his bite, the ſignes and cure. 791
Haÿt, a ſtrange beaſt. 1022
Haire what the originall and uſe, 160. How to make it blacke, 1081. 1082. How to take it off. 1082
Hairy ſcalpe, the connexion and uſe. 160. The wounds thereof not to bee neglected, ibid. The cure thereof being contuſed, 361
Hand taken generally what, 208, 209. The fracture thereof with the cure, 577. How to ſupply the defect thereof. 879, 881
Hares how they provide for their young. 61
Hare-lips what, 383. Their cure. 384
Harmonia what. 243
Hawkes. 70
Head, the generall deſcription thereof, 159. The containing and contained parts thereof, 160. The muſculous skin thereof, ibid. Why affected when any membranous part is hurt, 160. The watry Tumor thereof 289. The wounds thereof. 337, 338, &c. The falling away of the Haire and other affects thereof, 637, 638, &c. The diſlocation thereof. 603
Hearing, the Organe, object, &c. thereof, 24
Heart and the Hiſtory thereof, 144, 145. The ventricles thereof, 145. Signes of the wounds thereof. 388
Heate one and the ſame the efficient cauſe of all humors at the ſame time, 114. Three cauſes thereof. 250
Hecticke feaver with the differences, cauſes, ſignes and cure. 393
Hedg-hogs, how they provide for their young. 61
Heele, and the parts thereof, 234. Why a fracture thereof ſo dangerous, ibid. The diſlocation thereof, 632. ſymptomes following upon the contuſion thereof, ibid: why ſubject to inflammation. 633
Hemicrania, ſee Megrim.
Hemlocke the poyſonous quality thereof, and the cure. 806
Henbane the poyſonous quality, and the cure. 805
Hermaphrodites, 28, and 972.
Herne, his ſight, and the Falcon. 70
Hernia and the kinds thereof, 304. Humoralis. 313
Herpes and the kinds thereof, 264. The cure. 265
Hip-gout, ſee Sciatica.

Hippe, *the diſlocation thereof,* 623. *prognoſtickes,* 624. *ſignes that it is diſlocated outwardly or inwardly,* 625. *diſlocated forwards* 626. *backwards* ibid. *how to reſtore the inward diſlocation,* 627. *the outward diſlocation,* 629. *the forward diſlocation,* ibid. *the backward diſlocation,* 630
